

## WARRANTY

WARRANTY to Transbay Joint Powers Authority  
(Owner Name)  
201 Mission, Suite 2100, San Francisco, CA  
(Owner Address)

We hereby warrant and guarantee that the \_\_\_\_\_  
(Description of Work)

which we have installed at Transbay Transit Center has been done in strict accordance with the plans and specifications, and that the work installed will fulfill the requirements of those specifications.

We agree to repair or replace, or cause to be repaired or replaced, any or all of the work which may prove to be defective in workmanship or materials, together with any adjacent work which required repair or replacement because of our defective work within a period of \_\_\_\_\_ year(s) from the filing of the Notice of Completion on all improvements, or acceptance by the Owner of the building, whichever is later.

If we fail to commence to comply with the above paragraph within ten (10) days after receipt of written notice, or fail to pursue such compliance with diligence, we jointly, and severally, do hereby authorize the Owner or the General Contractor to proceed to have the defects repaired and made good at our sole expense, and we will honor and pay the costs and charges for it together with interest at the maximum rate permitted by law upon demand. If we fail to fulfill the preceding obligations, and if Owner or General Contractor bring an action to enforce this Warranty, we agree to pay Owner or General Contractor reasonable attorney's fees incurred in connection therewith.

## CONDITIONAL WAIVER AND RELEASE ON PROGRESS PAYMENT

### *California Civil Code Section 8132*

NOTICE: THIS DOCUMENT WAIVES THE CLAIMANT'S LIEN, STOP PAYMENT NOTICE, AND PAYMENT BOND RIGHTS EFFECTIVE ON RECEIPT OF PAYMENT. A PERSON SHOULD NOT RELY ON THIS DOCUMENT UNLESS SATISFIED THAT THE CLAIMANT HAS RECEIVED PAYMENT.

#### Identifying Information

Name of Claimant: \_\_\_\_\_  
Name of Customer: Webcor/Obayashi Joint Venture  
Job Location: Transbay Transit Center 425 Mission St. San Francisco, California  
Owner: Transbay Joint Powers Authority  
Through Date: \_\_\_\_\_

#### Conditional Waiver and Release

This document waives and releases lien, stop payment notice, and payment bond rights the claimant has for labor and service provided, and equipment and material delivered, to the customer on this job through the Through Date of this document. Rights based upon labor or service provided, or equipment or material delivered, pursuant to a written change order that has been fully executed by the parties prior to the date that this document is signed by the claimant, are waived and released by this document, unless listed as an Exception below. This document is effective only on the claimant's receipt of payment from the financial institution on which the following check is drawn:

Maker of Check: Webcor/Obayashi Joint Venture  
Amount of Check: \$ \_\_\_\_\_  
Check Payable to: \_\_\_\_\_

#### Exceptions

This document does not affect any of the following:

- (1) Retentions.
- (2) Extras for which the claimant has not received payment.
- (3) The following progress payments for which the claimant has previously given a conditional waiver and release but has not received payment:

Date(s) of waiver and release: \_\_\_\_\_

Amount(s) of unpaid progress payment(s): \$ \_\_\_\_\_

- (4) Contract rights, including (A) a right based on rescission, abandonment, or breach of contract, and (B) the right to recover compensation for work not compensated by the payment.

#### Signature

Claimant's Signature: \_\_\_\_\_  
Claimant's Title: \_\_\_\_\_

# **WAIVER OF OUR RIGHT TO RECOVER FROM OTHERS ENDORSEMENT**

This endorsement changes the policy to which it is attached effective on the inception date of the policy unless a different date is indicated below.

(The following "attaching clause" needs to be completed only when this endorsement is issued subsequent to preparation of the policy.)

This endorsement forms a part of Policy No. XYZ 1234567

Issued to: ABC SUBCONTRACTOR

By: XYZ INSURANCE COMPANY

Premium (if any) TBD

We have a right to recover our payments from anyone liable for an injury covered by this policy. We will not enforce our right against the person or organization named in the Schedule. (This agreement applies only to the extent that you perform work under a written contract that requires you to obtain this agreement from us).

You must maintain payroll records accurately segregating the remuneration of your employees while engaged in the work described in the Schedule.

The additional premium for this endorsement shall be 2-5% of the California workers compensation premium otherwise due on such remuneration.

## **Schedule**

Person or Organization	Job Description
WEBCOR/OBAYASHI JOINT VENTURE, Its Officers, Directors and Employees AND TRANSBAY JOINT POWERS AUTHORITY, its Board Members and Commissions, All Authorized Agents and Representatives, and Members, Directors, Officers, Trustees, Agents and Employees of Any of Them.	TRANSBAY TRANSITY CENTER BUILDING.

**WAIVER OF SUBRAGATION FOR WORKERS COMPENSATION INSURANCE TO BE INCLUDED.**

POLICY NUMBER: XYZ 1234567

COMMERCIAL GENERAL LIABILITY

**THIS ENDORSEMENT CHANGES THE POLICY. PLEASE READ IT CAREFULLY.**

**ADDITIONAL INSURED – OWNERS, LESSEES OR  
CONTRACTORS (FORM B)**

This endorsement modifies insurance provide under the following:

**COMMERCIAL GENERAL LIABILITY COVERAGE PART**

**SCHEDULE**

Name of Person or Organization:

WEBCOR/OBAYASHI JOINT VENTURE,  
Its Officers, Directors and Employees

AND

TRANSBAY JOINT POWERS AUTHORITY, its Board Members  
and Commissions, All Authorized Agents and Representatives, and  
Members, Directors, Officers, Trustees, Agents and Employees of Any  
of Them.

RE:

TRANSBAY TRANSIT CENTER BUILDING.

(If no entry appears above, information required to complete this endorsement will be shown in the Declarations as applicable to this endorsement.)

WHO IS AN INSURED (Section II) is amended to include as an insured the person or organization shown in the Schedule, but only with respect to liability arising out of "your work" for that Insured by or for you.

If required by your agreement with such insured, this insurance shall be primary insurance for such Insured. If anyone also provides similar insurance for such Insured, then that insurance will be primary, and this insurance will be excess over, or secondary to that insurance.

"The insurance afforded by this policy for the additional insured(s) is primary insurance and any other insurance maintained by or available to the additional Insured(s) is non-contributory."

## Exhibit E – LEED Trade Subcontractor Submission Letter & Data Sheet

Transbay Transit Center  
Webcor/Obayashi Joint Venture  
175 Beale Street  
San Francisco, CA 94105  
T 415-978-5700

To Whom It May Concern:

In our efforts to complete LEED Documentation for the **Transbay Transit Center Project** we will need the following information provided on your official company letter head:

1. Company Name & Contact Information
2. Contract Value
3. Progress Report Date
4. Scope of work included in Contract with specific Division and Sections listed.
5. **List of all materials permanently installed on the project**, within the LEED boundary that were included in the contract. A total estimated weight value and total actual material cost must be provided for each material. Please provide exact Material name & manufacturer, division and specification section number (XX XX XX).
6. Recycled content (**post-consumer and pre-consumer broken out separately**) percentages for each material from CSI Masterformat 2004 Edition Divisions 3-10, 31 (Section 31 6X XX Foundations) and 32 (Sections 32 1X XX Paving, 32 3X XX Site Improvements, 32 9X XX Planting). Please provide cut sheets of each material with the recycled content values posted.
7. List the location of material extraction (city, state, country) and material manufacturing (city, state, country) for all materials from CSI Masterformat 2004 Edition Divisions 3-10, 31 (Section 31 6X XX Foundations) and 32 (Sections 32 1X XX Paving, 32 3X XX Site Improvements, 32 9X XX Planting). Specifically, we are looking for those materials that were **both extracted and manufactured** within a weighted total travel distance of 500 miles of the jobsite. Per addendum to the BD+C v2009 Reference Guide, weighted total travel distance under Option 2 of the MR Credit 5 Regional Materials should be calculated using the following formula: (Distance by rail/3) + (Distance by inland waterway/2) + (Distance by sea/15) + (Distance by all other means) ≤ 500 miles [800 kilometers]. If you are sure that your materials do not comply as Regional Material, please note that the material was extracted/manufactured "greater than 500 miles" from the jobsite.
8. If you provided any adhesives, sealants, coatings, paints, carpet systems, etc. – please be sure to include these materials on your spreadsheet with the **actual VOC content (g/L)**. Please provide proof in the form of a cutsheet, or MSDS highlighting the VOC content value.
  - a. All particleboard, MDF, Agrifiber, Veneers, and composite wood products must be **Urea-Formaldehyde free**. Please note "*Urea-Formaldehyde free*" in the VOC column for these material types. All Agrifiber/composite wood products must provide proof of being Urea-formaldehyde free in the form of MSDS, Cut Sheet, or Letter from the Manufacturer.

Exhibit E – LEED Trade Subcontractor Submission Letter & Data Sheet

9. For all materials that contain wood, please specify the FSC Wood **Chain of Custody number (COC)**. The COC Certificate and **original purchasing invoices** must be provided as proof of purchase/certification.

