| <b>REQUEST:</b>   |   | <b>SUGGESTION:</b> |  | <b>ANSWER:</b>       |                      | <b>Accept Suggestion:</b> <input type="checkbox"/>         |                          |
| Reference: Spec Section 03 30 20, Attached sketches   |   |                    |  | 1. Confirmed.        |                      |  |                          |
| Per discussions on 7/31/13 between members of TT, Webcor, Shimmick and Gerdau please confirm the following clarifications and intent of method "B" as it relates to the response issued for RFI 631 reviewed via teleconference.  |   |                    |  | 2. Confirmed.        |                      |  |                          |
| 1. The clear cover of 1 1 /2" as described in the response to RFI 631 has been eliminated. The reinforcing bars may come into contact with the micropile and the waterproofing wrapped around the lower portion of the micropile.   |   |                    |  | 3. Confirmed.        |                      |  |                          |
| 2. At the contractor's discretion, he/she may displace the typical contract bar +/- 4" from the called out spacing as required to avoid clashes with the installed micropile. The displacment of the typical reinforcing may be either for the full length of the bar or weaved around the clashes depending on the specific condition. If this solution is incorporated and results in the typical reinforcing being displaced such that the end of the bar is not in the typical alignment a non-contact lap splice with the next adjacent designed/detailed bar is acceptable. Should the displacement of the typical contract bar to resolve the clash with the micropile result in another clash with another element of the reinforcing design this condition will be addressed through the RFI process upon recognition. See attached sketch #1 for reference. |   |                    |  |                      |                      |  |                          |
| 3. At the contractor's discretion, he/she may cut the typical contract bar creating a gap in the bar to allow for the clashing micropile. Should this be the selected method to resolve the clash a lap splice bar of the same grade and bar size will be required at either side of the gap. The splice bar may be a non-contact lap splice. See attached sketch #2 for reference.   |   |                    |  |                      |                      |  |                          |

|                              |                                 |              |                                |              |                                     |            |             |   |                |

|               | Reference Drawing: S1-3003<br>Reference Submittal: TG0300-620.1   |               |                     |  |                          | Confirmed that contractor-designed micropile without the plate is acceptable. |                          |
|               | Detail 1 on S1-3003 shows a 12"x12"x2" plate under the domed nut on top of the micropile. Note 1 on S1-3003 states that "the contractor is responsible for the design of the pile to meet the design load requirements ... as stated in the project specifications." Submittal No. TG0300-620.1 was returned "No Exceptions Taken" and did not include the plate under the domed nut as it was not a part of BBII's micropile design. Please confirm that it is acceptable to move forward with approved Submittal No. TG0300-620.1 without the 12"x12"x2" plate. |               |                     |  |                          |   |                          |
| T-0664        | BGP - Conflict Between Pit Reinforcing & Trestle/Pin Piles  | Closed        | 08/05/2013          | 08/15/2013   | 08/07/2013               | Potentially   | <input type="checkbox"/> |
|               | From: Webcor Construction LP Jackson Tukuafu To: Turner Construction Compan Gary Krutsch  |               | Answered By:        | Adamson Associates, Inc  | George Metzger           |   |                          |
| Co-Author:    |   |               |                     |  |                          |   |                          |
| REQUEST:      | Reference: Drawing S1-2022, Attached Photos   | SUGGESTION:   | ANSWER:             | Accept Suggestion:   | <input type="checkbox"/> |   |                          |
|               | During the installation of the pit reinforcing between GL 1.4-2.3 and D.4-F a conflict was discovered between trestle/pile and the tail of the #11 pit reinforcing that extends beyond the limit of the pit out and into the main mat slab. Gerdau proposes to trim the tails of the conflicting rebar (Flame Cut) such that clearance can be maintained to the sleeve around the piles.  |               |                     | The tails of pit reinforcement that are extending beyond limits of pits and are in conflict with trestle/pin piles may be trimmed for only the 4 of the 5 locations identified in the RFI.   |                          |   |                          |
|               | Please confirm this is acceptable or provide direction on how to proceed. This conflict is expected to occur at future pits too.  |               |                     | For the 5th location at trestle pile located at D.4-4.4 (which is within the pit depression), see attached SKS-0281.   |                          |   |                          |
|               |   |               |                     | Note that flame-cutting that has been allowed is limited to applications of this RFI only.   |                          |   |                          |
|               |   |               |                     | For future pits within the remainder of the Project, when the tails of pit reinforcement that extend beyond the limits of the pits that conflict with trestle/pin piles/bridge piers, Contractor shall coordinate with as-built locations and apply detail similar to 1/S1-3007 (where bars interrupted by trestle/pin/bridge pier shall turn up). |                          |   |                          |

| Co-Author:   |  |               |   |  |                      |  |                          |
| REQUEST:   |  | SUGGESTION:   |   | ANSWER: Accept Suggestion: <input type="checkbox"/>  |                      |  |                          |
| Webcor/Obayashi (W/O) is in receipt of attached Adamson Associates, Inc. (AAI) response to RFI T-0666 - BSE - Elevator Pit Dimensions Between GL1.4 and GL 2.  |  |               |   | The design team believes the elevator pit dimensions noted in the contract documents are coordinated with the requirements of the alternate elevator manufacturers noted in the specification. The CMGC shall confirm the work of adjacent trades have been coordinated between shop drawings and existing field conditions. The CMGC shall coordinate with the TJPA to hire Sub-contractors at the required times to ensure that construction work and shop drawings of adjacent trades are completed in time to coordinate between trades. |                      |  |                          |
| This response is unacceptable. The Architect has sole responsibility for confirming that the pit dimensions of all elevators and escalators will accommodate the Architect's proposed elevator and escalator systems.  |  |               |   |  |                      |  |                          |
| Until a 100% IFC set is completed by the Architect, W/O has no definite knowledge of the Architect's proposed elevator and escalator systems. This issue has been discussed verbally for over 2 years, during which the Architect has maintained that they have full responsibility for designing all pits and openings to fit their proposed elevator and escalator systems. W/O is unable to even start the RFQ/Bidding process for hiring sub-contractors until the 100% IFC Contract Drawings are finalized by the Architect and approved by the owner; therefore, it is impossible for W/O to hire/coordinate sub-contractors prior to pouring of the elevator pit in the mat slab. |  |               |   |  |                      |  |                          |
| The same applies to all pits and openings throughout the design documents, only the Architect is capable of confirming that these dimensions are acceptable for all of the Architect's proposed elevator/escalator systems.  |  |               |   |  |                      |  |                          |
| Please confirm all elvator pits and slab openings are acceptable as currently shown on the contract documents.   |  |               |   |  |                      |  |                          |

|   |  |                 |                                |   |              |   |                                     |                          |

|--|--|---|--|--|----------------------|--------------------|--------------------------|
|  | <p>SCCi is aware of the CDSM wall excavation required for the geothermal field risers, but is not aware of a geothermal specification requiring buttress shaft demolition for the geothermal loop trenches. Specification 31 23 34, Section 3.2 is very clear in the full scope of the ground excavation in soil and wall riser excavation in the CDSM, but it does not cover trenching in buttress shaft concrete.</p> <p>Please provide a design defining the geothermal fields within the buttress shafts. Please include slot excavation, back-fill and compaction requirements in the the affected buttress'.</p> |   |  |  |                      |                    |                          |
| T-0668   | BGP - CIDH Temporary Bridge Pier Sleeve Detail   | Closed                                      | 08/05/2013   | 08/04/2013   | 08/08/2013           | Potentially        | <input type="checkbox"/> |
| From: Webcor Construction LP Jackson Tukuafu   |  | To: Turner Construction Compan Gary Krutsch | Answered By:Adamson Associates, Inc George Metzger |  |                      |                    |                          |
| Co-Author: Shimmick Construction Company, Inc Ben Gordon   |  |   |  |  |                      |                    |                          |
| REQUEST:   |  | SUGGESTION:                                 |  | ANSWER: Accept Suggestion: <input type="checkbox"/>  |                      |                    |                          |
| <p>Please refer to drawing S1-3003, A1-8711, SCCI RFI #269 with asbuilt information of CIDH Piles at First Street, and ACI 117-90 section 3.4.1.2</p> <p>The typical 48" diameter bridge pier detail (6/S1-3003) and waterproofing detail (4/A1-8711, 5/A1-8711 and 6//A1-8711) are designed for a steel assembly i.e. bridge pier, piles for shoring, bracing and trestle columns, pin piles and dewatering wells. As a result, the means of achieving the shown steel pipe sleeve is attainable.</p> <p>As per submittal package TG0300-201.3, the 48" temporary bridge piers are designed as CIDH (cast-in-drilled piles) piles and not steel. Specifications for concrete construction tolerances in ACI 117, section 3.4.1.2 allow for horizontal dimension of unformed members cast against soil for greater than 2 ft. but less than 6 ft. allow for +6" and -1/2".</p> <p>The penetration sleeves for these piles have been fabricated.</p> <p>Proposed Solutions:</p> |  |   |  | <p>Utilization of concrete piles for the bridge piers was chosen by the contractor to suit their means and methods. The sleeve shown on the architectural and structural drawings provide details of sleeving penetrations to permit expected movement and provide a waterproofing interface. Sleeves at bridge piers were indicated on the Bridge shop drawings and the requirements for field measurements before fabrication were indicated on the metal sleeve shop drawings.</p> <p>New details will not be provided. CM/CG to provide means and methods of adapting concrete pier to suit mat slab waterproofing metal sleeve details.</p> |                      |                    |                          |

| Co-Author: Shimmick Construction Company, Inc Ben Gordon   |  |   |   |                      |                      |                    |                          |
| REQUEST:   |  | SUGGESTION:                                 | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                      |                    |                          |
| Reference: Spec Section 03 30 20, Attached Sketches  |  |   | Contractor-proposed CJ layout as presented in the RFI is acceptable.  |                      |                      |                    |                          |
| Please see attached sketches of mat slab CJ layout. SCCI has discovered conflicts between the CJ formwork and reinforcing steel, pin pile. SCCI proposes to modify the mat slab construction joint to clear the conflicting reinforcing steel and pin pile, as shown on the attached sketches. |  |   | Although the contractor has not inquired yet, one N-S line of shear reinforcement for the column at F-4 will conflict with the joint key. Contractor may shift this one conflicting line of shear reinforcement max of 3" to clear the key. |                      |                      |                    |                          |

| <b>REQUEST:</b><br>As discussed in the fire management coordination meeting on Monday 8/5, the contract plan device layout does not meet code for current draw. The stub ups from the mat slab to the devices shown on the contract plans at every other column will not be sufficient enough to meet code requirements for the future fully occupied space. If stubbed up at every other column, the consequences are having circuit runs that will end up doubling when the devices are added in the future. Siemens recommends that the stub ups are made at every column which will reduce the total current draw when devices are added in the future.<br><br>Please advise. |                                     | <b>SUGGESTION:</b>                                  | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>The fire management system of design is a performance based design as per Section 28 30 01-1.1C of the contract documents. The contractor is responsible for the design of the system, including stub ups and device layout, as required to adhere to all applicable code requirements. |                      |                      |                    |                          |

Reference Sketch: attached  
Reference Email: attached

The micropile designer has confirmed that it is not necessary to extend the micropile to within 6" of the top of concrete and that the 5' embedment in the sump pit is adequate. Please confirm that this is acceptable to the design team.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

This is acceptable with the design team.

**T-0690****SSS - Stainless steel welded to cast iron****Closed****08/23/2013****09/02/2013****09/05/2013****Potentially****From:** Webcor Construction LP

Robert Kjome

**To:** Turner Construction Compan Gary Krutsch**Answered By:** Adamson Associates, Inc George Metzger**Co-Author:****REQUEST:**

Reference Drawing: 1/S1-6056

A number of details throughout structural steel drawings indicate stainless steel welded to cast iron or mild steel, see detail 1, 2/S1-6056 as one example. If two metals are fused, cast iron welded to stainless steel results in carbon migration. The chromium in the stainless and carbon in the steel have affinity for each other at elevated temperatures that results in carbon and chromium combining to form chromium carbide. This turns the welded area into hard and brittle material with a potential for rust that overtime has a high possibility to crack and fail.

For Det. 1 and 2 on S1-6056 the added tension from cables may contribute to failure. The proposed solutions include:

1. Use stainless steel instead of mild steel for the bottom connection plate thus welding stainless steel to stainless steel. Where the bottom plate has to connect to structural steel use bolted connection with thin dielectric isolator between two surfaces.

2. Replace welded connection to bolted connection with an isolator.

3. Use galvanized and painted plate instead of stainless

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

The inquired connection can be executed in the way shown. Welding stainless steel to carbon steel is an established method, which can be done using an appropriate welding method. As with all welding methods, there are certain points to be considered, such as:

- The fabricator to be approved for welding stainless steel to carbon steel and/or cast steel (qualification submittals)

- The welder to be approved for welding stainless steel to carbon steel and/or cast steel (qualification submittals)

- Surface preparation before welding necessary (welding procedure submittals)

- Selection of weld filler material (welding procedure submittals in combination with structural design verification)

- Surface preparation after welding (welding procedure submittals)

- Coating of weld and stainless steel member 30mm beyond weld (welding procedure submittals)

| From discussions with the Design Team, we have been informed that a number of columns will have post installed steel jackets. Columns with Fire Management and steel jackets will require the conduits and j-boxes to be embedded. It is noted that the jackets will not be full height, so the j-boxes will be flush with the concrete face.  |                                    |   |                     | AAI response: Refer to the attached sketches SKA-2808R1, SKA-2809R1, SKA-2811R1 showing the locations of the West End B2 level concrete columns which will receive post installed steel jackets and embedded conduits. The attached SKA-2817R2 shows the mounting height of the surface mounted electrical boxes for these columns.  |                      |                    |                          |
| Please provide the locations of the affected columns and a height for the boxes.   |                                    |   |                     | WSP response: On the steel jacketed columns, backboxes will be surface mounted with conduit routed within the column. Conduit will exit the column terminating into the back of the surface mounted box. Contractor shall lay out and route the embedded conduits such that the number of bends between boxes does not exceed code (360 degrees between boxes). These embedded conduits shall not be required to follow building column lines, and direct runs between devices shall be acceptable to avoid intermediate junction boxes. |                      |                    |                          |

#### REQUEST:

In the MEP meeting on 9/4/13, the response to RFI T-0693 was clarified. To confirm conversations with the WSP Electrical Design representative, the only conduits to be embedded in columns per the RFI T-0693 response are to be fire management conduits per the locations depicted in the response. All other conduits (power recepticals etc) are to be stubbed up on the face of the columns and are not to be embedded in the column.

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

With reference to RFI T-0693, all other conduits (power receptacles etc.) are to be stubbed up adjacent to the face of the columns and are not to be embedded in the columns. The conduits and receptacles will be surface mounted on the post-installed steel jackets.  
Note that the conduits are to be stubbed up with 5" between the conduit face and the concrete column face, to allow for the post-installation of the steel jackets. There are also plumbing risers on a number of the steel jacketed columns. The pipe risers should be positioned relative to the columns in accordance with the plumbing documents, but should not be closer than 5" to the concrete column, to permit post installation of the steel jackets.

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Shimmick Construction Company, Inc Ben Gordon

#### REQUEST:

Please refer to drawings 1/A1-2122, 1/S1-3501 and attached Gerdau sketch SKS-1

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

Contractor-proposed option to omit additional trim bars to the east of the trimmed opening is acceptable for the cut plumbing opening at Grid 2/D.4. Added trim bars to the west of the opening will remain as placed.

Due to the density or the typical N-S top mat bars (#10) and additional bars (#11) near the elevator pit at Gridlines 2 and D.4, the additional trim rebar per 1/S1-3501 for interrupting the bars over the plumbing opening cannot be installed to the East of the plumbing opening within 3" of the opening. The alternative solution would be to install the additional steel in a new layer below the top mat; however, due to proximity of the piping to the steel the bars cannot be placed below the top mat. Gerdau proposes the folloing options:

- A. Omit the additional trim bars to the East of the trimmed opening.
- B. Relocate the additional trim bars approximately 3'-0" East of the opening where the rebar spacing would allow for additional steel.

Please advise if proposed options are acceptable.

| From: Webcor Construction LP Jackson Tukuafu  |  | To: Turner Construction Compan Gary Krutsch | Answered By:Adamson Associates, Inc George Metzger |   |                      |                    |                          |
| Co-Author: Shimmick Construction Company, Inc Ben Gordon  |  |   |  |   |                      |                    |                          |
| REQUEST:  |  | SUGGESTION:                                 |  | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                    |                          |
| See attached Gerdau's RFI #72, 1/S1-3501, A1-2122, attached Gerdau sketch SKS-1   |  |   |  | Per SKS-0282 (attached),  |                      |                    |                          |
| Due to the density of the typical N-S top mat bars (#10), additional N-S top mat bars (#11) and pin pile trim steel (#11 with lap splices directly over floor sink) near the floor sink at Gridlines 2.7 and B.7, the additional trim rebar per 1/S1-3501 for interrupting the bars over the plumbing opening cannot be installed on either side of the plumbing opening. The alternative solution would be to install the additional steel in a new layer below the top mat; however, due to the proximity of the plumbing piping to the steel the additional bars cannot be placed below the top mat. Also, the additional bar to the East of the opening would conflict with the pin pile. Gerdau proposes to cut top mat bars to allow for the floor sink installation and omit the additional trim bars. |  |   |  | Pin pile add bars will be calculated as ½ the number of interrupted bars each side in lieu of ½+1 bars. This eliminates (2) pin-pile add bars being interrupted by the drain. |                      |                    |                          |
| Please advise if the proposed solution is acceptable.   |  |   |  | One wall add bar interrupted by the drain will be cut short at the northern limit of the drain and not be considered interrupted by the drain.                                |                      |                    |                          |
|   |  |   |  | Reinforcing west of the drain centerline, but within the cut zone, will be jockeyed west so that no bars are required to be cut.  |                      |                    |                          |
|   |  |   |  | Reinforcing east of the drain centerline, but within the cut zone, will be jockeyed east so that no bars are required to be cut.  |                      |                    |                          |
|   |  |   |  | A single typical mat bar will remain within the cut zone and may be cut.  |                      |                    |                          |
|   |  |   |  | Congested reinforcing east of the cut zone will be jockeyed east aided by the partial (or complete) removal of a plumbing add bar.  |                      |                    |                          |
|   |  |   |  | Clear spacing of 1db to be maintained between all bars except where lap spliced.  |                      |                    |                          |
|   |  |   |  | In displacing bars to achieve the configuration shown in the SKS, resulting non-contact lap splices will be tolerated up to 6".   |                      |                    |                          |

| <b>REQUEST:</b>   |  |               | <b>SUGGESTION:</b>   |                      | <b>ANSWER:</b>   |                    |                          |
| Reference Drawings: S1-2502, S1-2503, S1-2504, S1-2505, S1-2506, S1-2507  |  |               |  |                      | <b>Accept Suggestion:</b> <input type="checkbox"/>   |                    |                          |
| The angles shown in the bus deck plan views (drawings S1-2502 through S1-2507) for the Type 1 drag connections to the bus deck cast nodes do not appear to match with the corresponding angles shown on the casting drawings (drawings S1-5121 throughS1-5125). |  |               |  |                      | Beam plan angles (Sheets S1-2502 through S1-2507) and Bus Deck casting angles (S1-5121 through S1-5125) will not match in all cases because some casting types are used at multiple locations as indicated in Sheet S1-5120. The design intent was to minimize the number of unique castings in the structure which is more cost effective than developing unique casting geometry for every joint. For example, as indicated Sheet S1-5120, Casting 21A is used at various different joints at which joining beam angles vary in a certain range. The pad widths on the castings have been designed to be wide enough so that beams with different plan angles can be connected to the casting. |                    |                          |
| The attached mark-ups show our fabricator¿s (Oregon Iron Works) attempt to calculate the angles on the bus deck plan views and compare them to the corresponding angles of the castings.  |  |               |  |                      | In some other cases, the casting angles were revised during cast node shop drawing review. For example, for Casting 35B one of the plan angles was changed from 42.25 to 26.14 degrees to match the beam angle. Contractor shall coordinate the information in the drawings with those in cast node shop drawings.   |                    |                          |
| Please clarify.   |  |               |  |                      |  |                    |                          |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**Co-Author:** Shimmick Construction Company, Inc Ben Gordon

**REQUEST:**

Please reference attached drawing S1-3411 .

The corbel section detail I of sheet S1-3411 calls for a 3/4"x4"x 18" embed plate at the toe of the corbel. However, the embed detail in 1D/S1-3411 shows the embed width at 24".

Please clarify the embed width dimensional discrepancy: 3/4"x4"x18" or 3/4"x4"x24". Please advise.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

The inquired embed width is 24" as shown in detail 1D.

**09/08/2013**

**08/29/2013**

**Potentially**

**From:** Webcor Construction LP

Jackson Tukuafu

**To:** Turner Construction Compan Gary Krutsch

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Shimmick Construction Company, Inc Ben Gordon

**REQUEST:**

See attached Gerdau's RFI#74.  
See attached SKS-74

In an effor to prevent the chamfer bar from encroaching on the existing shoring waler beams, Gerdau would like to propose over bending the top hook and turning it into a standard 180 degree hook as shown on the attached sketch.

Please advise if this is acceptable

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Contractor-proposed 180 degree hook for the chamfer bars that are in conflict with double shoring walers is acceptable for bars that have not been fabricated. The radius point for the bend shall remain located as originally detailed on 1/S1-3201.

**T-0703**

**BGP - Drainage Conflicts with Reinforcement**

**Closed**

**08/29/2013**

**09/08/2013**

**Potentially**

**From:** Webcor Construction LP

Jackson Tukuafu

**To:** Turner Construction Compan Gary Krutsch

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Shimmick Construction Company, Inc Filip Filipic

**REQUEST:**

See attached marked up contract drawings PSK-2022 and S1-3005

Some of the drainage lines and fixtures are designed to be constructed in close proximity of the concrete columns, similarly S1-3005 depicts typical mat shar reinforcement schedule and details. Some of these shear reinforcement bars will be interfering with the drainage lines and fixtures.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

General guidelines for displacement of headed reinforcing at plumbing conflicts are as follows:

Lines refer to heads that are perpendicular to a column face.

1) Any head in line can be displaced 4" in any direction provided that it is not the first head. First

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

The condition was observed at Grid 2/ A and will likely repeat at other double waler locations. The typical resolution to the condition shall be to adjust the position, where required, so that the interfering tail clears the double waler web. As a result the 1-1/2" clear cover will deviate up to 4-112" of clear cover. The plan location of the tail shall remain as close as possible per the placement drawings. See the attached Photo for further details.

The 1-1/2" clear spacing shall remain at locations unaffected by the reduced clearance of the double-wlaer. For pieces not yet fabricated and delivered, please refer to RFI T-0603 as the proposed solution to conform to the 1-1/2" clear cover.

Plases confirm the revised haunch reinforcement clear clover as coordinated in the field is acceptable.

| REQUEST:  |  | SUGGESTION:                                  |   | ANSWER:   |                      | Accept Suggestion: <input type="checkbox"/> |   |
| <p>A design change on the light column critical type LC301 (CN0058) node has changed the radius between the body and the lifting bracket from the original two inches to one inch. We would like to formally request a change to a minimum of a two inch radius in this location. A one inch radius on the 301 bracket creates the following manufacturing challenges:</p> <p>A. The sand in the 1 inch radius in the mold will superheat and cause burn in/on sand adherence to the casting causing additional grinding and work in the finishing department to meet visual acceptance criteria.</p> <p>B. The sharper radius will create a hot spot and solidification challenges - liquid metal contracts % inch per foot and silica sand expands 1.2% during solidification and as cast hot tear potential in the radius may occur causing welding, grinding and blending. This again will be to meet the visual acceptance criteria.</p> <p>C. With a 2 inch radius the appendage (lifting bracket) will be much closer to thermally neutral reducing solidification stresses and potential shrinkage in the section radius.</p> |  |  |   | <p>Proposed 2" fillet radius between the main body of casting LC301 and its side fin is acceptable.</p> |                      |   |   |

|---------------|---|--|--|----------------------|----------------------|--------------------|--------------------------|
|               | <p>D. Cosmetically a 2 inch radius will look much more presentable in the as cast state.</p> <p>E. The 1 inch radius will require either chill sand in the radius, a metal chill made in the mold, or solidification cracking brackets as heat sinks to equalize the solidification temperatures and add strength to prevent hot tearing during solidification. Additional grinding of these areas will be necessary to meet visual acceptance criteria.</p> <p>F. Items A, B, and E will add costs to the manufacturing process of the casting.</p> <p>Our purpose is to point out the effects of the 1 inch radius design request and make sure that the designers are aware of the potential impact of having the smaller radius versus the 2 inch radius in the original designs that were reviewed. Bradken Atchison can certainly produce the 1 inch radius and manage the effects the 1 inch radius causes, but producing that design will have cost impacts to the casting process.</p> |  |  |                      |                      |                    |                          |

#### Co-Author:

#### REQUEST:

Reference Documents: Exhibits A - B

Further to response to RFI T-637 please find attached proposed changes to the spandrel beams in pour Area 4 for location plan see exhibit - A.

Exhibit - B shows the plan view of the modification necessary to the spandrel beam due to the revised reinforcement width of the foundation wall as well as typical cross sections.

RFI T - 622.1 shows the extent of the modification to the foundation wall on the north elevation of area 4.

Please confirm that this modification as outlined at this location is acceptable.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

George Metzger  
9/13/2013

#### RESPONSE:

Contractor proposed modification to the Lower Concourse spandrel beam within Area 4 is acceptable. Proper lap splices shall be provided where the beam rebar is transitioned from 7-1/16 inch spacing to 6-1/2 inch at each side of the encroached wall region.

|                              |   |                 |                                |        |              |                                      |            |             |                          |                |

#### ANSWER:

Accept Suggestion: ☐

The 2 corner bar dowels of the pier that are in conflict with the pipe may be minimally bent to clear the pipe.

Non-corner vertical bar dowels within the pier that are in conflict with the pipe may be shifted to clear the pipe.

#### REQUEST:

See attached Gerdau's RFI #078.

Near Gridlines 3/C.3, there is a conflict between the partition wall pier dowels and the installed 6" plumbing pipe (8" with insulation). The wall pier currently overlaps with the plumbing pipe by approximately 6". Gerdau proposes to move the wall pier to the East, or West to allow the dowels to clear the pipe.

Please provide the acceptable direction (East or West) to shift the wall pier.

Please note that there are conduits stub up on the East side that would need to be moved, should the opening is shifted towards the East.

#### SUGGESTION:

**REQUEST:**

Reference Documents: Exhibits A - B

Further to response to RFI T-637 please find attached proposed changes to the spandrel beams in pour Area 6 for location plan see exhibit - A

Exhibit - B shows the plan view of the modification necessary to the spandrel beam on the north and south elevations due to the revised reinforcement width of the foundation wall due to encroachment of the CDSM beams as well as typical cross sections of the spandrel beam. RFI T - 627.1 shows the extent of the modification to the foundation wall on the north and south elevations of Area 6.

Please confirm that this modification as outlined at this location is acceptable.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion: ☐

George Metzger

9/18/2013

**RESPONSE:**

Contractor proposed modification to the Lower Concourse spandrel beam within Area 6 is acceptable. Proper lap splices shall be provided where the beam rebar is transitioned from 7-1/16 inch spacing to 6-1/2 inch at each side of the modified cross-section.

**Co-Author:**

**REQUEST:**

In Detail 2/A1-8710 (see attached) it's not clear as to the final cut-off elevation for the CDSM wall shoring piles. Currently CDSM shoring piles extend up past the existing grade and future TG12.1 Civil Site Work Trade Contractor will be responsible for cutting off the CDSM wall shoring steel piles to the final elevation. WOJV propose that the cut-off elevations for the shoring piles be established at 3" above the train box lid i.e. at the top of concrete protection slab. See attached sketch SK -1.

If the shoring piles are to be cut off below the train box lid as currently shown in detail 2/A-8710, the waterproofing membrane could be compromised by the heat generated by the cutting torches which will have to be used to cut these large steel piles, also this detail does not address the instances where the shoring wall is shared with further new projects i.e. 181 Fremont street in Zone 4 and 101 1st street in Zone 3.

It is preferable that the shoring piles be cut-off 3" above the top of the train box lid to ensure that the waterproofing system isn't compromised and omits the need to pothole around 861 CDSM piles which are in close proximity to adjacent property and live traffic.

Please confirm this is acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger  
9/17/2013

**RESPONSE:**

The soldier piles are within the City Public Right of Way. Obstructions either have to be at least 4' below the surface or be protected with 1" thick steel plates (similar to the Train Box Lid). Leaving the soldier piles in this Public Right of Way may compromise agreements that have been established with the City.

Either the piles will need to be cut down below the 4' depth entirely or the vertical flange adjacent to the Train box is left in place and the opposite (outside) flange and the web are cut down to 4' below the finished surface. Leaving the inside flange in place to the top of the Train Box Lid could facilitate support for the vertical waterproofing assembly.

**REQUEST:**

Further, in response to RFI T-725, WOJV requires the cut-off elevations for the 861 CDSM piles around the perimeter of the train box taking into account but not limited to, San Francisco city requirements for beam cut off in a public right of way, the elevation of utilities entering the train box structure, bridge structures and ramps as well as pedestrian stair towers 201A and 201 B and passenger elevator 201 foundations on the west side of Zone 1.

Another item which will also need to be taken into account is where the CDSM shoring wall is shared with adjoining Projects i.e. 181 Fremont Street in Zone 4 and 101 1st street in Zone 3.

This information once provided will but used as part of the future trade packages TG07.2 Concrete Superstructure and TG12.1 Civil Sitework scopes of work.

Please provide in tabular format a list of the final cut-off elevations for each individual CDSM pile around the perimeter of the train box.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

RESPONSE: RFI T-0725.1 BGP- CDSM Soldier Pile cut-off

George Metzger  
10/11/2013

**RESPONSE:**

Per Design Review Meeting discussion on 10/09/2013, TJPA (ES) stated to reject the RFI as it is not construction related and will be addressed with W/O within the bidding documents.

**REQUEST:**

Further to response to RFI T-725.1 TG07.2 trade package requires the cut off elevations for the 861 CDSM pile around the perimeter or the train box taking into account but not limited to, San Francisco city requirements for beam cut off in a public right of way, the elevation of utility's entering the train box structure, bridge structures and ramps as well as pedestrian stair towers 201A and 201B and passenger elevator 201 foundations on the west side of zone 1, Another item which will also need to be take into account is where the CDSM shoring wall is shared with adjoining Projects i.e. 181 Fremont street in Zone 4 and 101 1st street in Zone 3.

Please provide in Tabular format a list of the final cut-off

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

As discussed with the design team and the TJPA, Tabular format a list of the final cut-off elevations for each individual CDSM pile does not exist. The CDSM Wall cut-off elevations are by contractor means and methods with the elevation determined by the contractor based on the various components of the Transit Center building construction for example; contractor formwork, waterproofing and re-construction of adjacent streets/sidewalks.

Where CDSM wall is shared with adjoining Projects i.e. 181 Fremont street in Zone 4 and (Salesforce Tower) 101 First street again the CDSM Wall cut-off elevations are a contractor means and methods with

REQUEST:

Reference Documents: Exhibits A - E

Further to response to RFI T=0609 (see exhibit - D) this RFI shows the areas of foundation wall in pour area 8, on the north & south wall elevations which will have greater than 6" of clear cover to the vertical reinforcement for location plan see Exhibit - A

Exhibit - B & C depict the amount and location of the foundation walls which the will have greater than 6" of clear cover to the vertical reinforcement.

RFI T-0724 shows the thinning of the wall with the revised reinforcement spacing due to CDSM pile encroachment in Area 8.

Please confirm that the clear cover between the waterproofing system and the vertical reinforcement as outlined at these locations is acceptable.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

George Metzger  
9/17/2013

RESPONSE:

The clear cover between the waterproofing system and vertical reinforcement as presented in Exhibit C of this RFI is acceptable.

Answered By:Adamson Associates, Inc George Metzger

REQUEST:

Please refer to attached drawing S1-2024 (dated 11/27/12), S1-3005 (dated 08/3012) and attached Shimmick sketch SK-SCCI 316.

Per field measurements, the 36" bump-out trestle pile near gridlines F.7/15 interferes with the nearby column shear reinforcement at gridlines G/15. Due to the size of trestle pile, the adjustment of the shear head locations, as provided in RFI T-0703, cannot be achieved.

Please advise.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

Per SKS-0283 (Attached):

To avoid the trestle pile interference with the column shear heads at Grid G/15, the heads layout shall be rotated 45 degrees about the column center.

The layout of heads in an arm shall be modified such that each of the arms contains 9 lines of heads extending to 16' from the column center.

Heads in an arm shall be placed approximately at each 8' reinforcing module intersection, such that each adjacent line radiating from the column is staggered.

The minimum number of total heads shall be 508.

**Co-Author:** Shimmick Construction Company, Inc Ben Gordon

**REQUEST:**

Please refer to attached excerpt from specification section 033020, Article 3.3 - D.

The referenced specification section requires mixed discharge concrete "...be completed within 1-1/2 hours or before the drum has revolved 300 revolutions, whichever comes first..." However, Cemex the concrete supplier has performed the set time test to evaluate the time at which the onset of hydration occurs for mix #1557217 (Protection Slab Mix) as per the attached Cemex letter dated August 26, 2013.

As per the attached test result by Cemex, please confirm it is acceptable to extend the concrete delivery to two (2) hours in lieu of 1-1/2 hours as specified.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:** ☐

It will be acceptable to extend the concrete delivery time as proposed in the RFI.

The contractor shall be responsible for providing an end concrete product that meets the specifications.

| <b>REQUEST:</b>   |  |               | <b>SUGGESTION:</b>                                   |                      | <b>ANSWER:</b>  |  |                          |
| Reference Documents: S1-2303 thru S1-2307,  |  |               |  |                      | <b>Accept Suggestion:</b> <input type="checkbox"/>  |  |                          |
| Elevations for transfer girders shown on drawings S1-2303 thru S1-2307 are in decimal feet. Once converted to feet/ inches they become 1/16th values.   |  |               |  |                      | Transfer girder elevations may be rounded to the nearest 1/8".  |  |                          |
| Please verify if the elevations should be rounded up to the nearest 1/8th of an inch or kept as converted.  |  |               |  |                      |   |  |                          |
| See attached specific conversions for each transfer girder locations  |  |               |  |                      |   |  |                          |
| <hr/>   |  |               |  |                      |   |  |                          |

| <b>REQUEST:</b>   |  |               | <b>SUGGESTION:</b>                                   |                      | <b>ANSWER:</b>  |  |                          |
| Reference Drawing: S-0007   |  |               |  |                      | <b>Accept Suggestion:</b> <input type="checkbox"/>  |  |                          |
| Please identify what are considered "LATERAL SYSTEM MEMBERS" as called out in the GENERAL NOTES SS-9, B "REGARDLESS OF THICKNESS ALL TRUSSES, LATERAL SYSTEM MEMBERS (INCLUDING COLUMNS, BRACES, ETC.): 20FT-LB @ 70 DEG. F." |  |               |  |                      | Lateral system members refer to members of the seismic framing. Following members constitute the seismic frame: Members designated as SLRS or SFRS in the drawings, members in "seismic frame elevations". See plan notes to locate "seismic frame elevations".   |  |                          |
|   |  |               |  |                      | As called out in Specification 05 12 10 (Structural Steel - Additional Seismic Requirements) Section 2.1.A.1, "Heavy sections shall be supplied with CVN testing in accordance with AISC 341". Therefore, requirements of SS-9B need not be applied and CVN testing requirements can be limited to heavy sections (shapes) per the AISC 341 requirements. As noted in General Notes GR-2, AISC 341-10 is the governing provision. |  |                          |

| Reference Drawings: S1-5016 and S1-5017   |   | In concept, TT take no exception with standardizing the bolt and pin lengths, but offer the following comments:   |  |  |  |                    |                          |
| The spacing of the shear plates on the bus deck cast nodes varies in conjunction with the thickness of the web of each connecting beam. See 1c/S1-5016 and 1b/S1-5017 for reference.                            |   | 1. The bus deck cast nodes are in the process being fabricated, so the proposed change shall not affect the cast node pad width. The pad on the cast node has                                 |  |  |  |                    |                          |

|----------|--|-------------|--------------|---------------|---|--|--------------------------|
|          | <p>In order to avoid customizing the cast nodes, connection pins and/or the bolt lengths, our fabricator, Oregon Iron Works, proposes to standardize the spacing on the cast node shear connection plates and customize the thickness of the web reinforcing plates. See the attached mark-ups of S1-5016 &amp; S1-5017 depicting the proposed detail.</p> <p>Please confirm that this proposal is acceptable.</p> |             |              |               |   | <p>sufficient width to accommodate the connection plates as shown on the contract documents.</p> <p>2.For Type I drag connection, the tabulated plate thicknesses do not include the ones for W40 x327 (near Grid 9.9, 10.1, &amp; 19.9) and W40x392 (near Grid 20.1).</p> |                          |
| T-0738.1 | SSS - Nominal Gap Dimensions for Cast Node Drag Connections  | Closed      | 01/14/2014   | 01/24/2014    | 01/24/2014  | Potentially  | <input type="checkbox"/> |
|          | From: Webcor Construction LP Stephanie Azzolino To: Turner Construction Compan PHIL MILITELLO  |             |              |               | Answered By:Adamson Associates, Inc George Metzger  |  |                          |
|          | Co-Author: Skanska USA Civil West California DisRyan Clayton   |             |              |               |   |  |                          |
|          | REQUEST: WOJV RFI T-0738 (SK RFI 004.1) was submitted to the EOR proposing a 1/2" gap for Type 1 and Type 2M drag connections at the Bus Deck Level Cast Nodes. These ½" gaps were not explicitly called out, but were indicated on the suppor ting documents attached for your reference.   | SUGGESTION: |              |               | ANSWER: Accept Suggestion: <input type="checkbox"/>   |  |                          |
|          | Subsequent conversations with Thornton Tomasetti and Webcor/Obayashi have revealed that a 1/8" nominal gap is preferr ed in lieu of the noted ½" gap.  |             |              |               | The 1/2" gap was proposed initially in RFI T-0738 to allow for 1/4" gap at each side of the beam web. We propose a 1/8" gap each side to mitigate the potential joint movement in an earthquake. We believe that the 1/8" gap is sufficient for erection tolerance. If Skanska prefer the 1/4" gap, please provide justification for the Design Team to review. |  |                          |
|          | Please advise if a 1/2" or 1/8" nominal gap is required for the Type 1 drag connection on 1/S1-5016 and Type 2M drag connection on 1/S1-5017.  |             |              |               |   |  |                          |

**Co-Author:** Shimmick Construction Company, Inc Ben Gordon

#### REQUEST:

Please reference attached drawing S1-2057 and S1-3007.

The bridge pier pile (4'-0" diameter) near grid E/34.5 is shown in S1-2057 to be offset from the typical row of piles shown along gridline 34.7. In addition, detail 1/S1-3007 depicts the pile being located within the pit that is located at gridline E/34.5. However, as per BBI's Beale Street Bridge drawings and as-built conditions, the aforementioned bridge pile is installed in line with the other piles on gridline 34.7.

Please confirm the as-built location of the bridge pier is acceptable and the sump pit detail shown in 1/S1-3007 is no longer applicable.

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

George Metzger  
9/25/2013

#### RESPONSE:

This topic has already been addressed in past RFI's. Please refer to responses for RFI T-0264.7 BSE as well as RFI-0264.3 BSE.

**T-0742** **BGP- CDSM Soldier Pile Encroachment Area 9** **Closed** **09/20/2013** **09/30/2013** **09/26/2013** **Potentially** ☐

Reference Documents: Exhibits A - G

This RFI addresses the impact of the encroaching CDSM soldier piles (SP) and steel plate on the north & south wall in mat slab pour Area 9 as well as all levels of the encroachment into the foundation wall between CDSM piles 164 to 188 on the north elevation and 595 to 618 on the south elevation for Location Plan see exhibit - A Exhibit - B, & C depict the location and degree in which the SP are encroaching  
WOJV proposal North elevation on gridline A: (See Exhibit - B) Between CDSM piles 167 to 168 WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching Steel plate attached to SP 167 & 168, originally this was a WR1 reinforcement area #11@8" oc EF vertically and would change to #11@6" OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.1 (Exhibit - D).  
WOJV proposal on the South elevation: (See Exhibit - B) Between CDSM piles 611-612 to 613-614, WOJV is proposing to decrease the specified 36" wall thickness to

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

George Metzger  
9/25/2013

#### RESPONSE:

The contractor proposed revisions to foundation wall reinforcement due to encroaching CDSM Piles (and added steel plates) in Area 9 are acceptable. Note that reducing the spacing of embedded column vertical reinforcement from 6 inch to 5 inch may negatively impact the installation of embedded column cross-ties which are #5 per construction drawings.

#### REQUEST:

Reference Documents: Exhibits A - I

This RFI addresses the impact of the encroaching CDSM soldier piles (SP) on the north & south wall in mat slab pour Area 10 as well as all levels of the encroachment into the foundation wall between CDSM piles 164 to 188 on the north elevation and 571 to 595 on the south elevation for Location Plan see exhibit - A  
Exhibit - B & C depict the location and degree in which the SP are encroaching

WOJV proposal North elevation on gridline A: (See Exhibit - B) between CDSM pile 200-201 to 206, WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching SP 206. This foundation wall area was originally a WR2 reinforcement area (#11@6" OC EF vertically) and would change to #11@5" OC this reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.3 option 2 (Exhibit -E).

WOJV proposal on the South elevation: (See Exhibit - B) Between CDSM piles 574 to 576 and 587 to 588 - 589 WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching SP 575 & 588, originally these were WR1 reinforcement areas #11@8" OC EF vertically and would change to #11@6" OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.1 (Exhibit - D).

Between CDSM piles 588-589 to 591, WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching SP 589 & 590. This foundation wall area was originally a embedment column with reinforcement in this area was a double layer of #11@6"oc EF vertically and would change to #11@5" OC this reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.4 option1 (Exhibit -F).

In all other areas without CDSM pile encroachment issues the reinforcement will remain unchanged as per the Contract drawings.

See Exhibit - G, H & I showing details of transition

between modified reinforcement to contract reinforcement.

These solutions if approved would be incorporated into the TG06 shop drawings.

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

George Metzger

9/25/2013

#### RESPONSE:

The contractor proposed revisions to foundation wall reinforcement due to encroaching CDSM Piles in Area 10 are acceptable. Note that reducing the spacing of embedded column vertical reinforcement from 6 inch to 5 inch may negatively impact the installation of embedded column cross-ties which are #5 per construction drawings.

**REQUEST:**

See attached photos of the construction joint at mat slab area 6 South, near grid line 8.5, and CJ layout drawings.

Due to congestion and access SCCI would like to shift the walls and concourse joints at this location 14.5" to the East. This adjustment does not affect any other structure's elements and complies with the CJ parameters outlined in the contract specifications.

Please confirm modifying the construction joint layout is acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger  
9/27/2013  
RESPONSE:  
Per conversation between TT & Shimmick, it was clarified that the proposed joint modification is only at the south end where the original N-S running joint in the mat and the Lower Concourse will turn an angle near the toe of the chamfer so that the joint will end perpendicular to the foundation wall. The 14.5" shift proposed in the RFI is shift in the south end point only.

**REQUEST:**

Pleaes refer to attached plumbing drawing PSK-2022 (dated 04/26/2013) and IR Report 1633.

On 09/10/2013, the SFDBI inspector expressed concern about the installation of the 2" vent and 3" connections in the mat slab area 4 - See IR 1633.

Please confirm the 2" vent and 3" connection pipes are to be installed per drawing PSK-2022..

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger  
9/20/13  
RESPONSE:  
The 3" drain and 2" vent connections serve as drain for the future Phase 2 under car deluge system control assemblies. They are similar to sprinkler drains, refer to detail 3/P1-6001 (with trap below floor, no trap primer connection below floor, the trap primer connection will be above floor).

| REQUEST:  |  | SUGGESTION:  |                     | ANSWER:              Accept Suggestion: <input type="checkbox"/> |                      |                    |   |
| Reference is made to Drawings S1-2303 and S1-2304 near grids F.9 and G.13. Please verify the following:   |  | For the W30x90 beam near grid F.9 and the three W24x76 beams between grids F/G & 13/14, the beam cambers shall be 3/4" and not 3 1/4".   |                     |  |                      |                    |   |
| 1) S1-2303 indicates the W30x90 beam near grid F.9 is to have a 3 ¼" camber (reference CD RFI 028 SK1). Please verify the camber should be ¾" in lieu of the 3 ¼" dimension indicated.  |  |  |                     |  |                      |                    |   |
| 2) S1-2304 indicates that three W24x76 beams between grids F/G & 13/14 are to have a 3 ¼" camber (reference CD RFI 028 SK 2). Please verify the cambers should be ¾" in lieu of the 3 ¼" dimension indicated.                   |  |  |                     |  |                      |                    |   |

| Co-Author:  |  |  |                     |  |                      |                    |   |
| REQUEST:  |  | SUGGESTION:  |                     | ANSWER:              Accept Suggestion: <input type="checkbox"/> |                      |                    |   |
| Please verify the following in reference to Detail 5B on S1-5051 and the sketches attached (SD RFI 029 SK1, SK2, & SK3)   |  | 1) The Grout hole in the shear key is to be centered at the 10" deep shear key (5" from the bottom of the base plate).   |                     |  |                      |                    |   |
| 1) For type 2 column base plates at the lower concourse please confirm the grout hole indicated is to be 7" below the base plate in order to place it 5" below the top of concrete as appears to be shown in detail 5B/S1-5051. |  | 2) The location of the shear key shall be as shown on 3/S1-5051. Location of the shear key is controlled by the concrete beam top bars below. Where the base plate is only 26" wide, the shear key may be located 10" from center of column (instead of 10- 3/4" shown on 3/S1-5051) to fit within the width of the 26" wide |                     |  |                      |                    |   |
| 2) For the 26" by 30" type 2 base plates as shown in 2/S1-  |  |  |                     |  |                      |                    |   |

| Please refer to attached drawing S1-3201 and spec section 032000.  |  |   |  | George Metzger<br>9/30/2013   |                      |                    |                          |
| The #10, Grade 60 concrete reinforcement for the "haunch" is shown on the typical foundation wall section drawing S1-3201. The trade group package contractor SCCI proposes the use of a Grade 75 #10 or #11 rebar in-lieu of the Grade 60 #10 "haunch." |  |   |  | RESPONSE:<br>The #10 GR60 haunch reinforcing shown on the typical foundation wall section, 1/S1-3201, can be substituted with #10 GR75 reinforcing with the following conditions: |                      |                    |                          |
| Please confirm it is acceptable to use Grade 75, #10 or #11 rebar in lieu of the specified concrete reinforcement at the "haunch."   |  |   |  | 1. RFI T-702 BGP stands, i.e. the detailing and location of the hooked top remains unchanged.   |                      |                    |                          |
|  |  |   |  | 2. RFI T-710 is modified such that headed bars are not allowed.   |                      |                    |                          |
|  |  |   |  | 3. RFI T-710 is modified such that the straight embedment into the mat, either vertical or inclined, where the bar is interrupted by a dewatering well, shall be 52" minimum.     |                      |                    |                          |

| Co-Author:   |  |               |   |                      |   |                    |                          |
| REQUEST:   |  |               | SUGGESTION:   |                      | ANSWER:   |                    |                          |
| Please reference contract sheet S-0007, specifically structural steel note SS-1, which indicates that plates used for flanges in built up beams shall meet the criteria of ASTM Designation A572-50 (UNO) and have a maximum yield point of 58ksi.   |  |               |   |                      | Accept Suggestion: <input type="checkbox"/>   |                    |                          |
| The plate mills will not guarantee material that meets the A572-50 criteria and further restricts the yield to a maximum of 58ksi. The plate mills will guarantee material that will yield within the range of 50ksi - 65ksi. Attached you will find correspondence with two major US steel mills for reference. |  |               |   |                      | The maximum yield strength specified on General Note SS-1 is to ensure the strong column/weak beam condition is met. Hence, this requirement may be relaxed to applicable to steel plates for seismic moment frame beams only.                  |                    |                          |
| Please confirm, for the plates used for flanges in built-up members produced from A572-50 material, that a yield range of 50ksi - 65ksi is acceptable.   |  |               |   |                      | From our past experience, the maximum yield of 58 ksi is a very reasonable target. Also, the lab tensile tests commonly show a lower yield than what is provided on the mill certifications (around 2- 6 ksi lower).                            |                    |                          |
|  |  |               |   |                      | However, we understand that this is still a risk to the steel contractor even though it is only applicable to the seismic moment frame beams. We agree to relax this requirement further accepting the yield strength up to 65 ksi as requested |                    |                          |

| On the response to Webcor RFI # T-0770 (SK RFI # SK 052) & T-0769 (SK RFI # 050) we have reviewed and located most of the beam locations in question using the nearest gridlines, architectural dwg's, partial plans, equal spacing, etc per the noted guidelines in the response. However, on drawings S1-2602 to S1-2607 there are still some beam locations that cannot be located and require verification; therefore, on sketches CD RFI 026.1 SK1 to SK6 please verify all clouded dimensions in RED as noted to close this RFI. |   |                    |  | Responses to the queries on dimensions for locating beams on floor plans have been noted on the attached sketches SKS-0316 through SKS-0321. |  |                    |                          |

| 3)            | Confirm it is acceptable to supply a ½" x 4" x 4" (A36) plate washer above the column stiffener with a 1/16" oversize hole.  |               |                     |                      |                      |                    |                |
| 4)            | Confirm it is acceptable to locate the grout holes typically as shown on CD RFI 016 SK3.   |               |                     |                      |                      |                    |                |
| 5)            | To aid in the alignment of the thread bar anchor rods during concrete operations, please confirm it is acceptable to provide one ½" thick anchor plate at the base of the thread bars with size to match the base plate in lieu of four separate ½" x 4" x 4" anchor plates. |               |                     |                      |                      |                    |                |
| 6)            | Confirm the thickness of the stiffener for Type II and Type III column bases is to be 2".  |               |                     |                      |                      |                    |                |
| 7)            | Confirm an anchor bolt projection of 2.5 x AB dia. above the plate washer on top of the column stiffener is acceptable. See CD RFI 030 SK3 for reference.  |               |                     |                      |                      |                    |                |
| 8)            | Confirm an anchor bolt extension of 2.5 x AB dia. below the bottom plate washer is acceptable. See CD RFI 030 SK3 for reference.   |               |                     |                      |                      |                    |                |
| 9)            | Confirm that the 1" cover as shown on CD RFI 030 SK3 is acceptable.  |               |                     |                      |                      |                    |                |
| 10)           | Confirm that the anchor bolts shall be installed wrench tight.   |               |                     |                      |                      |                    |                |
| 4.            | Grout hole locations and procedure shall be confirmed by the mock-up.  |               |                     |                      |                      |                    |                |
| 5.            | 1/2" anchor plate matching the base plate at the bottom of the anchor bolt is not acceptable as it will affect the consolidation of the concrete.  |               |                     |                      |                      |                    |                |
| 6.            | Confirmed, the stiffener is 2" thick.  |               |                     |                      |                      |                    |                |
| 7.            | Contractor to verify with the anchor rod suppliers for the length of the hex nut. Recommend projection = washer thickness+ hex nut length + 1.5x d Minimum to account for construction tolerance   |               |                     |                      |                      |                    |                |
| 8.            | See response to question #7.   |               |                     |                      |                      |                    |                |
| 9.            | Confirmed the 1" clear is acceptable.  |               |                     |                      |                      |                    |                |
| 10.           | Confirmed that wrench tight is adequate.   |               |                     |                      |                      |                    |                |

**REQUEST:**

As per the response to RFI# T-0771 please confirm the following:

1. For items 8 & 9 please confirm it is acceptable to have 0" cover at the underside of the concrete beam. See attached sketch SK-1 for clarification.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

1) Confirmed that it is acceptable to have 0" cover at the underside of the concrete beam, as the bolt is directly above the concrete column.

2. Confirmed that it is acceptable to use an alignment plate with a 7" diameter center hole

**REQUEST:**

Please reference Drawing S1-5051 and the attached sketches in regards to the column base details:

1) Confirm that the 1-3/4" anchor bolts as referenced 7/S1-5051 are acceptable to typically locate as shown (reference CD RFI 034 SK1 attached) so that the plate washers clear the stiffener plate and weld.

2) Confirm the plate washer size, thickness and grade is acceptable (reference CD RFI 034 SK1 attached).

3) Confirm that the 2-1/2" anchor bolts as referenced 7/S1-5051 are acceptable to typically locate as shown (reference CD RFI 034 SK2 attached) so that the plate washers clear the stiffener plate and weld

4) Confirm the plate washer size, thickness and grade is acceptable (reference CD RFI 034 SK2 attached).

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

1) confirmed.

2) confirmed.

3) confirmed.

4) Use 1" thick washer plate per anchor rod catalog.

| <div>From: Webcor Construction LP</div> <div>Michael Spillane</div> <div>To: Turner Construction Compan</div> <div>Gary Krutsch</div>  |   |                        | <div>Answered By:Adamson Associates, Inc</div> <div>George Metzger</div> |   |                      |                    |                          |
| <div>Co-Author:</div>  |   |                        |  |   |                      |                    |                          |
| <div>REQUEST:</div> <div>In accordance with Spec section 31-55-00 1.4 J the contractor is to submit concrete strength results to the design team prior to the removal of internal bracing. In order to fulfill this requirement the contractor has asked the following questions.</div> <div>1. What is the criteria for bracing removal for instant if the average strength of the concrete cylinders tested is calculated to be above the design strength can the internal bracing be removed?</div> <div>2. Is there any tolerance on the design strength requirement for bracing removal, for example if the concrete has reached 90% of design strength could the bracing be removed? Obviously this could have a positive effect on the construction schedule.</div> |   | <div>SUGGESTION:</div> |  | <div>ANSWER:</div> <div>Accept Suggestion: <input type="checkbox"/></div> <div>George Metzger</div> <div>10/9/2013</div> <div>RESPONSE:</div> <div>The response of this RFI is limited to the scope of the removal of the lowest level D temporary shoring struts:</div> <div>1. The criteria for removing the shoring struts is defined in general note FO-5 on sheet S-0005 of the TG03 BSE documents: " F0-5 Do not remove temporary shoring struts against foundation walls until the foundation wall and mat concrete has attained 100% of its design strength."</div> <div>For consideration of bracing removal prior to 56 day concrete cylinder tests, design strength may be considered achieved when all earlier tested cylinders meet ACI 318 acceptance criteria. For this purpose, "test" in ACI will not be required to be the average of multiple test results of a particular batch.</div> <div>If the results of the concrete cylinders meet ACI criteria and averages (as defined by ACI) exhibit values above design strength, the element may be considered to have attained its design strength.</div> <div>2. The lowest level brace D may be removed when the concrete strength has reached 90% of design strength. Note that this is a relaxation of the contract document criteria and limited to the removal of the lowest level brace D.</div> |                      |                    |                          |

do not reflect the coordinated revised construction joint.

Please confirm it is acceptable to combine slab placement areas S102 and S104 into one pour without bulkhead forms in between.

cracking becomes increasingly likely when aspect ratios exceed 1.5:1. TT notes that the revised construction joint layout creates an additional high aspect ratio pour. While TT does not recommend the elimination of the joint, the contractor may at their own risk eliminate the joint between Area S102 and S104 per the revised joint layout contained in Submittal TG0600-030.3 (Item 033000-003.3) dated September 17, 2013. Further, the contractor shall verify that the new geometry does not change the previously issued CTL submittals.

| Co-Author: Shimmick Construction Company, Inc Ben Gordon   |   |                 |                                |            |              |  |             |                          |
| REQUEST:   |   |                 | SUGGESTION:                    |            |              | ANSWER:  |             |                          |
| Please refer to attached RFI T-0691.   |   |                 |                                |            |              | Accept Suggestion: <input type="checkbox"/>  |             |                          |
| This RFI is being submitted in response to RFI response T-0691. As per contract specification section 033020, Section 3.6.B the concrete finish of the lower concourse slab notes an FF value of 20.                     |   |                 |                                |            |              | George Metzger<br>10/16/2013   |             |                          |
| Table 8.15.3b of ACI 302.1R (page 46) states that to achieve a surface with an FF value of 20, it must be a smooth floated surface. ACI 302.1R does not provide any recommendations of "F" numbers for broomed surfaces. |   |                 |                                |            |              | RESPONSE:<br>The Lower Concourse shall be finished to the FF and FL numbers contained in the Specification 03 30 20, Section 3.6B-1a. Section 3.6B-1a will take precedence over Section 3.6B-1c. |             |                          |
| Please confirm the design intent for the concourse slab finish: 1. To have a rough broom/rake finish or 2. To have the concourse slab finished to an FF value of 20.   |   |                 |                                |            |              |  |             |                          |

|   |  |                 |                                |  |              |                                      |            |                    |             |                          |                          |

**Co-Author:** Shimmick Construction Company, Inc Chris Williams

**REQUEST:**

Please reference drawing E1-2025, A1-2105 and Spec Section 26 05 34.

As per spec section requirement 26 05 34 - Raceways and Boxes, Article 3.2 - B, please confirm the proposed "...location of outlets, fixtures and equipment..." layout as shown in the attached SCCI sketch SK-RFI-333 for Electrical Room B2560 in Area 09 is acceptable.

Please advise.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger  
10/10/2013

**RESPONSE:**

WSP has reviewed these layouts for conformance with electrical equipment locations. The layout dimensioning should be revised as noted in the attachments to be in conformance with the Contract Documents. As previously noted in response to RFI 0665.1, documentation should be presented on CAD for review and approval, hand sketches are not acceptable.

This RFI addresses the impact of the encroaching CDSM soldier piles (SP) on the north & south wall in mat slab pour Area 11 as well as all levels of the encroachment into the foundation wall between CDSM piles 188 to 236 on the north elevation and 548 to 571 on the south elevation for Location Plan see exhibit - A

Exhibit - B & C depict the location and degree in which the SP are encroaching

WOJV proposal North elevation on gridline A: (See Exhibit - B) between CDSM pile 234 to 236, WOJV is proposing to decrease the specified 36" wall thickness to 34' to clear the encroaching SP 235. Originally this was a WR1 reinforcement areas #11@8"oc EF vertically and would change to #11@6" OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.1 (Exhibit - D).

WOJV proposal on the South elevation: (See Exhibit - B)

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger

10/23/2013

**RESPONSE:**

The contractor proposed revisions to foundation wall reinforcement due to encroaching CDSM Piles in Area 11 are acceptable.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

Between CDSM piles 548 to 551 WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching SP 550, originally this was a WR1 reinforcement areas #11@8" oc EF vertically and would change to #11@6"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.1 (Exhibit - D).

In all other areas without CDSM pile encroachment issues the reinforcement will remain unchanged as per the Contract drawings.

See Exhibit - E & F showing details of transition between modified reinforcement to contract reinforcement.

These solutions if approved would be incorporated into the TG06 shop drawings.

Please confirm if these solutions would be acceptable.

**REQUEST:**

This RFI addresses the impact of the encroaching CDSM soldier piles (SP) on the north elevation in mat slab pour Area 12 for location Plan see exhibit - A. This RFI is subject to revision as the current survey data available does not recorded positioning of the CDSM beams at the lowest mat slab elevation.  
Exhibit - B, & C depict the location and degree in which the SP are encroaching

WOJV proposal North elevation on gridline A: (See Exhibit - B) between CDSM pile254 to 257, WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching SP 255 & 256. Originally this was a WR1 reinforcement areas #11@8"oc EF vertically and would change to #11@6"OC, the reduction in foundation wall thickness would be compensated by

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger  
10/23/2013

**RESPONSE:**

The contractor proposed revisions to foundation wall reinforcement due to encroaching CDSM Piles in Area 12 are acceptable. We note that the survey data for CDSM piles near the mat level is not provided in this RFI. Once that information is available, the encroachment information and therefore the foundation wall reinforcement in Area 12 may require further revision.

| REQUEST: Refer to the attached sketch 131003_S105-S106 South Radius.<br><br>In Areas S105 and S106, EW top mat reinforcing makes an increasingly acute angle with the south wall. This eventually prevents the reinforcing from penetrating the haunch and wall reinforcing curtains to reach the edge of the mat.<br><br>Per field coordination, please confirm it is acceptable to terminate EW top mat reinforcing in a hook prior to reaching the edge of the mat slab provided the following provisions are as followed:<br><br>- All terminating EW top mat reinforcing shall be hooked<br>- Where the angle becomes such that the mat reinforcing cannot penetrate the inner wall reinforcing. The reinforcing may terminate immediately in front of the wall reinforcing inside the haunch. This is labeled Zone 1 in the sketch.<br>- In Zone 1, single haunch bars that interfere with penetration of mat reinforcing into the haunch shall be relocated to allow penetration. Relocation will be to the nearest adjacent placement opportunity without regard to the 8" spacing module. Clear spacing, however, between haunch bars shall be maintained.<br>- The total number of haunch bars will remain unchanged.<br>- In Zone 1, provide a curved band of reinforcing at the typical size and spacing of the mat within the wall.<br>- Where the angle becomes such that the mat reinforcing cannot penetrate the haunch without relocating more than one haunch bar, reinforcing may terminate at the toe of the haunch. This is labeled Zone 2 in the sketch.<br>- In Zone 2, provide a curved band of reinforcing at the typical size and spacing of the mat within the haunch.<br>- Zone 1 and Zone 2 bands will overlap typical reinforcing by the distance LTS. |   |        | SUGGESTION:  |               |               | ANSWER: Accept Suggestion: <input type="checkbox"/><br>George Metzger<br>10/4/2013<br>RESPONSE:<br>It is acceptable to terminate EW top mat reinforcing of Areas S105 and S106 prior to reaching the edge of the mat as described in the RFI. |                          |

| Reference Drawing: S1-5051  |  |               |  |                      | In the direction parallel to column web, moving the anchor bolts to 5-1/2" from column center line as proposed in RFI will cause washer plates to clash with column flange (or welds). To alleviate this problem, suggest locating the 2 1/2" anchor bolts 4" from column center line (in direction parallel to web). The plate washer for the lower nut may be deleted. |                    |                          |   |
| 1) The plate washer will clear the fillet weld by 3/16". This is not sufficient to accommodate the maximum anchor bolt as-built tolerance based on the maximum oversize holes per A.I.S.C. Please advise.   |  |               |  |                      | In the direction perpendicular to column web, moving the anchor bolts as proposed in this RFI is acceptable.   |                    |                          |   |
| 2) The plate washer will clear the fillet weld by 1/4". This is not sufficient to accommodate the maximum anchor bolt as-built tolerance based on the maximum oversize holes per A.I.S.C. Confirm it is acceptable to locate the anchor bolts 5 1/2" from the center of the column.         |  |               |  |                      |  |                    |                          |   |

| <b>Co-Author:</b>  |   |               |   |                      |  |  |                          |
| <b>REQUEST:</b>  |   |               | <b>SUGGESTION:</b>                                  |                      | <b>ANSWER:</b>   |  |                          |
| Reference Drawings: S1-4300, S1-4308, S1-5052  |   |               |   |                      | <b>Accept Suggestion:</b> <input type="checkbox"/>   |  |                          |
| For columns above transfer girders Detail 1/ S1-5052 calls out thicknesses of "X=1 1/2" for tfc <2 or tfc=2" and "X=2" for tfc >2"). For columns that are below transfer girders 4/ S1-5052 calls out "2 1/2" thk stiffener PL ea side, typ. (see note 3)". Note 3 states "Stiffeners required UON in transfer girder elevations". |   |               |   |                      | When a below grade column is present immediately below an above grade column, full depth stiffeners that line up with the flanges of the column above are used within the transfer girder. Therefore, Details 1, 2 or 6/S1-5052, which are for above grade columns, govern the thickness of the full height stiffeners. This condition is indicated by Note 4 of Detail 1/S1-5052 which states, the stiffeners are half-depth UON in transfer girder elevations. For information not shown in Detail 2 and 6/S1-5052 (see Note 2 in these details), Detail 1/S1-5052 is referred to as correctly understood by the contractor. |  |                          |
| Where columns are directly above and below a transfer girder and full height stiffeners are shown per transfer girder elevations, please advise on what thickness these full height stiffeners should be.  |   |               |   |                      | Note that where the above grade columns are connected to the transfer girders via castings, different details apply and stiffener requirements are different. Refer to corresponding details from Transfer Girder elevations.  |  |                          |
| *Please note that 1/S1-5052 is also referred to on 2 and 6/S1-5052.  |   |               |   |                      |  |  |                          |

|   |   |        |   |            |            |   |                          |

| <b>REQUEST:</b>   |   |        | <b>SUGGESTION:</b>                                  |            |            | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>   |                          |
| Please refer to attached photos, excerpt drawing CJ-05 from submittal package TG0600-030.3 and SCCI sketch SK-0341.   |   |        |   |            |            | George Metzger<br>10/15/2013<br>RESPONSE:   |                          |
| The east side of the mat slab construction joint of Area 8 (S108) has several constructability issues with the mat keyway and other project structure elements. The following are identified conflicts and SCCI proposed remediation:         |   |        |   |            |            | 1. We assume the RFI means to state the proposed shift is "... 12"+/- to the East towards GL 16.6..." (and not "...12"+/- to the East of GL 16.6...") as graphically depicted in the RFI sketch SK-341. This is acceptable.   |                          |
| 1. The current east construction joint layout in Area 8 falls within the row of micropiles as shown in attached Photo-1 and Photo-2. SCCI intends to jog the joint an addition 12" +/- to the East of GL 16.6 to clear the micropile conflict |   |        |   |            |            |   |                          |
| 2. The east construction joint of area 8 currently jogs thru the thickened slab section at GL 16.6/G.3. SCCI intends to shift the joint Eastward to capture the thickened section   |   |        |   |            |            | 2. The proposed jog around the pit/thickened slab is not acceptable as proposed. However, an acceptable alternative would be to turn the CJ westward along (or parallel) to GL F.7 within S108 and then turn 90 degrees south to align with the CJ on the west side of wall W160. |                          |

#### REQUEST:

Please refer to attached SCCI sketch SK-345 and drawing (CJ-05) excerpt from submittal package TG0600-30.2.

The east side of the mat slab construction joint of Area 10 (S110) has several constructability issues with the mat keyway and other project structure elements. SCCI proposed to install the CJ between area 10 and 11 as shown on the attached sketches.

Please confirm the revised construction joint layout as shown in the attached SCCI sketch SK-345 is acceptable.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

George Metzger  
10/15/2013

#### RESPONSE:

The proposed mat joint between S110 and S111 is acceptable.

Refer to RFI T-0798 for the joint on west side of area 10 between S110 and S111.

#### Co-Author:

#### REQUEST:

On S1-2402, S1-2403, S1-2404, S1-2406 & S1-2407 there are some beam & HSS member locations that are not located on the design drawings therefore we have used the Revit model to locate these members. On sketches CD RFI 048 SK1 to SK5 please verify all clouded dimensions that were taken from the latest Revit model received 9/12/13 to locate the steel in question

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

The Revit model is not a contract document. See response to RFI-0769. Resubmit the RFI considering the guidelines provided in the response to RFI-0769 to locate beams on floor plans.

#### Co-Author: Skanska USA Civil West California DisRyan Clayton

#### REQUEST:

On the response to Webcor RFI # T-0769 (SK RFI # SK 050) & T-0803 SK RFI # 067) we have reviewed and located most of the beam locations in question using the nearest gridlines, architectural dwg's, partial plans, equal spacing, etc per the noted guidelines in the response. However on drawings S1-2402, S1-2403, S1-2404, S1-2406 & S1-2407 there are still some beam locations that cannot be located and require verification therefore on sketches CD RFI 048.1 SK1 to SK5 please verify all

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Responses to the queries on dimensions for locating beams on floor plans have been noted on the attached sketches SKS-0307 through SKS-0311 and SKA-2970.

**Co-Author:**

**REQUEST:**

With reference to the W21x44 and W21x50 beams shown on Dwgs S1-2302 to S1-2307 (Ground Level), S1-2402 to S1-2407 (Second Level), Dwgs S1-2502 to S1-2507 (Bus Level) and Dwgs S1-2602 to S1-2607 (Roof Park Level), these beams have relatively narrow flanges. These beams sizes are problematic with regard to stability during erection for spans over 30 feet in length. The substitution of the W21x48 for the W21x44 and W21x55 for the W21x50 would resolve the stability issue. Please advise if these substitutions are acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

In general, where there is no shaft opening or recess on either one or both sides of the W21, the proposed substitutions for temporary erection stability are acceptable as long as there is no additional cost to TJPA. However, where there is an opening or recess on either one or both sides of the W21, substituting W21x44 or W50 with a beam with wider flange might negatively affect the edge clearance. Skanska may decide to move the beam to gain the same edge distance and submit the revised framing plan (with dimensions) as a RFI.

| <b>From:</b> Webcor Construction LP Michael Spillane |   | <b>To:</b> Turner Construction Compan Gary Krutsch | <b>Answered By:</b> Adamson Associates, Inc George Metzger |                   |                   |                    |                          |

**Co-Author:**

**REQUEST:**

Further to response to RFI T-0641 please find attached supporting information from the internal bracing designer (PB&A) see exhibits B this information is a three dimensional structural analysis of the CDSM wall and bracing system. WOJV is proposing the removal of the level D bracing in area 7 and also the bracing which spans across the Construction joints between Areas 6 & 7 and Areas 7 & 8 waler (WD-09 to WD-12, & WD-60 to WD-63 as well as struts 20-25 level D See SK-1 2 & 3 in exhibit A) The removal of this bracing will allow all the first lift of wall to be completed in area 7 and mitigate any possible delays to the construction schedule.

As part of this bracing removal process, WOJV will also put a monitoring plan in place to monitor the CDSM beams which will be unsupported by either the concrete of the

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger

10/17/2013

**RESPONSE:**

For the condition where the Level D bracing will be removed above a poured mat slab that has not reached adequate strength, the structural engineer should comment as to the appropriateness of this.

Where mat slabs are not yet poured, Level D bracing removal will allow additional movement and pose a risk of cracking and loss of watertightness of the CDSM material as compared to the sequence illustrated on drawing GT-1112. Therefore we recommend that the early removal of the Level D bracing not be done.

**From:** Webcor Construction LP Jackson Tukuafu **To:** Turner Construction Company Gary Krutsch

**Answered By:** Webcor Construction LP Jackson Tukuafu

**Co-Author:** Shimmick Construction Company, Inc Ben Gordon

**REQUEST:**

Please refer to drawing S1-2052 and ACI 117.

**SUGGESTION:**

Please confirm it is acceptable to increase the top mat slab reinforcement placement tolerance from +/-1/2" to +1/2" and -1" as discussed and coordinated with TT field representative. This would also change the concrete cover tolerance from -1/2" to +/-1/2".

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger  
10/18/2013

**RESPONSE:**

Minimum acceptable concrete cover over top reinforcing stands at 1" per ACI 117 Section 2.2.2 (+1/2 proposed in RFI). Minimum acceptable concrete cover over headed reinforcing stands at 1/2" per ACI 117 Section 2.2.2.

Maximum acceptable concrete cover may be increased to as much as 3" provided that the distance from the top of reinforcing to the protection slab is no less than 58" (Relaxation of proposed -1" tolerance in RFI to -1.5" with stipulation).

**From:** Webcor Construction LP Michael Spillane **To:** Turner Construction Company Gary Krutsch

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:**

**REQUEST:**

The contractor has raised a concern see letter in exhibit A attached.

Does the design team envisage any possible issues with the CDSM wall if the waterproofing substrate becomes compressed between the permanent structure and the CDSM wall once the level D bracing is removed? The same question applies when the re-bracing is installed against the permanent foundation walls.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger  
10/21/2013

**RESPONSE:**

We do not envisage any problems with the CDSM wall due to the compressible layer. The performance of the CDSM wall with regards to meeting the specified deflection criteria is the responsibility of the internal bracing designer.

WOJV shall coordinate between the Waterproofing

Co-Author:

REQUEST:

On S1-2505 along grid line 20.1/E.6 where the W30x108 beam frames into the MF girder please refer to sketches CD RFI # 076 SK1 & SK2 for items 1 & 2 noted below.

- 1) The noted "MF" beam is a BU-44x24x1.25x2.75. Detail 1/S1-5011 does not apply as "bf" exceeds 22". Please supply a typical connection for a round circle on plans when the "bf" exceeds 22 (work with item 2 on SK2)
- 2) Please note that if a full depth shear plate is used it will foul the beam extension plate per 6/S1-5015. Please clarify.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

1) Provide double angle connection per 1/S1-5010 at the two W30x108 beams that frame into the Moment Frame beam at GL 20.1. For the four shear plate connections at the W30x108 and W40x149 beams on GL 21, provide connections per 1/S1-5011. There are no other locations where a shear plate connection per 1/S1-5011 is specified and where support beam flange width is greater than 22".

2) See response to 1.

Co-Author:

REQUEST:

Please confirm it is acceptable to oversize the bolt holes in the web stiffeners to the bolt diameter + 3/16". Reference Detail 1 on S1-5019 and CD RFI 055 SK1 for additional information.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

Use of oversize bolt holes in this drag connection is not acceptable.