**LEED Submittals:**

- A. **Preliminary LEED Material Spreadsheet Submittal** - Within 30 days of Contract award, assemble and submit the “LEED Material Tracking Spreadsheet” complete with all data described in 4-8 above. Cover letter and back up documentation are not necessary for this submittal. The quantities, costs, products, and LEED metrics should be entered in the spreadsheet as the project/contract scope was bid/ estimated. Please see the sample LEED Material Tracking Spreadsheet that you must complete and submit back to Webcor/Obayashi Joint Venture within 30 days of awarded contract.
- B. **Quarterly LEED Progress Reports (Reference 01 81 13 1.5 E 2)** – Quarterly LEED Progress Reports are due by February 10 (Q1), May 10 (Q2), August 10 (Q3), and November 10 (Q4) of each year. Assemble and submit the “LEED Material Tracking Spreadsheet” in, PDF and Excel formats, complete with all data described in 4-8 above and based on the Preliminary LEED Material Spreadsheet Submittal. All changes from the previous quarter shall be indicated in bold. Update each Material Status with one of the following: Preliminary, Approved, Bought, or Installed.
  - a. Preliminary – Indicates the material has been included in its preliminary stage of planning but has yet to be approved by the design team.
  - b. Approved – Indicates the material has been approved by the Design Team as meeting all requirements specified. Include Design Team submittal approval.
  - c. Bought – Indicates the material has been bought out after approval by the Design Team.
  - d. Installed – Indicates the material has been permanently installed on the project within the LEED boundary.
- C. **Final Exhibit E Submittal** – Prior to closeout, assemble and submit all ‘actual’ LEED material information on the “LEED Material Tracking Spreadsheets” and forms provided in the Project Manual, together with all supplemental documentation as required by LEED. Please see the sample LEED cover letter and Material Tracking Spreadsheet that you must complete and submit back to Webcor/Obayashi Joint Venture prior to closeout on the project.

If you have any questions or concerns, please contact Webcor/Obayashi Joint Venture. If there is any information that you are not able to track down please let us know. We are here to support your LEED efforts.

Sincerely,

**WEBCOR/OBAYASHI JOINT VENTURE**

# Exhibit F – BIM Requirements for Subcontractors

## Transbay Transit Center

Webcor/Obayashi Joint Venture

### *I. Introduction*

Webcor/Obayashi Joint Venture is implementing a virtual building process for this project. This process will include building a digital, three-dimensional Building Information Model (BIM) linked to a project cost and labor productivity database, which will provide a platform for collaboration throughout the project's construction. In implementing this virtual building process as further outlined below, the Subcontractors will have the ability to analyze different construction sequences and methods for construction. In turn, the Subcontractor's provision of accurate virtual building data facilitates analysis and mitigation of potential costs and scheduling impacts.

The participants will adhere to the following guidelines in connection with this virtual building process. The costs of all management, administration, software, modeling, drafting, transmission, submittal, meetings, etc. for this process shall be the responsibility of the subcontractor and are included in this Subcontract.

### *II. 3D Modeling Requirements*

Subcontractors will be a part of a team that will meet at least bi-weekly, but not more than twice weekly, for coordination meetings to model the building and its systems, coordinate the work, and build the project virtually. The objectives of these meetings include the elimination of as many conflicts and clashes as possible and the development of reliable schedules that allow for efficient workflow and effective production control. The coordination meetings will occur in multiple phases and as described for Target Schedule Development (TSD) in Subsection IV, Item a, below, but shall precede the TSD at each listed phase.

Webcor/Obayashi Joint Venture will manage and lead the coordination process and assist the subcontractors in bringing the individual models together, running clash detection reports, and generally coordinating the process. The individual participants will be partners in this process, model their work, coordinate this with other trades and building components, obtain submittal approvals from the architect and engineers of record, and relocate/modify their systems as necessary when conflicts arise.

The 3D model consists of geometry control models generated and provided by Webcor/Obayashi Joint Venture and/or the Owner's design team from the 3D Database and system models generated and provided by the Subcontractors for their respective scopes of work. The system models, when integrated with the geometry control models, are referred to as the "Federated Model."

The Subcontractor's system models are the Subcontractor's sole responsibility. Prior to commencing any modeling, the Subcontractor must coordinate the initial model orientation with Webcor/Obayashi Joint Venture. All information in the system models shall be consistent with and based on the Contract Documents. The system model shall be maintained throughout the duration of the Project and updated to reflect as-built

# Exhibit F – BIM Requirements for Subcontractors

## Transbay Transit Center

Webcor/Obayashi Joint Venture

conditions. The degree of detail and accuracy of the Subcontractor's system models shall be sufficient to enable accurate and complete clash detection as well as shop drawing extraction. Subcontractors will be required to print their shop drawings directly from the Federated Model, including dimensions, elevations and location of specific trade elements, based off of the building grid and/or coordinates. The printed material shall comply with the submittal requirements noted elsewhere in the contract documents. Lastly, to allow for model quantity extraction for cost and schedule information, the Subcontractor shall coordinate breakdown and classification of systems in the systems model with Webcor/Obayashi Joint Venture.

### **B...**

The Subcontractor's system models shall be fully compatible with **Autodesk BIM 360 Glue**, Autodesk Revit, Tekla, or Graphisoft ArchiCAD in the version contemporaneously current with Subcontractor's initial submission of its system model, or the version immediately preceding the contemporaneously current version. It shall be the responsibility of the Subcontractor to maintain this compatibility at its own expense. If more trade specific software is required for a particular system model, Subcontractor must obtain Webcor/Obayashi Joint Venture's prior consent to utilize such software.

### **...B**

The Subcontractor shall transmit its system model to Webcor/Obayashi Joint Venture's BIM Coordinator who will manage the coordination process. The Subcontractor shall be required to perform clash detections and identify conflicts which shall be communicated to the Project team in a discrepancy report. Subcontractor shall review the identified conflicts as set forth in the discrepancy report and jointly develop conflict solutions and modify their system models accordingly. Trade coordination and model modification shall at all times remain a responsibility of each Subcontractor.

#### a. Modeling Schedule

Webcor/Obayashi Joint Venture will develop a Modeling Schedule showing modeling and coordination efforts required by all subcontractors in order to meet the construction and installation performance shown in the Exhibit I Project construction schedule. Subcontractor will be required to maintain its performance to meet the dates shown in the Modeling Schedule Subcontractor shall ensure that it provides adequate modeling and coordination manpower to maintain the modeling/coordination schedule.

#### b. Modeling Coordination Meetings

Subcontractor shall participate in BIM coordination and review meetings with Webcor/Obayashi Joint Venture. Subcontractors can expect these meetings to occur at least weekly or biweekly depending on the projects schedule needs. As a result of the information exchanged at such meetings, both the system model and the Work depicted

# Exhibit F – BIM Requirements for Subcontractors

## Transbay Transit Center

Webcor/Obayashi Joint Venture

in the Subcontractor's system model may be required to be changed by the Subcontractor to achieve coordination with other elements of the Project being provided by others. In accordance with General Conditions subsection 1.03.G, Subcontractor will be compensated for the associated BIM coordination efforts under the provisions for Change Orders of Article 6. Subcontractor acknowledges that BIM coordination and review meetings will require attendance of personnel that are familiar with both the data entry aspects of the BIM as well as an understanding of the Work to be performed and its relation to other elements of the Project, and the Subcontractor therefore agrees that personnel conversant in both shall attend all such meetings.

**B...**

### **III.** ~~**DELETED**~~ *Cost and Productivity Data*

~~In addition to the 3-D modeling requirements set forth above, all Subcontractors shall provide accurate cost and productivity information to be imported into a project data base in order to facilitate 4-D (time dimension) and 5-D (cost dimension) modeling. This information shall be broken down such that line items describe work activities for each building system included in Subcontractor's scope of work.~~

- ~~a. Scheduling Information. Subcontractor shall provide detailed scheduling information including, but not limited to, the following:~~
  - ~~i. Provide a list of tasks which identify continuous activities that can be performed with other trades.~~
  - ~~ii. Provide a list of predecessor tasks for each above defined task that needs to be complete before Subcontractor can start the subject task.~~
  - ~~iii. Provide a list of preferred minimum work areas breakdown. This breakdown shall be based on the minimum work areas that will be necessary for the Subcontractor to work efficiently.~~
  - ~~iv. Provide task and specific location-based activity assignments for each item in Subcontractor Submittal Register when submitted in accordance with Exhibit F, Item III.A.12.~~
  - ~~v. All information noted within this Item 'a.' shall be provided within 15 days of Subcontract award.~~

**...B**

**A**

- ~~b. DELETED~~

**A**

### **IV.** *Project Scheduling and Production Control Phase Planning*

Project Schedule, is a critical path method (CPM) schedule that shows the initial plan to construct the project. This schedule sets forth certain dates for performance and a

# Exhibit F – BIM Requirements for Subcontractors

## Transbay Transit Center

Webcor/Obayashi Joint Venture

general sequence of construction that is subject to change based on project requirements and as set forth in Section G of the Instructions to Bidders. Because the BIM requirements contained in this exhibit provide an opportunity to develop a schedule that is optimized for subcontractor performance efficiencies, it is the intent of the Project Team to employ production control techniques to manage the day-to-day construction of the Project. This process will proceed generally in the following manner and is affirmatively acknowledged by Subcontractor as follows:

- a. Subcontractor agrees to participate in phased Target Schedule Development (TSD) at completion of each of the following stages of Consolidated Model Development:
  - i. TSD#1 – Foundation & Substructure
  - ii. TSD#2 – Superstructure & Exterior Envelope
  - iii. TSD#3 – Mechanical, Electrical, Plumbing, Sprinkler (Fire) [MEPS]
  - iv. TSD#4 – Interior Finishes
  - v. TSD#5 – Commissioning
- b. Phased Target Schedule Development (TSD) requirements:
  - i. Subcontractor agrees that durations for Subcontractor's tasks at each location will be calculated based on quantities at each location divided by the Subcontractor's crew production rate
  - ii. Subcontractor agrees to assist with optimization of the overall performance schedule for all trades, working from visualization(s) of labor flow using a Flowline chart (a modified Line of Balance schedule), to:
    - i. Balance the number of crews to improve flow
    - ii. Remove labor or material spikes to increase manageability and reduce site conflicts
  - iii. Use risk analysis to determine buffer placement points and durations required to minimize risk
- c. Subcontractor agrees to participate in Mid-Phase Re-optimization Development at least one (1) additional time following each of the TSD for phases of Consolidated Model Development described in Item A, above:
  - i. Mid-Phase Re-optimization Development (MRD) requirements:
    - i. Subcontractor agrees that durations for Subcontractor's tasks at each location will be calculated based on quantities at each location divided by the Subcontractor's crew production rate.
    - ii. Subcontractor agrees to assist with optimization of the overall performance schedule for all trades, working from visualization(s) of labor flow using a Flowline chart (a modified Line of Balance schedule), to enable the following:
      - i. Balance the number of crews to improve flow
      - ii. Remove labor or material spikes to increase manageability and reduce site conflicts
    - iii. Use risk analysis to determine buffer placement points and durations required to minimize risk

# Exhibit F – BIM Requirements for Subcontractors

## Transbay Transit Center

Webcor/Obayashi Joint Venture

### V. *Miscellaneous Provisions*

- a. Model Ownership: In accordance with Article 2, subsection 2.07A, BIM files, and other computer files created for the Project shall be made and remain the property of the TJPA, including all intellectual property rights to all documents or materials.
- b. Protection of Intellectual Property or Proprietary Information: Subcontractors who provide intellectual property and/or proprietary information which is incorporated into their models shall provide notification of the confidentiality of the information.
- c. Other Subcontract Requirements: Subcontractor agrees that neither the BIM nor the use of the BIM is in lieu of nor intended to relieve the Subcontractor of its responsibilities under the Subcontract, including, without limitation, to (i) coordinate its Work with the work of others involved in the Project and (ii) strictly comply with the other requirements of the Subcontract Agreement and the Contract Documents. It is expressly understood and agreed that, notwithstanding the requirement for submittals in connection with the BIM, other submissions shall be required of Subcontractor as required by the Contract Documents.
- d. BIM Liability: Subcontractor acknowledges and agrees that the TJPA and Webcor/Obayashi Joint Venture shall incur no responsibility or liability with respect to the BIM or the use thereof, including that resulting from errors, omissions or deficiencies in the BIM. In the event that Subcontractor provides deficient information or data that does not represent the Work it will ultimately be providing, or that is corrupted in that the information transmitted contains a virus, and/or that otherwise damages the BIM, Subcontractor shall bear all costs associated with reconstructing the BIM and to otherwise remediate such deficiencies and their effects. In the event Subcontractor discovers an apparent error, inconsistency or omission in its information or submissions it shall notify Webcor/Obayashi Joint Venture within 72 hours and via written correspondence. In the event Subcontractor discovers an apparent error, inconsistency or omission in the information or submissions provided by others Subcontractor shall promptly request clarification of the same from Webcor/Obayashi Joint Venture, with a written Request for Information per General Conditions Article 6.03.

### VI. *Modeling Specification*

#### **B...**

- a. The goal, through 3D coordination, is to create fully coordinated shop drawings derived from using the Models produced and coordinated by each discipline. ~~These models would then be used for scheduling (4D) and cost management (5D) purposes.~~ This section describes the **Degree of Detail (DOD)** to which

# Exhibit F – BIM Requirements for Subcontractors

## Transbay Transit Center

Webcor/Obayashi Joint Venture

each system will be modeled and whether the system should fall under the standard or high level category.

**...B**

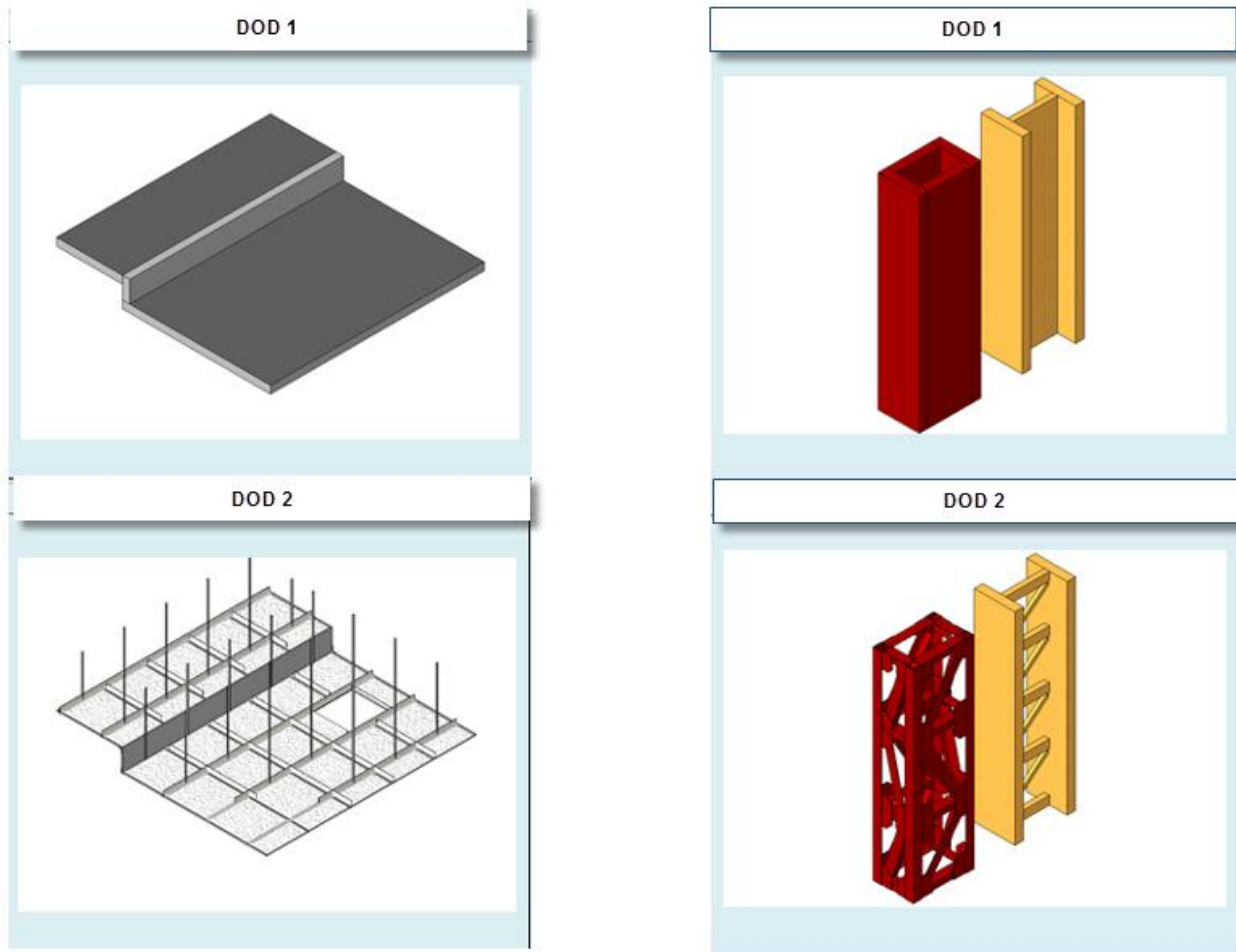

- i. DOD 1 indicates standard degree of detail where elements match the approximate space and shape the element occupies or the space required to access equipment for maintenance. Accurate geometry of components with rectangular cross sectional geometry. Components of complex cross sectional geometry are approximated with simplified cross sections and modeled with accurate enveloping geometry. Composite structures are modeled with solids. Symbolic representation of fixtures, equipment, furniture and like.
- ii. DOD 2 indicates a high degree of detail dimensionally accurate, and where applicable, manufacturer specific element (does not require manufacturing/fabrication detail – exterior envelope is required) Accurate geometry of components with rectangular and complex cross sectional geometry. The individual layers of composites are broken down to smaller components and built up piece by piece. Exact representation of fixtures, equipment, furniture and like. The model will include secondary components that may influence coordination, such as gusset plates, secondary steel members, hangers, braces etc.

# Exhibit F – BIM Requirements for Subcontractors

## Transbay Transit Center

Webcor/Obayashi Joint Venture

Please refer to the Trade Specific BIM Requirements below for the list of systems that are required to be modeled.

### *VII. Change Management*

Subcontractor will maintain its system model throughout the project duration, incorporating all changes that impact its Work. Subcontractor will update its Work as required through participation in the 3D coordination process outlined above. Subcontract may be required to re-extract shop drawings and prepare updated submittals to incorporate changes to its Work.

After each model update for a change package (e.g. ASI), Subcontractor shall archive a copy of its model before incorporation of further changes. Using versions of its system model, Subcontractor shall publish quantity deltas per system between models. Subcontractor will apply it's bought out unit rate for a particular changed system to the quantity delta to calculate

## Webcor/Obayashi Joint Venture Statement on Safety

It is the policy of Webcor/Obayashi Joint Venture to provide employees a safe place to work. The personal safety and health of each employee of this company is of prime importance. The prevention of accidents and injury will be given precedence over operating productivity whenever necessary. To the greatest degree possible, management will provide facilities required for personal safety and health.

Our objective is a program that will reduce the number of injuries to a minimum and to surpass the best experience of other operations similar to ours. Our goal is zero accidents and injuries.