REQUEST:

Please confirm the length of the elevator rail support embed dimension is 2'-7", as shown in the attached detail drawing 4/S1-7630..

SUGGESTION:

ANSWER:

Accept Suggestion:

George Metzger  
10/26/2013

RESPONSE:

Inquired length is confirmed.

Note that there is more than one size of HSS, therefore the height of vertical plate may vary.

CMGC shall make all future bidders of trades that may be impacted by detail issues such as this, aware of the work of adjacent trades.

Answered By: Adamson Associates, Inc George Metzger

Co-Author: Shimmick Construction Company, Inc Chris Williams

REQUEST:

Attached is a rebar congestion model of the concourse slab and column C2 at C/24.9. As is apparent, the structural steel shear lug portion of the plate embed is in conflict with the reinforcing steel and will not fit with required rebar spacing. The rebar conflicts with he shear lug and blockout that are present, include but are not limited to:  
  
- Typical MFB Beam at C/24.9 (blue colored bars in model)  
- B-68 Beam (yellow colored bars in model)  
- Main concourse slab (pink colored bars in model)

SUGGESTION:

ANSWER:

Accept Suggestion:

The 3-D images provided seems to orient the base plate/shear key in the wrong direction. The long face of the shear keys are to be in parallel to the web of the steel column as shown in details on Sheet S1-5051.

Spacing for the slab rebars and the top rebars for the misc. beams (e.g., B71 at Grid C/2, B68 @ Grid C/24.9) shall be adjusted slightly to clear the shear keys.

| REQUEST:   |   |                 | SUGGESTION:                    |            |              | ANSWER: Accept Suggestion: <input type="checkbox"/>   |   |                          |
| Reference: RFI T-0644  |   |                 |                                |            |              | George Metzger<br>10/22/2013  |   |                          |
| Three of the sump pit lower mat #11 tails near grid line 18.5/E are in conflict wit the nearby trestle pile. The bars have been trimmed to clear the trestle pile and provide an LTE of 34" instead of 60" as required per plans.  |   |                 |                                |            |              | RESPONSE:<br>Provide spliced bent bar as indicated in RFI T-0664 and that RFI's accompanying Sketch SKS0281. Lap length may be reduced to 69". The total length of bent bar extending beyond the intersection with the bottom mat reinforcing shall be 60". The bent bar may be rotated so that the tail clears the layer of mat top reinforcing. |   |                          |
| Typically, a bent bar would be spliced to the interrupted bar as required in SKS-0281 in the response to RFI T-066; however, the trimmed bars have a 70" length which would not beet the 78" LTS requirement. Gerdau propose to leave the 3 ea trimmed bars as-is and not incoporate an additional spliced bent bar. Please confirm if this is acceptable. |   |                 |                                |            |              |   |   |                          |

|               | REQUEST: Please refer to the attached drawing A1-2844, S1-2204 and RFI T-0838.  | SUGGESTION:                                 | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                      |                    |   |
|               | WOJV is in receipt of AAI's response to RFI T-0838, in which the slab opening dimension is referenced in a drawing that has yet to be issued for construction (A1-2844, ASI 107). |   | George Metzger 11/14/2013 RESPONSE: See attached SKA-2870 showing dimensions to the slab opening east of GL 13 and north of GL C. Structural beams are aligned at the edges of the opening.   |                      |                      |                    |   |
|               | Please provide the dimensions for the slab opening east of GL 13 and north of GL C as located on the current contract drawing A1-2844 dated 08/31/2012.                           |   |   |                      |                      |                    |   |
| T-0839        | SSS - Bolt Specifications   | Closed                                      | 10/18/2013  | 10/28/2013           | 10/30/2013           | Potentially        | <input type="checkbox"/>                  |
|               | From: Webcor Construction LP Robert Kjome   | To: Turner Construction Compan Gary Krutsch | Answered By:Adamson Associates, Inc George Metzger  |                      |                      |                    |   |
|               | Co-Author:  |   |   |                      |                      |                    |   |
|               | REQUEST: As per the Contract Drawings and Specifications all high strength bolts shall be A325, A490 & A354 BD. All TC bolts shall additionally conform to ASTM F1852 & F2280.    | SUGGESTION:                                 | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                      |                    |   |
|               | 1. We propose to use TC bolts for all connections (shop & field) 1-1/8" diameter or less (unless galvanized). All galvanized bolts to be standard A325.                           |   | We assume the term "Standard AXXX" used in this RFI refers to high-strength bolts with Hex Heads that will be pre-tensioned using acceptable methods per Specification Section 05 10 00 - 3.2.K (other than TC). If this is not the case, please resubmit the RFI with additional clarification. Responses to individual items in RFI as follows: |                      |                      |                    |   |
|               | 2. All bolts 1-1/4" to 1-1/2" diameter to be standard A490.   |   | 1.) As indicated in Specification Section 05 10 00 - 3.2.K.1, it is acceptable to use TC bolts. Bolt specification shall be as indicated in the construction drawings. Standard A325 is acceptable for galvanized   |                      |                      |                    |   |
|               | 3. All bolts larger than 1-1/2" diameter to be standard A354 BD   |   |   |                      |                      |                    |   |

| <b>Co-Author:</b>  |   |                    |   |  |  |                    |                          |
| <b>REQUEST:</b>  |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>  |  |                    |                          |
| As noted on sketches CD RFI 075 SK1 through SK8, there are several instances where the clip angle at the beam to transfer girder connection is in conflict with the transfer girder web splice. This condition occurs at TR7, TR8, TR11, TR19.1, TR19.9, TR21, and TR24.   |   |                    |   | Transfer girder splice locations may be moved as shown in sketches SK1 through SK7 in this RFI.  |  |                    |                          |
| Please reference the sketches attached and confirm the modified transfer girder web splice locations are acceptable to avoid conflict with the beam clip angle connection.   |   |                    |   | There is no splice specified on the structural drawings (D/S1-4305) at TR24 between gridlines E.2 and D.8. Additional splice shown on SK8 is not acceptable.   |  |                    |                          |

## PROJECT MANAGEMENT - REQUEST AND ANSWERS LOG

# 30100 - Transbay Transit Center Project

The weld size shown in Detail 1/S1-4205 is the effective weld size required for this joint. It is acceptable to revise the bevel size shown in 2/S1-5131 according to the effective weld size as required by the welding procedure.

process. AWS D1.8 Section 6.2.1 allows the use of alternate weld processes contingent upon approval by the Engineer.

with AWS D1.5.

Attached is a detailed narrative and supporting data for this welding process including the following:

- Process Details, General Parameters, and Practices from ARCMATIC (OIW welding consultant)
- Sample Welding Procedure Data Sheets (WPS) including MTR's and destructive testing

Upon conceptual approval of this process, applicable and job specific PQR/WPS data will be provided for Engineer review.

Please confirm that NGI ESW welding process is acceptable in this application.

#### REQUEST:

The response to RFI T-0847 states that "WPS shall be prepared in accordance with AWS D1.5," while the specifications require that welds be prepped in accordance with AWS D1.1 and D1.8. Please verify that the reference to AWS D1.5 is the intended Standard for the proposed weld process, as Skanska intends to prepare PQR/WPS in accordance with D1.1 and D1.8.

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

The specification requires that weld to be prepped in accordance with AWS D1.1 and D1.8. However, since the weld procedure proposed by Skanska (narrow gap improved electroslag weld) is not covered in AWS D1.1 and D1.8, but covered in AWS D1.5, the WPS shall be prepared in accordance with AWS D1.5

SCCI is requesting to re-route all 2" dewatering well lines as proposed in the attached drawings and depicted in the attached photo. The SCCI proposed re-route is to eliminate any potential conflicts with future work (bracing removal, wall waterproofing, rebar, and form/pour/strip). Upon completion of the use of the dewatering system, the line will be cut below the sleeve, capped and grouted in with the trestle block-out pour back. The line will be poured in place with the future mat and concourse slabs and all 3 wall lifts. The line will also be capped at the top of the final wall lift.

Routing the temporary dewatering system within the permanent foundation wall will not be permitted.

Please confirm the proposed dewatering well re-route as shown in the attached file is acceptable.

| Co-Author:  |  |   |   |   |                      |                    |                          |
| REQUEST:  |  | SUGGESTION:                                 | ANSWER:   | Accept Suggestion: <input type="checkbox"/>   |                      |                    |                          |
| Detail 3 on sheet S1-4205 indicates the weld requirements from the underside of the EBF link beam (28" W) to the roof node (24" W). Detail 3 requires a 3 ½" reinforcing weld to be returned (boxing) 6" at each interior corner of the welded roof node. The distance from the roof node to the edge of the girder flange is only 2" on each side based on the dimensions noted above (reference drawings attached). |  |   | It is acceptable to use 1-1/2 inch reinforcing fillets at the 6 inch returns provided that welding pass is continuous from the 3-1/2 inch thick region into the 6 inch returns. |   |                      |                    |                          |
| Please confirm it is acceptable for the returns running longitudinal to the direction of the EBF Beam to be made as 1 ½" reinforcing fillets, while the weld running transverse to the girder flange remain at 3 ½" as specified. Reference the attached detail showing this condition.   |  |   |   |   |                      |                    |                          |

| Co-Author:  |                               |              |                                |   |              |  |                          |
| REQUEST:  |                               | SUGGESTION:  |                                | ANSWER:   |              | Accept Suggestion: <input type="checkbox"/>        |                          |
| For the skewed beam connections up to 15 degrees per detail 7/S1-5011 see sketch CD RFI 087 SK1 for items 1 to 3 noted below. |                               |              |                                | 1) Acceptable.  |              |  |                          |
| 1) Confirm it is acceptable to typically locate the bolts 2 3/4" as shown to minimize the number of shear plate marks.        |                               |              |                                | 2) Acceptable.  |              |  |                          |
| 2) Confirm it is acceptable to cut the end of the skewed beams square and clip the flange as shown.                           |                               |              |                                | 3) Acceptable provided that weld sizes in Detail 7/S1-5011 are adjusted to account for the root opening introduced by the square cut. |              |  |                          |
| 3) Confirm it is acceptable to cut the shear plates square as shown and apply the welds per schedule in detail 7/S1-5011.     |                               |              |                                |   |              |  |                          |

|   |                               |                    |                                |   |                |  |                          |                    |                          |

**Answered By:** Webcor Construction LP Robert Kjome

**Co-Author:**

**REQUEST:**

Please reference detail 1/S1-5013 regarding the full height fitted stiffener detail and confirm the following:

- 1) Confirm it is acceptable to provide a 2" end distance typically at beams with 7/8" dia. bolts in lieu of the 1 3/4" end distance noted by the "2db" dimension.
- 2) Confirm the stiffener width is to equal the beam "a" dimension, defined as  $[bf - tw]/2$ , thus the noted dimension should read "2db min."

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

1.) Acceptable.

2.) Confirmed.

|               |   |               |                   |                   |                   |                    |                          |

|-------------------------------------|--------------|---------------------------------------|--------------|
| <b>From:</b> Webcor Construction LP | Robert Kjome | <b>To:</b> Turner Construction Compan | Gary Krutsch |
|-------------------------------------|--------------|---------------------------------------|--------------|

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:**

**REQUEST:**

For the double angle beam connections per detail 1/S1-5010 into the TPG1 & TPG3 roof girders on detail 1/S1-4200 are problematic due to the thick flanges. See sketches CD RFI 091 SK1 & SK2 for items 1 & 2 below for proposed modified connection.

- 1) Confirm it is acceptable to reduce the end distance on the connection angles to 1 1/4" per A.I.S.C.13th Edition Table J3.4 in order to fit the connection angles inside the beams at the TPG1 & TPG3 girders.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

For connections to TPG1:

- 1)
  - a) W14x22: Provide one less bolt than that required by 1/S1-5010. All other connection parameters including edge distance on the connection angles shall be per 1/S1-5010.
  - b) For all other beam sizes noted on SK1, our response is "Acceptable".

2)

**Co-Author:****REQUEST:**

Reference sheet S1-2606 for the BU beam to column connection at grids 31/D.4 and 31/E.6. Please confirm it is acceptable to reduce the "Lev" dimension indicated on 3/S1-5011 from 5" to 2 ¾" in order to clear the BU flange to web weld as indicated in CD RFI 092 SK1 & SK2.

If this is not acceptable, please provide an alternate detail for this condition.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

Provide 10 bolt rows ("M" = 10) and vertical bolt edge distance, Lev = 4" for connections at all BU56 beams where 3/S1-5011 is applicable.

**T-0865** **SSS - Clarifications for Kicker Brace at Ground Level****Closed****10/28/2013****11/07/2013****11/07/2013****Potentially** ☐**From:** Webcor Construction LP

Robert Kjome

**To:** Turner Construction Compan Gary Krutsch**Answered By:** Adamson Associates, Inc George Metzger**Co-Author:****REQUEST:**

Please refer to detail 6/S1-5022 and verify the kicker brace requirements at ground level as noted on CD RFI 093 SK1 to SK3 and in the items below:

- 1) Confirm the alternate bracing connection proposed in CD RFI 093 SK1 is acceptable.
- 2) Supply the weld size and length for brace angles to ½" plate.
- 3) Confirm the work point location indicated is acceptable (intended to match S1-5015 details).
- 4) Confirm the reference to S1-2304 should be added to the referenced detail and the reference to S1-2307 should be deleted.
- 5) Confirm detail 6/S1-5022 applies only to grid lines 16.9, 19.1, 24.9 & 27.1 on the Ground Level as referenced on plans.
- 6) Confirm detail 6/S1-5022 is typical for all braces along grid line 16.9, similar to grid line 19.1.
- 7) Confirm detail 6/S1-5022 is typical for all braces along grid line 27.1, similar to grid line 19.1.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

1) Locate the top gusset plate such that the centerline of kicker angle divides the gusset plate into a 1:3 ratio (3":9") at the top of the plate.

2) Provide a weld size of 5/16" with a minimum length of 4" on each side of the kicker angles.

3) Confirmed.

4) Correct references are S1-2304 and S1-2306 (updated in ASI 106 drawings).

5) Detail 6/S1-5022 is applicable at Gridlines 16.9 and 27.1 at Ground Level. Detail 9/S1-5022 is applicable at Gridlines 19.1 and 24.9.

6) Refer to SKS-0297 (attached) that shows applicable bracing type along GL 16.9 transfer girder. As indicated in the sketch, the bracing along GL16.9 is either transfer girder brace per 5/S1-5015 or kicker brace per 6/S1-5022. Same sketch can be used to identify the bracing type along 19.1 transfer girder by replacing 6/S1-5022 with 9/S1-5022.

7) Refer to SKS-0298 (attached) that shows applicable bracing type along GL 24.9 and GL 27.1 transfer girders. As indicated in the sketch, the bracing along GL 27.1 is either transfer girder brace per 5/S1-5015

| Refer to details 7 & 8/S1-5010 regarding bending radius requirements for skewed beam connections. The radius indicated in CD RFI 095 SK2 is per A.I.S.C. (2.5t for A572 GR50 material). Please confirm it is acceptable to proceed per this criteria.   |   |               |  | The minimum inside bending radius for a A572 GR 50 plate up to t = 1" is 1.5t per AISC 360-10 Table 10-13, if the bend line is perpendicular to final direction of rolling. These values need to be increased 50% if the bend lines are parallel to the final direction of rolling. 2.5t inside bending radius proposed by the contractor is acceptable for the condition presented in SK2, where t = 1/2". In general, it is acceptable to proceed with the minimum bending radii specified in AISC 360-10 Table 10-13. |                      |                    |                          |

indicating the W40 beam connection to TR11 at Grid F.11. This detail requires a full height shear plate per 1/S1-5019 and bracing per 5/S1-5015. (Reference CD RFI 116 SK2). This same condition occurs on S1-2303 along grid D.11.

Please confirm it is acceptable to connect the required kicker brace to the 1 ½" full depth shear plate and increase the gusset plate below the beam to 1 ½" thick. Otherwise, please provide an acceptable detail for this condition.

1-1/2" thick full depth shear plate at the location highlighted in the RFI and at other similar instances. Length of the fillet weld between the kicker and the shear plate shall be 7" min each side as indicated in detail 5/S1-5015.

2-) It is acceptable to increase the thickness of the gusset plate at the top of the kicker to 1-1/2".

#### Co-Author:

#### REQUEST:

Following a review and discussion with Thornton Tomasetti on the trestle pile locations, it was noted that trestle pile numbers 10, 12 and 14 (see sketches attached) are in conflict with a step in the slab on the lower concourse elevation between gridline 06-08, E-F. Thornton Tomasetti noted it may be possible to move this step clear of the trestle pile blackout locations.

Please confirm if this option on moving the step location is still possible.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

George Metzger  
11/26/2013

#### RESPONSE:

The plan location of the drop shall remain. In order facilitate temporary conditions, such as support of the slab transition without shoring, Detail 2/S1-3501 may be modified increasing the distance "6D" to allow additional reinforcing bars to replace bars interrupted by the blackout in the temporary condition. Additional simplifications to the temperature steel continuity may be allowed. The specific details of the blackout shall be provided by the contractor in accordance with General Note GR-9 on S-0005 and shall provide continuity of longitudinal and temperature steel in the final condition.

#### Co-Author:

#### REQUEST:

Reference sketches: SK1 and SK2

1. Please supply the angle to locate the anchor bolts as referenced in SK1
2. Please supply the material grade of the stiffeners, shear tabs, and welded shear keys as referenced in SK1
3. Please confirm a 6"x6" corner clip is acceptable or supply the dimensions as referenced in SK1
4. Please confirm a 2" set back from the edge of the base plate to the edge of stiffener plate is acceptable or supply the dimension.
5. Please supply oversize hole criteria as referenced in SK2

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Question 1: Angle as indicated in SK1 = 8.18 degrees  
Question 2: Material grade of stiffeners, shear tabs, and welded shear keys as referenced in SK1 is ASTM A572 Gr. 50  
Question 3: 6" x 6" corner clip as referenced in SK1 is ok  
Question 4: Set back from the edge of the base plate to the edge of stiffener plate is 2" (note: as shown in dim. line on 3/S1-6008).  
Question 5: As referenced in SK2, oversized hole diameter = 6-1/2"

**REQUEST:**

Please refer to similar RFI T-0838 and T-0838.1.

The structural drawings for the lower concourse (SI-2202 through SI-2207, framing plans) do not include dimensions for the slab openings. Scaled dimensions from these drawings conflict with many of the dimensions provided on the architectural slab edge plans (AI-2842 through AI-2847).

Please see attached for observed conflicts (highlighted). Please confirm that the dimensions shown on the architectural plans at the slab openings are correct.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

George Metzger  
11/18/2013

**RESPONSE:**

The attached SKAs are provided to clarify and confirm current slab openings as well as setting out of couplers at the Lower Concourse Level.

1. For setting out of slab openings at the Lower Concourse Level, refer to the Lower Concourse Level Slab Edge Plans (SKA-2916 to SKA-2923).

2. For Setting out of PH1 walls at the Lower Concourse Level, refer to the Lower Concourse Level Zone Plans (SKA-2900 to SKA-2907) and Enlarged Plans (SKA-2924 to SKA-2945).

3. For setting out of couplers for PH2 walls, refer to the Lower Concourse Level Wall Plans (SKA-2908 to SKA-2915).

Note: The "Wall Plans" show wall starter couplers installed in the Below Grade Package, however the "Wall Plans" provide coupler setting out dimension for Phase 2 walls only. For coupler setting out for walls and curbs constructed in Phase 1, refer to the wall types and dimensions shown on the Lower Concourse Level Zone Plans.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

#### REQUEST:

Please refer to drawing S1-3304 to S1-3306.

Please confirm if it is acceptable to replace the typical T9 column ties (90° or 135° bend on either end) with T12 ties (135° bends on both ends). See the attached SCCI sketch SK-101 for further details.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

George Metzger  
11/12/2013

#### RESPONSE:

It is acceptable to replace T9 column ties with T12 for Column Types C1 and C2. Note that the location of the second cross-tie from each end is not shown correctly in SK-101. In SK-101, these two cross-ties shall be flipped to clear the shear plates for the steel column base plate at Lower Concourse Level. Refer to Sheet S1-3304 of the construction drawings where the column reinforcement details Type A1 (for Column C1) and Type A2 (for Column C2) are shown. Refer to Sheet S1-5051 of the construction drawings for information on steel column base plate details.

#### Co-Author:

#### REQUEST:

Please review sketch CD RFI 059 SK1 and details 1/S1-5016 and 1/S1-5018 for type 1 - drag connection details on brace beams at the Bus Deck Level framing plan.

1). Please verify the bottom flange of brace beams noted in detail 1/S1-5016 can be cut flush to the beam web on both sides of web allowing beam to be erected between the shop welded connection plates on the cast node.

2). Verify the diagonal bracing beam web connection plate noted in detail 1/S1-5018 can be shifted to the acute angle side of the connection as indicated in the attached sketch and bottom flange cut flush to the web to allow beam to be dropped into location in the field.

3). Please provide welding details for the relocated web connection plate to the supporting grid beam as connection plates will overlap at these locations.

4). Please verify if additional bolts are required connecting the flange plate where the dimension to the plate edge and

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

#### RESPONSE:

1) Acceptable. See response to RFI T-0869 for the extents of the bottom flange cope.

2) Moving the web connection plate on the other side of the beam is acceptable however, the shear plate shall still be welded to the north-south girder not the east-west running beams as shown in SK1 of this RFI. With this modification, the diagonal beam centerline will not coincide with the connection work point. This eccentricity shall be minimized as permitted by the connection geometry and shall not exceed 1". The question regarding flange coping is not clear, please provide a sketch that shows the intended coping. Note that there are bolted flange plates top and bottom.

3) Use of PJP welding (full web thickness) is acceptable where the shear plates are welded to the girder web. See also response to 2nd question.

Please refer Contract Specification Section 03 20 00-3.1.A.6.b and attached excerpt from CRSI Chapter 11

Contract Specification 03 20 00-3.1.A.6.b states, "No field bending of bars partially embedded in concrete is permitted, unless specifically approved by the TJPA Representative and tested by Independent Testing Laboratory for cracks."

1. Please clarify if the statement applies to field realignment as defined in CRSI Chapter 11.
2. Please confirm if it is acceptable to field realign bars per the parameters described in CRSI Chapter 11.

Accept Suggestion: ☐

George Metzger  
11/17/2013

RESPONSE:

Field bending, including field realignment, of partially embedded reinforcing shall be subject to the approval of the SEOR on a case-by-case basis.

|               | <p>2) Confirm the increased thickness and placement of the continuity plate are acceptable to allow for beam over roll. [Reference CD RFI 080 SK1]</p> <p>3) Please confirm the continuity plate dimensions noted on CD RFI 080 SK2 are acceptable. Note that the "a" dimension shown is defined as ½(bf-tw).</p> <p>4) Please confirm the dimensions and weld prep indicated for the Type 4 Drag connection are acceptable. [Reference CD RFI 080 SK3]</p>   |               |                     |                      | <p>continuity plate thickness match the thickness of the moment frame beam flanges as shown in relevant details in Sheet S1-4201 and S1-4203. However, at joints GL 32.4/D.4 and GL 32.4/E.6 at Second Level where Detail 5/S1-5012 is called out, continuity plates at the beam bottom flange (bottom continuity plate) shall be 2 1/2" thick. In addition, at GL 32.4/D.4 locate the bottom continuity plate such that top of the continuity plate is aligned to top of the bottom flange of the BU40 Moment Frame Beam. At GL 32.4/E.6 locate the continuity plate such that bottom of the continuity plate is aligned with bottom of the bottom flange of the BU 40 moment frame beam. The reason this is needed is that although the moment frame beam is 40" deep in both cases, the perpendicular beam sizes are different at GL32.4/D.4 (W40x294, d = 40 3/8") and GL32.4/E.6 (W40X199, d = 38 5/8") therefore continuity plates need to be thick enough to pick up both the moment frame beam and the perpendicular beam bottom flanges.</p> <p>3) Confirmed.</p> <p>4) Confirmed.</p> |                    |                          |

| Reference CD RFI SK1 to SK3 indicating the plate on the transfer girder which typically fouls the beam to transfer girder connections along grid lines C.3 and F.7. This is typical at the following locations at Ground Level: 2/C.3; 4/C.3; 5/F.7; 6/C.3; 8/C.3; 9.9/C.3 (see SK2 & SK3); 10.1/C.3 (see SK2 & SK3); 12/C.3; 14/C.3; 16/C.3; 19.9/C.3; 20.1/C.3; 21/C.3; 23/C.3; 23/F.7; 24/C.3 & 24/F.7 |  |                 |                                | Confirmed. Shear plate connection details provided in the response to the RFI T-0820 may be used in lieu of double angle connections at the locations noted in the RFI where the intermediate transfer girder plate fouls the double angle connection. For W16 and deeper beams, the total number of bolts at a shear plate connection shall be per schedule on 2/S1-5011. Provide two bolts in the top shear plate and remaining bolts in the bottom shear plate. For W14 and shallower beams provide two bolts with only the top shear plate. Bolt edge distances, shear plate thickness and welds shall be per 2/S1-5011 with the exception of W40 beams where the vertical bolt edge |               |  |                          |
| Please confirm that the response and details provided in W/O RFI T-0820 can be applied at these locations, thus shear plates may be used in lieu of double angle connections. (W/O RFI T-08020 response is attached for   |  |                 |                                |  |               |  |                          |

Beam cross section, also detailed in OIW sketch 2770-SKTH01 attached.  
1) The specified 1" x 5" weld access hole does not allow for weld runoff tabs to be added as specified in AWS D1.8 paragraph 6.11.1.  
    a. Please confirm that the 1.5" x 5' weld access holes detailed in OIW SK 2770-SK-TH01 are acceptable to accommodate the 1" weld tabs.  
    b. Please confirm that the weld tabs are to remain after welding as allowed by AWS D1.8 paragraph 6.11.  
  
2) The specified CJP weld using a backing fillet and welded substantially from one side increases weld distortion compared to a balanced weld. Please confirm that the proposed double bevel CJP weld is acceptable.

acceptable. At this location, weld ends can be cascaded as shown in Figure C-6.3 of AWS D1.8, similar to continuity plate welding details.

1b) Weld tabs not required, see response to 1a.

2) Double bevel CJP weld (DCW) as proposed by the contractor is acceptable.

#### REQUEST:

During level D bracing removal in area 7, a column rebar dowel was bent, as shown in the attached photograph.

BBII proposes to:

1. Abandon the bent rebar
2. Drill and Hypoxy
3. Leave the dowel as is, couple the bar onto it and bring it back in line as the bar continues vertically. Place an additional equal size bar along side the damaged bar as a replacement, possibly a 90 degrees hook at the base (Sketch 1 attached)
4. Concrete around the rebar to be removed.The bar would be cut and a bar lock would be used to couple the rebar .(Sketch 2 attached)

Please advise on which option is acceptable.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Contractor to resubmit RFI with all information contained. RFI was submitted for review to the Design Team and then Contractor requested to add additional information.

#### REQUEST:

During level D bracing removal at area 7,a column rebar dowel was bent, as shown in the attached photograph.

Please see below repair options:

1. Abandon the bent rebar leave it in its current position projecting 5' above the mat slab, place and additional equal size bar alongside the damaged bar as a replacement with possibly a 90 degrees hook at the base
2. Leave the dowel as is, couple the upper section of the bar onto it and bring it back in line as the bar continues vertically
3. Drill and epoxy in a new same sized bar beside the damaged one, the slab would have to be scanned for

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Option 3 is acceptable with the following notes:

1. Damaged rebar shall be cut off at slab level.
2. New starter bar to be doweled with approved adhesive.
3. New starter bar shall be placed as close as possible to original bar location and bar location to be approved by SEOR.
4. Remaining column starter bars and mat reinforcing shall be avoided.
5. Mat cover concrete may be removed locally to abandoned bar.

| <b>REQUEST:</b><br>As discussed in the 10/28/2013 ASI 104 Concourse Plumbing design meeting, this RFI is requesting confirmation that it is acceptable for the Early Below Grade Package (TG06) contractor to block out the concourse slab where plumbing fixtures are shown to be embedded in concrete.<br><br>General notes in TG06 drawing P-0005 call for sleeves only in elevated slabs in the EBG. However, for the future main package plumber to be able to install the cast in place floor sink and floor drain fixtures, larger openings and structural details are needed. The contractor is proposing to install square blockouts sized larger than these fixtures so that they can be installed and grouted in a later date by the main package plumber. The desired benefit of this proposed logic is that concourse plumbing will be installed by one trade contractor who will provide a single source warranty for the work. Also, the later installation allows for more precise coordination of fixture rim elevations.<br><br>If this proposed sequence is not acceptable, CIP plumbing fixtures will need to be supplied and installed by the BPG (TG06) contractor. If this proposal is acceptable, please provide blackout size, rebar trim details and rebar doweling details for floor sinks and also floor drains. Sample product data for the fixtures are attached for reference and for sizing of openings. |  |               | <b>SUGGESTION:</b><br><br><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>George Metzger<br>11/22/2013<br><b>RESPONSE:</b><br>We confirm that installing block-outs for the floor drains and floor sinks (to be installed later) is the acceptable solution. The size of the block-outs has to be determined by the contractor, it is part of the means and methods as a temporary condition. |                      |                      |                    |                          |

**Co-Author:** Shimmick Construction Company, Inc Sylvia Hartanto

**REQUEST:**

Please reference Specification Section 07 09 16 - 2.6.A.1.

The aforementioned section states, "Provide joint assemblies in single lengths between changes in direction with vulcanized, mitered comers where joint changes directions or abuts other materials."

1. Please confirm that this is in reference to the Omega Seal gasket, and not the clamping system and embedded steel.
2. Please confirm that it is acceptable to use clamping components with 4'-0" maximum lengths with butt joints not to exceed 1/8".
3. Please confirm that it is acceptable to use 14' max lengths on steel embed with butt joints not to exceed 1/8".

**SUGGESTION:****ANSWER:**

**Accept Suggestion:** ☐

George Metzger  
11/25/2013  
RESPONSE:

AAI Response:

1. Confirmed. The Specifications Section 07 09 16-2.6.A.1 refers to the Seal gaskets and not the clamping system and embedded steel.
2. For Clamping component lengths, contractor to coordinate with manufacturer of Double Seismic Joint Seal complete with clamping assembly.

TT Response:  
3. Acceptable.

**From:** Webcor Construction LP Gregory Kemerer

**To:** Turner Construction Compan Gary Krutsch

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Refer to the beam bottom flange bracing connection detailed on 8/S1-5015 and CD RFI 127 SK1 & SK2 for the following items:

- 1) In order to support erection requirements, please confirm it is acceptable to:
  - a. Typically locate the bolts shown 3" from the underside of the top flange and 3" from the face of the beam web as indicated in CD RFI 127 SK2.
  - b. Typically locate the bolt 3" from the top of the flange indicated.
  - c. Typically locate the bolt outside the beam profile as shown to make the brace erectable.
- 2) Confirm the stitch plates should be ½" thick to match the ½" thick gusset plates at each end.
- 3) Please confirm that it is acceptable to provide slotted holes in the brace at the end connections.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:** ☐

- 1) It is acceptable to typically locate bolts as shown in SK2. However, the slope of the kicker angle shall be such that the centerline of the angle should pass through the centerlines of the beam web and flange similar to that shown in 7/S1-5015 at both top and bottom ends.
- 2) Confirmed.
- 3) Slotted holes are not acceptable. Bottom flange bracing detail 8/S1-5015 applies only at beams with the "dashed arrow" symbol (See Note 1 on 8/S1-5015). Bottom flange bracing of 2nd floor and bus deck level spandrel beams is to be provided per S1-8020 as noted on typical sheet notes on S1-2402 and S1-2502 (See Note 3).

**From:** Webcor Construction LP Gregory Kemerer

**To:** Turner Construction Compan Gary Krutsch

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

The braces per detail 8/S1-5015 have been added in the model for the area between grids 1.4 to 19.9 as shown on attached SK2. Please see attached CD RFI 127.1 SK1 & SK2 for items 1 & 2:

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:** ☐

- 1). From the comment on T-0919, the clouded dimension shall be equal to 0.
- 2). Detail dimensions for the gusset plate is the responsibility of the steel detailer.

**REQUEST:**

Per the response to Webcor RFI T-0920 (SK RFI # 172) it was confirmed acceptable to increase the full depth shear plate from 3/8" to 1". Upon further review of this location there would be an issue where a 1" thick shear plate would foul the bolts connecting the top flange of the Transfer Girder to the Cruciform column base plate.

1). Please confirm it is acceptable to center the 3/8" shear between the bolts and move the beam 5/8" south from its original location.

2). Please confirm the 1" gusset plate welded to the bottom flange of the beam can be moved off the center line of the beam to line up with the 3/8" full depth shear plate. The gusset would move 7/16" from the centerline at this location.

3). If it is acceptable to line up the gusset with the full depth shear plate, there will be a 5/8" discrepancy between the two plates. Please confirm if stitch plates with varying thicknesses can be used to make up the difference.

4). Confirm that it is acceptable to typically apply the

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:** ☐

- 1) Confirmed.  
2) Confirmed.  
3) Confirmed.  
4) Confirmed.  
5) See responses to 1) through 4). Further comments may be provided on a case by case basis during shop drawings review

| Co-Author: Skanska USA Civil West California DisRyan Clayton   |   |   |                     |   |                      |                    |                          |
| REQUEST:   |   | SUGGESTION:                                 |                     | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                    |                          |
| Per the response to Webcor RFI T-0920 (SK RFI # 172) clarification is required regarding the last statement where "Coping the bottom flange of the shallow beam is not allowed" and also per the response to Webcor RFI T-0934 (SK RFI # 187) clarification is required regarding the last statement where coping the bottom flange of the shallow beam shall not exceed 1" from the end of the beam.  |   |   |                     | 1). Coping the bottom flange 4- 4 1/2" long will affect the block shear of the connection design in some cases. Contractor shall prepared the shop drawings satisfying the require tightening clearance and cloud the coped area requesting approval by the Engineer on a case by case basis. |                      |                    |                          |
| 1). Per detail 1/S1-5010 where there is a double sided beam connection, the bottom flange is required to be coped in the shallow beam in order to allow for installation of the bolts from the shallow beam side. Note the bolts cannot be torqued if erected from the other side and would also foul the shallow bottom beam flange in question. On the attached sketches CD RFI # 126.1 SK1 to SK4 show some typical sample conditions illustrating the clearance required. The beam flange cope lengths required will range from 4" long in most cases to 4 1/2" at larger web thicknesses. Please verify the shallow bottom beam flanges can be coped for bolt clearance and erection of the beams as noted on SK2 to SK4. |   |   |                     | 2) Confirmed.   |                      |                    |                          |
| 2). Per detail 9/S1-5010 where the WT on the top of the beam flange is required to extend to the end of the beam please verify the beam flange can be coped back to the "k1" of the beam in order to get full bearing and weld for the WT and to clear bolts as noted on SK2.  |   |   |                     |   |                      |                    |                          |
| <hr/>  |   |   |                     |   |                      |                    |                          |

#### REQUEST:

Per details 8 & 10/S1-5001, refer to sketches CD RFI 121 SK1 for items 1 & 2:

- 1) Confirm the noted area indicates that the concrete slab is not required and the edge plates may be terminated as shown.
- 2) Confirm the noted area indicates that the concrete slab is not required and the edge plates may be terminated as shown.

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

The noted area does require concrete slab. Note that this detail is for the slab reinforcement at an edge column condition and the detail note references to ¿see typical slab edge details for additional information¿. Refer to detail 2/S1-5001 for additional info regarding edge of deck at exterior columns.

The noted corner area does require concrete slab. Note that this detail is for slab reinforcement at a corner column condition and the detail note references to ¿see typical slab edge details for additional information¿. Refer to detail 3/S1-5001 for additional info regarding edge of deck at exterior corner columns.