Our policy will be implemented as follows:

- Management will continue to develop policies and procedures that will assist in the control of personal injury, property damage and losses and fleet damage. Direct and indirect costs associated with these types of losses contribute unfavorably to operating expenses. These policies and procedures will be reviewed and updated as needed.
- Safety is the direct responsibility of all personnel. Safety is of prime importance to production and quality. Everyone has the right to stop work to address safety concerns.
- Safety on the job in all company facilities and job sites is a priority. In no instance will safety become secondary to any other considerations. Any recognized safety activity or hazard will be corrected.
- It is mandatory that all personnel engaged in work on this project comply with all federal, state and local safety codes and regulations throughout the duration of their construction on this project.
- Each site will have a Supervisor available to support the safety effort.
- Each Supervisor will be assigned various levels of safety responsibility and authority.
- All employees will be held accountable for the safety policy.
- An established system of communication, measurement, and documentation exists throughout the company.
- A Safety Committee is in place to formulate and update the company safety program and policies. This committee operates under the supervision of management.

# Health and Safety Communication

This Webcor/Obayashi Joint Venture project plan will be developed incrementally as trade packages are awarded and trade subcontractors are brought on board. Each trade subcontractors plan will become part of Webcor /Obayashi's overall project plan and will be submitted to the Transbay Joint Powers Authority (TJPA) as they are received.

## Orientation

The Webcor/Obayashi Joint Venture training will contain required elements stipulated by Webcor/Obayashi Joint Venture [Code of Safe Conduct and Work Practices](#).

Webcor/Obayashi Joint Venture and ClickSafety have partnered to create a web-based Contractor Safety orientation course for the Transbay Transit Center. All contractors requiring access to the Transbay Transit Center project must successfully complete the three (3) required sessions online through ClickSafety prior to working on site. This site-specific safety orientation will take approximately one (1) hour to complete the three (3) sessions:

- Webcor/Obayashi Safety Passport
- Webcor/Obayashi Click Green Construction Practice
- Webcor/Obayashi Transbay Transit Center Project

The three sessions' includes a discussion on site protocol, evacuation procedures, a description of the logistics of the site, safety expectations and requirements that employees are expected to understand and comply with while working on the premises. These sessions are available in both English and Spanish.

Subcontractors are required to provide other task specific orientations as needed.

## ClickSafety - Project Fees

The fee structure for ClickSafety services is a \*\$100 annual fee per user.

*\*Prorate will apply to those that begin the training after the first quarter of the current year.*

The prorate schedule is as follows:

January – June	\$100	Valid January – December
July – December	\$50	Valid July 1 – December

## ClickSafety – Account Setup

These steps are to assist Contractors in setting up their account, user registration and implementation of ClickSafety.

1. Access ClickSafety's Transbay Safety Passport home page at <http://www.clicksafety.com/safetypassport-transbay/>
2. Create a company account. Click on the *Company* tap, then on *Register Company*, follow the prompts
  - a. If your Company already have an account, your Company will still need to register your existing account for this project
3. Assign the three sessions:
  - a. Webcor/Obayashi Safety Passport
  - b. Webcor/Obayashi Click Green Construction Practice
  - c. Webcor/Obayashi Transbay Transit Center Project

4. Prepay for employee training with a credit card and create an access code
  - a. Keep this access code available as your employees will be required to enter it when they register
5. Direct all employees to ClickSafety's home page to conduct their on-line orientation
6. Employee Registration:
  - a. Click on the *User* tab
  - b. Then on *Register For Training* tab
  - c. Select *Webcor/Obayashi TransBay Terminal* from the drop down menu
  - d. Enter first name, last name, last 4 digits the employees social security number (SSN)
    - i. Employees user name will be the first letter of their first name and there full last name, there password is the last 4 of their SSN
  - e. Select preferred language to receive training in
  - f. Select your Companies name from the drop down menu
  - g. Enter access code
  - h. Continue
  - i. The three sessions will appear in the employees screen. Please ensure all employees complete each session

### **ClickSafety - Contact**

A ClickSafety representative is available to answer any of your questions about this program. For general information about this project or registration assistance, please contact ClickSafety Support at (925)855-SAFE (7233) ext. 629 or [cshep@clicksafety.com](mailto:cshep@clicksafety.com). ClickSafety's Account Manager is Christina Parkin, (925)208-2618, Email: [cparkin@clicksafety.com](mailto:cparkin@clicksafety.com).

Should you have specific questions regarding the project or safety requirements, you may contact Webcor Builders Administrative Assistance for the EHS Department Kyla Burke at (510)748-1994 or at [kburke@webcor.com](mailto:kburke@webcor.com).

### **ClickSafety - Disclaimer**

ClickSafety and Webcor/Obayashi Joint Venture make this training material available with the understanding that users exercise their own skill and care with respect to its use. It is the duty of each employer as specified in the Occupational Safety and Health Act of 1970 (P.L. 91-596)

- (a1) Shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;
- (a2) shall comply with occupational and health standards promulgated under this Act.
- (b) Each employee shall comply with occupational safety and health standards and all rules, regulations, and orders issued pursuant to this Act which are applicable to his own actions and conduct.

## **Emergency Response Procedures**

Webcor/Obayashi Joint Venture provides a safe and healthful work environment for all workers through progressive, proactive injury prevention planning. Job pre-planning and identification of up-coming potentially hazardous activities is supported by regularly reviewing trend analysis. Everyone on site has a

responsibility for their own safety and the safety of their work environment. If an activity is deemed unsafe workers have several ways to communicate these activities to management. Workers shall always contact their immediate supervisor and Webcor/Obayashi Joint Venture SSM if something is unsafe or an incident occurs.

Prior to starting work on this project a designated area for emergency service vehicles to enter without any delay shall be established. A current, certified First Aid/CPR/AED trained individual must be on site during work operations. All employees shall be instructed in the proper chain of command for reporting emergencies. 9-1-1 may be called at any time for an emergency by anybody on site. Each trade subcontractor and tiered subcontractor shall maintain a Cal/OSHA approved First Aid Kit on the Project at all times. An investigation will be conducted by the controlling employer's Project Management, Supervisor and SSM/DSP, under the direction of Webcor/Obayashi Joint Venture Project Management and SSM.

Reporting and documenting all accidents, incidents and near misses, is extremely important to track trends and investigate possible root causes. All on-site incidents, accidents and near misses shall be reported to Webcor/Obayashi Joint Venture Project Management and SSM immediately. All accidents resulting in industrial injuries or illnesses occurring on the jobsite will be thoroughly investigated. Completion of appropriate forms, as defined in the [Incident Reporting Instruction](#) section must be completed and submitted immediately after occurrence. Depending on the severity of the incident a [Detailed Incident Analysis \(DIA\)](#) may take place.

The scene shall be left *as is* for investigation purposes as well as safeguarded to ensure the safety of other nearby workers until Webcor/Obayashi Joint Venture Management Team releases it. Identification and review process of root causes shall be completed. Corrective actions, identification of persons responsible for corrective actions, and date of completion must be established. Follow up documentation verifying corrective action completion is required. Lessons learned from the DIA reviews will be shared with the project.

OSHA and the National Safety Council (NSC) define the following:

“Accident - The National Safety Council defines an accident as an undesired event that results in personal injury or property damage.

Incident - An incident is an unplanned, undesired event that adversely affects completion of a task.

Near Miss - Near misses describe incidents where no property was damaged and no personal injury sustained, but where, given a slight shift in time or position, damage and/or injury easily could have occurred.”

([osha.gov](http://osha.gov))

## **Near Miss**

A near miss is an unplanned event that does not result in injury or property damage.

## **First Aid**

A first aid case is one where a person is injured requiring minor first aid treatment that does not require medical attention or prescription medication.

## Minor Injuries

Minor injuries are those which require only immediate first-aid treatment and do not result in modified work or lost work days.

## Major Injuries

A significant accident is where personal injury is sustained or tangible property loss is sustained, or where the event posed a significant threat of loss or personal injury. Major injuries or illness may be those which require extended medical treatment, hospitalization resulting in loss of work time, or result in death, disfigurement, or dismemberment.

In the event of a major injury, emergency vehicles shall be directed to enter the Project at a site entrance that will be determined as conditions change on the logistic map. Upon entering the project, the emergency personnel shall be directed to the exact location of the injured person/s. While awaiting arrival of the Emergency Vehicle(s), the injured shall not be moved unless he/she is in immediate danger of additional injury in his/her current location. Equipment and material involved in or responsible for the accident shall not be disturbed unless it presents an additional danger to the injured person(s).

Immediately after the accident, Webcor/Obayashi Joint Venture Management team will meet with the responsible trade subcontractor's Superintendent and/or Foremen, review the conditions, and direct the appropriate corrective action. The trade subcontractor is responsible for ensuring the injured employee/s are escorted to and from medical facilities, reporting employee/s condition to Webcor/Obayashi Joint Venture regularly and completing and submitting a copy of all required incident reports to Webcor/Obayashi Joint Venture SSM.

Persons who have sustained head injuries, major impacts, or whose injuries are the result of a fall shall be evaluated and stabilized by a professional medical personnel and provided transportation to the medical facility. Upon return from treatment, the employee shall return to work ONLY if so released in writing by the attending physician. If required by law, injury notification to OSHA must be coordinated through the Webcor/Obayashi Joint Venture Corporate Safety Director.

Within 24 hours of a major injury, Webcor/Obayashi Joint Venture shall conduct a Safety Meeting with attendance required of all jobsite personnel.