#### REQUEST:

Refer to CK RFI 125 SK1, SK2A, SK2B, SK3, and SK4 requesting clarification at the Bus Deck level on the following:

- 1) Confirm the noted connection should be a moment connection.
- 2) At the noted location, two supports for CP5 connections are required adjacent to Grid 9. Based on the CP5 detail requirements, a 1 ¼" horizontal stiffener should span from shear plate to shear plate per 1B/S1-8003; however, because these two connection points span the same beam, the horizontal stiffener would foul the incoming beam to shear plate connection, as there is a horizontal stiffener welded on both sides of the shear plate. Please provide a solution for this condition.
- 3) Confirm the vertical spacing of the 1 ¼" horizontal stiffeners is acceptable to accommodate the connection bolts on the incoming beams.
- 4) In the beam connection shown in detail 1/S1-8003, the required shear plate will foul the 2" web reinforcement plate required per 1/S1-5017. Please confirm the shear plate is to be welded to the 2" web reinforcement plate with a ½"double fillet weld per 1/S1-8003 or provide an

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

1. Yes, the connections shall be a moment connection as shown on Detail 1/S1-8003 and as denoted on the plans.
2. The horizontal plates shown on 1B/S1-8003 are eliminated (see ASI 109).
3. See response to item 2)
4. Is this question related to the vertical shear plate? If so, Confirmed that the shear plate may be welded to the 2" web reinforcement plate with 1/2" double fillet weld as shown.
5. 3/4" partial pen weld at the bottom flange called out may be replaced by a partial penetration weld with an 3/4" fillet weld overlay built-up.
6. Confirmed.
7. Confirmed.
8. Confirmed.
9. See ASI 109 for bolt hole dimensions.
10. Use 2 1/16" holes for 1 ½" bolts to allow for ½" field tolerance.

| Please reference attached Grace/DeneefTechnical Letter and RFI #T-0927 response.   |                                       |                 |                                | George Metzger   |              |  |   |
| RFI T-0927 response states that "contractor shall use air to test hoses as specified," but the specifications call out several different types of injection hoses. Although, air testing may be suitable for other products specified, Grace/Deneef requires water testing for the INJECTO Tube system. The attached technical letter from Grace/Deneef states that "INJECTO is an open system, and any air pumped in will begin to flow immediately through the 35 micron filter and polypropylene mesh out into the concrete." |                                       |                 |                                | 1/17/2014  |              |  |   |
| Please review and confirm that water testing is acceptable for the Deneef INJECTO Tube system on the TTC project.  |                                       |                 |                                | RESPONSE:  |              |  |   |
|  |                                       |                 |                                | H&B does not disagree with deNeef that air will flow into the concrete. We also assume that water will also flow as readily into the concrete as air. What is the water test intended to demonstrate? The requirement in the specifications was in response to a Webcor comment during the design phase on the system and specification. |              |  |   |
|  |                                       |                 |                                | The reason air was specified, rather than water is that the injection hose is flanked with hydrophilic water stops. If the hose leaks, it will activate the water stops and the leaks in the hose will go undetected.  |              |  |   |

|                              |                                       |               |                                |            |                |  |             |                          |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Please refer to the isolation bearing details on S1-5021 and CD RFI 138 SK1 & SK2 attached for the following items:

- 1) Please provide dimensions required to located bolts.
- 2) Confirm the cap plate may be welded as indicated in the attached sketch.
- 3) Please provide dimensions required to located bolts.
- 4) Please provide dimensions required to located bolts.
- 5) Please provide dimensions required to located bolts.
- 6) Please provide dimensions required to located bolts.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

- 1) Align the bottom bolts with top bolts.
- 2) Acceptable.
- 3) Locate bolts per workable gauges provided for wide flange beams in AISC 360-05. Top and bottom bolts shall be aligned to each other.
- 4) Provide a 3" offset between the bolts and the centerline of the rubber bearing.
- 5) Provide a 3" offset between the bolts and the centerline of the rubber bearing.
- 6) Provide a 3" offset between the bolts and the centerline of the rubber bearing.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Please refer to the isolation bearing details on SK1 & SK2 attached for the following items:

- 1) Please provide the bolt pattern & size connecting the isolation bearings to the W12x65 & W8x31.
- 2) Please provide the bolt pattern & size connecting the isolation bearings to the 3" steel plate & C15x40.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

- 1) Total 4 bolts shall be provided at the top and bottom of each rubber bearing with a 3" offset between the bolts and the centerline of the bearing (square pattern) as noted in response to RFI 931. All bolts are to be 3/4" diameter A325N bolts as noted in the detail.

- 2) See response to 1).

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Refer to S1-2403 (CD SK1) which indicates the edge detail between grids 8 & 9.9 is to be constructed with an L5x5x3/8 angle per 9/S1-5000. Please confirm it is acceptable to extend the W24x68 beam to the edge of slab, eliminate the L5x5x3/8, and connect the HSS 5" hanger to the W24x68 similar to the detail shown on 1/S1-5020 or provide an alternate detail for this connection.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Not acceptable. Provide the edge of slab support detail per 9/S1-5000 except:  
1) Weld the gusset plates to the HSS column  
2) Stop the 3/8" bent plate short at the HSS column face. The 3/16" field weld at the bent plate edge is not required  
3) Coordinate with RFI T-0901 for information missing on 9/S1-5000  
Note that the back span kicker angle is not required at posts or columns as noted on 9/S1-5000.

| <b>From:</b> Webcor Construction LP                                 | Gregory Kemerer                         | <b>To:</b> Turner Construction Compan | Gary Krutsch      | <b>Answered By:</b> Adamson Associates, Inc |                   |                    |                          |
| <b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton |   |                                       |                   | <b>Answered By:</b> Adamson Associates, Inc |                   |                    |                          |

**REQUEST:**

Refer to the SMRF flared end connections detailed in CD RFI 144 SK1 to SK5 and clarify the following:

Detail 9/S1-4202 indicates that the flared beam flange is to be the same width as the column flange while detail 5/S14202 does not match this detail and indicates a narrower flared beam flange. Please confirm that the beam flange width is as noted on the elevation drawings and the flange width shall increase at the flared ends to match the column width per detail 9/S1-4202.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Confirmed that the beam flange width is as shown in elevation drawings. Flared beam flange is 6" wider (3" flare on each side) than the beam flange width shown on elevation drawings. Therefore, depending on the location, flared beam flange width is either equal to the column flange width or smaller.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Refer to CD RFI 132 SK1 to SK4 requiring clarification on the moment beam to beam connections per the following.

- 1) At the location indicated on CD RFI 132 SK1, the continuity plate will foul the bolts if (8) are provided per 1/S15010. Please confirm it is acceptable to provide (6) bolts in the W30x99 as shown on CD RFI 132 SK2.
- 2) Confirm the continuity plate detailed on CD RFI 132 SK2 is correct as shown with tf and bf per W24x68.
- 3) Please confirm it is acceptable to provide one continuity plate with a slot 1/8" larger than the beam web and the 3 ½" beam cope as indicated on CD RFI 132 SK2 to allow for a continuous CJP weld of the continuity plate.
- 4) At the location indicated on CD RFI 132 SK1, the continuity plate will foul the bolts if (11) are provided per 1/S1-5010. Please confirm it is acceptable to provide (8) bolts in the W40x277 as shown on CD RFI 132 SK3.
- 5) Confirm the continuity plate detailed on CD RFI 132 SK3 is correct as shown with tf and bf per W30x99.
- 6) Please confirm it is acceptable to provide one continuity plate with a slot 1/8" larger than the beam web and the 3 ½" beam cope as indicated on CD RFI 132 SK3 to allow for a continuous CJP weld of the continuity plate.
- 7) At the location indicated on CD RFI 132 SK1, the continuity plate will foul the bolts if (9) are provided per 1/S15010. Please confirm it is acceptable to provide (8) bolts in the W33x118 as shown on CD RFI 132 SK4.
- 8) Please confirm it is acceptable to provide one continuity plate with a slot 1/8" larger than the beam web and the 3 ½" beam cope as indicated on CD RFI 132 SK4 to allow for a continuous CJP weld of the continuity plate.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

- 1) Acceptable.
- 2) Confirmed.
- 3) Confirmed.
- 4) Acceptable.
- 5) Confirmed.
- 6) Confirmed.
- 7) Acceptable.
- 8) It is acceptable to use a single plate with a slot, however, coping of the beam bottom flange is not allowed at this (or similar) location(s) since there is bottom flange bracing (see 6/S1-5015). It is acceptable to locally cope the beam web for the slotted continuity plate.
- 9) Confirmed.
- 10) It is acceptable to apply solutions provided in 1 through 9 at similar locations at Bus Deck Level along GLs 9.9, 10.1, 19.9 and 20.1 only. For all other locations submit a separate RFI for each case.

| Co-Author: Skanska USA Civil West California DisRyan Clayton  |   |   |  |   |  |                    |                          |
| REQUEST:  |   | SUGGESTION:                                 |  | ANSWER: Accept Suggestion: <input type="checkbox"/>   |  |                    |                          |
| 1. Please supply the material manufacture(s) for the<br>"SEAL RING" a catalog cut or other information.<br>Additionally, please supply the specifications for the<br>material, size necessary to fit specified tube and other<br>information necessary to install the seal rings.   |   |   |  | 1. Seal ring is to stop grout from entering steel tube as<br>well as to limit spread of corrosion protection. This<br>requires a rubber O-ring or possibly just denso tape to<br>seal the gap. Additionally, please add a second seal<br>ring between the PE-Tube and the shrinkable tube, to<br>also inhibit the spread of corrosion protection. |  |                    |                          |
| 2. Please provide weld size and weld process indicated on<br>the attached sketch.   |   |   |  | 2. These are non-structural welds. Min. fillet size is all<br>that is required.<br>2e. Please note that there should be no weld here.<br>The plastic PE-Tube cannot be welded to the steel<br>cavity tube.  |  |                    |                          |
| 3. Please provide omitted dimensions for "CAVITY TUBE"<br>requested on the attached sketch  |   |   |  | 3. Dimension has been added, see marked-up sketch.  |  |                    |                          |
| 4. Please confirm that welding the WELDED STEEL<br>TUBE to the SOLID ROUND ANCHOR PLATE is<br>acceptable and the alteration of the A722 plate by the<br>welding process is acceptable.  |   |   |  | 4. Only the threadbar is Grade 150 ASTM A722 Type<br>II. Anchor plate and steel tube are ASTM A572 Gr.<br>50. Steel tube should be welded to anchor plate prior<br>to installation, so no welding is done near threadbar.   |  |                    |                          |
| 5. Please confirm missing dimension for anchor bolt<br>projection. Note on 4/S1-6008 states "END OF ANCHOR<br>BAR LEFT AFTER TRIMMING MUST BE LONG<br>ENOUGH TO ALLOW RE-TENSIONING LATER".<br>Skanska will provide projection of ½ coupler length to<br>attached stressing rod at future date. Please confirm<br>compatibility with TJPA's stressing system used later may<br>be different than Contractor's stressing system. |   |   |  | 5. Min. length above nut to be determined by<br>contractor based on his means and methods of pre-<br>tensioning. Final length of threaded rod above nut<br>must be long enough to allow re-tensioning at a later<br>date, which must equal thread length of jack used +<br>elongation of threadbar.   |  |                    |                          |

| Co-Author: Skanska USA Civil West California DisRyan Clayton  |   |                 |                                |            |              |  |   |                          |
| REQUEST:  |   |                 | SUGGESTION:                    |            |              | ANSWER:  |   |                          |
| Refer to CD RFI 169 SK1 and SK2 showing beam connections into slab openings near grid 11/C on S1-2403.  |   |                 |                                |            |              | Accept Suggestion: <input type="checkbox"/>  |   |                          |
| 1) The double angle connection required per S1-5010 will extend past the edge of slab as shown on CD RFI 169 SK2. Please confirm it is acceptable to replace these connections with shear plate connections per S1-5011 or provide an alternate solution. |   |                 |                                |            |              | 1) Confirmed.  |   |                          |
| 2) Confirm it is typically acceptable to replace the double angle connections with shear plate connections when the double angles extend past the edge of slab.   |   |                 |                                |            |              | 2) Solution in item 1 will be reviewed on a case by case basis. For other similar conditions submit a separate RFI for each case.  |   |                          |
|   |   |                 |                                |            |              | Note that for beams that are perpendicular to the slab edge (for example W21x44 beams that support the W12x14 beams on SK1), the distance between the beam end and slab edge should not exceed 1 1/2" typically. |   |                          |

|   |   |                 |                                |  |              |   |                          |
|---|---|-----------------|--------------------------------|--|--------------|---|--------------------------|

| <b>REQUEST:</b><br>Per the response to Webcor RFI # T-0948 (SK RFI # 227) the cap plate length was revised to suit a shear plate fouling issue at the cap plate bolts. Please verify the sketch from Thornton Tomasetti SKS-306 can be applied at grids 8/G on S1-2303 and we can adjust the plate length for this similar condition. Refer to sketches CD RFI 178.1 SK1 & SK2 showing a 6 1/4" adjustment at one side of the cap plate.   |  | <b>SUGGESTION:</b>                                   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>At GL 8/G transfer girder, it is acceptable to increase bottom base plate length by 6-1/4" on the north side and 4" on the south side (plate flush with the end of the transfer girder). It is also acceptable to conceptually apply the solution provided in SKS 306 for RFI T-0948. As indicated in this sketch, one of the stiffeners on the north side can be omitted. All other 18" long stiffeners, machined geometry and the bolts to be moved 6-1/4" outwards from the plate center (both on the south and north sides). |                      |                      |                    |                          |
|  |  |  |   |                      |                      |                    |                          |

| REQUEST:   |                                    | SUGGESTION:                                 |                     | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                    |                          |
| <p>On S1-2303 there is a detail 7/S1-5004 shown near grids F/11 to supply bent plate to support the permanent slab. This is a general bent plate detail for the knock-out areas and does not provide enough detail at the stepped Transfer Girder. Please see the following questions below:</p> <p>1) Please verify if bent plate is required parallel to the Transfer Girder along grid 11 to support the permanent slab at the knockout areas? If yes, will new beams be needed to support the bent plate and slab? Please provide size and location if new beams are needed at these areas. See RFI 185 SK1 &amp; SK2.</p> <p>2) Please verify step in slab from grid D to F along grid line 11 will incase the Transfer Girder? Will headed studs be required at the transfer Girder web? If so, please provide size and spacing. See RFI 185 SK1 &amp; SK2.</p> <p>3) Please verify it is the designs intent to have the edge of the knock-out slab extend past the edge of the Transfer Girder flange at grid line 10.1? If yes, please provide details to support the edge of the permanent slab at these locations. See RFI 185 SK1.</p> <p>4) Please confirm only steel highlighted in yellow will require bent plate to support the permanent slab? See RFI 185 SK1.</p> <p>5). Please clarify if any slab support is required for the knock-out slab at the edge of the escalator pit as shown on detail 6/S17660, referenced from the escalator plan on 1/S1-7302? Should the knock-out slab be separated in some way from the curb/wall of the escalator pit? See RFI 185 SK1.</p> |                                    |   |                     | <p>1) The low permanent slab and new supporting beams are not required.</p> <p>2) Step in slab does not need to encase the transfer girder. The top slab stops at the step and is supported by edge of slab detail similar to 9/S1-5000 (See attached sketch SKS-0315). There will be architectural wall between the high and low slabs as shown in the sketch.</p> <p>3) The edge of knock-out slab is 1' - 9" away from GL 10. With a 36" wide flange of the transfer girder, the edge of knock-out slab is 21- 36/2 = 3" outside of the flange edge. The small overhang of the slab is to be supported per detail 8/S1-5000.</p> <p>4) Bent plate and edge of slab detail per 8 or 9/S1-5000 shall apply not only at the members highlighted in yellow but also at portion of the W21x50 beams below the escalator pits. Coordinate with response to RFI T-0868.1.</p> <p>5) See response to 4). Coordinate with response to RFI T-0868.1.</p> |                      |                    |                          |

**From:** Webcor Construction LP Michael Spillane **To:** Turner Construction Compan Gary Krutsch

**Answered By:** Webcor Construction LP Jackson Tukuafu

**Co-Author:**

**REQUEST:**

Further to discussion with Thornton Tomasetti field personnel.

WOJV is asking for the remainder of the Mat slab pour, that the requirements per specification Section 31 55 00 1.4J may be deemed satisfied after 14 days to start removing the level D bracing based on historical data of the 284 concrete strength test results completed to date.

Please confirm if this would be acceptable

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger  
12/4/2013

**RESPONSE:**

The RFI does not stand as written.  
The historical mat slab break data is sufficient only to waive the specification requirement that the TJPA Representative review and approve strength test results prior to removal of bracing (Section 31 55 00 1.4J). It is permissible that Webcor-Obayashi review the 14 day results to determine early brace removal provided they establish and submit acceptance criteria. SEOR is awaiting documentation of the procedure and acceptance criteria, which may take the form of an RFI. Language for this RFI has already been discussed with WO and TCCO.

**From:** Webcor Construction LP Gregory Kemerer **To:** Turner Construction Compan Gary Krutsch

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

On S1-  
2505 at grids 21 & 22 refer to sketches CD RFI 149 SK1 t  
o SK5 for items 1 to 3:

1) The plates for the pin connection per 5/S1-5017 foul the

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

1) Do not modify the pin connection. Move the beams away the pin connection slightly to clear the pin connection.  
2) Do not cut the beam bottom flange. The erection issue can be resolved by field welding the bottom

| <div><div>From: Webcor Construction LPGregory Kemerer</div><div>To: Turner Construction CompanGary Krutsch</div><div>Answered By:Adamson Associates, IncGeorge Metzger</div></div>   |  |               |                     |   |                      |   |                          |
| Co-Author: Skanska USA Civil West California DisRyan Clayton   |  |               |                     |   |                      |   |                          |
| REQUEST:   |  | SUGGESTION:   |                     | ANSWER:   |                      | Accept Suggestion: <input type="checkbox"/> |                          |
| Observation: Job specifications and Code AWS D1.1, Table 3.1, matching strength filler metal combinations for Group IV material, specifies for use an E91XTX for FCAW and F9XX for SAW process(s).   |  |               |                     | The proposed under match the base material and filler metal is not acceptable. The AWS electrode specification A5.29 for FCAW doesn't change, so the electrode classification as noted by the D1-code committee (E9xxx) shall stay. The contractors supplier is welcome to certify-by-test their electrode E8 as a E9 and provide the documentation as-such and submit it for approval. |                      |   |                          |
| Concern: ASTM A709GR 70W material hardening during welding (alloying up) as each weld layer is deposited (in 2" to 4" material thickness). An increased hardness value is expected and the actual concern is that, in this instance, the E91XX specified will create an overmatching filler metal condition during the welding process.  |  |               |                     |   |                      |   |                          |
| Review: The AWS D1.1 2008 edition in table 3.1 for ASTM A709 Grade HPS70W specified a minimum of 70 ksi Yield Point and 90-110 ksi Tensile Range. In comparison, the AWS D1.1 2010 edition, a revision was made on this same material and the Tensile Range was dropped to 85 ksi minimum and maximum to remain at 110 (85-110).   |  |               |                     |   |                      |   |                          |
| Research: Currently for seismic application, the filler metal companies have seismic testing certificates for E81XX and F8XX electrodes. The Tensile test range for AWS D1.8 requirements is 80ksi minimum, but the manufacturers' test results consistently come in at 88 to 95 ksi, which would meet the 85-110 ksi range for the material. The two manufacturers contacted, ESAB and Lincoln, are willing to do seismic testing (test data) for the purpose of supplying AWS D1.8 seismic certificates to meet the E91XX requirements. However, when reviewing the current test data from the manufacturer, the test tensile range is 90-110 ksi, but the results are 97-110 ksi. |  |               |                     |   |                      |   |                          |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

Conclusion: TMF and their welding consultants believe that starting with a near Minimum Tension ksi (under match in classification/specification) that allows the use of E81TXX or F8XX electrodes with current seismic certificates would be best for the welding of the A709 HPS70W material due to the 2-4" thickness in this application.

Please confirm this proposal is acceptable.

**REQUEST:**

Please refer to drawing S1-5052 and S1-5050.

Refer to attached sketches CD RFI 099 SK1 & SK2 for items noted below.

3) To allow sufficient clearance to position a hydraulic tensioning device we require a dimension of 30"h instead of the 24"h indicated on 3/S1-5050, please confirm this is acceptable.

5) Confirm Section C shows the 3" thick plate only.

6) Confirm the 2 1/2" thick bearing plate is shaped as shown.

7) Confirm the 2 1/2" thick plate is welded on 3 sides as shown. Supply the welding requirement for the 2 1/2" thick plate to the WT below if required.

10) To allow sufficient clearance to position a hydraulic tensioning device we require a dimension of 30"h instead of the 24"h indicated on 3/S1-5050, please confirm this is acceptable.

12) Provide the weld requirements for the 4" plate to the column web.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

3.) Please consider the option of pre-tensioning from the bottom. This item may be discussed further in next structural issues conference call.

5.) Confirmed.

6.) Confirmed.

7.) Confirmed. No welding required to WT, direct bearing. WT surface shall be milled as called out in the detail.

10.) See our comment to RFI Question #3.

12.) No welding required.

13.) Confirmed. Note that the coupler should clear the base plate by a minimum of 1-1/2 inches.

14.) It is acceptable to use larger washers at Contractor's option.

15.) Use of 2-1/2" dia rods is acceptable at the Contractor's option, pretension shall be kept the same. Note that there are some steel rod vendors that can provide larger jacking force for 1-3/4 diameter rods. One example is Dywidag, which shows a jacking force of up to 330 kips in their catalogue for 1-3/4 diameter rods.

**From:** Webcor Construction LP Stephanie Azzolino

**To:** Turner Construction Compan PHIL MILITELLO

**Answered By:**Adamson Associates, Inc George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

The response to WOJV RFI T-0979 indicated that the curved W27x84 beams shown on S1-2305 at grid 23/E are to be connected together with a single shear plate connection per 1/S1-5011.

The referenced detail shows a beam to beam "T" connection, rather than two rolled shapes butting up to each other. Please clarify how the connection shown on 1/S1-5011 is to be applied to curved beam connections.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:** ☐

Use a 3/8" single shear plate with 2 rows of 7/8" dia A325N bolts (14 total), connecting 2-W27 at web.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

The W40x503 beams along grids C & G on the Ground Level have been substituted with BU beams per RFI # T-0704.1. This changes the flange copes in details 3 & 7/S1-4350. Please refer to attached CD RFI 162 SK1 & SK2 for the following items:

1) Please confirm it is acceptable to extend the web plate above the BU beam and cut the top flange plate flush to the web plate as shown. Confirm the CJP weld indicated is acceptable to weld the top flange to the web plate. The web to flange fillet welds per RFI T-0704.1 will be applied beyond the shown CJP welds.

2) Confirm it is acceptable to stop the bottom flange plate of the BU WT short as shown, extend the web plate of the BU WT to the web plate of the BU beam and weld as shown. The web to flange fillet welds per RFI # T- 0704.1 will be applied beyond the shown CJP welds.

3) Confirm it is acceptable to have a continuous 4" vertical bolt spacing in lieu of the pattern interruption as shown in detail 3/S1-4350 to avoid cutting the bottom flange of the BU beam. This may mean that the holes for the 1 1/2" dia. bolts near the WT to BU beam web weld will have to be drilled after the weld is made.

4) Confirm it is acceptable to have a continuous 4" vertical

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:** ☐

1) Confirmed. Weld joint detail will be reviewed during shop drawings stage after the weld procedure has been submitted and approved.

2) Confirmed. Weld joint detail will be reviewed during shop drawings stage after the weld procedure has been submitted and approved.

3) Confirmed.

4) Confirmed.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

It is requested that work points be added to the Cast Connex machine drawings and Bradken Cast Nodes as outlined on the marked up Cast Node drawings attached. These external "physical" work points will be used to reestablish the "non-physical" internal work points set during the pre-machining of Cast Nodes at Bradken. These external work points will be used to aid the following construction activities:

- 1) Shop fabrication of shear plates and pipe columns
- 2) Shop trial assembly and QC dimensional inspections
- 3) Field assembly and final QC dimensional inspections

Please confirm each work point will be precision punch marked and highlighted with paint marker for easy identification.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

Webcor needs to liaise with Bradken to determine if they are willing and able to punch these marks on the castings, and what (if any) the cost and schedule impact would be. If Bradken can complete the work, then Cast Connex is willing and able to update the machining drawings (at Skanska's cost). The cost for Bradken's additional work will have to be taken care of between Skanska and Bradken and not the TJPA.

**REQUEST:**

On S1-2303 there are two W33x118 beams between grids D.8/E.2 that connect to the stepped Transfer Girder along grid line 11. These connections should be typical double angle shear connections, but due to the location of the stiffeners for the Moment frame column cap/base plate there is a fouling issue. Please see the following questions

below:

1) Please verify a partial full depth shear plate connection similar to detail 2/S1-5011 can be provided at these locations in lieu of the double angle shear connections.

The shear plate cannot be full depth as it will foul the bolts connecting the Transfer Girder bottom flange to the column cap/base plate. See CD RFI 204 SK1 to SK3.

2) If a shear plate connection is acceptable at these locations, please verify plate thickness & welding per 2/S15011. See CD RFI 204 SK1 to SK3.

3) The numbers of bolts in a single row per the schedule on 2/S1-5011 cannot be provided if bolt spacing and edge distance are to be maintained due to the difference in

**SUGGESTION:**

**ANSWER:**

Accept Suggestion: ☐

1) Acceptable.

2) Acceptable.

3) Acceptable. Provide 3" horizontal spacing between the two vertical bolt columns.

4) Provide plates welded to the transfer girder bottom flange and the W33x118 beam web as shown in attached sketch SKS-0314 in lieu of the angle braces at the two W33x118 beams highlighted in the RFI.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Refer to CD RFI 199 SK1 requesting clarifications for dimensions and connections at Elevator PE202 as follows:

1) Detail 8/S1-5004 shows the edge of slab is to be 1'-0" from the toe of the WF beam, but based on the dimensions shown on S1-2502, the 1'-0" requirement is met only on the west side of the elevator opening. The north, south, and east sides do not meet the 1'-0" requirement. Confirm the dimensions to locate the elevator opening WF perimeter beams are correct as indicated on S1-2502.

2) Please supply the missing dimensions to locate the HSS 12x6x1/2 on four (4) sides of the elevator opening.

3) Please clarify how the HSS12x6x1/2 perimeter members are supported and connected to each other at the corners.

4) Confirm edge plate per 8/S1-5000 is required on 4 sides of the elevator opening as none are indicated on detail 8/S1-5004.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

1). Please refer to the attached A1-2892 2014JAN06 for the dimension of the raised elevator cap and EOS  
2). See the green markups on the sketch submitted with RFI T-0987  
3). The HSS 12 x 6 shall be supported by W16 at the south and W27 at the north. The TOS for the HSS 12 x 6 shall be at 1'-1/4" below the TOP of the W27. Use double angle bolted connection (L 4x4x3/8" with 3-1" dia A325 bolts, which pipe sleeve inside the HSS to allow for pretension). Similar double angle connections may be used to connect the HSS at the corner, except one side of the double angle shall be welded to the face of the HSS with 5/16" fillet weld with 5/8" return.  
4). Confirmed

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 199.1 SK1 & SK2 for items 1 to 4:

1) The noted dimension per S1-2502 places the beam inside the slab opening.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

1) The noted dimension shall be 6'.  
2) See attached sketch SKS-0375 for correct dimensions.

| Reference sketches CD RFI 193 SK1 & SK2 indicating one specific location where the bolt spacing provided in detail 8/S1-5010 will not work as the bolts will foul each other. In the specific case shown on SK2, the "H1" dimension will need to be increased to 7 1/2" to avoid the fouling issue. Please confirm it is typically acceptable to increase the "H" or "H1" dimensions as required to allow sufficient clearance between the bolts for installation and tightening. If not, supply an alternate solution. |  |        | Confirmed that in concept, it is typically acceptable to increase the "H" or "H1" dimensions as required to allow sufficient clearance. Final approval of this change will be provided during submittal review.  |               |   |             |                          |
| NOTE: RFI #T-0976 item 4 requested permission to typically move the shear plate to the opposite side of the skewed beam from what is shown in 8/S1-5010 to allow erection access for the skewed beams.  |  |        |  |               |   |             |                          |

| Please refer to drawing S1-3304 and S1-3301.   |   |                 |                                |            |              | Accept Suggestion: <input type="checkbox"/>             |             |                          |
| Detail 2/S1-3301 requires the couplers of adjacent column vertical bars to be staggered with a vertical distance of 24" or more; however, at gridlines 16.9/G there is a column dowel that should have been a shorter bar (L) but was installed as a longer bar (H) and casted in the mat foundation concrete. This does not allow for the stagger pattern as required. See the attached sketch SK-RFI-114 for more details. Gerdau proposes to leave the bar as-is. |   |                 |                                |            |              | George Metzger<br>12/11/2013<br>RESPONSE:<br>Confirmed. |             |                          |

| Please refer to drawing S1-5111 thru S1-5133.  |   |        |   |  |            |               |  |
| <p>In recent meetings, Webcor/Obayashi has made it clear that the same Bus Deck Cast Node geometry will be used at multiple locations even though the angle of the lower Basket Columns changes at each Node. This adds a level of complexity and cost to the joint between the Cast Node and Basket Column Pipe due to the kink imposed on that joint as a result of the following:</p> <ul style="list-style-type: none"><li>- The Lower Pipe Columns will be required to be "miter cut" instead of a traditional square cut end. (Please note Spec Section OS 10 00, paragraph 3.2.M.1 states "Bearing ends of columns shall be milled or sawn square perpendicular to axis of the column.")</li><li>- Miter cut Pipe will have an ellipse cross section and will not match the circular Casting Node.</li><li>- Backing bars used to full pen weld the Pipe Column to the Cast Node would need to be custom machined to match the ellipse Pipe and circular Node to eliminate weld gaps. This significantly increases the complexity and risk for successfully welding the joint, and reduces the adjustability for fit up of these joints in the shop and the field.</li></ul> <p>This kink can be accommodated either by machining the nozzle of the Cast Node to be perpendicular to the pipe, or by machining the pipe end at a mitered angle to match the Cast Node.</p> <p>Since this joint on the Cast Node is already being machined, Skanska/OIW believes that the more desirable</p> |   |        |   |  |            |               |  |
|  |   |        | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>   |  |            |               |  |
|  |   |        | <p>The contract drawings at bid time clearly showed that the centerline of the pipe is not in line with the centerline of the cast node nozzle, that the same cast node is to be used at multiple locations, and that the cast nodes were not miter cut to be perpendicular to the incoming pipe. The reference to Spec section 05 10 00 noted in this RFI regarding bearing ends does not apply for this condition as the pipe to cast node connections are not <math>\angle</math> bearing <math>\angle</math> connections, they are a fully welded connections as shown on the contract documents.</p> <p>This <math>\angle</math> kink <math>\angle</math> between the topside of the ground floor basket column and the bottom-side of the bus deck cast node <math>\angle</math> resulting from the building's geometry and the use of the same cast node type in multiple locations <math>\angle</math> can be accommodated by either miter cutting the pipe or the cast node. However, the contract documents, including those available during bid, clearly show that the bus deck cast nodes were not going to be miter cut, and so miter cutting of the basket column pipe members by the Steel Contractor is necessary to accommodate the building's geometry.</p> <p>The specified miter angle does not exceed 1.5-degrees in any location. Miter cutting a 32-inch diameter steel pipe by 1.5 degrees results in an elliptical cross-section having a major diameter of <math>32 / \cos (1.5^\circ) = 32.011</math>-inches and a minor diameter of 32-inches. This results in a minimal mismatch in cross-sectional dimension / shape between the</p> |  |            |               |  |

**REQUEST:**

Please refer to drawing S1-4205.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

Please see Plan Sheet S1-4205 Detail 1 for typical details at EBF Link Beams. The typical arrangement specifies a transition from CJP weld to fillet welds and incorporates a weld access hole to separate the 2 welds. In an effort to reduce the number of weld access holes and the inherent issues that can arise with them, Oregon Iron Works is proposing to extend the CJP welds to the end of the girders thus removing the weld access holes at the weld transition point.

Please see attached OIW sketch 2770-SK-TH02 representing a typical EBF Blank Beam Fabrication. It is Skanska/OIW's intent to extend the UT testing 1'-0" beyond the specified CJP weld zone. The balance of the weld will be MT/VT tested as required by Contract Documents.

Please confirm that the proposed welding and NDE is acceptable for all EBF link Beams at the roof perimeter. There is no cost or time impact with this change.

Confirmed that the proposed welding and NDE is acceptable for all EBF link beams at the roof perimeter. Also, please note the special CVN requirements for the weld materials for this EBF link beam CJP weld noted in Specification 05 12 10, paragraph 2.1.C.2.

**REQUEST:**

At a sample location on S1-2503 at grids 9/F refer to sketches CD RFI 150 SK1 & SK2 as noted below.

As the sloping BU beam rises 1/2" above the opposite BU beam, the thickness of the top continuity plate will be increased to 3-1/4". Confirm this is the design intent and should be applied typically at similar conditions.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

For the conditions described in the RFI, continuity plate thickness shall be per construction drawings (no need to increase thickness). At the condition described in the RFI (1/2" difference between the top of flange elevations), line the continuity plate up with the non-sloping MF beam. At Bus Deck Level joints at GL 2/D.4, 2/E.6, 3/D.4 and 3/D.6, the difference in elevation of MF beams on each side of the column is 2". At these joints, slope the continuity plate between the top flanges of the two beams (no need to increase thickness).

**REQUEST:**

Please refer to the the following: S1-5017, S1-5131, S1-5132, S1-5133, 05 10 00 - 2.3.J & 3.2.B.2.

Paragraph 3.2.B.2 specifies the holes for the pins shall be no more than 1/32" over the diameter of the pin.

Paragraph 2.3.J specifies the pins to be Hot Dip Galvanized (HDG). This combination will lead to interference at assembly due to the following factors:

- 1) Tolerance in bored hole diameter of 0.010 (+0/-0.010)
- 2) Tolerance of Pin diameter of 0.010 (+/-0.005)
- 3) Tolerance of galvanize thickness at pin of 0.012 (+/-0.006/side x 2)
- 4) Tolerance in thickness of primer at pin holes of 0.002 (+/-0.001/side x 2)

The stack-up of tolerances is 0.034" which is greater than the specified 1/32" maximum clearance.

Skanska/Oregon Iron Works is requesting approval to supply the pins and bored holes to the following nominal values and within the tolerance identified above. These values are measured after machining and prior to coating.

1. 7" diameter pins:

- a. Pin diameter = 6.906" (bored holes -1/8")
- b. Bored holes = 7.032"

2. 8" diameter pins:

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Per Specification 05 10 00, the pin is to be measured by a ring gage after galvanizing. The 1/32" tolerance is for pin after galvanizing.

We don't feel a chrome coating is equal to the specified galvanized coating. Chrome coatings do not have the construction industry track record that galvanizing has. Skanska has not provided a substitution request with technical data showing a chrome coating has the same performance as galvanizing.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

On S1-2603 near grids 9/D the grid locations for the note indicating to use detail 3/S1-5011 at the weak axis at MF columns is unclear. On sketch CD RFI 227 SK1 please verify detail 3/S1-5011 only applies to grid lines 9/D & 9/F.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Detail 3/S1-5011 applies at beams framing into weak axis of moment frame columns at all North-South gridlines on roof level except otherwise noted. As the note calls out, moment frame columns are either located on GLs D and F or D.4 and E.6. Detail 3/S1-5011 is called out once per sheet on all roof plan sheets S1-2602 through S1-2607.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

At the ground level for the concrete beam locations and 1" plate requirements refer to sketches CD RFI 230 SK1 to SK7 for items 1 to 5: Note the structural & architectural drawings do not locate these members in question.

1) Confirm all dimensions for the spacing of the concrete are correct as shown.

2) Supply all clouded concrete beam location dimensions.

3) Confirm the intended location for the 1" stiffener plates is correct as shown.

4) Confirm the welding for the 1" stiffeners is acceptable as shown.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

1. Confirmed.

2. For all "clouded" dimensions, refer to architectural slab edge plans for location of the slab openings.

3. The 1" stiffener plates are no longer needed.

4. See response to item 3

5. See response to item 3

**REQUEST:**

Plan drawings S1-2503 and S1-2505 indicated a Type S8 floor type at the seismic joints at the Bus Deck level. Based on the Type S8 floor type detailed on detail 4/S1-5003, please confirm the dimensions indicated on CD RFI 202 SK1 for the structural slab and architectural topping thicknesses are accurate.

**SUGGESTION:****ANSWER:**

Confirmed

**Accept Suggestion:** ☐

**REQUEST:**

Refer to sketches CD RFI # 059B.1 SK1 to SK5 for items 1 to 3:

1) This diagonal beam will typically have to be erected from the top due to the slope of the pipe at the perimeter node connection. This will require the top gusset plate to be shipped loose per CD RFI 059B response and the bottom flange of the beam cut flush to the web to slide past the shear plate on the gusset plate end. Please review attached sketches and confirm.

2) This diagonal beam will typically have to be erected from the bottom due to the slope of the pipe at the perimeter node connection. This will require the bottom gusset plate to be shipped loose contrary to CD RFI 059B response and the top flange of the beam cut flush to the

**SUGGESTION:****ANSWER:**

This RFI is a follow up to RFI T-0883 and 0883.1.  
1) Confirmed that the end connecting to the cast node may have the bottom flange cut flush to the web as noted in RFI T-0883. Shipping the gusset plate loose is a means and methods issue.  
2) Confirmed that the end connecting to the cast node may have the top flange cut flush to the web as noted in RFI T-0883, shipping the gusset plate loose is a means and methods issue.  
3) Confirmed that the top flange of this beam at both ends may be coped to clear the connection plates.