The recommended local Emergency Medical Facilities are:

**St. Francis Health Center**  
24 Willie Mays Plaza  
San Francisco, CA 94107-2134  
(415) 972-2249

**St. Francis Memorial Hospital**  
900 Hyde St  
San Francisco, CA 94109  
(415) 353-6000

**SF General Hospital**  
1001 Potrero Ave  
San Francisco, CA 94110  
(415) 206-8000

## Incident Reporting

*This Section will conform to Specification Sections 01 13 40 (1.5 A thru C) 01 15 45 (1.9 A thru C) found in The Transbay Transit Center Contract Number 08-04-CMGC-000*

A TJPA Representative will inform Contractors of any additional hazardous condition encountered in writing. Trade subcontractor shall respond indicating their action or disposition of the matter by returning

an annotated copy of the written communication to the TJPA Representative within three (3) days. If death, serious injury, multiple injuries or serious damages occur, the accident shall be reported at once by telephone or messenger to the TJPA as well as to the proper governing authorities. In addition, trade subcontractors shall promptly report in writing to the TJPA all accidents whatsoever arising out of or in connection with the performance of the work whether on or adjacent to the site, giving full details and statements of witnesses. Within three (3) days of occurrence, the trade subcontractor shall provide the TJPA with two (2) copies of the trade subcontractor's accident and near-miss reports.

If a claim is made by anyone against the any trade subcontractor on account of any accident, the trade subcontractor shall promptly report the facts in writing to the TJPA, giving full details of the claim. Contractor shall provide the TJPA Representative copies of any laboratory test data, and medical monitoring results for record and evaluation within three (3) days of receipt of the above information or upon the request of the TJPA Representative.

All incidents, accidents and near misses shall be immediately reported to Webcor/Obayashi Joint Venture Project Management/SSM and fully investigated. Investigation shall be completed to identify the possible contributing factors and the corrective actions. A DIA will be completed for major injuries, severe property damage and as needed per Webcor/Obayashi Joint Venture Management Team. Trade subcontractors shall complete required incident packages and return them to Webcor/Obayashi Joint Venture SSM within 24-hours.

### **Accident Investigation**

The initial accident investigation is to be completed within 24 hours, with immediate notification of Webcor/Obayashi Joint Venture safety. Identification and review process of contributing factors of the accident, incident or near miss must be completed. Corrective actions, identification of persons responsible for corrective actions, and date of completion must be established. Follow up documentation verifying corrective action completion is required. Lessons learned from a DIA may be shared with the project, regionally and globally.

### **Detailed Incident Analysis (DIA)**

To identify details in incidents, accidents, near misses and at-risk behavior Webcor/Obayashi Joint Venture and trade subcontractor management will be required to, within 48 hours of the incident, conduct a Detailed Incident Analysis (DIA). The DIA will analyze any accidents, incident, near misses, environmental incident, or impact to existing facilities and operations. Accident trends will be identified and plans developed to prevent additional incidents from occurring. The DIA will be performed involving at least the Webcor/Obayashi Joint Venture Manager and SSM and trade subcontractor project teams. The mission of these meetings will be to identify problem areas, develop specific action plan(s) to address contributing factors and to immediately implement corrective actions. Webcor/Obayashi Joint Venture will periodically review implemented plans for effectiveness. Lessons learned from the DIA will be shared with the project, regionally and globally.

## **Responsibilities for Safety & Loss Control**

The objective of this Project Safety Overview (PSO) is to establish that safety and health must be addressed throughout the entire project. The prevention of accidents and protection of property are company values and are integral to our success. All safety issues shall receive active support and participation by the entire project team.

The principles of safety and loss control are intended to prevent injuries on the jobsite and to reduce the potential for damage to property and equipment. No phase of construction is of greater importance than incident and accident prevention.

Planning for safety starts with project design and continues through purchasing, fabrication and construction in all phases of the project. Practical steps will be taken to maintain an injury free environment. All trade subcontractors must accept responsibility for preventing accidents and be responsible for thorough safety and loss control training and instruction for their workers.

The primary objective of the Webcor/Obayashi Joint Venture PSO is to coordinate the elimination or reduction of risk associated with the construction of the project. Associated missions are to promote safe work practices/behaviors, prevent accidents, prevent worker injuries, prevent damage to property, and promote maximum efficiency and effect savings by reducing unplanned business interruptions.

Active participation by Webcor/Obayashi Joint Venture management, trade subcontractors, tiered subcontractors and all workers will make the program effective and successful by coordinating the participants' efforts in performing the following tasks:

- Providing a safe environment in which workers can perform high quality work.
- Using [Job Hazard Analysis \(JHA\)](#) as a tool to reduce injury to persons and property.
- Conduct jobsite safety audits to locate and abate unsafe work practices/behaviors and unsafe conditions.
- Protecting the public and property potentially affected by Webcor/Obayashi Joint Venture sites.
- Educating and training workers through new hire and site specific orientation and safety meetings.
- Task specific safety training.
- [Personal Protective Equipment \(PPE\)](#) programs.
- Immediate injury reporting and effective record keeping to maintain an up-to-date accident experience and trends analysis.
- Use of audit forms to abate deficiencies and eliminate any additional losses.

## **Webcor/Obayashi Joint Venture Responsibilities**

### **Management Team**

Webcor/Obayashi Joint Venture Management Team is responsible for construction management services for the Transbay Transit Center. The Management Team is also responsible for encouraging, reinforcing and modeling Webcor/Obayashi Joint Venture culture, including injury free environment initiatives, participating in the development and assessment of Environmental Health and Safety (EHS) leading indicators, reviewing and approving project corrective action/recovery plans. Furthermore the Management Team shall institute accountability when action plans and culture are not maintained and has the authority to stop any operations that pose a potential threat.

### **Project Manager**

The Webcor/Obayashi Joint Venture Project Manager(s) are responsible for construction management services for the Transbay Transit Center as well as determining if contract documents and specifications support the project's safety missions and objectives. The Project Manager shall also monitor trade subcontractor selection process and adherence to established guidelines, conduct periodic auditing of trade subcontractor's safety plans for compliance with the Webcor/Obayashi Joint Venture 's Environment Health & Safety Procedures (EHSP), participating in pre-task planning and trade

subcontractor pre-construction safety meetings, document weekly jobsite safety audits and support Webcor/Obayashi Joint Venture SSM for obtaining corrective actions necessary to comply with Webcor/Obayashi Joint Venture EHSP. The Project Manager must be aware of loss control and public protection requirements of the project, they must participating in fact finding, Detailed Incident Analysis (DIA), and the implementation of corrective actions. Project Manager's shall promote and support our injury free culture.

### **Superintendent**

It is the responsibility of Webcor/Obayashi Joint Venture Superintendents are to oversee safety on the jobsite. The Superintendent's EHS responsibilities include overseeing the planning and execution of all work in compliance with the Webcor/Obayashi Joint Venture EHSP and contract specifications. The Superintendent needs to be aware of loss control and public protection requirements identified in the safety specifications of the contract documents, promote and support our injury free culture and support Webcor/Obayashi Joint Venture SSM in obtaining corrective actions necessary to comply with Webcor/Obayashi Joint Venture EHSP. Furthermore, the Superintendent shall complete and review daily jobsite safety audits to ensure identified hazards are addressed in a timely manner, monitor and participate in JHA planning and shall participate in incident investigation, DIA meetings, tailgate meetings, pre-construction meetings, kick off meetings and implementation of corrective actions. Superintendents must take appropriate action to abate identified unsafe conditions and practices and document corrective actions.

### **Site Safety Manager**

The Webcor/Obayashi Joint Venture Project Site Safety Managers (SSM) has a responsibility for the safety and health on the project. The Webcor/Obayashi Joint Venture SSM is considered to be the program administrator and has the authority delegated by Webcor/Obayashi Joint Venture Corporate EHS Department to implement and promote safety as well as setting project missions and milestones goals and reporting indicators for all project personnel. Webcor/Obayashi Joint Venture SSM manager may assign all or some of these tasks to other responsible persons as appropriate.

The SSM must help ensure that the guidelines, rules and procedures in this document are followed for site work. The SSM shall be familiar with local emergency services, help ensure that the proper steps are taken in the case of emergencies when a major event resulting in a fatality, multiple injuries, or property loss occurs. The SSM is responsible for requiring that we preserve the accident scene in an "as is" condition, including any construction equipment involved, to allow for a proper investigation. The SSM must order, if necessary, the area or piece of equipment to be stabilized to preclude further injuries or loss. Furthermore, the SSM shall notify Webcor/Obayashi Joint Venture Project Manager should an OSHA inspection be required. Should citations, warnings or safety violations be issued Webcor/Obayashi Joint Venture Management Team shall receive copies within 48 hours.

The SSM will be conducting or taking the necessary steps to help ensure that tool box/tailgate safety meetings are conducted before work startup. Additional meetings may be required for specific job tasks or site activities. Webcor/Obayashi Joint Venture SSM also must help monitor the maintenance and inspection of PPE, onsite hazards, the physical condition of site personnel, and perform daily safety audits of work site activities. Furthermore the SSM shall maintain safety files, which will include training and applicable medical certifications, environmental testing and special associated training, tool box/tailgate meeting notes and rosters, safety observation/audit reports, investigation reports including near-misses, injury summaries, required safety permits, security issues, or other safety and health documentation, as applicable.

The SSM is responsible for supporting Project Management in achieving an injury, incident and impact free environment as well as reporting all accidents and incident to the Project Manager in a timely manner as well as a responsibility for overseeing development, implementation and maintenance of the project's safety program by expediting corrective action(s) to abate any observed or potential safety exposure(s) to workers. The SSM shall continuously monitor trade subcontractor's safety performance and expedite abatement action(s) report unsafe acts and conditions and notify Webcor/Obayashi Joint Venture Project Manager and Superintendent regarding advisable corrective actions.

More duties of Webcor/Obayashi Joint Venture SSM include monitoring the subcontractor's compliance with the Webcor/Obayashi Joint Venture EHSP and to help familiarize sub-contractors and trade subcontractor Project Managers, Superintendents and Supervisors with the Webcor/Obayashi Joint Venture EHSP. These individuals must be familiar with safety and health hazards to which all workers may be exposed, as well as applicable laws, regulations and safety rules and policies and how to handle emergency situations. SSM is to help assure that all workers are trained in accordance with applicable requirements and ensure that observations, inspections, recognition, evaluations and abatement of hazards are conducted on a continuous basis. If the subcontractor does not make immediate corrections after initial notification, Webcor/Obayashi Joint Venture EHS will notify the subcontractor's Project Management in writing to make prompt corrective action to help eliminate construction safety concerns, forward copies of the written notice to Webcor/Obayashi Joint Venture Project Management and develop the direction to help resolve outstanding construction safety issues and maintain documentation of corrective actions.

The SSM is responsible for ensuring a Hot Work Permit is completed prior to hot work commencing and shall keep a log of all Permits.

### **Project Engineer**

The Webcor/Obayashi Joint Venture Project Engineer assists the Webcor/Obayashi Joint Venture Project Manager with his/her responsibilities for construction management services for the project. This person will complete weekly jobsite safety audits, participate in pre-task planning, subcontractor pre-bid, pre-construction, and/or kick-off meetings, assist with jobsite safety startup, safety orientations, participate in fact finding, Detailed Incident Analysis (DIA), implementing corrective actions to prevent further occurrences on all injury/incident investigations and attend and/or participate in jobsite safety meetings.

### **Subcontractor Responsibilities**

The subcontractor has overall responsibility for accident prevention and implementation of this Webcor/Obayashi Joint Venture EHSP for anyone under their control, including their respective employees, tiered subcontractors, vendors and suppliers.

Where subcontractor is not using a Site Safety Manager (SSM) the subcontractor will assign safety responsibilities to a member of their Project Management, that person(s) will be considered a Designated Safety Person (DSP). This assignment is subject to approval by Webcor/Obayashi Joint Venture Management and Webcor/Obayashi Joint Venture SSM. The subcontractor may be responsible for providing their SSM or DSP with a reliable communication method or device in order to contact Webcor/Obayashi Joint Venture Project Management and Webcor/Obayashi Joint Venture SSM during emergency response and/or other safety related communications. Although many existing hazards may be corrected through informal communications between the trade subcontractor's and tiered subcontractor's SSM or DSP with members of Webcor/Obayashi Joint Venture Project Management, all corrective actions must be documented, with copies forwarded to Webcor/Obayashi Joint Venture Project SSM.

Subcontractors will submit a copy of their companies and their tiered subcontractors company's safety program prior to beginning work. All subcontractor workers must be orientated to their company's safety program as well as to applicable sections of this Webcor/Obayashi Joint Venture EHSP. Furthermore, subcontractors and tiered subcontractors are required to incorporate the requirements of the Webcor/Obayashi Joint Venture's EHS Plan into their safety programs and safety orientation if theirs are less protective than those of Webcor/Obayashi Joint Venture.

### **Project Manager**

The subcontractor's Project Manager is responsible for planning and monitoring all work performed in compliance with the objectives of this Webcor/Obayashi Joint Venture EHSP, trade subcontractor's safety program, federal, state and local safety and health regulations. Authorizing immediate correction of any existing construction safety-related concerns, fully supporting the SSM or DSP and cooperating with all designated project safety personnel in obtaining corrective actions necessary to comply with the Webcor/Obayashi Joint Venture EHSP. Furthermore, trade subcontractors Project Managers shall complete weekly safety audits, participate in pre-task planning and subcontractor kick-off meetings, participating in fact finding, DIA, and resolution on all injury/incident investigations as well as when requested, attend special construction safety meetings.

### **Superintendent/Supervision/Foremen**

Responsibilities of the trade's subcontractor Superintendent/Supervisor/Foremen are the same as Webcor/Obayashi Joint Venture Superintendent/Supervisor/Foremen and they shall attend weekly contractors' safety meetings.

All supervisory personnel shall have as a minimum the OSHA 30 Hour Construction Safety training within the prior four years and possess a current CPR /First Aid and AED certification. In addition supervisory personnel shall have at a minimum 5 years' experience as a superintendent in a similar type of project.

### **Site Safety Manager / Designated Safety Person**

Every trade subcontractor employing **40** or more workers, including their lower tier sub-subcontract employees, must provide a full-time SSM/DSP that has no other job duties and is present on the project anytime work is being performed. An additional DSP shall be required for each additional **60** workers thereafter. Subcontractor shall also provide EHS Administrative support personnel as necessary to implement their EHS program. Contractor reserves the right to determine appropriate qualifications for Subcontractor's SSM/DSP personnel, based on project demands and reserves the right to interview candidates to determine qualifications.

The SSM/DSP shall be current in First aid/CPR/AED and hold a Construction Health and Safety Technician (CHST) and OSHA 500 certificate and have three (3) years prior full time safety duty experience working on a similar type of project at a minimum. The SSM / DSP is responsible for ensuring a Hot Work Permit is completed prior to hot work commencing. The Fire Safety Manager shall keep a log of all Permits. Subcontractors SSM shall serve as technical advisors to their project management team on safety and health planning, training and problem resolution issues.

The SSM/DSP shall report all incidents and injuries immediately to Webcor/Obayashi Joint Venture Project Management and SSM. In the event of an accident or injury the trade subcontractors Project Manager and SSM shall complete and forward all claim forms; injury, liability, property damage, and the

like, to Webcor/Obayashi Joint Venture SSM immediately. The SSM shall participate in accident investigations and recommend proper courses of corrective action. When serious accidents occur, this task will be performed in conjunction with Webcor/Obayashi Joint Venture SSM and Webcor/Obayashi Joint Venture and the subcontractor Project Management or their representatives. Each SSM/DSP has the right and authority to stop any and all hazardous work activities being performed by his/her company or their subcontractors until necessary corrective actions are taken or if there is an immediate danger to life and/or health present.

The SSM/DSP shall perform continuous safety audits of all their respective trade subcontractors and their tiered subcontractors' work areas throughout the entire workday and take immediate action to eliminate all unsafe acts and/or conditions. These observations, along with corrective actions taken shall be reported in writing to the appropriate member of Webcor/Obayashi Joint Venture Project Management, SSM and the subcontractor's own management. The SSM/DSP shall ensure that prior to the commencement of any work activity every Supervisor/Foreman reviews each task assignment with every affected employee to ensure a comprehensive understanding of the safety requirements and precautions to be followed while performing this work. This shall be documented using a JHA. The SSM/DSP shall ensure that appropriate PPE is provided and its use enforced, ensure that all of the necessary guards are in place, safety equipment is provided, and other required steps are taken prior to starting the work.

The SSM / DSP shall attend and participate in required safety meetings. The SSM / DSP shall provide appropriate materials for those conducting weekly tool box/tailgate meetings or safety meetings, as well as, review safety meeting reports for attendance and implement required safety training programs for subcontractor employees and supervisors. The SSM / DSP shall enforce their company's safety program and disciplinary procedures, accompany Webcor/Obayashi Joint Venture's supervisory personnel as directed and perform joint inspections of work areas and activities, orient all new personnel to the site's safety program prior to work commencement and the SSM/DSP are subject to Webcor/Obayashi Joint Venture's approval and may be removed at any time with or without cause and replacement personnel shall be provided at the subcontractor's / employer's expense.

### **Everyone's Responsibilities**

Everyone has the ability to stop work for safety reasons. Everyone shall report injuries, near misses, unsafe acts and conditions immediately to supervision. Everyone shall work according to good safety practices as posted, instructed and discussed. Everyone shall comply with Webcor/Obayashi Joint Venture EHSP and subcontractor's safety program. The use of all required safety devices shall be used. Everyone shall come to work alert and free of any impairment that may affect safety. Everyone is to keep their work areas clean and orderly as well as promote and support the Injury Free Environment. Everyone agrees to be held accountable for your safety, and the safety of others. Furthermore, everyone is held accountable for their designated assignments of responsibilities as denoted in their respective definitions. Refrain from performing any work which may feel unsafe or for which proper equipment and/or training have not been provided. Everyone has the right to stop work when an unsafe condition or act occurs.

### **Weekly Safety Meetings**

Trade subcontractors and tiered subcontractors are required to hold Weekly Safety "Tool Box" Meetings with their field crews. Copies of the meeting minutes and attendees shall be submitted to Webcor/Obayashi SSM at the end of each week. Webcor/Obayashi Joint Venture may provide assistance and information to trade subcontractors and their tiered subcontractors as requested.

In addition, subcontractors and tiered subcontractors are to attend monthly or whenever determined by Webcor/Obayashi Joint Venture all hands safety meeting.

## Pre-Task Planning

Pre-planning tasks has been proven to reduce incident and accidents. All workers engaged in a specific task are required to participate in pre-planning activities. Every worker has the right to stop work and contact management if unsafe acts or conditions occur.