**Accept Suggestion:** ☐

**From:** Webcor Construction LP Jackson Tukuafu **To:** Turner Construction Compan Gary Krutsch

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Shimmick Construction Company, Inc Sylvia Hartanto

**REQUEST:**

Please refer to detail 2/S1-3600.

Due to the possibility of limited access during the installation of the individual moment frame hairpins as detailed in 2/S1-3600, SCCI/Gerdau proposes to modify the typical moment frame beam tie configuration to what is shown in the attached SCCI sketch SK-RFI-399.

Please confirm if this is acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

George Metzger

12/12/2013

**RESPONSE:**

The proposed configuration containing hairpins with 555 t-heads is acceptable for the 48" deep moment frame beams only in regions further than 96" from the face of supporting vertical elements. For locations within 96", the stirrup configuration may remain as proposed; however, the 555 t-heads shall be replaced with hairpins conforming to those of Detail 2/S1-3600. Note that all ties (including cap ties) which contain both 90 and 135 hooks shall have their hooks alternated for all locations.

#### REQUEST:

In order to comply with OSHA regulation 1926.501 - 'Duty to Have Fall Protection', Skanska has directed our modeling contractor, Candraft, to incorporate holes in new framing members to facilitate installation of the guard rail systems and life lines. Please see the attached sketches, SK 6 A-F, SK 7-8 and SK R-4, which are consistent with the National Institute of Steel Detailing standards for safety holes on beams and columns, and confirm that the EOR takes no exceptions to our proposal.

Particular attention is drawn to the note on our proposal that states 'No Holes or Welded Tabs will be located in the protected zones of the new members.' All open holes will be filled with high strength bolts upon removal of the safety systems.

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

The holes for erection safety railing are acceptable in concept. The holes shall be detailed on the shop drawings submitted for review as a part of review process. The holes shall not be in any steel exposed to view in the completed design and there may be other areas that are not acceptable once the holes are shown on the shop drawings. Any holes in galvanized steel shall have the galvanized finish repaired.

#### REQUEST:

In orThe web to flange T-joint CJP welds for the transfer girders shown on drawings S1-4300 to S1-4308 do not indicate that a reinforcing fillet weld is required. Note 1 on 4/S1-4202 calls for reinforcing fillets to T-joint groove welds of SLRS members. Please confirm that a reinforcing fillet weld is not required for the transfer girder

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

The T-joint CJP welds for the transfer girders shown on drawings S1-4300 to S1-4308 are double side CJP weld, not requiring reinforcing fillet weld. Detail 4/S1-4202 is for single side CJP weld at beam flange to column moment connection, therefore, Note 1 in Detail 4/S1-4202 does not apply.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

On 2 & 6/S1-5052 @ the Pretensioned Rod details refer to sketches CD RFI 228 SK1 & SK2 for items 1 & 2:  
1) The WT surface below will be milled to bear against the 2 1/2" thick plate. Work with item 2 below as shown on SK2 and confirm welding at this joint is not required as none is shown.  
2) Similar to detail 2/S1-5052 as shown on SK1 (item 1 above), the contact surface will be milled for bearing as requested. Please confirm the noted 1/2" fillet welds for the built-up TT section to the 4" thick plate are to be applied as shown.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

- 1) Confirmed.  
2) Confirmed.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

1/S1-5001 refer to sketch CD RFI 119 SK1 & SK2.  
Confirm the specified L3x3x12GA deck support angles are adequate given the approximate length of these angles will be 3' 9-1/2".  
The contractor proposes to use A36 L3x3x5/16" at these typical details. Please confirm this is acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

L 3 x 3x 12 gage deck support is adequate as shown.  
It is acceptable to use L3 x 3 x5/16 as proposed.

|                                     |  |                                       |                   |  |                   |                    |                          |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Refer to sketch CD RFI 231 SK1 and confirm it is acceptable to fabricate the double bent deck support plate as shown when the beam is sloping and the underside of slab is horizontal, resulting in a variable height along the deck support plate. It is not possible to model a double bent plate with a variable height in Tekla.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Acceptable to fabricate the double bent deck support angle as proposed, but the weld shall be a continuous 1/4" double fillet weld, not a 3" long weld at 12" on center. Note that the lower horizontal plate needs to be welded according to welds shown in detail 4B.

| REQUEST:   |   | SUGGESTION:                                 | ANSWER: Accept Suggestion: <input type="checkbox"/>  |                      |                      |   |                          |
| The 1 1/4" top flange plate per 6/S1-5010 & 7/S1-5032 will require bending due to the sloping TPG girders on the roof and a 5/16" shim will be required to fill the gap as shown in CD RFI 154 SK1&2. Confirm it is acceptable to bend the top flange plate at the edge of the BU beams on grid lines B & H and supply a 5/16" shim plate to fit the profile of the top flange plate to be welded all around to the TPG girders with 1/4" fillet weld. If not, supply an alternate solution. |   |   | It is acceptable to bend the 1 1/4" plate and add shims to match the profile of the sloping tapered girders. Note that T/steel of tapered girder is not correctly shown on SK2. T/steel of the tapered girder should match the T/steel of the BU girder at the flange edge of the BU girder.<br>- End of Response -<br><br>Turner disputes the claim that there is a probable cost increase as noted in this RFI. The top of steel of the beams connected are shown in the contract document. The necessity of bending the connection plate due to beam slope should be anticipated by the contractor. |                      |                      |   |                          |

| REQUEST:<br>The response to T-1039 references details 3/S1-3703 & 6/S1-5022 for stitch plate information although these sections are only cut at Ground Level at Fremont & First Street. Please confirm the response is intended to indicate stitch plates are required at all kicker brace locations including details 4, 5 & 7/S1-5015 as per details 3/S1-3703 & 6/S1-5022. If so please confirm detail 8/S1-5015 can also be used for the stitch plate detail. |   |        | SUGGESTION:                                    |               |               | ANSWER: Accept Suggestion: <input type="checkbox"/><br>Confirmed. Stitch plates are required for kickers where Details 4, 5 and 7/S1-5015 are applicable, except where the kicker is shorter than 1.5'. Stitch plate details provided in 8/S1-5015 can be used at locations where kickers are required except that the stitch plate thicknesses shall match those of the gusset plates in the details. Stitch plates can be either welded (as shown in 8/S1-5015) or bolted (as shown in 6/S1-5022) to the kicker angles. For kickers shorter than 3' but longer than 1.5', provide a single stitch plate centered on the kicker angles. |                          |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 183.1 SK1A, SK1B, SK2A & SK2B for items 1 & 2:

1.) Confirm the elevator rail support connection with erection aids is acceptable as shown.

2.) Confirm the elevator rail support connection with erection aids is acceptable as shown.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

RFI number changed to RFI T-1105

|                                     |   |                                       |                   |   |   |

**Co-Author:**

**REQUEST:**

Ref: 1 and 3/S1-5051, S1-3600, S1-2205

To erect and plumb Lower Concourse Column with base plates Types I as shown on schedule 1/S1-5051 and II at 7/F.8 shown on detail 5A/S1-5051, erection aids will be required at the base plate. However, due to the depression, rebar running thru the depression and based on our experience with the grouting at column base plate mock-up, allowable clearances to set these base plates may not be adequate. As an example, column at GL C/24.9, the bottom of type I C base plate is within 1" from the top of rebar and does not have adequate area for shim packs.

Question # 1:

To provide adequate erection aids, please review the following options and advise as to which one is acceptable:

Option 1: Lower rebar around the base plate area by 1" to allow for 2" clear between rebar and bottom of base plate. Install 4 shim packs for erection purposes under each corner of the base plate on top of level concrete surface.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Question 1, Option 1: Lowering the MF Beam reinforcing is not acceptable. Erection aids are contractor's means and methods.

Question 1, Option 2: The reinforcing adjustments allowed are contained in RFIs 908.1, 917, 924, 925 and 1015. Erection aids are contractor's means and methods.

Question 1, Option 3: Raising the column base plates is not acceptable. Erection aids are contractor's means and methods.

Question 2: Increasing the plan dimension of the column base plate block-out to 6" all around is acceptable.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

Option 2: Stop or adjust reinforcing steel under the base plate and use shim packs for erection on top of level concrete surface.

Option 3: Do not modify rebar, raise base plate elevation by 1" to provide minimum of 2" clearance under the base plate. Locate two shim packs next to key plates and install two additional erection aid threaded bolts with leveling nut drilled in concrete by Skanska as shown on the attached sketch SK-2.

Question # 2:

There is a 3" dimension between edge of steel plate and edge of depressed slab. Pls confirm if 6" dimension is acceptable in lieu of 3" around the base plates Type I C , I B and Type II at 7/F.8.

| REQUEST:<br>On S1-2602 to S1-2607 along lines B & H the bottom flanges of the sloping W40x264 moment beams are deeper than the BU 40 girders by 5/16" of an inch as noted on sketch CD RFI # 217 SK1.<br>1). To accommodate for the depth discrepancy verify a 1/2" plate can be added to the bottom of the BU 40 girders and the welds as noted on sketch SK1.<br>2). Also for the top & bottom flange welds for the W40x264 sloping beams verify the CJP weld noted on the sketch SK1.<br>3). Option # 2 is to move the work points of the W40x264 beams up 5/16" thus flanges would then be flush for both W40 & BU 40 members.   |  | SUGGESTION:                                   |  | ANSWER: Accept Suggestion: <input type="checkbox"/><br>1) The top of steel for the slope W40 may be set to match the BU40 girder at the tip of the flange, thus, avoid the need for the 1/2" connection plate.<br><br>2) 1 3/4" bevel for 1 1/2" effective PJP weld is acceptable.<br><br>3) See response to Item 1). |                      |                    |                          |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Reference the response to RFI T-1053. Per the conversation during the 1/21/14 Structural Issues Meeting, please address the following:

1) Please confirm that a 1/2" plate is acceptable as described in RFI T-1053, item #1

2) Please confirm that a CJP weld will be acceptable in lieu of a PJP weld, as described in RFI T-1053, item #2

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

- 1) Confirmed.
- 2) Confirmed.

|                                     |   |                                       |                   |  |                   |                    |                          |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

ASI 0106 changed the majority of the detail and section references on drawing S1-6005 that result in incomplete or incorrect traceability. These changes were not clouded. Two possible issues exist as a result of these changes:

- 1) Some of the revised detail/section references were revised in error, and/or
- 2) Some of the revised detail/section references are correct and the referenced drawing requires either a revision to match the sourced reference or the addition of a new detail/section.

Please advise.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

This RFI references the outdated drawings in ASI 106. Please reference the updated drawings in ASI 108 & 109 and clarify your question.

|               | required as shown. Please confirm.<br>4) (SK5) Per A1-8152, kicker braces per 4/S1-8020 are required as shown. Please confirm.<br>5) The mullion locations on A1-8157 cannot be located with the information provided. Please supply the dimensions off grid lines to locate the bracing and mullions.<br>6) It appears that W-2 mullions occur along the entire wall on grid line 1.4, however A1-8157 only shows mullions between grid lines C and D.4. If mullions occur south of GL D.4, please provide the dimensions required to locate the mullions, braces, and stiffeners.<br>7) A1-8158 is shown on grid line 2.5. Please advise if A1-8158 is to be mirrored on GL 3.5 or provide the required mullion spacing.<br>8) A1-8158 does not provide the locations of the mullions. Please supply the required dimensions off grid lines.<br>9) A1-8159 is shown on grid 8.5. Please advise if this elevation also applies on grid 9.5 or provide the required mullion spacing.<br>10) The locations of the mullions cannot be located with the information provided on A1-8159. Please provide a reference dimension off a grid line to locate the mullions.<br>11) A1-8152 is reference on A1-8150 between grid lines 2 and 3, with grid lines 2 and 3 shown on the elevation. Please confirm this detail also applies at the corners on grid lines 4, 8, 10, 12, and 14.<br>12) Please confirm details 1 and 4 on S1-8020 do not apply to drawings A1-8156, A1-8165, A1-8166.<br>13) A1-5167 is reference on the south portion of grid 16.9. Please advise if this detail also applies on the north portion of grid 16.9.<br>14) It appears that partial dimensions are provided (between grid lines E.6-F.7) for the mullion locations on A1-8161 along grid line 27 on the Second Level. Please provide the remaining dimensions required to locate the mullions along the remainder of grid line 27.<br>15) No detail reference is provided on the north half of grid line 27 and grid line 32.5. Please provide the mullion spacing requirements at these locations.<br>16) A1-8156 is referenced on grid line F.7 between grid lines 27 and 32.5 on the Second Level, but this detail does not appear to be correct. Please confirm the reference should be A1-8160 or provide the corrected reference. |               |                     |                      |                      |                    |                |

| REQUEST:<br>While specification section 05 10 00-3.2 .P.3b excludes shop paint from areas to receive cementitious fireproofing, the response to SK RFI 319 (WOJV T-1060) indicates that all steel is to be prepped per the manufacturer's recommendations. The response to WOJV T-1060 provided three potential manufacturers for the SFRM-1 per the preliminary specification section 07 81 00-2.3.A.<br><br>1.) Based on the product data sheets published for the Grace Monokote Z-146 and Cafco Fendolite M-II products, Skanska understands that these products are recommended to be applied to bare steel that is free of oil, grease, excess rolling compounds, lubricants, loose mill scale, excess rust,..., or any other substance that will impair proper adhesion. Please confirm this interpretation is acceptable and the potential use of these products is intended for application on bare steel. |  | SUGGESTION:   | ANSWER: Accept Suggestion: <input type="checkbox"/><br>1.) Confirmed.<br>2.) The two manufacturers described in item 1 above meet the technical performance requirements specified. The third product on item 2 should match the technical performance requirements specified in section 07 81 00 without requiring additional treatments to meet the specified requirements. If the manufacturer of this product deems it necessary to add corrosion protection for meeting the requirements, they should add this to their bid.<br><br>As an additional measure prior to issuing specification section 07 81 00 for bid, we will add "or equal" to the Materials listing of Specification Section 07 81 00. |                      |                      |                    |                          |

| <p>2.) The Carboline Pyrocrete 40 product does not require the use of a primer, however the published data sheets state that "Pyrocrete 40 neither promotes nor prevents corrosion". It is understood that the manufacturer finds application of Pyrocrete 40 to bare steel to be acceptable on the building interior, but recommends the Owner's consideration of a primer on steel exposed to corrosion. Please advise which areas, if any, are required to be primed prior to application of the Carboline Pyrocrete 40 product.</p> <p>Please note that application of a primer for areas receiving any of the three SFRM-1 products will incur additional costs and schedule impacts, as these areas were originally specified to be bare steel per 05 10 00-3.2.P.3b.</p> |  |  |   |                      |                      |                    |                          |
| <hr/>   |  |  |   |                      |                      |                    |                          |

| From: Webcor Construction LP Gregory Kemerer  |  | To: Turner Construction Company PHIL MILITELLO | Answered By: Webcor Construction LP Gregory Kemerer   |                      |                      |                    |                          |
| Co-Author:  |  |  |   |                      |                      |                    |                          |
| REQUEST:  |  | SUGGESTION:                                    | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                      |                    |                          |
| Details 5, 6, and 7/A1-8662 indicate "12 inches of fireproofing required on stiffener fins, typical."   |  |  | 1) Refer to 'Fire Protection Matrix & Schedule' per attached A1-8662 for UL Assembly listings. Refer to drawings A1-9317, A1-9351 and A1-9354 for related details.  |                      |                      |                    |                          |
| 1) Please provide a UL assembly # and details for conditions where cruciform columns are enclosed with exterior wall cladding or interior furred-out walls.   |  |  | 2) The 'stiffener fins' as noted on sheet A1-8662 are added to the Ground Level columns to increase weak axis bending stiffness of what are known as the cruciform columns on the Structural drawings. These stiffeners are provided for vibration control and being non-load carrying elements they do not require fire protection from a code perspective. As typically recommended by the fire protection manufacturer, non-load carrying attachments be fire proofed to the same level as the protected structural elements to mitigate 'thermal bridging'. |                      |                      |                    |                          |
| 2) Structural drawings reference cruciform columns while A1-8662 references "stiffener fins." Please advise if the A1-8662 drawings are intended to show the cruciform columns, and provide revised drawings as necessary. Please provide the applicable UL assembly for cruciform columns with any revised details.  |  |  | 3) Confirmed  |                      |                      |                    |                          |
| 3) Please advise if the cruciform columns are to be fireproofed SFRM-1 per spec section 07 81 00  |  |  |   |                      |                      |                    |                          |

| Per the response to Webcor's RFI # T-1061 (SK RFI # 180B.1) we have complied with the geometry for the weld access hole size per AWS D1.8, section 6.10. Using this formula we have shown the connection on CD RFI # 134.2 SK1 for a BU column with a 3 1/2" thick web. Please confirm the remaining 5 1/2" web material as shown on SK1 is acceptable.  |   |   | Confirmed that it is acceptable to use AWS D1.8 for WAH geometry and confirmed that the 5 1/2" remaining web material for the column with 3 1/2" web thickness is acceptable.            |                      |                      |                    |                          |

| REQUEST:   |   | SUGGESTION:                                   | ANSWER: Accept Suggestion: <input type="checkbox"/>  |                      |                      |                    |                          |
| BBII has located portions of timber piles in several CDSM wall panels along gridline A in zone 3 at excavation levels 4 and 5, between soldier piles 255-257 and 259-261. BBII believes any attempt to remove the piles has the potential to damage the CDSM wall. Given that there is no issue with water intrusion at the pile locations and the CDSM material is in good condition, BBII believes the best course of action is to leave them in place. To ensure a smooth surface for waterproofing, the piles have been ground down so that they are recessed from the face of wall. BBII will then patch over the panel to bring it flush with the CDSM piles. (Patching has already occurred on a portion of the affected areas - see attached photos of panels before and after the above procedure.) |   |   | ARUP Response:<br>We take no exception.  |                      |                      |                    |                          |
| Please confirm this is acceptable  |   |   | Adamson Associates, Inc. Response:<br>The CM/GC shall confirm the waterproofing subcontractor/manufacturer and the contractor's waterproofing system designer accept the site conditions |                      |                      |                    |                          |

1) Confirm it is acceptable to (a) field weld the bottom connection after aligning the top connection to center of low flutes when deck flutes are parallel to kicker and (b) field drill the top connection after aligning the L6 to center of low flutes when deck flutes are perpendicular to the kicker.  
2) Confirm the diameter of expansion bolt required.  
3) Confirm the field drilled top connection is acceptable at deck flutes perpendicular to the kicker as this will vary from the direction in T-1067 #5.

the closest deck flutes.

2) Confirmed.

3) It is unclear how the 2" bolt edge distance requirement to the edge of the angle brace per response to item 5 of RFI T-1067 affects the distances noted as "6 inch" and "varies" on SK1. Please add this item to the agenda of an upcoming structural coordination meeting.

| From: Webcor Construction LP Gregory Kemerer                 |                                       | To: Turner Construction Compan Gary Krutsch | Answered By: Adamson Associates, Inc George Metzger |            |            |             |                          |
| Co-Author: Skanska USA Civil West California DisRyan Clayton |                                       |   |   |            |            |             |                          |

**REQUEST:**

Details 7 & 8/S1-3703 are shown on sheet S1-2305 as typical sections for beams connecting perpendicular to the perimeter BU & WF beams at grid lines C & G. These sections reflect the varying elevation differences between the two members. In most conditions, the remaining depth of the beam framing into the perimeter BU or WF will only allow for a two bolt connection as shown in details 7 & 8/S1-3703.

- 1) Please confirm it is acceptable to use a two bolt shear plate connection for any beam size where the remaining depth of the connecting beam will only allow for two bolts. The shear plate thickness and welding will be per the schedule on 1/S1-5011.
- 2) Please confirm at some locations it is acceptable to cut the flange flush on one side of the beam to maintain edge distance.
- 3) Please confirm edge distance can be reduced where needed to complete connection.
- 4) Please confirm a double angle connection should be used when the varying elevations will allow for more than a two bolt connection. The angle size & thickness will be per the schedule on 1/S1-5010.
- 5) Please confirm the maximum amount of bolts that will be used would be based on the remaining depth of the

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:** ☐

1). Details 7 & 8 /S1-3703 showing 2 bolt shear connection are applicable to the condition where the sections are cut and similar condition.

2). Confirmed. Specific application of this detail will be reviewed on a case by case basis during shop drawing review.

3). AISC minimum edge distance shall be maintained.

4). Confirmed.

5). Confirmed. Specific application of the approach stated will be reviewed on a case by case basis during shop drawing review.

| <u>Number</u>   | <u>Subject</u>   | <u>Status</u> | <u>Date Created</u>  | <u>Date Required</u>      | <u>Date Answered</u>                               | <u>Cost Impact</u> | <u>Proceed</u>           |
|---|--|---------------|--|---------------------------|--|--------------------|--------------------------|
|   | At the Bus deck level (S1-2503) @ grids D/9.9 & 10.1 and F/9.9 & 10.1 the 3/8" edge of slab bent plate protrudes 3'-4 & 2'-3 from grid lines 9.9 & 10.1 respectively as shown on sketch CD RFI 244 SK1. Due to the 5'-0 protected zone at these lo cations the angle supports per detail 9/S1-5000 cannot be attached due to no welding is allowed in this area. Please advise on this non supported area and other similar type areas where no welding is allowed in the protected zones. |               |  |                           | <b>Accept Suggestion:</b> <input type="checkbox"/> |                    |                          |
|   | At grids D/9.9 & 10.1 and F/9.9 & 10.1, run an L5x5X3/8 parallel to the moment frame beam between the two outriggers, namely, the cantilever W30x90 (gravity moment connected to the MF beam) and the support angle at the moment frame column. Attach the angle legs to each support using fillet welds (1/4" thk, 2" long), cope the angle as needed. Note that seam welding to be provided where the bent plate width changes.  |               |  |                           |  |                    |                          |
| <b>T-1071.1</b>   | <b>SSS - Edge of slab support @ protected zones</b>  | <b>Closed</b> | <b>02/11/2014</b>  | <b>02/21/2014</b>         | <b>02/24/2014</b>                                  | <b>Potentially</b> | <input type="checkbox"/> |
| <b>From:</b> Webcor Construction LP      Stephanie Azzolino <b>To:</b> Turner Construction Compan   PHIL MILITELLO  |  |               | <b>Answered By:</b> Adamson Associates, Inc   George Metzger   |                           |  |                    |                          |
| <b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton   |  |               |  |                           |  |                    |                          |
| <b>REQUEST:</b>   | <b>SUGGESTION:</b>   |               | <b>ANSWER:</b>   | <b>Accept Suggestion:</b> | <input type="checkbox"/>                           |                    |                          |
| 1). Per the response to Webcor RFI # T-1071 (SK RFI # 313) please verify the bolted end connections for the new L5x5x3/8 angle now required as shown on sketch CD RFI # 244.1 SK1.  |  |               | 1) The intent for the RFI T-1071.0 is further clarified on the attached sketch. Either bolted or welded connection is acceptable.  |                           |  |                    |                          |
| 2). To eliminate any overhead field welding confirm the bent plate required will be shop attached to the angle.   |  |               | 2). Skanska should verify whether the bent plate is to be shop welded. Shop welded bent plate might affect the weld access of the moment connection at the beam bottom flange if a "wild cat" position is to be used.  |                           |  |                    |                          |

In so doing, there is potential that the "minimum 1-inch extrusion" called out for the drag pads on the bus deck nodes on the structural drawings may be violated in some cases (refer to 1/S1-5121 attached).

Assuming that this minimum dimension was provided to accommodate fabrication, and given that the responsibility for fabrication and erection is with Skanska, please confirm that it would be acceptable for Skanska to violate the 1inch minimum extrusion with machining of the pad.

With the design team's approval, Skanska hereby proposes to move forward with machining of the pads without the submission of RFIs for every bus deck node. RFIs will only be submitted for those cases where the planned machining of the pad may slightly undercut an adjacent pad or where the planned machining may slightly bite into the main body of the node.

Co-Author:

REQUEST:

Bracing removal/re-bracing sequence on the East end of Zone 4  
WOJV is proposing the following sequence for the re-bracing/ Bracing removal for the East side of Zone 4 See sketches SK1, 2, 3 & 4 attached.

For level D strut removal see sequence on attached sketch SK1. WOJV is proposing to remove level D bracing in two defined areas.

1. Remove level D Cross lot struts and walers from west to east direction once the mat slab beneath has been placed, cured and reached adequate strength.
2. Remove level D struts and walers from south east and north east corner's once the mat slab beneath has been placed, cured and reached adequate strength.

For level C strut removal see sequence and defined areas

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

The proposed method is not acceptable. Both sets of diagonal bracing, on the north side and the south side, and the first few cross lot braces work in conjunction as a group. Any one part cannot be removed until the rebracing is complete for the entire group.

| <p>In recent meetings, Webcor/Obayashi has made it clear that the same Ground Level Cast Node geometry will be used at multiple locations even though the angle of the lower Basket Columns changes at each Node. This adds a level of complexity and cost to the joint between the Cast Node and Basket Column Pipe due to the kink imposed on that joint as a result of the following:</p> <ul style="list-style-type: none"><li>- The Lower Pipe Columns will be required to be limiter cut" instead of a traditional square cut end. (Please note Spec Section OS 10 00, paragraph 3.2.M.1 states 11Bearing ends of columns shall be milled or sawn square perpendicular to axis of the column.")</li><li>-Miter cut Pipe will have an ellipse cross section and will not match the circular Casting Node.</li><li>- Backing bars used to full pen weld the Pipe Column to the Cast Node would need to be custom machined to match the ellipse Pipe and circular Node to eliminate weld gaps. This significantly increases the complexity and risk for successfully welding the joint, and reduces the adjustability for fit up of these joints in the shop and the field.</li></ul> <p>This kink can be accommodated either by machining the nozzle of the Cast Node to be perpendicular to the pipe, or by machining the pipe end at a mitered angle to match the Cast Node.</p> <p>Since this joint on the Cast Node is already being machined, OIW believes that the more desirable and less expensive option is to machine the nozzle of the Cast Node perpendicular to the axis of the Basket Column Pipe. As the nozzles will each be custom machined regardless,</p> |                               |                 |                                | <p>Per Contract, RFIs shall not be used as a vehicle for requesting cost and schedule increases which appears to be the purpose of this Skanska/OIW statements; "A negative response will result in a cost increase and a time increase" are examples.</p> <p>The contract drawings at bid time clearly showed that the centerline of the pipe is not in line with the centerline of the cast node nozzle, and that the cast nodes were not miter cut to be perpendicular to the incoming pipe. The reference to Spec section 05 10 00 noted in this RFI regarding bearing ends does not apply for this condition as the pipe to cast node connections are not "bearing" connections, they are a fully welded connections as shown on the contract documents.</p> <p>This "kink" between the bottom-side of the ground floor basket column and the top-side of the ground floor cast node - resulting from the building's geometry and the use of the same cast node type in multiple locations - can be accommodated by miter cutting either the pipe or the cast node. However, the contract documents, including those cast node shop drawings available during bid, clearly show that the ground floor cast nodes were not going to be miter cut, so miter cutting of the basket column pipe members by the Steel Contractor is necessary to accommodate the building's geometry.</p> <p>Miter cut of the cast node is not acceptable architecturally. The specified miter angle of the pipe does not exceed 1.5-degrees in any location.. Even</p> |                |  |                          |

| REQUEST:  |  | SUGGESTION:                                   | ANSWER: Accept Suggestion: <input type="checkbox"/>  |                      |                      |                    |   |
| <p>Please reference TG06.0 technical specs section 033020.2.1 and cast-in-place mix designs submittal numbers: TG0600-203 (Foundation Walls) and TG0600-204 (Slabs, Beams and Shear Walls).</p> <p>Foundation Wall cast-in-place mix satisfies all requirements prescribed in table 2-1 "Concrete Properties" (033020.2.1) for the Shear Wall cast-in-place mix design. In order to limit site congestion (1 concrete pump vs. 2 concrete pumps) and to aid in logistic coordination between trade subcontractors (BBII Steel offhaul and/or bracing/rebracing work and SCCI concrete placing activities). SCCI is proposing to utilize the Foundation Wall mix when placing the shear walls. Per the project schedule there will be instances in which a foundation wall and shear wall that are in close proximity, are to be poured on the same day. If the same mix is approved to be used for both types of walls, one pump can be utilized vs. two.</p> <p>Is this proposed mix design variance acceptable?</p> |  |   | <p>Contractor-proposed mix design variance for convenience as proposed in RFI is acceptable.</p> |                      |                      |                    |   |

#### REQUEST:

See attached CD RFI # 267.1 SK1 for items 1 to 3:  
At GL 22/C detail 3/S1-3705 is noted as typical at Grids 19.9 & 20.1 on S1-2305. However, TR19.9 & TR20.1 do not match the information as shown in detail 3/S1-3705. See SK1 for the outline of the MFB1 and please provide direction for the following items at Grids 19.9 & 20.1.

- 1) The 112 headed studs requested in detail 3/S1-3705 will not fit inside the MFB1 as is shown. Confirm it is acceptable to eliminate the top row of headed studs and supply a total of 98 headed studs (49 per side) or supply an alternate solution.
- 2) The 2" diameter holes for the #4 stirrups will not fit inside TR19.9 & TR20.1. Give direction on the bottom stirrup holes and confirm the top stirrup holes are still to be supplied as shown.
- 3) Confirm the 2 1/2" diameter holes in the bottom stiffeners are no longer required as they will foul the bottom flange of TR19.9 & TR20.1.

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

1). The top row shall not be eliminated. Those studs will be casted inside a concrete pad.

2). The top row of 2" dia holes is to be located 3" from the top of the concrete beam.

The bottom 2" holes shall be located similar to Section 7/S1-3704

3). Holes still be needed in the vertical stiffeners. See 7/S1-3704 for hole detail and lenth couplers.

| Please reference attached letter Authored by Robert Foley, CEMEX QC Manager, dated 1/2/2014 and TG06.0 technical spec section 033020.2.3.F.1.b.   |  |   |   | George Metzger<br>1/15/2014   |                      |   |                          |
| SCCI and CEMEX are proposing the following guidelines regarding slump of cast-in-place mix designs that contain 30% or higher fly-ash (CM) and HRWR:  |  |   |   | RESPONSE:   |                      |   |                          |
| 1. Maximum 8-inch slump will continue to be the target slump for delivery of concrete mixes with HRWR.<br>2. 9-inch and higher slump will be considered an action limit. Whenever slump of consecutive loads exceeds 9 inches, actions wiII be taken to reduce subsequent slump measurements.   |  |   |   | The revised guidelines are not acceptable. Acceptability is governed by the limits in the approved mix design submittals and the project Specification within ACI 117 tolerances. |                      |   |                          |

| Co-Author: Shimmick Construction Company, Inc Sylvia Hartanto   |  |                 |                                |            |                |  |             |                          |
| REQUEST:  |  |                 | SUGGESTION:                    |            |                | ANSWER:  |             |                          |
| Please reference TG06.0 contract specs section 033020.3.2.A.4, submittal TG0600-030.2 and attached drawing showing proposed CJ layout per variance below. SCCI is proposing to increase the allowable maximum construction joint spacing in the lower concourse slab:   |  |                 |                                |            |                | Accept Suggestion: <input type="checkbox"/>  |             |                          |
| With the use of currently approved Concourse Slab cast-in-place mix design, SCCI is proposing to eliminate every other construction joint. See attached pages for reference example. Maximum construction joint spacing would be 96-feet. Joint location will always land on wall joint location below per 033020.3 .2.A.4. |  |                 |                                |            |                | George Metzger<br>1/27/2014  |             |                          |
| Construction joint layout submittal TG0600-030 will be revised and resubmitted to reflect any change made to currently approved layout.   |  |                 |                                |            |                | RESPONSE:<br>The contractor-proposed Lower concourse slab CJs presented in the RFI will be acceptable. |             |                          |
| Is this acceptable?   |  |                 |                                |            |                |  |             |                          |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

please confirm it is acceptable to increase the diameter of the hole in the 4" bearing plate to the maximum allowable size of 3-3/4" as per ASIC table 14-2 (attached) to allow for additional tolerance and workability when installing the 2-1/2" diameter 18' rod. The oversized side hole will only be required at the 17 built-up TT locations and the 6x6x2" plate washer hole will remain the major diameter of the rod + 1/16".

Please confirm this proposal is acceptable.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**REQUEST:**

Reference Spec: 03 30 20-3.a.

"The TJPB Representative shall conduct tests of concrete as follows:

a. Testing frequency: Sample sets for all tests listed below of each concrete design mix placed each day shall be taken not less than once a day, nor less than once for each 100 cubic yards of concrete, nor less than once for each 5000 square feet of surface area for the mat, cast-in-place formed concrete slabs or walls. Additional tests shall be performed if deemed necessary by the TJPB Representative. Sample each column, regardless of other frequencies listed above."

We request that the last sentence "Sample each column, regardless of other frequencies listed above", be deleted. The current testing of columns would fall under the statement to test "...not less than once a day, nor less than once for each 100 cubic yards". As the current schedule shows two columns to be poured per day, this will produce one set per day for testing.

**SUGGESTION:****ANSWER:**

Accept Suggestion: ☐

George Metzger  
1/17/2014

**RESPONSE:**

The requirement that samples be taken for every column may be relaxed to a single sample set for every two columns placed contemporaneously with the same pump.

**Co-Author:****REQUEST:**

DTDS is concerned about delays and extra costs resulting from drilling Micropiles adjacent to buttress piles from Gridlines 26.5 to 30. As stated in our Contract Change Order request (CCO #04) regarding "Final Micropile Layout - Additional Micropiles" (attached for reference), drilling for the micropiles may encounter overbreak pile concrete and grout placed during buttress pile remediation. The current drilling system cannot be used to drill through the pile overbreak and/or remediation grout.

**SUGGESTION:****ANSWER:**

Accept Suggestion: ☐

This is not an acceptable alternate at this time. If serious delays begin to be encountered, the design team, Turner, Webcor and their subcontractors should meet to discuss this issue immediately.

|---------------|---|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|               | <p>The reduced pile spacing from 10 feet on center to 5 feet and less may also cause problems such as communication between piles.</p> <p>Significant additional costs and schedule delays will result should DTDS have to change our procedure and/or equipment to drill through buttress pile concrete and/or remediation grout. Delays will also be realized should DTDS have to change our drilling sequence to mitigate problems that may arise from the reduced pile spacing.</p> <p>Should detrimental issues arise, DTDS proposes to drill, install, and grout micropile dowels in the center of the existing buttress piles as an alternative to drilling adjacent to buttress piles. A micropile dowel could take the place of a micropile as necessary. A dowel would consist of the same #20 Gr. 80 reinforcing bar used for the micropiles. A six- inch diameter, 20 foot long hole would be drilled in the center of the buttress pile. An additional drill rig will be required to perform the drilling. A 25' bar would be set with centralizers and tremie grouted with the same grout used for the micropiles. Based on an assumed minimum Buttress pile concrete and grout strength of 3,000 psi, the developmental length (ld) of a #20 bar is 182.5 inches (15.2 feet). 20 feet embedded would develop the yield strength of the #20 bar (393 kip) and exceed the design micropile load of 308 kips.</p> <p><math>ld = (80,000 \text{ psi} / (20 * \text{sqrt}(3000 \text{ psi}))) * 2.5 \text{ in} = 182.5 \text{ in}.</math></p> <p>Accepting this alternative would mitigate delays and extra costs that will result should buttress pile concrete and/or grout be encountered while drilling adjacent to these piles.</p> <p>Please confirm that this alternative micropile procedure is acceptable.</p> |               |                     |                      |                      |                    |                |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

WOJV recieved FO T-00008 9/07/2012 which added micropiles within the footprint of the buttress shafts. RFI T-0323.1 returned 10/24/12 directed BBII to install buttress shaft E4, which is in direct conflict with Micropile E520.

BBII proposes to:

Option 1. Remove Micropile E520  
Option 2. Drill Micropile E520 into the center of the buttress shaft as proposed in RFI T-1115  
Option 3. Relocate Micropile E520 to a location provided by the design team.

Also, BBII is requesting that they be permitted to relocate Micropile E519, 1' to the South, to allow further clearance form Buttress Shaft E4.

Option 1 and 2 are not acceptable (also see response to RFI T-1115) Option 3: Move E520 toward east or west (approximately 6'+/-), in the space between 2 buttress piles.

Relocate E519 as proposed is acceptable.

| Co-Author: | Webcor Construction LP  |  | Jackson Tukuafu |     |                            |                |  |            |             |                          |

#### REQUEST:

There are areas in Zone 3 (and perhaps in Zone 4) that Geothermal trenches will be trenched through that Arup identified as unsuitable soils (high in bay mud) , which is of such nature as to be incapable of being compacted to specific density using ordinary methods of optimum moisture content. Additionally, there are areas in Zone 3 (and perhaps in Zone 4) that Geothermal trenches will be trenched through that Arup identified as in-situ suitable, which are incapable of being compacted.