## Job Hazard Analysis (JHA) Guidelines

A JHA is to be conducted daily, led by the Supervisor of the crew, documented in writing and signed by all crew members prior to starting work. JHA's shall include hazards relating to the task being done and the plan of actions the crew shall take to mitigate that hazard from occurring.

The JHA shall be readily available at the work site and posted and/or placed where crew members have knowledge of its location at the work area. JHA's should be reviewed and revised whenever work conditions or crew membership change that may affect the ability to safely complete the work.

A JHA is required for the following activities (at a minimum):

• Chemicals: hazardous & irritant	• Concrete: pre-cast, tilt up, vertical, form work
• Confined Space	• Hoisting & Rigging activities
• Demolition	• Framing activities
• Excavation & Trenching	• Fall Hazards: elevated work, overhead work
• Material Handling	• Non-routine activities
• Public Exposure	• Scaffolding
• Steel Erection	• Startup/Shut down/ System testing
• Working with hazardous materials	• Introducing chemicals into systems

## Safety & Health Training/Information

*This Section will conform to Specification Section 01 15 45 (1.10A) found in The Transbay Transit Center Contract Number 08-04-CMGC-000*

Trade subcontractors and their tiered subcontractors shall maintain, on-site, all training records in accordance with federal, state, and local statutes, regulations, and policies, and provide copies of these records to Webcor/Obayashi Joint Venture Management and the TJPA upon request.

New workers will be provided with initial training and/or orientation prior to assignment or when assigned to a new task for which training has not been received. Training will include general area and specific assignment topics. Refresher training will be provided in accordance with Federal/State OSHA guidelines. Completed training records are to be submitted to Webcor/Obayashi Joint Venture SSM in a timely manner. Supervisors are expected to be knowledgeable and informed on hazards and safe work practices in their area of responsibility and to coordinate the disbursement of this information to crews.

Training may include, but not be limited to:

• Aerial / Boom Lifts	• Asbestos awareness
• Confined Space	• CPR / 1 <sup>ST</sup> aid / AED
• Electrical	• Excavation & Trenching

• Fall Protection	• Fire Watch
• Forklift	• Hazard Communication
• Hazardous Chemicals	• Ladder
• Lasers	• Lead Awareness
• Lockout / Tagout (LOTO)	• Powder Actuated Tools
• Respirator Protection	• Rigging
• Scaffolding: Use & Erection / Dismantle	• Steel Erection
• Job Hazard Analysis	• Accident Investigation (Management)

## Code of Safe Conduct and Work Practices

The following Safety Procedures will be complied with on the Transbay Transit Center project. These Safety Procedures are in accordance with Webcor/Obayashi Joint Venture Safety Program, the TJPA and the division of Industrial Safety Cal/OSHA Construction Safety Orders.

### General

All subcontractors must submit their Company's Project Safety Program to the Project Site Safety Manager (SSM) prior to the start of their work. As a minimum, the subcontractor's Safety Program shall meet or exceed Webcor/Obayashi Joint Venture safety requirements, the applicable parts of the Webcor/Obayashi Joint Venture Corporate Safety Manual, the contract documents and federal, state, local or other applicable regulations.

Prior to trade subcontractors arrival, measures to identify, monitor and control the workers and the general public from identified hazards shall be included in their safety plans. The Program shall be reviewed by the Webcor/Obayashi SSM who may require additional written Safety Procedures and training records as may be necessary to address the potential hazards of the operations.

### Personal Protective Equipment (PPE)

All persons entering the work area shall wear the proper PPE at all times.

#### Hardhats

All persons entering the work area on this project are required to wear ANSI Z89.1 approved hardhats. 100% hardhats use is required at all times while on this project. Any person refusing to wear a hardhat will be immediately dismissed from the project site. Metal hardhats and "Cowboy" hardhats are not allowed to be worn.

#### Eye Protection

The wearing of eye protection will be strictly enforced at all times. 100% safety glasses use is required at all times while on the project. ANSI approved prescription glasses with side shield are acceptable as well as ANSI approved goggles.

#### Hearing Protection

Each trade subcontractor shall provide and enforce the use of hearing protection for all workers exposed to noise levels exceeding 85 decibels (db). Where hearing protection is required, signs stating so shall be posted.

## **Hand Protection**

Hand protection must be worn 100% of the time in any situation where hand/finger exposure to hazards exists, unless the manufacture of the equipment/material being used states gloves should not be worn. Supervisory Positions, Visitors, and Observers of work are not required to wear hand protection 100% of the time as they are not performing work, but must have gloves readily available in case a situation where hand/finger exposure to hazards arises.

## **Clothing & Foot Protection**

All personnel shall wear safety vests, work boots or acceptable work shoes while employed on this project and keep their clothing and footwear in good condition at all times. Long pants and shirts with “T-shirt-length sleeves or longer shall be worn at all times. No sneakers, tennis shoes, soft-suede/canvas hiking boots, shorts, tank tops, tattered clothing etc., will be allowed.

Additional foot protection shall be used with jumping jack compactors and jackhammers.

## **Safety Disciplinary Policy**

Under Webcor/Obayashi Joint Venture, all employees are required to follow company safety policies and operating procedures. When needed, employees will be provided with additional training and information, or retraining to maintain their knowledge.

Although Webcor/Obayashi Joint Venture reserves the right to discharge “at will,” we believe that employees found performing work in an unsafe manner that would endanger the employee or another employee shall be subject to discipline or termination by management. Webcor/Obayashi Joint Venture strictly maintains a zero tolerance policy towards violations involving, but not restricted to: fall protection, lock-out/tag-out, and confined space violations. The Webcor/Obayashi Joint Venture Project Management and SSM shall determine the course of action best suited to the circumstances. The steps to be taken at a minimum shall include the following:

*Verbal Warning* – As the first step in correcting unacceptable behavior, the Supervisor shall review the pertinent facts with the employee. The Supervisor will consider the severity of the problem, and the employee’s past performance. A verbal warning will be issued to the employee, if necessary; the employee will be placed on probation.

*Written Warning* – If the unacceptable performance continues, the next step will be a written warning. The written warning will clearly state the safety policy that was violated. Probation will be a part of the written warning. It may also include time off without pay. At the completion of the probationary period, the Supervisor will meet with the employee to determine if the employee has achieved the required level of performance.

*Termination* – The employee may be terminated if said employee does not improve their performance while on probation, or has violated another company safety policy within twelve (12) months.

## **Dismissal from Project**

The following is prohibited and the individual(s) engaging in such activity(s) may be subject to dismissal from this project:

- Fighting and horseplay.
- Alcohol consumption or controlled-substance use on the site.

- Crowding or pushing while accessing work levels on ladders, scaffolds, etc.
- Throwing trash or any objects from heights.
- Using fire equipment irresponsibly.
- Destroying property or the work of other trades.
- Stealing.
- Gambling on the project site.
- Unsafe work habits.
- Persons using prescribed medication must notify his/her employer of such use prior to going to work or taking the medication.
- Working while your ability or alertness is so impaired by illness or fatigue or other causes that it might unnecessarily expose you or others to injury.
- Noncompliance of any safety rules or regulations.
- Lewd or abusive language towards jobsite personnel, Owner's personnel, or any member of the public.
- Smoking Cigarettes/E-Cigarettes in unauthorized areas

## **Job Vehicular Traffic**

Only company-owned vehicles with signage are continuously required for the pursuit of trade subcontractor's and tiered subcontractor's work, and trucks delivering materials may be allowed access to the project site. All construction vehicle traffic access will be coordinated by Webcor/Obayashi Joint Venture.

There is no trade subcontractor or tiered subcontractor onsite parking on this project. Trade subcontractors and tiered subcontractors in violation of this request will be towed at their expense without further notice.

Subcontractors are to notify Webcor/Obayashi Joint Venture 48 hours in advance for approval of material deliveries. Material storage and layout must be approved by Webcor/Obayashi Joint Venture prior to delivery. Delivery vehicles will unload and depart the project site as soon as possible with the assistance of a qualified flagger to ensure pedestrian and vehicular traffic is controlled.

Subcontractors are reminded that continuous 2-way vehicular traffic must be maintained at all times for safe public accessibility unless posted otherwise. Two-way traffic control is to be provided by trade subcontractors prior to delivery vehicles entering the property.

Due to general liability exposure created by improper traffic control, all flagging, training, lane closures, etc. shall conform to the most current edition of the Manual on Uniform Traffic Control Devices (MUTCD). Local permitting issues shall be addressed by Webcor/Obayashi Joint Venture prior to the start of work. All workers in the traffic control area must be trained according to local, state and federal requirements and wear the appropriate reflective vest or high visibility clothing. Stop/Slow paddles shall be used to control traffic flow.

## **Temporary Offices**

Temporary offices will be constructed of fire-resistant materials only and heated with approved fire-safe heating devices in accordance with manufacturers' instructions. Shall be equipped with a minimum of one 20lb ABC fire extinguisher and shall have a 40-gallon waste container adjacent to it. Temporary office locations must be approved by Webcor/Obayashi Joint Venture prior to installation.

## **Fire Protection**

The purpose of the Fire Protection is to reduce to a minimum the possibility of fire damage and associated losses incurred during the construction of the Project. The following is a guide to be used on the Project to aid in preventing the spreading of materials loosed by fires and gases associated with combustion.

Appropriate action is the key to the prevention of loss of life and property damage. Emergency phone numbers will be posted in such a manner so as to be clearly visible. If a fire occurs, notify the local fire department and Webcor/Obayashi Joint Venture Management Team immediately. Extinguish fire with a noncombustible, such as sand, or an available fire extinguisher if properly trained to do so. Remove or shut off fuel supply and combustible material if trained and safe to do so.