- Spec. 23-57-34 Ground Loop Heat Exchanger states "placing and compacting soils the loop installation, the trenches shall be back filled per IGSHPA with loose soil minimizing air gaps or voids and then marked with warning tape. After bedding around the loop and header piping, the backfill shall be watered to settle the loose soil to ensure there are no air gaps along the length of the pipe."

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

George Metzger  
1/23/2014

#### RESPONSE:

Backfill with Native Soil to replace the unsuitable material is acceptable to WSP. Reference RFI 356.1 for relaxation of wetting requirement.

| <b>REQUEST:</b><br>Balfour Beatty Infrastructure Inc. (BBII) has experienced complications with micropile testing in geothermal field 11 due to unsuitable material. In an effort to minimize additional cost and maintain schedule, Webcor/Obayashi Joint Venture (WOJV) requests the testing requirement be reduced in unsuitable areas to test one (1) in five (5) micropiles. To date, all micropiles have passed the testing requirement. WOJV proposes to test seven (7) of the remaining 31 micropiles in geothermal field 11. The micropiles selected to be tested will be approved by a TJPA representative.  |   | <b>SUGGESTION:</b>  |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>No. Per discussions with TJPA, AAI and T-T the following response is provided.<br><br>The contract Specification Section 31-63-33 Drilled Micropiles is clear; All Micropiles shall be proof tested. Paragraph 3.2H Proof and performance Testing in accordance with ASTM D3689 "Standard Test Method for Individual Piles Under Static Axial Tensile Load" SubParagraph 8 states "Proof tensile load testing shall be performed against reaction piles or cribbing in accordance with ASTM-D3689. Existing footings, piles, or other structures shall not be used as reaction points for load testing. An adjacent production micropile in a group may be used as reaction pile. If cribbing is used, the contractor's attention is drawn to the presence of poor bearing soils and underground utilities, which may require special measures to protect against settlement and damage."<br><br>Also; Requests such as these should be accompanied by the [Drilltech] Pile Test Engineer's written recommendation. |                      |                    |                          |

|---------------|--|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|               | <p>Room B1253. DWG EI-2202 identifies Room B 1253 as Emergency Equipment Storage.</p> <p>DWG EI-4103 indicates the F15 fixtures in Zone 3 up to Gridline 9 are to be fed from Panel EDMH-B1-A-EMG in Electric Room B1496. This is the same panel as indicated in Zones 1 and 10, but a different room is specified. Room B 1496 is not shown on the drawings.</p> <p>DWG EI-4103 and DWG E1-4104 indicate the F15 fixtures in Zone 3 past Grid Line 9, and the F15 fixtures in Zone 4 are to be fed from Panel EDMH-B1-B-EMG in Electric Room B1322. SKE-02-3201 issued with ASI 104 does not have a Panel EDMH-B1-B-EMG in Rm B1322.</p> <p>DWG E1-4105 and DWG E1-4106 indicate the F15 fixtures in Zone 5 and Zone 6 are to be fed from Panel EDMH-B1-C-EMG in Electric Room B1541. Plan sheet E1-3204 Detail 6 referenced does not seem to be included in the contract drawings.</p> <p>DWG E1-4107 indicates the F15 fixtures in zone 7 are to be fed from EDMH-B2-D-EMG in Electric Room in Electric Room B1644 in Lower Concourse. Per the "Equipment Naming" char on DWG E1-0010, the B2 in the panel name indicates that it is on the Train Platform Level. However, the room number indicates that it is indeed on the Lower Concourse level.</p> <p>1. Please provide an enlarged room plan showing the location of each of the following panels: EDMH-B1-A-EMG, EDMH-B1-B-EMG and EDMH-B1-C-EMG</p> <p>2. Please confirm that panel EDMH-B1-D-EMG is in ROom B1644 per detail E1-3203 (dated 8/30/12) on that the panel was incorrectly labeled EDMH-B2-D-EMG on E1-4107</p> |               |                     |                      |                      |                    |                |
|               | <p>2. Sheet E1-4103 has been revised. Refer to attached sheet dated 01/23/2014 for revisions. Per circuiting note on E1-4103, the type F15 fixtures up to gridline 9 on the Train Platform Level are to be fed from Panel EDMH-B2-A-EMG-1 located in Electric Room B2280 on Train Platform Level.</p> <p>3. Sheets E1-4103 and E1-4104 have been revised. Refer to attached drawings E1-4103 and E1-4104 dated 01/23/2014 for revisions. Type F15 fixtures in Zone 3 and Zone 4 are to be fed from Panel EDMH-B1-B-EMG located in Electric Room B1325 on Lower Concourse Level.</p> <p>4. Sheets E1-4105 and E1-4106 have been revised. Refer to attached sheets E1-4105, E1-4106, and E1-3204, Detail 6 dated 01/23/2014 for revisions. F15 fixtures in Zones 5 and 6 are to be fed from EDMH-B1-C-EMG in Electric Room B1563 on Lower Concourse Level.</p> <p>5. Sheet E1-4107 has been revised. Refer to attached sheet dated 01/23/2014 for revisions. Type F15 fixtures are to be fed from Panel EDMH-B1-D-EMG located in Electric Room B1644 on Lower Concourse Level.</p> <p>6. Refer to attached drawings dated 01/23/2014 for enlarged plans requested (Panels clouded in blue). EDMH-B1-A-EMG is now EDMH-B2-A-EMG-1.</p> <p>7. Refer to revised sheets E1-3203 and E1-4107. Revised sheets dated 01/23/2014 are attached</p>  |               |                     |                      |                      |                    |                |

#### REQUEST:

Ref: E1-2202, E1-3201

Electric Rooms B1222 and B1223 on plan sheet EI-2202 (Issued in ASI 104) and rooms B1560 and B1561 on plan sheet EI-2205 (Issued in ASI 104) do not match the enlarged room plans shown on EI-3201 (IFC) and EI-3202 (IFC) respectively.

Please issue revised electrical drawings including, but not limited to EI-3201 and EI-3202.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

The requested updated drawings will be issued in a forthcoming ASI 0112 scheduled for issue on 02/24/14.

| From: Webcor Construction LP                                  |   | Jackson Tukuafu | To: Turner Construction Compan | PHIL MILITELLO | Answered By: Adamson Associates, Inc George Metzger |            |            |             |                          |
| Co-Author: Shimmick Construction Company, Inc Sylvia Hartanto |   |                 |                                |                |   |            |            |             |                          |

#### REQUEST:

Please refer to attached drawing A1-2224, A1-2844, A1-2225, A1-2845, A1-2846, A1-2226 and excerpt from spec section 22 05 30, 3.2.

Details for plumbing and floor drains in the drawings for the Lower Concourse have the following discrepancies:

1. Drawing A1-2224 left of gridline (GL) 13 between GL B - GL C shows two plumbing details and in drawing A1-2844 these plumbing details are not shown
2. Drawings A1-2845 and A1-2225 between GL 22 - GL 23 and GL G - GL H where A1-2845 shows a plumbing (PLBG) detail and A1-2225 shows a floor drain (FD) detail
3. Drawings A1-2846 and A1-2226 between GL 29 - GL 30 and GL G - GL H where A1-2846 shows a plumbing (PLBG) detail and A1-2226 shows a floor drain (FD) detail
4. A plumbing detail shown in drawing A-2225 on GL G between GL 24 - GL 24.9 is not shown in drawing A1-2845.

5. Furthermore, the PLBG callouts in all the Architectural and Structural drawings do not include the size for each pipe or sleeve. Plumbing sleeve details in spec section 22 05 30 - 3, do not state the required clearance spacing needed.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

1. 2 PLBG penetrations on A1-2224 (refer to SKA-3021) have been removed and are coordinated with A1-2844 (refer to SKA-3029).

2. PLBG annotation on A1-2225 (refer to SKA-3022) revised to FD and is coordinated with A1-2845 (refer to SKA-2845).

3. PLBG annotation on A1-2226 (refer to SKA-3023) revised to FD and is coordinated with A1-2845 (refer to SKA-2845).

4. PLBG annotation on A1-2225 (refer to SKA-3022) is coordinated with A1-2845 (refer to SKA-2845).

5. For Pipe Sleeve Schedule - Refer to PSK-0051.

For updated Lower Concourse plans, refer to attached SKAs:

SKA-3011 to 3018 - B1 Zone Plans,

SKA-3019 to 3026 - B1 Wall Plans,

SKA-3027 to 3034 - B1 Slab Edge Plans.

| Co-Author:   |  |        |  |               |   |             |                          |
| REQUEST:   |  |        | SUGGESTION:  |               | ANSWER:   |             |                          |
| As discussed in the 3.24.2014 submittal TG0600-121 comment review meeting, please issue current design drawings P1-2202 through P1-2211 so that the size of plumbing pipes that pass through the concourse slab can be ascertained for the purposes of sizing the plumbing penetration sleeves per PSK-0051 (issued in RFI 1145rev0). The -8.30.2012 Issued for Construction - Below Grade Package- P1-2202 through P1-2211 pipe plans do not match up to the current sleeve layout as shown in sheets A1-2842, A1-2843, A1-2844, A1-2845, A1-2846, A1-2850 & A1-2851. |  |        |  |               | Accept Suggestion: <input type="checkbox"/>   |             |                          |
| The size of the Concourse level slab sleeves required in the above mentioned A1-2800 series drawings cannot be determined without the current coordinated plumbing design.   |  |        |  |               | Refer to ASI 112, ASI 113 and Addendum #2 for the most current plumbing drawings as of this date.   |             |                          |
|  |  |        |  |               | RESPONSE: 3-28-14<br>Judy Long: Refer to the attached ASI 112, ASI 113 and Addendum #2 plumbing drawings for the most current plumbing drawings as of this date. These drawings will be issued on April 1, 2013 as "Issued for Construction" documents. |             |                          |

| On S1-2304 there are W16's centered under CMU wall connecting into a W40 along grid F near grid 14. The drag connection for the W33 connecting into the Transfer Girder and the W16 connections will foul each other. Please verify the following:<br>1. Per the schedule on 1/S1-5010 the W16 connections should be three bolts. Please verify it is acceptable to reduce the bolts form three to two bolts?<br>2. Please verify it is acceptable to move the drag connection down to clear the two bolt W16 connection?<br>3. Please verify coping the bottom flange of the W16's to clear the W40 drag connection is acceptable? |   |        |  |            | Accept Suggestion: <input type="checkbox"/>        |             |                          |
|   |   |        |  |            | 1) Acceptable.<br>2) Acceptable.<br>3) Acceptable. |             |                          |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 277 SK1 to SK3 for items 1 to 3:  
In order to maintain interior TOS (Top of Steel) elevations shown on the contract documents, the connection detail as shown on 1/S1-5010 needs to be modified along the ground level perimeter beams at certain locations. Please

confirm the following:

- 1) Confirm the proposed connection is acceptable as shown or supply an alternate detail.
- 2) Confirm the proposed connection is acceptable as shown or supply an alternate detail.
- 3) Confirm the connections in items 1 & 2 may be applied typically at other similar conditions.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

1) Provide connection details per 6/S1-5011 (similar) at the W12x14 beams highlighted in the RFI.

2) Provide a double angle connection per 1/S1-5010 with 2 bolts at the W16 beams highlighted in the RFI.

3) Solutions in 1) and 2) can be applied typically at other W12 and W16 beams with similar conditions, except at beams with \* notations. For beams with \* notations provide connection detail per 1/S1-5028 as noted on sheet note 2 on S1-2305.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 331 SK1:

The connection per RFI T-1147 (SK 356, CD 277) item 2 on SK3 will not work here as the connection angles will foul the Girder connection to the column as shown.

Confirm it is acceptable to connect the W16 to the W40 per 1/S1-5028 with S < 12" or supply an alternate connection detail.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Provide a shear plate connection at the W16 beam per attached sketch SKS-366. The beam and shear plate may be adjusted slightly to avoid the bolts at the W40 drag connection.

**To:** Turner Construction Compan PHIL MILITELLO**Answered By:** Adamson Associates, Inc George Metzger**Co-Author:****REQUEST:**

There are some discrepancies between the Train Platform Level Lighting Plans(E Drawings) and the Lower Concourse Level Slab Edge Plans(A Drawings). Please provide direction and revised drawings for the following instances.

1) The Lighting Plans show two exit signs in close proximity, yet on the Slab Edge Plan only one EJB layout is shown:

A1-2844/E1-4104 at approximate Grid Lines:

-14.5/F

-16.6/A.6

-16.7/F

A1-2850/E1-4110 at approximate Grid Lines:

-2.8/V.8

2) The Slab Edge Plan shows EJB layout, yet there are no fixtures on the Lighting Plan:

A1-2842/E1-4102 at approximate Grid Lines:

-1.6/C.5

-2.7-3.5/C.3 (Three EJBs in a row)

-4.5/C.3 (Two EJBs)

A1-2846/E1-4106 at approximate Grid Lines:

-25.7/F.I

-26.6/C.5

-26.7/A.6

3) The Lighting Plan shows fixtures, yet there is no layout on the Slab Edge Plan:

A1-2845/E1-4105 at approximate Grid Lines:

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

Please refer the following SKAs, ESKs and TE1 pdfs:

SKA-3059 to SKA-3066 for Lower Concourse Slab Edge Plans

ESK-026 to ESK-033 for Train Platform Level

Electrical Lighting Plans

TE1-2202 - Lower Concourse Zone 2 Floor Plan

TE1-8014 - Telcom Closet Details

1. EJBs on the Lower Concourse slab edge plan A1-2844 were updated and coordinated with Train Platform Level Electrical Lighting Plan E1-4101: see SKA-3061 and ESK-028

2. EJBs on the Lower Concourse slab edge plan A1-2842 were removed and coordinated with Train Platform Level Electrical Lighting Plan E1-4102: see SKA-3059 and ESK-026 Same with A1-2846, EJBs were coordinated with E1-4106: see SKA-3063 and ESK-030

3. EJBs on the Lower Concourse slab edge plan A1-2845 were updated and coordinated with Train Platform Level Electrical Lighting Plan E1-4105: see SKA-3062 and ESK-029

4. For Train Platform Level Zone 11 Lighting Plan: see ESK-033 and SKA-3066

5. There are no Telcom conduit penetrations for

**REQUEST:**

See at tached CD RFI # 286 SK1 to SK4:  
The attached sketches show (2) conditions where the back-up angle braces at the "CP6" (W-1 facade connection) connect ions are very close to the floor beams. Please review and confirm that the braces are required at all noted locations no matter what their proximity to the beams is. If not, supply a maximum/minimum off-set dimension criteria for omitting the braces.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Where a W40 beam connection (as shown on 1A/S1-8000) is within 1'-0" from the CP-6 connection, the 2L 3x3 kicker at the CP-6 connection may be deleted.

**REQUEST:**

Reference Documents: Exhibits A - B

Further to response to RFI T-637 please find attached proposed changes to the spandrel beams in pour Area 10 for location plan see exhibit - A

Exhibit - B shows the plan view of the modification necessary to the spandrel beam on the north and south elevations due to the revised reinforcement width of the foundation wall due to encroachment of the CDSM beams as well as typical cross sections of the revised spandrel beams.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Modifications for the spandrel beam at locations outlined are acceptable.

| <b>REQUEST:</b><br>Due to a revision in the concourse slab elevation, waler lookouts from gridline 9.5 west must be removed to allow for construction of the slab. BBII's EOR for the internal bracing has approved the use of additional 6x6x3/8" angle braces to replace the lookouts in conflict. Reference the attached RFI response, supplemental calculations, and details from PB&A. |  | <b>SUGGESTION:</b>                              |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>The following is URS' comments on the PB&A's response to the RFI.<br><br>It is not acceptable to proceed with removal of the lookouts per PB&A's RFI response until the following items are resolved. Please revise and resubmit the RFI response with the following items addressed.<br><br>1. The drawings do not show the sequence of installing new items and removing existing items. The construction sequence is required to ensure proper load transfer from removing elements to new load-carrying elements. Information provided for construction must clearly identify details and sequencing. There should be nothing left to interpretation by field personnel. This includes all detailing as well as full identification of what is to be installed and where, and what is to be removed, with clear identification of what is required prior to removal, and when (relative to installation of new bracing elements). The specific degree of finalization for installation of the new installed bracing elements prior to removal of lookouts is required. This includes identification of the specific inspections required to be complete prior to allowing any removal of existing lookouts to occur.<br><br>2. For welding of an angle brace to a waler, please |                      |                    |                          |
| Please confirm it is acceptable to proceed with removal of the lookouts per PB&A's RFI response.  |  |   |                     |  |                      |                    |                          |

|        | <p>design alone (with the assumed actual contact width of the washer) the plate still works at a 6" hole diameter. This is designing for 95% of the ultimate capacity of the bar."</p> <p>The maximum outside diameter of the HSS tube inside the base plate is 3.5". Within a 6" hole, this allows for 1.25" of clearance all around the tube, which is more than adequate clearance based on the AISC allowable tolerances for installations of anchor-rod groups. Reference AISC Steel Construction Manual, Section 16.7.5.1 attached, which does not allow for any more than ¼" variation between anchor rod groups nor between anchor rod group and column lines. Please confirm it is acceptable to proceed with a 6" base plate hole size to avoid modifications to the top anchor plate grade and geometry.</p> <p>2) Adequate corrosion protection of bar with clearance provided between 2.79" bar and 3" galvanized tube</p> <p>See the email attached from Dywidag stating that the provided clearance allows for adequate corrosion protection of the anchor bar. Please confirm the galvanized duct is acceptable as detailed based on this information.</p> |        |              |               |               |             |         |

#### REQUEST:

Drawings S1-6008 and S1-6009 as well as the specifications issued with the TG07.1 trade package do not provide requirements for the grease at the light column anchor bolts. Please review the product attached, which has been recommended by the basis of design post-tension anchor bolt supplier, Dywidag. Confirm that the proposed product is acceptable.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

We have reviewed the product recommended by the post-tension anchor bolt supplier, Dywidag, and based on this recommendation we find this product acceptable.

**T-1174** **BGP Horizontal Cast-In Inserts - W111, W165, W164**

#### REQUEST:

SCCI is in receipt of RFI response T-0599.1 and ASI 110 drawings.

1. Please confirm it is acceptable to install 1st lift Horizontal Cast-In inserts at elevations -22.25, -27.08, & -31.92, except:

2. Horizontal Cast-In inserts in 1st lift foundation wall 111 & 165 were installed at elevations -22.08, -26.91 and -31.75 respectively. Please confirm this is acceptable? See attached sketch.

3. 1st lift wall 164 2nd row up from bottom Horizontal Cast-In insert, was installed at elevation -27.20 for 13'-10" from the East end of Wall 164. Please confirm this is acceptable? Please note the remainder of the Cast-In insert in wall 164 was installed at elevation -27.08 (see #1 above). See attached sketch.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

1. It is acceptable to install 1st Lift Horizontal Cast-in inserts at elevations -22.25, -27.08, & -31.92.

2. 1st Lift Horizontal Cast-in inserts at Foundation wall 111 and 165 are confirmed at elevations -22.08, -26.91 and -31.75 respectively.

3. 1st Lift Horizontal Cast-in insert at Foundation Wall 164, 2nd row is confirmed at -27.20 13'-10" from East end and remainder installed at -27.08.

**REQUEST:**

Skanska proposes the erection aids detailed in attached sketches to position 8 No. W10 system support posts. Please confirm no exceptions are taken to hole locations and quantity drilled to accommodate these erection aids.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

TT takes no exception to the proposed erection aids as shown in the sketches attached to this RFI.

**REQUEST:**

Please see attached concourse deck typical blockout detail at pile penetrations.

SCCI proposes to construct the temporary pile penetrations as shown in the attachment.

Please confirm this is acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

The accompanying calculations only include the required development lengths for the additional bars placed with couplers. The additional bars are placed at a lower level due to the form saver that reduce slab flexural capacity, therefore, additional bars are needed to make up for the reduced flexural capacity. A calculation justifying the number of additional bars required shall be submitted as a shop drawing for review.

For the case when the blockout is unfilled, the calculation was incorrectly done assuming #6 bar for calculating the moment capacity instead of #5s actually specified for RCS1. Update this calculation and resubmit for review, or clarify that shoring will be required while the blockout is unfilled.

Note that the application of the blockout detail at the specific field condition shall be incorporate into all applicable reinforcing submittals. Additionally a complete set of calculations addressing all temporary blockout conditions is required for submittal.

| Co-Author: Skanska USA Civil West California DisRyan Clayton   |   |               |  |                      |                      |                    |                          |
| REQUEST: A1-8660 conceptually indicates the boundaries of Category 2 and Category 3 AESS requirements for the basket columns. Based on this information and the documents provided for the TG07.1R trade package, SK1 has been provided to depict Skanska's understanding of the basket column finish requirements. Please review the following and confirm the various finish boundaries associated with the basket columns:<br><br>1) Confirm the Category 2 AESS boundary is from the Ground Level cast node to the end of the pipe column from the Ground Level to the Bus Deck Level as indicated in SK1.<br>2) Confirm the Category 3 AESS begins at the Bus Deck level cast node and extends through the pipe column to the Roof Level cast node as indicated in SK1.<br>3) Confirm the AESS boundary ends at the Roof Level cast nodes and that the Roof Level connection plates are to be delivered on site in the bare steel condition to receive SFRM.<br>4) Confirm the AESS boundary at the Bus Deck cast nodes extends to the cast node pad, with all shear plates, reinforcement plates, and perimeter beams to receive SFRM as indicated in SK1.<br>5) Confirm these boundaries can be typically applied to all perimeter basket columns at North, South, East, and West |   |               | SUGGESTION:  |                      |                      |                    |                          |
|  |   |               | ANSWER: Accept Suggestion: <input type="checkbox"/><br>1. Boundaries indicated on SK RFI 418 SK1 generally appear to be OK. However, this information should be confirmed by the CM/GC, as this RFI states "by others", which is information for the CM/GC. All this information should be clearly submitted for review in shop drawing submittal per drawings and specification 05 12 14 Paragraph 1.4.<br><br>Additionally, see added notes on your SK RFI 418 SK1 attached. The elements currently highlighted in cyan color in the enclosed sketch should be AESS category 3 per A1-8660 and finished per specification section 09 97 16.<br><br>2. See response to item 1) above.<br><br>3. This statement is incorrect. Cast node connecting plates are AESS members that should be prepped and finished per specification section 09 97 16. SFRM fireproofing should be applied to perimeter beam per A1-8662 and details in sheets A1-8611 and A1-8612.<br><br>4. Please submit shop drawings submittals per specification 05 12 14 Paragraph 1.4 and as noted on item 1) above. |                      |                      |                    |                          |

| <div><div>From: Webcor Construction LPClaude Titcher</div><div>To: Turner Construction CompanPHIL MILITELLO</div><div>Co-Author: Balfour Beatty Infrastructure, Inc.Kelly Phariss</div><div>ANSWERED By:Adamson Associates, IncGeorge Metzger</div></div>   |   |               |                     |   |                      |   |                          |
| REQUEST:  |   | SUGGESTION:   |                     | ANSWER:   |                      | Accept Suggestion: <input type="checkbox"/> |                          |
| During level 4 and 5 excavation, a high volume leak occurred in zone 4 between CDSM pile 450 and 451. In an effort to stabilize the CDSM panel and repair the leak, BBII installed a steel road plate between soldier piles 167-168 and injected grout behind it.   |   |               |                     | Confirmed, it is acceptable to leave the steel plate in place, provided, as stated in the RFI, it does not encroach into the permanent structure and the edges of the plate are ground smooth. This location should be reviewed by the waterproofing manufacturer and details developed for the waterproofing and cushioning layers between the CDSM wall and foundation wall, to ensure a smooth transition for the CDSM wall waterproofing at this condition. |                      |   |                          |
| BBII is concerned that removing the plate will likely cause the panel to become destabilized and could reopen the flow of water. BBII survey of the plate indicates that the plate is behind the theoretical face of CDSM wall and does not encroach into the permanent structure - reference the attached drawing. |   |               |                     |   |                      |   |                          |
| Please confirm is is acceptable to leave this plate in place. The edges of the plate may be grinded to provide a smooth transition to the CDSM wall for waterproofing.  |   |               |                     |   |                      |   |                          |

In all other areas without CDSM pile encroachment issues the reinforcement will remain unchanged as per the Contract drawings.  
See Exhibit - G & H showing details of transition between modified reinforcement to contract reinforcement.

These solutions if approved would be incorporated into the TG06 shop drawings.

Please confirm if these solutions would be acceptable.

REQUEST:

Reference Documents: Exhibits A - H  
This RFI addresses the impact of the encroaching CDSM soldier piles (SP) on the north & south wall in mat slab pour Area 14 as well as all levels of the encroachment into the foundation wall between CDSM piles 288 to 318 on the north elevation and 465 to 495 to on the south elevation for location Plan see exhibit - A.  
Exhibit - B & C depict the location and degree in which the SP are encroaching.

WOJV proposal North elevation on gridline A: (See Exhibit - B) Between CDSM piles 284 to 290, WOJV is proposing to decrease the specified 36" wall thickness to 33" to clear the encroaching SP 284,285,286,288-290. This foundation wall area was originally a WR1 reinforcement area #11@8"oc EF vertically and would change to #11@6"OC this reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on detail A/Sk.1 (Exhibit -D).

Between CDSM pile 299 to 301,305 to 312 & 315-316 to 322-323 WOJV is proposing to decrease the specified 36" wall thickness to 33.5" to clear the encroaching SP 299 & 301. Originally these were WR1 reinforcement areas #11@8"oc EF vertically and would change to #11@6"OC,

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

The contractor proposed revisions to foundation wall reinforcement due to encroaching CDSM Piles in Area 14 are acceptable. Update Area 14 shop drawings affected by the shoring encroachment info presented in this RFI and submit them for record.

## Co-Author:

## REQUEST:

Reference Documents: Exhibits A - G

This RFI addresses the impact of the encroaching CDSM soldier piles (SP) on the north & south wall in mat slab pour Area 15 as well as all levels of the encroachment into the foundation wall between CDSM piles 318 to 343 on the north elevation and 440 to 465 on the south elevation for location Plan see exhibit - A. Exhibit - B & C depict the location and degree in which the SP are encroaching.

WOJV proposal North elevation on gridline A: (See Exhibit - B) Between CDSM pile 315-316 to 322-323, 326 to 330 & 334 to 337-338. WOJV is proposing to decrease the specified 36" wall thickness to 33.5" to clear the encroaching SP 316 to 322. Originally these were WR1 reinforcement areas #11@8"oc EF vertically and would change to #11@6"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.1 (Exhibit - D).

Between CDSM piles 322-323 to 326, 330 to 334 & 337-338 to 341 WOJV is proposing to decrease the specified 36" wall thickness to 33.5" to clear the encroaching SP 323 to 326 & 330 to 335, 338 & 339 Originally this was a WR2 reinforcement areas #11@6"oc EF vertically and would change to #11@5"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.3 option 2 (Exhibit -E)

WOJV proposal on the South elevation: (See Exhibit - B) Between CDSM piles 438 to 442 & 445-446 to 448 WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching SP 441, 446 & 447, originally this was a WR1 reinforcement areas #11@8"oc EF vertically and would change to #11@6"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.1 (Exhibit - D).

In all other areas without CDSM pile encroachment issues the reinforcement will remain unchanged as per the Contract drawings.

## SUGGESTION:

## ANSWER:

Accept Suggestion: ☐

The contractor proposed revisions to foundation wall reinforcement due to encroaching CDSM Piles in Area 15 are acceptable. Update Area 15 shop drawings affected by the shoring encroachment info presented in this RFI and submit them for record.

depicted in the attached sketch due to a shop fabrication error (see attached photo). Per AWS DI .1, the pre-qualified joint designation B-U2a-GF for FCAW allows a 65 degree groove angle with detail and fit up tolerances. The welded joint is approximately 15 degrees out of tolerance and is on one side of the sleeve only (2 joints per sleeve).

Due to the member considered as non-structural, SCCI requests this joint to be acceptable as welded at this location only. SCCI will adhere to Spec Section 05 50 10 - 2.5.C.2 - "Weld mat foundation sleeve components continuously and test their water tightness by filling with water. Monitor water level for 48 hours minimum. Dry and correct faulty welds and re-test until proven watertight." Is this acceptable?

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Please reference Details 4 and 7 on sheet S1-8001.

Detail 7 specifies a 1" thick filler plate between the beam web and the 2 1/2" thick backing plate. Detail 4 Section E notes 1" typical from the edge of the fill plate to the adjoining stiffener or beam web. 1" opening does not allow for adequate access to perform the welding.

Oregon Iron Works(OIW) is requesting that all filler plates for CP2 connections have a minimum clearance of 1 1/2" from any adjoining edges. Additionally, OIW is requesting that this minimum clearance be applied to any similar areas that exhibit this limited access for welding.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Welding of the vertical stiffener should be done prior to installing the filler plate, hence there should be no weld access issue.

The proposal to increase the 1" gap to 1 1/2" gap is acceptable.

**REQUEST:**

At SE401 see attached CD RFI # 317 SK1 to SK5 for items 1 to 7:

1) It is not clear what is meant by the noted slope designation.

Confirm the roof slab slopes and the top of pad slab is EL 56'-11 per A1-2894 (SK3).

2) Confirm the noted dimension is 1'-2 3/4 per 8/S1-5004 (SK4).

3) This note is pointing to the edge of slab and giving a top of steel elevation. Work with SK5 and clarify.

4) Confirm the noted dimensions should read 1'-9 & 9'-2 per 1/S1-7113 & RFI T-0965 (SK251, CD 200). If not, clarify.

5) The noted HSS members are not shown on S1-2504 (SK1) or 3/S1-7113 (SK2) but this detail is referenced on both plans noted above.

a) Please confirm the HSS members are required.

b) If yes, supply the size.

c) Supply the horizontal locations on plan

d) Supply the elevation

e) Supply connection details

f) NOTE: the elevator post connections per 1/S1-7600 may foul the HSS members (work with SK5)

6) Confirm the slab edge plate terminates below the 10" raised slab as shown.

7) Confirm detail 1/S1-7600 with the full depth stiffener and kicker brace applies in the noted cases with no elevator post on top of the beam.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

1) The roof slab does not slope. T/Slab of the elevator shaft roof slab is 56' - 11" as noted on A1-2894.

2) Confirmed.

3) The note is pointing to the horizontal steel beams shown on 8/S1-5004 and notes the T/steel of these members.

4) No. The 10' - 3" and 1'-3" dimensions noted on A1-2894 are correct. The edge of slab for SE 401 at the top of the elevator shaft size increases at the top of the elevator shaft. Also see revised dimensions in the attached sketch SKS-0333.

5a) Yes, beams are required at these locations. These members shall be W18x50 beams. Refer to attached sketch SKS-0333. Note that there are four beams, one on each side of the shaft.

5b) See response to 5a).

5c) Centerlines of the W18 beams shall be 3 3/4" from the edge of the elevator shaft opening (see note on sketch SKS-0333).

5d) Elevation is 54' - 5" as noted on 3/S1-7113 (see note on sketch SKS-0333). Also see response to 3).

5e) Connection at the elevator machine support beams is shown in the attached sketch SKS-0333.

5f) See response to 7.

6) Confirmed.

7) The elevator rail posts shall be connected to the depressed W18x50 beams per 1/S1-7600. See detail in attached sketch SKS-0333.

**REQUEST:**

This is a follow-up RFI to RFI T-1223 (SK 426, CD 317) See attached CD RFI # 317.1 SK1 & SK2 for items 1 & 2:

1) Confirm the beam locations from the edge of slab as shown are acceptable.

2) The L5x5 angles will foul the shear plate for the W30 to the column connection if we use the double angle connection per 1/S1-5010 to connect the W16 to the W30. Confirm it is acceptable to connect the W16 to the W30

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

1) Confirmed.

2) Confirmed.

| Reference: SKS-0324 and SKS-0325<br>Per SKS-0324 and SKS-0325, where the top bars for the concourse slab intersect type 1 B and 1 C embedded base plates, the bars are to be trimmed and supplemented with a matching slab dowel in MF beam layer 1. The typical deck top reinforcing consists of a continuous run of #9 bars @ 12" and alternates with a #9 x 28'-0" long bars@ 12". See attached sketch for details. To avoid trimming a 28'-0" bar and splicing it with a 17'-0" bar, please confirm if it is acceptable to relocate the #9 x 28'-0" top bars@ 12" to the MF beam layer 1. The continuous #9 bars@ 12" will remain at 3/4" from the top of concrete and trimmed according to SKS-0324 and SKS-0325. |  |   | It is acceptable to relocate the discontinuous T2 bars to the lower layer with the typical continuous T1 bars remaining in the top layer. We note that the RFI mentions the matching dowel length as being 17'-0". For RCS1, this would be a #9 bar with a splice length of 122" for Top Bar, Category II. Given a 42" base plate and either a 3" or 6" oversized block-out, the minimum length of the dowel would be 292" (24'-4") or 298" (24'-10"). The appropriate splice category and block-out size shall be considered when determining the length of the matching dowel.<br><br>Alternatively, the Contractor may place the T2 bars that conflict with the base plate in the lower layer. |                      |                      |                    |                          |

#### REQUEST:

Please reference attached sketch that show as-built location of sump pit near GL 14/G.

Please confirm this as-built location is acceptable.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

The RFI and as-built sketch refers to a sump pit at west of Gridline 14-G. However, on comparing with the slab edge and reviewed matt slab submittal drawings, the location reference for the subject sump pit should be west of Gridline 16-G.

The sump pit is to serve an escalator which will be installed in Phase 2. The as-built location is not acceptable as the sump pit will not be accessible under the landing for clean-out once the escalator is installed.

Please provide a solution to revise the sump location to its correct position.

#### REQUEST:

Please confirm it is acceptable to provide the machined surface of the train box column cap plates with a prime coat finish in lieu of the rust inhibiting coating. The surface prep will be SSPC-SP6 commercial blast cleaning with International Interzinc 315B primer (attached).

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

The specified product (Interzinc 315) calls out for a zinc load in the dried film of 83%, where as the proposed product (Interzinc 315B) has only 80%.

The Design Team does not object to this substitution as long as the application meets the performance requirements; it meets the SSPC Paint 20 standard for organic zinc rich primers; it is acceptable to the manufacturer and the entire work receives the specified warranty.

#### REQUEST:

SCCI performed a survey of the CDSM Soldier Piles approximately March 2013 for the North of Area 3 and West of Area 3 and Area 1. SCCI re-surveyed the soldier piles again this year (March 2014) and have found that the Soldier Piles in the area have displaced into the structure by approximately 1.5" at both the North Wall and the West wall. Please find attached survey information and the changes noticed in the past year.

1. Please confirm that the additional encroachment and future potential movement of wall into the structure will not cause conflict with current and future rebar installation.

2. Please confirm and demonstrate that the future potential movement will not cause additional stress to the Wall Lift 1, which will be poured in the next week.

3. Please confirm that future potential CDSM movement in this area will not impact any of SCCI's future permanent work.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

It is requested this RFI be withdrawn as discussed with Turner.

WOJV - 4/23/14

In addition to this WOJV request more information and request that each CDSM wall pile is resurveyed after the level C bracing is removed prior to waterproofing . Two points per pile one at top elevation (similar elevation of the previous surveys) and the other at an elevation of approximately -16'. This survey information should then be then sent to both WOJV and the design team highlighting any additional encroachment which has not been already taken in to account with the current RFI for the relevant area.

| See attached CD RFI # 335 SK1:   |   |               |  | Detail 5/S1-5026 has two connection details for drag beams at Gridlines C & G / C.3 & F.7. First detail is for typical conditions and the second detail applies at Gridlines 19.9, 20.1, 22 and 24 as indicated in the construction drawings. For the conditions shown in this RFI, the second detail applies. |                      |                    |  |
| The pretensioned rod per detail 2/S1-5052 fouls the beam connection as shown. This occurs on S1-2305 at Grids 19.9/C,G; 20.1/C,G; 22/C,G & 24/C,G. |   |               |  |  |                      |                    |  |

See attached CD RFI # 329 SK1 & SK2:

The connection for the W36 beams will foul the connection for the W21 to the W40.

Please provide a solution.

Adjust the work point for W21 slightly north to clear the W36 connection.

| REQUEST:   |   | SUGGESTION:                                   |                     | ANSWER:   |                      | Accept Suggestion: <input type="checkbox"/> |                          |
| Reference atached contract drawings.   |   |   |                     | Confirmed, there is an offset between CB16 Curved beam and CB7 Curved beam. Please see the attached SKA-3105~SKA-3111 for clouded dimensions. |                      |   |                          |
| Latest CDs S1-2203. S1-2210, and S1-2211 have added curved CB16 and CB&B7 downturned beams which appear to be concerntric to South spandrel beam B65. However, no dimensions have been provided, i.e. radius, offset etc. Furthermore, CD s1-2211 shows tat CB16 and CB&B7 do not follow the same radius. There appears to be an offset between the CB16 and CB/B7 at the MFB at GL 6, and the offset dimensions are not shown. If architectural drawings are used to find the missing radius (reference SKA-3017 and SKA-3026), one can find that the future partition walls at the South corridor have R=647' - 7 1/2" on both East and West side of MFB at GL6. This implies that the partition walls in this area would off center (non-concentric), and the South corridor would taper (or narrow) Down towards East. SCCI. believes that this was not designer's intent. |   |   |                     | CB16 Curved beam between gridline 5 and 6 to follow radius of curved beam CB16/partition to the west.   |                      |   |                          |
| Please provide accurate and consistent dimensions and offsets for the LCC beams and future partition walls.  |   |   |                     |   |                      |   |                          |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**Co-Author:** Bradken, Inc. Wayne Braun

**REQUEST:**

See attached Dimensional report and numbered print.

Bradken has found dimensional deviations due to tooling on Cast Node Type LC 103 PN WC0052 (2 castings LC103-1 & LC103-2).

Please confirm attached dimensions are acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

**T-1258 SSS - Stair and Elevator SFRM Clarification**

**Closed**

**03/18/2014**

**03/28/2014**

**03/27/2014**

**Potentially** ☐

**From:** Webcor Construction LP Gregory Kemerer

**To:** Turner Construction Compan PHIL MILITELLO

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Reference is made to the Fire Proofing Schedule on A1-8662 where Note 2 indicates that all elevator and stair structures are to use SFRM. It appears that architectural drawings, issued for reference, indicate various HSS posts are to receive alternate coating systems or finishes. For example:

- Detail 3 on A1-7576 indicates two HSS "Divider Beams" to be painted to match shaft walls
- Detail 1 on A1-7870 indicates HSS outriggers are to be galvanized

Please confirm that all stair and elevator members are to receive SFRM. This is inclusive of framing which extends above the Roof Level and west of Grid 1.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Not all stair and elevator steel members are to receive SFRM, it is only when a steel member interrupts a rated wall assembly that a fire resistance rating is required for the steel. The various HSS members referenced are not part of the building structural frame nor do they interrupt a rated wall assembly, therefore no fire resistance rating is required at these locations.

**T-1259 SSS - Deviation Due to Tooling - Cast Node Type LC 201 WC0054 - Dimensional Re Void**

**03/18/2014**

**03/28/2014**

**Potentially** ☐

**From:** Webcor Construction LP Stephanie Azzolino

**To:** Turner Construction Compan PHIL MILITELLO

**Answered By:**

**Co-Author:** Bradken, Inc. Wayne Braun

**REQUEST:**

See attached Dimensional report and numbered print.

Bradken has found dimensional deviations due to tooling on Cast Node Type LC 201 PN WC0054 (2 castings LC201-1 & LC201-2).

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

**REQUEST:**

See attached CD RFI # 343 SK1:  
The approval comment on A4714 (CS2) is contrary to the information issued in RFI T-1111, item #7 (SK 327, CD 254)  
Confirm the response to RFI T-1111, item #7 is valid and the approval mark-up may be ignored.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

Confirmed.

**REQUEST:**

See attached CD RFI # 364 SK1 to SK3 for items 1 to 4:

- 1) Confirm the (4) W10x22 beams are located on the center of the supporting posts. If not, supply the location dimensions.
- 2) Supply the clouded dimensions (4 total).
- 3a) Confirm the stair stringers do not connect to the W12x14.
- 3b) If yes, supply a connection detail as 1 or 3/S1-7601 will not work with the 5" offset dimension.
- 3c) If yes, please supply east/west location dimensions for the stair stringers.
- 4) Confirm it is acceptable to prep the flanges of the WT5x15 for the 1/4" PJP weld in lieu of the beam flange as shown.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

1) The stair framing is a design/build item and comes under the stair contractor's scope (W/O to verify). The W10 x 22 is to be provided by stair supplier.

2) See response to 1).

3a) Stringer is to be designed by the stair supplier, however, we anticipate that it is to be connected to W12x14.

3b) See response to 1).

3c) See response to 1).

4) Confirmed.

| See attached CD RFI # 348 SK1 to SK3 for items 1 to 8:   |   |   | 1) Locate the sloping W16x26 beams as close to the center of the concrete walls as possible without conflicting with the W27x84 beams above at the roof level.  |                      |                      |                    |                          |
| 1) Supply location of sloping W16 beams from face of concrete wall.  |   |   |   |                      |                      |                    |                          |
| 2) Confirm location of W44x335's is acceptable as shown or supply the location.  |   |   | 2) The noted dimension shall be 1' - 1". Note that the 8x8x5/8 posts are to be connected to the top of the W44x335 per 10C/S1-7630, except that the 8x8x5/8 posts will be partially welded to the flange due to offset between the posts and the W44 beam centerline. Provide bottom flange bracing for the W44x335 girder per 4/S1-5015 at the W14x61 beams (total 4 locations). |                      |                      |                    |                          |
| 3) Confirm HSS8x8x5/8 post locations are acceptable or supply the locations.   |   |   | 3) Confirmed.   |                      |                      |                    |                          |
| 4) Clarify/supply edge plate requirements for the 'S4' slab at EL. 74'-10 as well as the sloping 'S4' slab.            |   |   | 4) Provide edge plate per typical edge of slab details on S1-5000. Also refer to response to RFI T-1279.  |                      |                      |                    |                          |
| 5) Confirm dimension is acceptable or supply dimension.  |   |   | 5) Confirmed.   |                      |                      |                    |                          |
| 6) Confirm dimensions per A1-2904.   |   |   | 6) Confirmed.   |                      |                      |                    |                          |
| 7) The connection for the W40 to the HSS8x8 per 6/S1-7661 will not work at the corner. Supply an alternate connection. |   |   | 7) Connection at the W40 framing into the HSS post shall be similar to 8/S1-5012.   |                      |                      |                    |                          |
| 8) It appears this detail will not work with the elevations noted. Please supply an alternate detail.                  |   |   | 8) Provide a full depth shear plate connection per 1/S1-5013 at the two W10 beams except, 1) cope only one side of beam flange at top and bottom and 2) Provide 4 bolts at the connection (2 vertical rows of 2 bolts each) with a 3" horizontal spacing between the bolts. Bottom flange brace per 2/S1-7604 is not required at these connections.                               |                      |                      |                    |                          |

| From: Webcor Construction LP Gregory Kemerer  |  | To: Turner Construction Compan PHIL MILITELLO | Answered By:Adamson Associates, Inc George Metzger   |                      |                      |                    |                          |
| Co-Author: Skanska USA Civil West California DisRyan Clayton  |  |   |  |                      |                      |                    |                          |
| REQUEST:  |  | SUGGESTION:                                   | ANSWER: Accept Suggestion: <input type="checkbox"/>  |                      |                      |                    |                          |
| 1) The WT5x15 interferes with the connection for the W10x22 to the HSS12x6x5/8 post. Please supply a solution.  |  |   | 1) We assume that the "interference" noted in item 1 refers to the accessibility issue for bolt tightening. If the WT5x15 restricts the accessibility for bolt installation, the nuts may be tack welded to the beam web and bolts may inserted from the other side and tightened once the beam is in place. Or, bolts may be tack welded to the beam web on the WT side and nuts may tightened from the other side once the beam is in place. |                      |                      |                    |                          |
| 2) Confirm the connection for the W10x22 to the HSS6x6 post is acceptable as shown or supply a new detail.  |  |   | 2) Acceptable, except, provide a 1/4" fillet weld on three sides   |                      |                      |                    |                          |

| REQUEST:  |  | SUGGESTION:                    |                     | ANSWER: Accept Suggestion: <input type="checkbox"/>  |                      |                    |                          |
| <p>Per the meeting between TCCO, WOJV, SCCI, and AAI on Monday 3/24/14, it was made clear that AAI believes that all documents have been issued to WOJV in order for construction of the lower concourse deck. WOJV stated that there are currently drawings out to bidders (for TG 07.2 /TG10 MEPS Series) and in Pre-Construction, but that WOJV has not been provided direction by TJPA/TCCO to proceed with construction in the field, nor to utilize the most current drawing sets. Prior to this meeting, WOJV requested that all IFB drawings be issued as an ASI's in order to coordinate with current and continuing construction. ASI's 112 and 113 drawings were issued, however they are not complete per our initial request. AAI has responded to RFI's and submittals referring to sheets that have yet to be issued for construction. This has caused confusion and frustration for all parties. Therefore, in lieu of continuing to request ASI's to address this specific issue at the lower concourse, WOJV/Turner have agreed to utilize the RFI process to construct the lower concourse deck.</p> |  |                                |                     | <p>See the "Issued for Construction" drawings dated April 1, 2014 for the most current drawings.</p>   |                      |                    |                          |
| <p>For the list of series of drawings below, please note and/or provide the latest drawings or ASI(s) that should be used to construct the lower concourse deck. We understand that there are drawings issued for pre-construction, that will not be issued for construction for multiple bid packages. For those cases, TJPA/TCCO needs to inform and provide WOJV with the set of the most current and coordinated drawings to be used for construction of the lower concourse, including (but not limited to) blockouts, deck penetrations (such as MEPS), beams, dowel/formsaver locations, and electrical conduit locations.</p>   |  |                                |                     | <p>RESPONSE:<br/>Judy Long 3/28/14<br/>The drawings, some issued with ASI 115, forthcoming CR-104, are attached for your use and coordination with construction.</p> |                      |                    |                          |

#### REQUEST:

See attached CD RFI # 355 SK1 & SK2:  
The connection per 5v/S1-5026 creates erectability issues for the beams on Grids C & G.  
Please confirm it is acceptable to cope the bottom flange of the drag beam to clear the double angles.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

It is acceptable to cope the bottom flange of the drag beam up to 8" from the bolt centerline at locations highlighted on SK1.

#### Co-Author:

#### REQUEST:

Under the Below Grade Concrete TG-06 Contract, SCCI is bound by concrete standard for Anchor Bolt placement. Concrete industry standard, ASI 117-90, Section 2.3 allows a tolerance of vertical, lateral and level alignment of +/- 1".

Per Anchor Bolt DFO meeting on 11/29/2014, SCCI proposed to use ASCC (American Society of Concrete Contractors) "Anchor Bolt Tolerances" Position Statement #14 (attached) with the following tolerance for each bolt location:

- 3/4 and 7/8 diameter bolts : +/- 1/4 in
- 1-, 1-1/4, and 1-1/2 in diameter bolts: +/- 3/8 in ; and
- 1-3/4, 2-, and 2-1/2 in diameter bolts: +/- 1/2 in

Please confirm that the proposed anchor bolt placement tolerance as prescribed by ASCC "Anchor Bolt Tolerances" Position Statement #14 is acceptable. Please note that this tolerance is more stringent than ACI Concrete Standard ACI 117-90, Section 2.3.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Under TG06 contract SCCI is required to place all light column and steel column anchor bolts supplied by TG07.1 in accordance with the contract documents.

- 03 20 00 Concrete Reinforcement and Embedded Assemblies - Section 3.2 A. 1 States: "Set and secure embedments, including embedded plates, bearing plates, and anchor bolts per approved setting drawings and in such a manner to prevent movement during placement of concrete and to allow removal of formwork without damage."
- 03 10 00 Concrete Formwork - Section 3.1 B. 1. a. States: "Use setting drawings, diagrams, instructions and directions by suppliers of items to be attached."
- Structural Drawing Sheet S-0005, GR-2 lists both ACI and AISC reference standards for this project. At the bottom of GR-2 it states: "THE MORE STRINGENT REQUIREMENT IN THE CODES LISTED ABOVE GOVERNS".
- 01 10 90 References - ASCC reference standard discussed in SCCI RFI 452 is not listed in project standards.
- ACI 117-10
  - 1.1.2 States: "Tolerances in this specification are for typical concrete construction and construction procedures and are applicable to exposed concrete and to architectural concrete. Materials that interface with or connect to concrete elements may have tolerance requirements that are not compatible with those contained in this document." - AISC

| <b>REQUEST:</b> <p>Please reference Specification Section 03 30 20 - Cast-In-Place Concrete.</p> <p>Spec Section 03 30 20 - 3.6.A.3 states "For shored floor construction: Floor flatness/floor levelness tolerance compliance testing is to be performed prior to the removal of shores and forms but not later than 72 hours of concrete placement by the TJP A Representative." SCCI intends on providing a moist cure on the concourse slab per Spec Section 03 30 20 - 3.7.A.5.b.3 - cover concrete surface with specified absorptive cover, thoroughly saturate cover with water, and keep continuously wet. The absorptive cover is to remain for 10 days for type II cement (Mix #1558218) per Spec Section 03 30 20 - 3. 7 .A.2 and is to be installed as soon as free water has disappeared from concrete surface and finishing has been completed. The FF/FL 72 hour testing requirement is in conflict with the immediate installation of the moist cure cover requirement.</p> <p>SCCI requests either of the following:</p> <p>1. Waiving the FF /FL requirement on the lower concourse slab due to the later installation of the 5" topping slab it will receive. SCCI will maintain its adherence to dimensional tolerances per ACI 117 and flatness variance per ACI 318 and provide a stiff broom finish per Spec Section 03 30 20 -3.6.B.1.c. (similar to mat slab).</p> |   | <b>SUGGESTION:</b>                                   |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> <p>Neither request is acceptable. FF/FL testing within the 72 hour time limit and curing are not mutually exclusive.</p> |                      |                    |   |

**From:** Webcor Construction LP Gregory Kemerer

**To:** Turner Construction Compan PHIL MILITELLO

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

The contract specifications state that steel fabrication and erection are to:

"Compensate for the difference between the temperature at the time of fabrication and the mean temperature in service." - Spec 05 10 00 - 3.2.B.1

"Compensate for the difference between the temperature at the time of erection and the mean temperature in service." - Spec. 05 10 00 - 3.3.A

Mean service temperature is referenced, but not defined. So that we are coordinated in our efforts, please identify the "Mean Service Temperature."

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:** ☐

For the work in the referenced specification section 05 10 00, assume Mean Service Temperature equal to 60 deg F.

**03/26/2014 04/05/2014 04/04/2014 Potentially** ☐

**From:** Webcor Construction LP Gregory Kemerer

**To:** Turner Construction Compan PHIL MILITELLO

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 372 SK1 & SK2 for items 1 & 2: Drawings 643AC and 645AC from TG0701-075 SSS - Structural Steel Shop DWG (CS3) GL 12-13 are attached for your reference

1) The noted approval comment does not help as the plate will foul the rebar holes when located 11" down. See SK2 and confirm the 8 7/8" dimension is acceptable or supply a workable solution.

2) The weld is not missing. It is shown in Detail 1 on drawing 643AC as WD1Q, which is correct per 6/S1-4350 as the weld is non-DCW.

NOTE: The same applies to drawing 645AC.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:** ☐

1). Agree the 8 7/8" dimension as detail is okay to clear the holes.

2). Noted. WD1Q is okay, but we still think that it is more appropriate to show the weld on sheet 643AC, not in Detail 1.

| The 4th review comment to SUBM TG0600-095 (document enclosed as reference) states after plant recertification a "test batch" will be prepared and tested for accuracy. Attached is SCCI's concrete supplier (CEMEX) responses to the submittal review comments. |  |   |                     | After further discussion with Bob Foley of CEMEX, we are satisfied with the corrective actions CEMEX has already taken. The proposed plant visit and batch constituent verification are not required. |                      |   |                          |
| Regarding the test batch, is it acceptable to either:   |  |   |                     |   |                      |   |                          |
| 1) Have an Owner's representative perform a plant visit during production operations to observe batching tolerance during normal business hours?  |  |   |                     |   |                      |   |                          |
| or  |  |   |                     |   |                      |   |                          |
| 2) Neither perform the test barch nor plant visit?  |  |   |                     |   |                      |   |                          |

| REQUEST:   |                                      | SUGGESTION:                                   | ANSWER: Accept Suggestion: <input type="checkbox"/>  |                      |                      |                    |                |
| The contract drawings indicate that lift eyes will be provided for shop handling:  |                                      |   | George Metzger<br>4/9/2014   |                      |                      |                    |                |
| "Provide picking eye(s) as required for the handling of the cast node in the foundry AND the shop of the steel fabricator. Picking eye(s) to be located withing the interior of the casting's nozzle(s)"   |                                      |   | Taping holes at the back side of the cast node for erection is a means and methods issue.  |                      |                      |                    |                |
| The lift eyes that were cast into the back side of the ground level cast nodes have now been machined off by Bradken, leaving only the lift eyes inside the nozzles. In order to safely handle these castings, new lift features need to be added to the back side to replace those that were machined off.  |                                      |   | Stacy Wilson<br>4/9/2014   |                      |                      |                    |                |
| OIW notes that if the castings are picked using only the lift eyes inside the nozzle, the center of gravity causes the castings to rotate into an unworkable position. Some other manner of rigging must be employed in order to manipulate the castings into positions required for shop fabrication work. CastConnex noted exactly the same issue in their Release 1 Pre Shipping Inspection Summary, even noting that the improvised and awkward handling was causing damage to the castings: |                                      |   | To note, the referenced Cast Connex report was in regards to the roof nodes, not the ground floor nodes. In addition, the contract drawings never called for eyes on the backside of the ground floor nodes, therefore at the contractor's option, the addition of drilled and tapped holes shall come at no cost to the TJPA. |                      |                      |                    |                |
| "The lifting lugs are located inside the nozzle-end on these parts making the machined nodes difficult to manipulate. Often the parts have to be lifted using straps thru the pin hole causing some broken edges on the radius of the pin hole."   |                                      |   |  |                      |                      |                    |                |
| To facilitate handling the cast nodes in the shop in a way that is safe and that avoids damaging the castings, OIW proposes that drilled and tapped holes be added. The attached sketches (2773-SK-401 and 2773-SK-402) show a proposed arrangment of these holes. Note that the proposed locations are in areas that will not be visable in the final product, and also are in areas of minimal stress. OIW requests that the engineer of record  |                                      |   |  |                      |                      |                    |                |
| review the attached drawings and determine if the proposed modifications to the cast node are acceptable.  |                                      |   |  |                      |                      |                    |                |

| REQUEST:   |   | SUGGESTION:                                   | ANSWER: Accept Suggestion: <input type="checkbox"/>                        |                      |                      |                    |                          |
| Detail 1/S1-8003 shows a corner to corner joint between the 2.5" mounting plate and the two supporting vertical stiffeners and the single horizontal stiffener on top.   |   |   | Confirmed.   |                      |                      |                    |                          |
| Please confirm the two vertical stiffeners can be repositioned 1/4" in towards the center of the connection as well as lowering the horizontal stiffener. These adjustments will provide a land for the specified fillet weld and minimize melt through and weld splatter at the corners of each plate. Backside stiffeners will be repositioned to match as required. |   |   |  |                      |                      |                    |                          |

| Please review and confirm the items below regarding the TG0701-075 SSS - Structural Steel Shop DWG (CS3) GL 12-13 approval comments:  |   |               |  |                      | Accept Suggestion: <input type="checkbox"/>   |                    |                          |
| 1) Drawing 2669 ~ the noted beam is not sloping per S1-4004. Confirm the drawing is correct as submitted and no action is required.   |   |               |  |                      | 1) Confirmed.   |                    |                          |
| 2) Drawing 2707 ~ the noted beam is not sloping per S1-4015 (S1-4004 is not the correct drawing reference). Confirm the drawing is correct as submitted and no action is required.  |   |               |  |                      | 2) Confirmed.   |                    |                          |
| 3) Drawings 2706, 2710, 2713AB ~ the 3 1/16" dimensions are necessary as the beam webs vary in thickness. The 3" dimension on the angles has been used at the thickest beam web. Confirm the drawings are correct as submitted and no action is required.   |   |               |  |                      | 3) Confirmed. Note that there is another comment on sheet 2706 for which the sheet needs to resubmitted for record. |                    |                          |
| 4) Drawings 3792, 3793 & 3794, 4933, 4935, 4994, 4995, 4998 ~ The top cope on the right end is correct as shown. The Approver's reference to a 2" flange is incorrect as the TPG1 on Grid 13 has a 3 1/2" thick flange per S1-4200. We have limited the clearance at the top to 1/4" be able to fit the number of bolts per S1-5010. Confirm the drawings are correct as submitted and no action is required. |   |               |  |                      | 4) Confirmed.   |                    |                          |
|   |   |               |  |                      | 5) Confirmed.   |                    |                          |

|---------------|---|---|--|----------------------|----------------------|--------------------|--------------------------|
|               |   |   |  | 2) Confirmed.        |                      |                    |                          |
|               | 1) Confirm a 2" gap is acceptable.  |   |  |                      |                      |                    |                          |
|               | 2) The bolts cannot be located as shown in detail 4/S1-5026. Confirm the bolt locations as shown are acceptable with the bottom flange of the beams coped for bolt access. If not, supply an alternate solution.  |   |  |                      |                      |                    |                          |
| T-1313        | SSS - Deck Support Detail at Column   | Closed  | 04/09/2014   | 04/19/2014           | 04/21/2014           | Potentially        | <input type="checkbox"/> |
|               | From: Webcor Construction LP Gregory Kemerer  | To: Turner Construction Compan PHIL MILITELLO | Answered By: Adamson Associates, Inc George Metzger                                      |                      |                      |                    |                          |
|               | Co-Author: Skanska USA Civil West California DisRyan Clayton  |   |  |                      |                      |                    |                          |
|               | REQUEST:  | SUGGESTION:                                   | ANSWER:  | Accept Suggestion:   |                      |                    |                          |
|               | Please reference detail 1/S1-5001. The L3x3x12ga deck support angle is shown coping into the web of the girder. At the majority of the conditions where this may occur the girders have thick and wide flanges. After the angle is coped as detailed we will have very little material to work with and it is unlikely to have much structural integrity. |   | Alternative deck support detail shown in the RFI can be used at the Contractor's option. |                      |                      |                    |                          |
|               | Please see attached alternative sketch. In this condition the angle is lapped on top of the girder and connected with fillet welds. The depth of the girder has no impact on the detail. This is a common detail in the metal decking industry.   |   |  |                      |                      |                    |                          |
|               | Please confirm the proposed column angle support sketch is acceptable.  |   |  |                      |                      |                    |                          |

|----------|--|---------------------------|--------------|---------------|--|-------------|--------------------------|
|          | <p><b>REQUEST:</b></p> <p>See attached CD RFI # 383 SK1 to SK3 for items 1 to 3: Drawings A1-2502 (SK1), A1-2892 (SK2), A1-2951 (SK4), and 1/A1-2951 (SK5) show a valley. A valley is not shown on S1-2502 and S1-2602 and it is not clear what the intent is for the structural framing:</p> <p>1) In order to keep the diagonal brace framing along Grid H in one plane (shown in blue), it is necessary to introduce a valley as indicated by the red line. If not, twisting will be introduced into the framing and connection details 3/S15025 at Grid 1.4 and 1/S1-5018 at Grid 2. Per Note 6 on S1-2602 the beams are canted to match the slope of TPG1 on Grid 2 but the BU-40 on Grid 1 is horizontal. This will result in the beams having to twist. To avoid this a valley as shown on the architectural drawings is required. Please confirm a valley as indicated by the red line is required or clarify/supply the top of steel elevations between grids 1-2.</p> <p>2) If a valley is introduced, all beams crossing the red valley line will need to be broken-back/bent beams. Please supply a detail showing the splice at the bend lines.</p> <p>3) If the valley is to occur, please clarify the location of the valley as drawings A1-2502 (SK1) and A1-2892 (SK2) show conflicting information. The same condition shown here also occurs between Grids 1-2/B-D, 32.4-33.5/B-D &amp; 32.433.5/F-H. The same condition except opposite shown here occurs between Grids 1-2/F-H on the roof park level.</p> <p>4) It is not clear on S1-2606/S1-2607 where the east-west slopes start east of Grid 31.7. Please clarify the framing.</p> | <p><b>SUGGESTION:</b></p> |              |               |  |             |                          |
|          |  |                           |              |               | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>1.) A valley is not required. See specific comments for Bus Deck and Roof Park Levels below:</p> <p>At Bus Deck Level, an additional top of steel elevation is provided within the deck zone bounded by Gridlines 1&amp;2 and E.6&amp;H. Top of Steel at Gridline 2/G can be calculated as 55' 10 3/8" by linear interpolation using the top of steel information provided at Gridlines 2/E.6 (at column face) and 2/H. At GL 1.4/G top of steel can be assumed the same as 2/G therefore the diaphragm truss is in single plane. Metal deck will need to be slightly warped at other parts of this zone, where two way slopes are present. Ultimately, thickness of the structural topping slab can be adjusted locally to achieve the slab slopes per architectural drawings.</p> <p>At the Roof Level, following info is provided for the deck zone bounded by Gridlines 1&amp;2 and E.6&amp;H. East-west running beams are to be set perpendicular to TPG1. These beams will land on the Gridline 1 slightly rotated however rotation is small resulting in an approximately +/- 1/8" vertical deviation at the tips of the east west running beams' flanges with respect to the GL 1 beam. Metal deck will be slightly warped at this zone. Per our estimations, metal deck steel beam gap/clash is in +/- 1/16" range which can be addressed by small amount of warping in the metal deck.</p> <p>2.) See response to (1).</p> <p>3.) A valley is not required. Information provided in item 1 is applicable to the locations noted in this question at the Bus Deck and Roof Levels.</p> <p>4.) In Sheet S1-2607, East-West slope starts at GL 32.4 as indicated Sheet S1-2607 (between gridlines 32.4/D4 &amp; 32.4/E.6). As indicated in item 1, metal deck will be slightly warped in this area where two way slopes are present.</p> |             |                          |

| Co-Author: Skanska USA Civil West California DisRyan Clayton  |   |   |                     |   |                      |                    |                          |
| REQUEST:<br>Skanska has incorporated the response to RFI T-1324 into the drawings and made the necessary adjustments, while maintaining the required stiffness factor, at gridlines 28-29/D.4, 29-30/D4 and 30-31/D.4. These adjustments have been submitted under submittal package TG0701-415.4.<br><br>However, after discussions with Star Seismic, at GL 4-5/F the stiffness factor plays a limiting role into modifying the length of the brace. Please see the attached stiffness and over strength analysis, provided by Star Seismic, and confirm that the brace lengths may stay the same as previously approved in TG0701-415.2. |   | SUGGESTION:                                   |                     | ANSWER: Accept Suggestion: <input type="checkbox"/><br>GL 4-5/F dimensions shall be as indicated in RFI T-1324. It is acceptable to have a stiffness ratio of 11% as shown in the calculation submitted by the Contractor. We also note that there may also be other ways to achieve the required pin-to-pin dimension and the required stiffness multiplier called out on the contract drawings. Also, it is not clear why the yield zone length is reduced by 16" whereas the pin-to-pin dimension is reduced by 6" in the calculation. With a longer yield zone length a lower stiffness multiplier can be achieved. |                      |                    |                          |

| Co-Author: Shimmick Construction Company, Inc Sylvia Hartanto  |   | Answered By:Adamson Associates, Inc George Metzger |                     |   |                      |                    |                          |
| REQUEST:   |   | SUGGESTION:  |                     | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                    |                          |
| Please reference RFI #T-0440 and #T-0440.1 responses and the attached Contract Drawings S1-3410, SI -2203, and SI-2204.  |   |  |                     | Bottom embed plate at B1 members not required. Additional supporting member to be included as part of Phase 2 scope. Top embed plate at B1 to be placed with 8" min coverage and align with top embed at supporting concrete girders. |                      |                    |                          |
| The detail for the glass guardrail embed depicted in 7/SI-3410 calls for a 3/8"x7" embed with an 8" minimum coverage for the top embed and a 6 1/2" minimum coverage for the bottom embed. The guardrail embeds located at B1 beams on the east side of openings between GL 11/12 and D.8/E.2 (SI-2203) and GL 18/19 and B/C (SI-2204) will not have minimum sufficient coverage due to the 18" beam depth of BI beams (see attached photo). |   |  |                     |   |                      |                    |                          |

**REQUEST:**

See attached CD RFI # 389 SK1 to SK7 for items 1 to 12:

- 1) The noted W16x26 beams are centered below the concrete wall on S1-2303. Confirm the lower beam may be moved below the stair post or supply an alternate solution.
- 2) The noted W16x26 beam is centered below the concrete wall on S1-2303. Confirm it may be moved below the stair post or supply an alternate solution.
- 3) Supply all clouded dimensions on SK2 thru SK7.
- 4) Confirm equal spacing.
- 5) It appears the noted stair stringer connects to the HSS post. Please supply the missing connection detail.
- 6) The plan shows a moment connection but detail 3/S1-5012 does not. Please clarify the intent for the beam to post connections at (8) locations.
- 7) 9/S1-7601 is not the correct detail because it shows an HSS beam and we have a W21x50 at this location. Please clarify and note that detail 3/S1-7601 will not work as the edge of slab is 7" from beam center.
- 8) This dimension is 7" per S1-2403. Confirm 7" is correct.
- 9) Confirm the "CB" notation should be removed.
- 10) The minimum distance between the center of post and the W10x22 must be 1'-1 3/4 in order to connect per 3/S1-5012 and 1/S1-5010. Supply alternate connection details if the dimension is less.  
This is a typical occurrence on all stairs.
- 11) The red dimensions match the dimensions shown in detail 3/S1-7006 (SK3). Please clarify the discrepancy in dimensions.
- 12) 9/S1-7601 is not the correct detail because it shows an HSS beam and we have a W21x50 at this location. Please clarify and note that detail 3/S1-7601 will not work

**SUGGESTION:**

**ANSWER:** Accept Suggestion: ☐

1) Not acceptable. Provide a W16x26 beam centered on the two HSS posts as shown in the attached sketch SKS-0350. Provide shear plate connections per 1/S1-5011 at the ends of this beam. The W16x26 beam will be added on the structural drawings in the next ASI.

2) See response to 1).

3) Refer to architectural drawings A1-7006, A1-7501, A1-7502 and 3/A1-7506 for the stringer and landing beam locations.

4) Align the intermediate W10 beams to the stringers.

5) Correct detail reference at the 8 locations should be 6/S1-5012.

7) Detail at the highlighted location is similar to 3/S1-7601 except the stringer shall be welded to the bent plate at the edge of slab and not the WT.

8) Confirmed.

9) Confirmed.

10) Provide shear plate connection per 1/S1-5011 at the W10 stair beams typically at such locations where double angle connection is not possible.

11) Refer to architectural drawing A1-7006 for correct post locations.

12) See response to 7).

| REQUEST:<br>The Train Box Column cap plates at GL 18 as shown on 5 A/ S1-5050 have been ordered and modeled as 3-1/2" thick plate instead of the 3-1/4" shown. The column flange and web length have been adjusted accordingly. Please confirm it is acceptable to proceed with the 3-1/2" thick cap plate.  |   |               | SUGGESTION:  |                      | ANSWER: Confirmed.  |                    |                          |

| REQUEST:   |  | SUGGESTION:                                    | ANSWER: Accept Suggestion: <input type="checkbox"/>  |                      |                      |                    |                          |
| RFI SK534 (T-1339) addressed steps in the ground floor slab which occurred between grid lines 12-14. This condition also occurs between the following grids: 2-3, 3-4, 8-9 & 9-9.9 (16 locations).   |  |  | Provide a WT per 4 or 5/S1-5002 at locations where the distance between supporting beams is greater than 3'. At other locations where the distance between beam is less than 3', a Z closure plate is sufficient, however, the Z closure plate is not correctly shown on SK3. See attached sketch SKS-0357 for correct extents of the Z closure plate. |                      |                      |                    |                          |
| Item #1 added a 3/8" bent plate to support the upper level deck and can be applied at two locations between grid 2-3 as indicated on SK1. At the other 14 locations the step is similar to item #2 of T-1339 which added an 18 gauge Z closure. At grid 12-14 the perpendicular support beam is located within 1'-9" of the step, at the 14 locations listed above the support beam varies from 2'-0" to 6'-0" and at two locations at grid 2-3 no support beam is provided. Refer to SK3 for clarification. |  |  |  |                      |                      |                    |                          |
| Please confirm the 18 gauge Z is sufficient to carry the load of the deck at the 14 locations or provide an alternative detail.  |  |  |  |                      |                      |                    |                          |

#### REQUEST:

Please see attached drawing showing the location of the west wall in the IDF Room B2228 located in the Area 3 mechanical rooms. Typical pier width dimensions for the mechanical rooms are 24" and are not typically dimensioned out in the plans. Based on scaling, the pier in the northwest corner of Room B2228 is 16"x28". However, this pier was labeled as a 16"x24" pier in the rebar shop drawings (see Submittal TG0600-301.2) and as a result the dowels for the west wall were placed 4" to the west to align with the pier edge.

Please confirm that this new location is acceptable.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

The west wall of IDF Room B2228 at the B2 level cannot be moved 4" to the west to align with the 16x24 pier due to Building Code Accessibility and Egress requirements for the adjoining room at Phase 2 build-out.

#### REQUEST:

Please see attached drawing for clarification regarding dimension of the plumbing opening above the door in Room B2203. In A1-9215, the door opening and distance between piers is scaled to be 3' -5" and was submitted as a 3' -5" opening per approved submittal TG0600-102. However in A1-9217 a plumbing opening with a dimensioned width of 3' -11" is shown to span the distance between the piers. If the 3' -11 " opening dimension is correct as shown, the blockout would cut into the piers. Please confirm the dimension of the plumbing opening and whether or not it is intended to cut into the piers. Please note that the pier dowels have already been installed with the 3'-5" span per approved submittal TG0600-102.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

The 3'-5" width dimension for the door opening in between piers, described in this RFI, is correct. For updated plumbing opening above the door at Stair 203 (Room B2203), refer to the attached SKA-3142 and SKA-3143.

REQUEST:

Please reference plan sheet EI-3212.

1) Note 4 on plan sheet EI-3212 states, "Cadweld main #4/0 grid to #6 mesh with #1 stranded Cu conductor (typical). Refer to Detail 1/EI-3212." Detail 1/EI-3212 does not show a #1 copper conductor connecting the grid to the mesh. Please confirm the 4/0 grounding grid is to be connected directly to the grounding mesh.

2) Please see the attached Detail 5/EI-3212. Please identify which part of the grounding grid system the highlighted portion belongs to and provide the proper wire size.

3) Detail 5/EI/3212 designates the embedded conductors going to the battery rack as #2. Please confirm this means #2 AWG copper conductors. In addition, no designation is provided on Detail 4/EI-3212 at the pigtail which appears to be for the battery rack in B1289. Please confirm this is pigtail is to be #2 A WG conductor as well.

ANSWER:

Accept Suggestion: ☐

1) The #6 mesh is to be interconnected to the grounding grid in several locations. Where the #4/0 grid crosses or contacts the mesh, it could be directly connected. Additional connections to the #4/0 grid are required from remote parts of the mesh. These interconnections shall be made with #1 bare CU connections.

2) The Detail 5/ E1-3212 did not convey a numbered note for this connection. Similar to the response to question 1, this connection refers to additional bond points (using #1 bare CU conductors) between the #4/0 ground grid and the grounding mesh.

3) Yes, the callout refers to using #2 AWG bare CU to the battery racks. The pigtail in Detail 4/E1-3212 is also required to be #2 AWG bare CU to the battery rack.

|   | <p>on EI-3212/Detail 1 is to be interconnected to the grounding grid at "several locations" and that the #4/0 grid could be "directly connected" where it crosses or contacts the mesh. This response also stated that all other connections are to be #1bare CU connections.</p> <p>1) Please provide the exact quantity of connections which are required from the #4/0 grid to the #6 mesh.</p> <p>2) Please provide the interval distance between required direct connections from the #4/0 grid to the #6 mesh.</p> <p>3) Plan sheet shows six (6) total #1 "remote connections" in each room. Please confirm this is the proper quantity required.</p> |  |                     |   | <p>Per TJPA( Guy HOLLINS ) direction, this RFI shall be redirected to the TJPA to forward to SFPUC for response.</p> <p>Matt Ho 6/17/14:</p> <p>1) RESPONSE: Referring to Details 4 and 5 on Sheet E1-3212 for the West and East Switchgear Rooms, we count 16 locations in the West room and 17 locations in the East room that offer an opportunity to connect the #6 mesh to the #4/0 grid. These locations include all interconnections of the #4/0 grid to ground riser conductors, grid cross connections, grid to pigtails (for equipment grounds), and grid to ground test bar connections.</p> <p>2) RESPONSE: As noted above, the recommended connections to the mesh do not need to be evenly spaced. The connections can be made by including the mesh in the various connections to the #4/0 grid.</p> <p>3) RESPONSE: The quantity noted should be adequate.</p> <p>Response by: Matt Ho, SFPUC dated 6/17/14</p> |                    |                          |

| <p>Structural detail 10/S1-4202 shows a yellow paint marking to be applied to mask the protected zone. The attached products, J.P. Nissan Co &amp; Brite Mark, are representative of what Skanska feels should be applied to satisfy this requirement.</p> <p>Skanska's experience with these paint coatings or marking systems is such that it retains its color and adherence to the structural steel well beyond the erection activity and is not detrimental to fireproofing systems. Please confirm that the aforementioned products are acceptable to be applied as the yellow paint marking.</p> <p>*NOTE - the attached photo does not have the signage displayed; final product will include the signage as shown on 10/S1-4202. In addition, Skanska has spoken to technical representatives from both Carboline (Pyrocrete-40) &amp; Isolatek (Cafco M-II) and they do not foresee any compatibility issues (See SK1 &amp; SK2).</p> |                                   |   |                     | <p>RFI is rejected, WO to submit with information previously submitted in submittal TG0701-37.</p> |                      |                    |                          |

**From:** Webcor Construction LP Stephanie Azzolino

**To:** Turner Construction Compan PHIL MILITELLO

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 401 SK1 & SK2:

The Scougal Rubber Bearing Pads (Package Number TG0701-95.1) foul the flange of the W40x327 as shown.

Please provide a solution.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

The 2 - 3/4" clearance between the W12x65 beam and the W24x68 beam shown on 1A/S1-5021 may be increased and the bearing assembly may be lowered so that the bearing pads clear the W40x327 flange. Adjust the hanger length accordingly. A minimum clear horizontal clearance of 3/4" shall be provided between the pads and adjacent structure.

**T-1362 BGP - Lower Concourse Confirmation**

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:**

**REQUEST:**

See attached submittal sheet D2.28 and sheet E1-2204. Response comment to Submittal Package TG0600-121.1 on sheet D2.28 between gridlines 12-13 B-C, calls out "conduits are now embedded in the lower concourse slab". Per the TG0600-121.1 submittal review comment meeting held on 4/30/14, please confirm that embedded conduits FE045,FE051,FE052,FE058 incorporated on sheet E1-2204 dated 03/31/14 will continue to be surface mounted and blockout will be left in place for penetrating the slab.

Please confirm attached sketch SKA-3148 showing the coupler setting out dimensions for the future corridor wall at B1 level, GL 10, B-C as reviewed with AAI in our slab edge workshop held April 30, 2014

Please confirm rebar for Lower Concourse Floor drains marked "Future" are to be trimmed as detailed on 1/S1-3501 but not blocked out.

For door openings not dimensioned on architectural slab, floor or wall plans, please confirm it is acceptable to size door rough openings in the lower concourse partition walls to be 4.5" larger than doors scheduled on sheets A1-9700, A1-9701, A1-9702. If not please provide a door jamb detail for these openings.

Please confirm that Lower Concourse telecom penetrations shown on slab edge plans A1-2841 through A1-2851 to be 4" x 90 GRS elbows with a factory 30"

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

1. Embedded conduits:

WSP Response: WSP does not object to the proposal of surface mounting conduits and retaining the slab blockout in these specific referenced zones. For other areas where embedded conduits are indicated, WSP recommends the embedment in this phase.

2. SKA-3148 showing coupler setting out dimensions for future corridor walls at B1 Level, GL10/B-C:

AAI Response: Confirmed.

3. Future Floor Drains:

WSP/MDS Response: It is confirmed that the lower concourse floor drains marked "Future" will be trimmed as detailed on 1/S1-3501 but not blocked out.

TT Response: The reinforcement for the Lower Concourse slab at Floor Drains marked as "Future" are to follow detail 1/S1-3501. It is acceptable to trim bars.

4. Door Rough Opening:

AAI Response: As stated in workshop meeting April 30th, 2014, AAI cannot provide rough opening dimensions, as the rough openings may vary between

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

#### REQUEST:

With reference to the Train Box Column cap plate, our machine shop has drilled (1) non-standard hole in (1) p395 cap plate due to a broken tool. See attached inspection report and photos.

The hole is dimensionally in the correct position but has an internal spiral cut. The minimum diameter is 1-9/16" (1.563) and the max diameter is 1-49/64" (1.770).

Please confirm if one of the following is acceptable:

Option 1 - Proceed with the as-built condition, no further action required.

Option 2 - Reem out the hole to 1-13/16 and use a 1-1/2" bolt. AISC Table J3.3 page 16.1-121 allows oversize hole in slip critical connections, a hardened washer will be installed over the oversized hole. (see attached)

Option 3 - Drill the hole to 1-13/16 and use a 1-3/4" diameter bolt.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Both option 2 and option 3 are acceptable. This approval does not set a precedent, evaluation will be made case by case for similar issues in future.

#### REQUEST:

See attached CD RFI # 410 SK1 for items 1 & 2:

1) The Architectural Slab Edge Drawings indicate round slab openings greater than 8".

Confirm structural perimeter steel is not required at all round openings or supply a detail.

2) It is not clear what is meant by large openings. Does detail 12/S1-5003 apply to all rectangular/square slab openings shown on the Architectural Slab Edge Drawings?

Please clarify.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

1) For openings greater than 8" and up to 2' provide rebar as shown in the attached sketch SKS-0354.

2) The large opening detail applies for openings that are greater than 2' but limited to the dimensions specified on 12/S1-5003.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Specification section 07 81 23 (Intumescent Fire Resistive Materials), issued with Field Order 00027, lists three acceptable basis of design manufacturers for IFRM systems. Additionally, specification section 07 81 23, 1.7.C.2 states that the intumescent fire protection system is to be from a single source, indicating that the prime coat Skanska shop applies must be from the same manufacturer as the subsequent coats that are field applied.

Per the monthly schedule delivered to TJPA, the IFRM contractor is not to be selected until 10/16/14.

Skanska requires direction as to which of the three approved basis of design manufacturers will be used on subsequent coats in order to obtain a recommendation from that intumescent coating manufacturer as to the appropriate primer to be utilized.

Alternatively, priming of IFRM steel can be removed from Skanska's scope and added to the scope of the IFRM contractor. This will result in a cost increase.

Please provide direction.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

TJPA has rejected this RFI per 01 10 40 1.6 C 2 c.

|                                     |   |   |  |                   |                   |                    |                          |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

During a Quality Control review, performed by Thompson Metal Fab for compliance with the "Buy America" clause of the Contract, a question was noted regarding the proposed use of ESAB Spoolarc F9A4-ENi4 Submerged Arc Welding (SAW) Electrode for the welding of the HPS70W steel in the Train Box Columns. The attached letter from ESAB, dated April 22, 2014, describes the process that ESAB employs in the manufacture of the referenced product. It notes the fact that the tensile and yield properties of the specific filler metal alloy required to meet the Contract specifications of 90XX are not offered or produced by any mills within the United States. The alloy is provided as a "Greenrod" and is acquired outside of the States. The cold drawing, proprietary processing and packaging of the product is done, by ESAB, wholly within the United States and uses, other than the alloy itself, domestically produced and acquired materials. The Certificate of Conformance from ESAB states that the product is manufactured in the United States (attached).

An inquiry was made, by Skanska, to Lincoln Electric regarding a similar product classification that met the Contract requirement (F9A4-ENi5). Lincoln Electric advised Skanska that they also receive "Greenrod" and strip from sources outside of the United States for this product.

A subsequent Quality Control review by The Herrick Corporation revealed a similar condition for the use of the Lincoln Electric product Outershield XLH-70, AWS classification E70T-1C-H8, FCAW process weld electrode.

Once again, Lincoln has indicated that "Greenrod" for weld electrode products may not be domestically available and may be sourced from throughout the world. However, the manufacturing process, like ESAB, is done wholly within the United States. The Certificate of Conformance from Lincoln also states that the product is manufactured in the United States (see attached certificate and letter dated 04/28/2014).

The CFR Part 661.5 of the Clause gives the following definitions:

c) The steel and iron requirements apply to all construction materials made primarily of steel or iron and used in

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

The Contract Documents are clear, and ¿Buy America¿ requirements can reasonably be derived from a review of the Contract Documents. RFI are not an appropriate request to the TJPA for interpretation if products meet ¿Buy America Certification¿

The Contractor shall submit the ¿Buy America Certification¿ and the Prime Contractor is responsible for ensuring that lower tier subcontractors are in compliance.

REF: SECTION 00 08 13 ¿ SPECIFIC PROJECT REQUIREMENTS

SECTION 00 08 13 - USDOT REQUIREMENTS FOR AGREEMENTS WITH THE TJPA

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

decrease the specified 36" wall thickness to 33" to clear the encroaching SP 436 & 437 Originally this was a WR2 reinforcement areas #11@6"oc EF vertically and would change to #11@5"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.3 option 2 (Exhibit -E)

In all other areas without CDSM pile encroachment issues the reinforcement will remain unchanged as per the Contract drawings.

See Exhibit - G shows a typical detail of transition between modified reinforcement to contract reinforcement.

These solutions if approved would be incorporated into the TG06 shop drawings. Please confirm if these solutions would be acceptable.

**Co-Author:** Shimmick Construction Company, Inc Sylvia Hartanto

**REQUEST:**

Please reference attached letter dated 5/2/2014, authored by Robert Foley, CEMEX QC Manager.

On March 20, 2014 the column mix was modified to increase average compressive strength due to low test results for laboratory cured cylinders. The changes that were made to mix #1557205 to increase strength are having an effect on the slump variability. SCCI and CEMEX propose the design slump range be increased to 6 to 9 inches. Is this proposed change acceptable?

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:** ☐

Acceptable for Mix 1557205.

**Co-Author:****REQUEST:**

Please reference RFI T-1227.1 - SFPUC Plate Grounding.

Please confirm the SFPUC Transformer mounting plate is to be installed by a future contractor and SCCI is only to stub the grounding conductor into each corner of the Electrical Room( see Note 1 on Plate Sheet EI-2203).

If SCCI is to install this SFPUC Transformer mounting plate, provide the specifications, including but not limited to material type, size and thickness.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

It is confirmed that SFPUC Transformer mounting plate in transformer vault room elevated slabs will be supplied and installed by future contractors. However, SCCI BGP base bid scope needs to be increased from the corner of the three electrical rooms originally bid in BGP. This increase shall be priced and coordinated as described in RFI 1227.1 sketch in order for grounding conductors to be embedded in the structural Concourse slab. Grounding conductors must be extended from the corner of each Electrical Room to each future pad location and stubbed up so that transformer mounting plates can be connected by future electrical contractor. Please provide a sketch and product detail of how BGP electrical intends to implement this grounding extension so that SFPUC review can proceed as described on new sheets E1-3208, E1-3209 and E1-3210

IFC drawings (dated 3.31.2014) issued in Field Order 27 contain updated electrical drawings. BGP contractor should review these drawings for any modifications to Electrical scope bid during TG06. This is to include Grounding and embedded conduit for F-15 EJB conduit. New electrical scope other than that described above is not currently requested at this time.

|  | <div><div>REQUEST:</div><div>After reviewing the response to T-1380 there are several items of concern:<br/>A.<br/>Access from the underside will not always be possible. At certain locations the perimeter wall bracing and rebracing that will remain in place during the deck installati on operation at Ground Level is in close proximity to the transfer girder and will restrict the mobility of a sciss or lift required for a welder to reach the work point from the lower concourse slab, approximately 30' bel ow.<br/>B.<br/>To provide an effective weld from the underside, the deck l ower flute is required to overhang the toe of the angle. In order to achieve this, shifting the deck may result in the loss of bearing at other locations. If the deck can't be shifted a 12ga minimum flashing plate will be requ ired, see details 3 &amp; 4 on SK1.<br/>C.<br/>Effective concrete placement will be an issue if adequate c learance from the top of deck flute to bottom of girder flange is not established.<br/><br/>To move forward we propose the following:<br/>1.<br/>Where d&lt;7" we will use stock angle sizes up to 8x4x1/2" ( LLV) welded to the toe of the flange, see detail 1.<br/>2.<br/>Where d&gt;7" but &lt;15" we will use an overhead 1/8" fillet fro m the underside as per the response to T-1380 (where accessible), see detail 2. This will allow a minimum of 4" clearance from top of deck flute to underside of flange for placement of concrete.<br/>Where the bottom flute does not overhang the toe of the a ngle and shifting the deck creates a loss of bearing at another location, a 12ga min flashing will be welded to t he angle and deck bottom flute, see detail 3 &amp; 4.<br/><br/>Please confirm items 1 &amp; 2 are acceptable.</div></div> | <div>SUGGESTION:</div>                        | <div>ANSWER:</div> <div>1. | <b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton |  |               |                              |                      |  |                    |                |
|   | <b>REQUEST:</b><br><p>The response to RFI T-1034 indicates that secondary steel components (stiffeners, connection plates, continuity plates, etc.) are to be CVN tested in accordance with their respective ASTM specification. In the CS05 (TG0701-077) and CS07 (TG0701-079) submittal packages, Skanska's detailer inadvertently tagged the spandrel shear plates and web reinforcement plates at the Bus Deck level to receive CVN, Frequency P testing. These same components were not tagged for CVN testing in the CS1, CS2, CS3, CS4, and CS6 packages and the drawings were approved with no comment on the CVN requirements.</p> <p>For the subject material, the governing ASTM 572 specification indicates that supplementary CVN, Frequency P testing is not required unless specifically indicated in the contract documents. In accordance with the response to RFI T-1034, Skanska has proceeded without CVN-P testing for the following secondary components: (Note that the material listed has been ordered without Frequency P testing.)</p> <ul style="list-style-type: none"><li>Bus Deck Spandrel Plates</li><li>Bus Deck Web Reinforcement Plates</li><li>Bus Deck Drag Connection Plates</li><li>Roof Level Fabricated Nodes (as per submittal package TG0701-097.1)</li><li>Other secondary materials (stiffeners, connection plates, continuity plates, etc.)</li></ul> <p>In preparation for the resubmittal of CS05 and CS07 drawing packages, Skanska will remove the CVN remarks for these components to conform to the RFI T-1034 response, the ASTM specifications, and the previously approved packages.</p> <p>Please confirm concurrence.</p> |               |                              |                      |  |                    |                |

REQUEST:

Reference Documents: Exhibits A - B

Further to response to RFI T-637 please find attached proposed changes to the spandrel beam on the north and south elevations as well as modifications to the Corbel detail on east wall within mat foundation wall Area 16 for location plan see exhibit - A

Exhibit - B shows the plan view of the modification necessary to the spandrel beam on the north and south elevations and the modifications to the Corbel detail at mat foundation, lower concourse and ground level on the east elevation GL -35. These modifications are necessary due to the revised reinforcement width of the foundation wall due to encroachment of the CDSM beams.

RFI T-1372 shows the extent of the modification to the foundation wall on the north, east and south elevations of Area 16.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

Modifications for the spandrel beam at locations outlined are acceptable.

| <b>REQUEST:</b><br>With reference to the Linden Steel decking drawings the reviewer's comment references general note DK-5 - Distribute steel studs uniformly over beam span unless otherwise noted on drawings. Maximum spacing of ¾ inch headed studs shall not exceed 24" on center (one stud every 2 feet) unless otherwise noted.<br><br>As per note 1 on 1/S1-5000 - "See general notes for headed stud size and maximum spacing. Number of studs is indicated on the framing plan." Linden has modeled their drawings as per note 1, referring to the general notes for size and spacing requirements and the framing plans for stud quantities indicated on each member as per the Steel Beam Legend on S1-2302.<br><br>If a stud quantity is not indicated on a beam member, no studs are provided. Please confirm this interpretation is correct. If additional studs are required on members that are not currently identified please provide revised drawings identifying beams and quantities required. |  |               | <b>SUGGESTION:</b>   |                      |                      |                    |                          |
|  |  |               | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>While the maximum stud spacing requirement of 24" noted in General Note DK-5 is the design intent, we understand that the Note 1 on 1/S1-5000 is somewhat conflicting. We agree to handle the 24' spacing requirement on a case by case basis, by marking on the shop drawings where this requirement is to be enforced to minimize the impact. We will re-submit the metal deck shop drawings for clarification. |                      |                      |                    |                          |

| <b>REQUEST:</b><br>Please reference S1-2305 grid 23/H.7 (Sk1 attached). Two W16x26 beams are indicated with 16 shear studs each. We believe the 16 studs to be a typo and should be 6 studs. Note the mirror image location at grid 23/C.3 indicates 6 studs. All 4 of these beams only have 3 low flutes crossing over the beam. 6 studs would allow 2 studs per flute but 16 studs would require 5/6 studs per flute which is not feasible.<br><br>Please confirm it is acceptable to provide 6 studs on the 2 |   |               | <b>SUGGESTION:</b><br><br><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Confirmed   |   |                      |                    |                          |

| From: Webcor Construction LP Claude Titcher  |  | To: Turner Construction Company PHIL MILITELLO |                     | Answered By:Adamson Associates, Inc George Metzger  |                      |                    |                          |
| Co-Author: Shimmick Construction Company, Inc Ben Gordon   |  |  |                     |   |                      |                    |                          |
| REQUEST:   |  | SUGGESTION:                                    |                     | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                    |                          |
| Please clarify the designer's intent:  |  |  |                     | The Elevation 19.07 is the elevation below the concrete pad. The concrete pad is at El.17.71. See the attached response to RFI SSS-T-1097.1 for additional information. |                      |                    |                          |
| Sheet S1-2305 indicates the upper Slab elevation as 17.71' and the top of the Lower Slab as 16.07' in elevation at Girders TR19.9 and TR20.1. The connecting MFB1 30"(W) X 48" (W) X 48"(H) beam top is indicated at the 16.07' elevation per details on Sheet S1-3600. The referenced Section 9/S1-3702 at the south ends of TR19.9 and TR20.1 doesn't correlate with the slab elevation in relation to the top of structural steel.  |  |  |                     | WOJV Received: 6/2/14   |                      |                    |                          |
| Please clarify the detail for the welded couplers at the south end of TR19.9 and TR20.1.   |  |  |                     |   |                      |                    |                          |

| From: Webcor Construction LP Claude Titcher  |  | To: Turner Construction Company PHIL MILITELLO |                     | Answered By:Adamson Associates, Inc George Metzger  |                      |                    |                          |
| Co-Author: Shimmick Construction Company, Inc Ben Gordon   |  |  |                     |   |                      |                    |                          |
| REQUEST:   |  | SUGGESTION:                                    |                     | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                    |                          |
| Please clarify the designer's intent:  |  |  |                     | As noted on the plan, the slab west of Grid 1.4 has a step at Grid E.   |                      |                    |                          |
| Sheet S1-2302 indicates that the 2 northern 72"x40" CBM beams east of Grid 1.4 are sloping and references Section 1/S1-3700 which indicates that the CBM beams are level. The 2 southern 72 "x40" CBM beams east of Grid 1.4 are not indicated as sloping and reference Section 1 /S1- 5023 that indicates that the beams are sloping. Please clarify the details for the welded couplers and #11 bars for the 72"x40" CBM beams at east side of TR1 .4. Section 2/S1- 7605 indicates 17-#11 bars top and bottom, one added set of 17-#11 bars 3" below the top bars, and 4-#11 side |  |  |                     | As noted on the plan, along Grid 1.4 , top of slab is at 20.23 north of Grid E and at 21.21 south of Grid E.  |                      |                    |                          |
|  |  |  |                     | As noted on the plan, along Grid 1 (top of concrete wall), top of slab is at 20.03 north of Grid E and 21.00 south of Grid E.   |                      |                    |                          |
|  |  |  |                     | The 72x40 concrete beams are to have a slope per elevation noted on plan.   |                      |                    |                          |

#### Co-Author:

#### REQUEST:

On May 20, 2014 WOJV received an email from Adamson-Associates containing 28 SKA's with the request that WOJV incorporate the SKA's into the TCB construction documents via the RFI Process.

#### Reference attached sketches:

- SKA-3322 TO SKA-3325 (CONC WALL ELEVATIONS)
- SKA-3326 TO SKA-3329 (CONC WALL ELEVATIONS)
- ZONE 2- SKA-3330, SKA-3334, SKA-3338, SKA-3357
- ZONE 3 - SKA-3331, SKA-3335, SKA-3339
- ZONE 4 - SKA-3359, SKA-3360, SKA-3361
- ZONE 5 - SKA-3322, SKA-3336, SKA-3340
- ZONE 10 - SKA-3333, SKA-3337, SKA-3341

Please confirm the attached architectural SKA's shall be incorporated in the TCB construction documents. Please note these unissued SKA's have been referred to in submittal package "TG0600-341 - REBAR - Shop Drawings - Partition Walls" returned to WOJV 5/21/2014.

Also, in the attached, there are two versions of the SKA's. Please clarify which shall be deemed "current" for use in the project.

#### SUGGESTION:

#### ANSWER:

**Accept Suggestion:** ☐

The following SKAs, included with this RFI response, are current and shall be incorporated in the construction documents.

B2 and B1 Level Concrete Wall Elevations: SKA-3322 TO SKA-3329 Zone 2: SKA-3330, SKA-3334, SKA-3338, SKA-3357\_R1 Zone 3: SKA-3331\_R1, SKA-3335\_R1, SKA-3339\_R1 Zone 4: SKA-3359\_R1, SKA-3360\_R1, SKA-3361\_R1 Zone 5: SKA-3332, SKA-3336, SKA-3340 Zone 10: SKA-3333, SKA-3337, SKA-3341

For updated enlarged plans and details as discussed during the June 4, 2014 coordination workshop - Refer to the following SKAs

SKA-3416 (A1-3007)

SKA-3417 (A1-7426)

For Future Washroom plumbing layouts, refer to the following sketches: PSK2-3001, PSK2-3002

Note that the Design Team did not receive RFI T-1410 until yesterday, June 4, 2014, even though Shimmick indicated it had been submitted at least a week ago. The RFI was issued with a large volume of attachments and consequently did not reach the design team from Constructware. In future, please limit Constructware email attachments to less than 5 megabytes.

| <b>REQUEST:</b><br>The responses to the following items were not sufficient for Candraft to proceed.<br>7) The response notes one of the requested dimensions as "VARIES". Please provide criteria for this varying dimension.<br>12) Detail 3/A1-8551 does not provide the bottom of the HSS post elevations. Please supply the elevation at each post.<br>13) Per the structural details only the 1/2" plate is to be galvanized. Confirm this is correct and supply weld required for PL3/8" to HSS4x4.<br>14) Supply the requested missing dimension as shown at each post.<br>17) Please supply the elevations for the stiffeners in the columns.<br>18b) Please provide the size, radius, hole location and dimension on the 1/2" x 8" plate. Note: See response sketches SK1 through SK7 |                                      | <b>SUGGESTION:</b>                                   |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Please see OCS configuration in 1/A1-8550. Notice the OCS path relative to the beam (16'-4 1/2" from GL C.3 in CD RFI 296.1 SK4) is not a constant offset in plan and changes locations traveling east to west. From this, the HSS structure supporting the OCS assembly from above will also have an offset dimension from the beam that is not constant and will vary.<br><br>12) The bottom of HSS post elevation will vary because the bottom elevation is dependent upon the elevation of the OCS Universal Spacer Bar which is dependent upon the ultimate constructed sloping grade below (concrete). The OCS Universal Spacer Bar shall be 18'-0" above the built finish grade and the dimension between the bottom elevation of the supporting post and the Universal Spacer Bar is given on detail 3/A1-8151.<br><br>13) All should be hot dip galvanized as noted in the CDs. The weld shall be 1/4" double sided fillet weld. Please note that the connection plate shall be centered to the work point of the diagonal angles.<br><br>14) Same response as in item #12.<br><br>17) CL of plate is determined by SFMTA OVS. See response to item #14 on attached CD RFI 296.1 SK5.<br><br>18b) Plate size, thickness and hole location are provided in 6/S1-9101. SFMTA must provide size of plate hole, as the cable tensioner components are provided by SFMTA. TJP A shall assist with the SFMTA contact if required.<br><br>The Design Team suggests that the OCS connectors be field installed to accommodate the final coordination with the SFMTA |                      |                    |                          |

|  |                                      |   |   |            |            |             |                          |

**REQUEST:**

See attached CD RFI # 296.4 SK1 to SK3 for items 1 to 4: Skanska plans the following erection aids for the OCS. Please review and confirm there are no adverse structural implications.

- 1) Confirm the concept of the erection aid detail as shown is acceptable to accommodate the field welding required.
- 2) Confirm welding for cap plate as shown is acceptable.
- 3) Confirm the concept of the erection aid detail as shown is acceptable to accommodate the field welding required.
- 4) Confirm it is acceptable to supply (4) 15/16 diameter holes per plate for erection lifting holes as shown.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

- 1) Confirmed.
- 2) Confirmed, but use all around weld.
- 3) Confirmed, but finger tighten A325 through bolt.
- 4) Holes are acceptable. However, contractor is to plug holes completely with full grommet of the shield plastic fiber insulating material specified in Section 05 50 00 .

**To:** Turner Construction Company PHIL MILITELLO**07/25/2014****08/04/2014****07/28/2014****Potentially** ☐**Answered By:** Webcor Construction LP Gregory Kemerer**Co-Author:** Skanska USA Civil West California DisRyan Clayton**REQUEST:**

This is a follow-up to RFI T-1417.1 (SK 399.3A, CD 296.3)

Skanska: The responses to items 7, 12, 14 & 17 require further clarification. Please review the items below.  
Item 7 ~ the response and reference to A1-8550 does not provide the requested dimensions. Please provide the dimensions to locate the posts.

Item 12 ~ the response tells us that the Universal Spacer Bar is to be 18'-0" above the ultimate constructed sloping grade with the bottom of the post being +/- 4" above that per 3/A1-8151. Several unknowns remain:

- a) What does "ultimate constructed sloping grade" mean?
  - b) The top of slab information on drawings S1-2306, A1-2306 & A1-2866 is not clear
  - c) What does the +/- 4" in detail 3/A1-8151 mean?
- Item 14 ~ same as item 12  
Item 17 ~ same as item 12

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

Item 7 - information has been provided. Skanska should review with WOJV and TJPA.

Item 12 -

a) It means field dimension must be determined from the constructed grading by the CM/GC and coordinated between trade subcontractors and the SFMTA (the transportation agency). The design team cannot provide the as-built field dimensions that are required for this item.

b) The reviewer should be using civil (grading) information - not structural information. Refer to sheets L1-3306, L1-3307, C1-4007 and C1-4009.

c) This dimension is incorrect - It is 1'-0" +/-4". This will be corrected in VE Round #4 submission.

Item 14 - This question is the same as in Item 12, so the response is the same.

Item 17 - This question is the same as in Item 12, so the response is the same.

| From: Webcor Construction LP Gregory Kemerer  |   | To: Turner Construction Compan PHIL MILITELLO |                     | Answered By:Adamson Associates, Inc George Metzger  |                      |                    |                          |
| Co-Author: Skanska USA Civil West California DisRyan Clayton  |   |   |                     |   |                      |                    |                          |
| REQUEST:  |   | SUGGESTION:                                   |                     | ANSWER: Accept Suggestion: <input type="checkbox"/>   |                      |                    |                          |
| See attached CD RFI # 433.1 SK1 & SK2 for items 1 & 2:  |   |   |                     | 1). Confirmed. However, the requirement for the closure plate and other misc. steel per Detail 9/S1-5000 noted in TT's previous responses to RFI 1425.0 may be waived to negate SKANSKA's claim of added scope. If the closure plate is not provided by SKANSKA, the concrete contractor shall provide proper forming/shoring for supporting wet weight of the concrete while pouring slab concrete. How to support the wet weight of the concrete when placing the slab is the contractor's means and methods. |                      |                    |                          |
| 1) Confirm the outline of top of slab/edge plate at grids B & H at the expansion joints.  |   |   |                     | 2). Confirmed, also see the response to comment #1.   |                      |                    |                          |
| 2) Confirm the edge plate support detail at the 1/1/4" connection plate is acceptable as shown or supply an alternate detail.   |   |   |                     | 3). It is W/O's option to stop the vertical leg of the closure plate at the top of slab (additional forming is required to retain the concrete while placing the slab), or stop the vertical leg of the closure plate at the concrete key location (additional forming not required).   |                      |                    |                          |
| 3) The 10" on SK2 indicates top of roof floor slab. Confirm the bent plate will stop at top of slab OR is an additional 8" required to the concrete key location.   |   |   |                     | 4). Confirmed that the outrigger spacing may be increased to 8'-6" to be in line with the back span beam spacing.   |                      |                    |                          |
| 4) For detail 9/S1-5000 now required at the Seismic joints, verify the 8'-0 Max spacing for the angles can be increased to 8'-6 in order to line up with the back span beam spacing per design.                                     |   |   |                     |   |                      |                    |                          |

| The response to RFI T-1425 indicates that detail 9/S1-5000 is to be used at the roof deck level expansion joint. The rebar in that detail is incompatible with the rebar layout shown in detail 3/S1-3282. Please clarify the rebar |   |   |                     | 1). As noted in the response to RFI 1425.1, the requirement for the closure plate and other misc. steel per Detail 9/S1-5000 noted in TT's previous responses to RFI 1425.0 may be waived to negate SKANSKA's   |                      |                    |                          |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 435 SK1 & SK2:  
The upper angle per 5/S1-7600 will foul the gusset plate for the brace.  
Please supply an alternate detail.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Move the upper angle to the side of the horizontal HSS 12x6. Provide vertical fillet welds to connect the angle to the post and the horizontal HSS . Angle and weld sizes shall remain the same as specified in detail 5/S1-7600.

**T-1433** **SSS - Conflicting ST401 Dimensions**

**Closed**

**05/30/2014 06/09/2014 06/10/2014 Potentially** ☐

**From:** Webcor Construction LP Gregory Kemerer

**To:** Turner Construction Compan PHIL MILITELLO

**Answered By:** Adamson Associates, Inc George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 437 SK1 to SK3:  
The approval instructions on drawing 3265 in the CS6 approval submittal (Package Number TG0701-78) require a clarification. S1-7011 and A1-7011 show conflicting dimensions to locate the posts as shown on SK2 & SK3. Currently the model reflects S1-7011. Please confirm that S1-7011 is correct or supply clarifying direction on which ST403 post locations are correct.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Refer to attached sketch SKA-3379 for Stair HSS locations. Structural drawings will be updated in a future ASI.

**REQUEST:**

The reviewer's comment on Linden Shop drawing D3 detail 49, requests the contractor to coordinate the change of steel deck height with RFI T-0803.1 and with W2 roof assembly components (see SK1).

After further review of the available information, detail 1/A1-8171 provides conflicting information to what is indicated on 1/S1-5032, the W-2 retail façade roofing assembly build-up indicates a 1-1/2" metal deck (see SK1).

Please confirm the steel framing and 1-1/2" metal deck as currently detailed is acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

This item was already confirmed by RFI T-1413.

**Co-Author:** Shimmick Construction Company, Inc Sylvia Hartanto

**REQUEST:**

Reference: RFI T-0620  
For constructability purposes, the shearwalls require horizontal construction joints at the same elevations as the foundation wall construction joints. All vertical reinforcing has been detailed with HRC mechanical couplers with the exception of the 3rd lift of the shear wall column located adjacent to the knockout wall. Please confirm that it is acceptable to splice the verticals in the shear wall column with a Dayton Superior Barlock D250SCA coupler

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Acceptable provided that the coupler is a Type II coupler, such as Dayton Superior Barlock L-Series. The coupler proposed in the RFI does not qualify. The contractor shall plan for the installation of the coupler by taking into account the length of the coupler, the length of the reinforcing stub to be spliced, and the available clearance. The coupler may need to be preinstalled with the stub or a blockout created depending on the proximity of the obstruction to the planned construction joint. The detailer shall account for the increase in effective bar diameter at the mechanical coupler with respect to ties and clear cover.

#### REQUEST:

See attached CD RFI # 449 SK1 & SK2:  
Please confirm the location of the slab opening on SK1 as it is currently located over a kicker brace and not indicated on the structural drawings.  
Please provide revised structural drawings indicating all slab openings required.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Slab opening locations per A1-2862 govern. Move the kicker brace so that it is in between the two openings. Structural drawings will be updated in a future ASI to show the two openings.

Note: Small openings in slabs are to be coordinated between sub-contractors by GC and included in the contract as defined in Contract Documents.

#### REQUEST:

Due to the thickness of the cruciform column base plate and the transfer girder top flange connection (7-1/2" to 9-1/2" thick). Please confirm it is acceptable to provide oversized holes in the base plate only at the slip critical connection as per AISC (see SK1). This will allow additional tolerance for threading the 2-1/2" diameter post tensioned rods varying from 14' to 38' long through the 7-1/2" to 9-1/2" thick steel.  
Note: The transfer girder top flange will remain a standard size hole (d+1/16").

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Using oversized holes in the SFRS bolted connection indicated in the RFI is not acceptable. It is acceptable to achieve additional tolerance for the post-tensioned rods by using oversized holes for these rods within the base plate.

#### REQUEST:

After reviewing the contract documents for the moment frame protected zones, please reference attached SK1/SK2 and note the following:  
For the built-up moment frame beams, details 1, 3/S1-4201 have a note that directs Skanska to detail 10/S1-4202, which depicts the yellow striping and warning signage to be installed. However, the protected zone detail for the moment frame columns, 2/S1-4201, does not have

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Detail 10/S1-4202 is a typical detail that applies for all moment frame protected zones (beams & columns).

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

On Thursday, May 22, 2014, there was slurry intrusion through dewatering well #34, from the Transbay Tower Project. After the Transbay Tower Project placed a lean mix to plug the slurry intrusion, only water has come out of the well at a pressurized rate, not yet experienced on this project prior to the event.

The water in this well has been confirmed acceptable by the SFPUC to discharge into the City's combined sewer system, on 6/5/14. A plug has been placed in this well in order to keep the jobsite from flooding due to the volume of water pushing through the well. We want to replace the dewatering pump in this well, but are concerned that we may end up dewatering the Transbay Tower Project and possibly draw the water table on their project outside of the requirements of our specification.

- 1) Please confirm that it is acceptable to re-install the dewatering pump in well #34.
- 2) Please let us know if there are certain steps or durations that you want us to pump in an effort for ARUP to monitor the water table on Transbay Tower's Project and/or other adjacent properties.
- 3) Please confirm that in performing this activity, we are not held to the requirement of Spec Section 31 56 13-13.F.1. in regards to "The performance of the shoring wall shall be such that the groundwater levels around the excavation are maintained within 3 feet from the pre-excavation levels" since there is the potential of us drawing their groundwater through our well.

Accept Suggestion: ☐

1. It is acceptable to reinstall the dewatering pump in well #34.
2. Access has been provided to the global analyzer. Please watch carefully the affects from dewatering in wells P-03DS and P-6MS. These have currently not shown any change in the piezometric elevation since May 22.
3. The specification will not be relaxed at this time.

**REQUEST:**

As a follow-up to the review comment on drawing 1202 within Submittal Package TG0701-73.1, the elevation of the grout/vent holes on the pipe basket columns is called out to be 6'-0" above finished floor per S1-4003 (SK1). Skanska's modeler has taken the finished floor to be the

**SUGGESTION:**

**ANSWER:** Accept Suggestion: ☐

We confirm the grout/vent hole elevation of 63'-6" at the Bus Deck Level is acceptable for shop drawing packages CS1 through CS7.

The elevation of the finish floor at Bus Deck Level is

#### REQUEST:

See attached axle loadings for Hyundai forklift model 70DS-7E. The forklift is intended to be used on the concourse deck for removal of bracing and installation of rebracing.

Please confirm if it is acceptable to use the noted forklift on top of the concourse slab.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

Verifying the adequacy of the structure for construction loads as well as the design of any required shoring is the responsibility of the contractor. See also General Requirement note GR-18 on S-0005.

#### REQUEST:

See attached CD RFI # 457 SK1 & SK2 for items 1 to 7:  
1) Confirm edge plate per 8/S1-5000 is required at 4 sides of the S7 slab shown in yellow.  
2) Supply dimension.  
3) T/Wall (shown in green) is at EL 86'-9 per A,B/S1-7134 & A/S1-7135. Please confirm.  
4) Confirm the top of S7 slab shown in yellow is at EL 86'-10 3/4 based on the T/STEEL 86'-6 + 4 3/4" slab thickness.  
5) Supply dimension.  
6) Supply dimension.  
7) Confirm edge plate per 8/S1-5000 is required at 4 sides for the 4 3/4" S7 slab and the curbs per A1-2965 will be a separate pour.

#### SUGGESTION:

#### ANSWER:

Accept Suggestion: ☐

1) Confirmed.

2) Noted dimension is 3'-3". See attached sketch SKA-3673.

3) T/Wall elevation is 87'-5" per A1-2904. Structural drawings will be updated in a future ASI to match architectural drawings.