### **General Fire Safety**

- All temporary electric service, equipment, and wiring must be in accordance with Cal OSHA and NFPA 70, National Electric Code.
- Storage of any material within ten (10) feet of fire hydrants is strictly prohibited.
- Work areas shall be inspected on a regular basis to prevent accumulation of material.
  - All combustible waste material, dust, and debris shall be removed from the building and its immediate vicinity at the end of each work shift, or more frequently as necessary, for safe operations.
- No motors or machinery shall be left running during nonworking hours except as specifically directed by Webcor/Obayashi Joint Venture.
- All heating equipment shall have necessary Safety devices and shall be operated according to all applicable codes, rules and regulations, and manufacturers' instructions.
- All tarps and blankets shall be of fire-retardant material.
- All fuel and solvent containers shall be in approved containers and placed on drip pans.
  - Storage of these materials shall be in accordance with product Safety Data Sheet (SDS), statutory Hazardous Material requirements, and Fire Department requirements.
- No open or burning fires shall be permitted onsite.
  - Anyone doing so will be subject to immediate dismissal.
- No solid fuel shall be permitted on the site.
- Fire extinguishers shall be placed and maintained on the job in conspicuous and identified locations.
  - These fire extinguishers shall not be moved or discharged, except for fighting a fire.
- All gas bottles, such as propane, oxygen, and acetylene, shall be stored and secured in a vertical position in areas designated by Webcor/Obayashi Joint Venture.
  - All stored bottles shall be capped.
  - Oxygen and acetylene will not be stored within 20 feet of each other or must be separated by a one-half-hour-rated fire barrier.
  - At no time during construction shall propane or LPG be stored inside of a structure or building.
- All oxygen and acetylene in use shall be in proper carts with required separations and with at minimum a 10lb ABC fire extinguisher.
- During welding or cutting operations, a hot work permit and a fire watch with the proper fire extinguisher will be required and shall be the responsibility of the subcontractor or its tired subcontractor performing the work.
  - Hot work permits can be obtained from the SSM/DSP.

- Each trade is responsible for providing fire extinguishers and a fire-watch program for their work as required.

### **Hot Work Activities**

When all fire prevention measures are taken, permits shall be authorized for the work. New construction work shall require the presence of a dedicated fire extinguisher (20lb, ABC), provided by the trade subcontractor performing the work, and any other preventive measures as may be necessary for protection of life and property such as but not limited to fire blankets and water supply.

The trade subcontractor and the SSM/DSP shall ensure that the surrounding area(s) are free of combustible material. When the work is of the nature that hot material may fall to areas below, the trade subcontractor and the SSM/DSP shall ensure that those areas are free of combustible material or material that may otherwise be damaged. Work in place must be protected by the trade subcontractor performing the work.

Each trade subcontractor and tiered subcontractor shall notify Webcor/Obayashi Joint Venture of proposed Hot Work activities through a Welding/Cutting Permit. The SSM/DSP shall review the Permit form with the trade subcontractor to assure that all areas of concern are accounted for in fire protection. Hot Work shall not be performed near fuel storage areas or other areas where combustible vapors may accumulate.

In occupied building, Hot Work shall not be performed in occupied buildings without notification of the local Fire Department responding agency. The fire suppression system for the building must be in operation. The appropriate Building or Department Managers must be notified and the work coordinated with their operations. Preparation for the work and clearing of combustible materials shall be in accordance with federal and state standards. Combustible material shall be cleared from the work area by a distance of 35 feet.

### **Material Handling**

Housekeeping is an extremely important contributing factor for ensuring the safety and health in the workplace. Keeping aisles and passageways clear to provide for the free and safe movement of material handling equipment and employees is of the utmost importance. Other important contributing factors to ensure a safe working environment is as follows:

- Wear proper PPE at all times while handling material, equipment and tools.
- Post conspicuously the maximum safe load limits of floors within buildings and structures, in pounds per square foot, in all storage areas, except for floor or slab on grade.
  - Do not exceed the maximum safe loads.
- Do not store materials on scaffolds or runways in excess of supplies needed for immediate operations.
- Use ramps, blocking, or grading when a difference in road or working levels exists to ensure the safe movement of vehicles between the two levels.
- Do not place materials stored inside buildings under construction within six (6) feet of any hoist way or inside floor openings, or within ten (10) feet of an exterior wall which does not extend above the top of the material stored.
- Do not drop or throw blocks from an elevation or deliver blocks through chutes.
- Remove all nails from used lumber before stacking.
- When bending reinforcing steel on the job, use a strong bench set up on even dry ground or a floor to work on.

- Do not remove frozen material in a manner that would produce an overhang.
- Use proper lifting techniques.
- Stacking Material
  - Make sure that all materials stored in tiers are stacked, racked, blocked, interlocked, or otherwise secured to prevent sliding, falling, or collapse.
  - Stack bagged materials by stepping back the layers and cross-keying the bags at least every ten bags high.
  - When bags are removed from the pile, keep the length of the pile at an even height and maintain the necessary step backs every five bags.
  - When stacking inside a building, distribute the piles to prevent overloading the floor.
  - If not racked, stack and block structural steel, poles, pipe, bar stock, and other cylindrical materials as to prevent spreading or tilting.
  - Carefully pile structural steel to prevent danger of members rolling off or the pile toppling over.
  - Keep structural steel in low piles, giving consideration to the sequence of use of its members.
  - Stack corrugated and flat iron in flat piles, with the piles not more than 4 feet high; place spacing strips between each bundle.
  - Frequently inspect stock piles of sand, gravel, and crushed stone to prevent their becoming unsafe by continued adding to or withdrawing from the stock.
- Stacking Lumber
  - Do not stack lumber more than 20 feet high; if handling lumber manually, do not stack more than 16 feet high.
  - Stack lumber on level and solidly supported sills, and such that the stack is stable and self-supporting.
  - Stack stored lumber on timber sills to keep it off the ground. Sills must be placed level on solid supports.
  - Place cross strips in the stacks when they are stacked more than 4 feet high.
- Stacking Bricks
  - Do not stack bricks more than 7 feet high. When a loose brick stack reaches a height of 4 feet, taper it back 2 inches for every foot of height above the 4-foot level.
  - Never stack bricks, for storage purposes, on scaffolds or runways.
  - Always stack blocks; do not throw in a loose pile.
  - When stacking masonry blocks higher than 6 feet, taper back the stack one-half block per tier above the 6-foot level.
- Cement Bags
  - Carefully handle cement and lime delivered in paper bags to prevent the bags from bursting.
  - Do not pile cement and lime bags more than ten bags high except when stored in bins or enclosures built for the purpose of storage
  - When handling cement and lime bags, wear eye protection preventing any contact with the substance (such as goggles or other sealed eye protection) and wear long sleeve shirts with close fitting collar and cuffs.
  - Do not wear clothing that has become hard and stiff with cement.
  - Make sure to report any susceptibility of skin to cement and lime burns.
  - Make sure that a hand cream or Vaseline and eyewash is provided and kept ready for use to prevent burns.

- Store lime in a dry place to prevent a premature slacking action that may cause fire

## **Cleanup and Housekeeping**

Trade subcontractors and tired sub-subcontractors shall leave the site clean and free of debris and hazardous materials by the end of each working day to the satisfaction of Webcor/Obayashi Joint Venture. Each subcontractor is responsible for removal of debris created by their work. Rubbish containers will be placed at a central location for the removal of trash and debris. Accumulation of trash and debris will not be tolerated. Webcor/Obayashi Joint Venture will perform necessary cleanup of same, at trade subcontractors' expense, upon failure to comply with cleanup notice request.

Ensure compliance with local fire regulations if disposing of waste material or debris by burning. Remove all scrap lumber, waste material, and rubbish from the immediate work area as the work progresses. Keep all solvent waste, oily rags, and flammable liquids in fire-resistant covered containers until removed from the work site.

Whenever materials are dropped more than 20 feet to any point lying outside the exterior walls of the building, use an enclosed chute of wood or equivalent material. When debris is dropped without the use of chutes, make sure that the area onto which the material is dropped is completely enclosed with barricades at least 42 inches high and 20 feet back from the projected edge of the opening above. Post at each level warning signs of the hazard of falling materials. Do not remove debris in this lower area until debris handling ceases above.

## **Security Services**

Trade subcontractors and tired sub-subcontractors shall be responsible for the security of toolboxes, onsite storage materials, etc.

## **Noise Control**

*This Section will conform to Specification Section 01 35 65 (1.2E) (1.8B), (1.8C) found in The Transbay Transit Center Contract Number 08-04-CMGC-000*

Trade subcontractors shall conduct noise inspections and noise testing of equipment to ensure that all equipment on site is in good condition and effectively muffled per manufacturer's recommendation. Noise control shall be maintained by the trade subcontractors in all areas of construction, guarding against undue noise.

All motor-drive equipment shall have a proper exhaust system, which shall meet Cal/OSHA Standards on noise levels. Subcontractors are to post signage and provide proper hearing protection to employees using chipping guns, jackhammers, rock drills, or similar devices where the decibel level exceeds 85 and double hearing protection as required by state law.

Playing of radios, including headsets, is prohibited.

## **Combustible Material**

Separate storage areas for acetylene, oxygen, and gasoline will be established by Webcor/Obayashi Joint Venture. The trade subcontractor shall post proper warning signs where combustible material is being used or stored. All gasoline will be in containers that meet NFPA and Cal/OSHA requirements, and will be stored in designated areas only.

All acetylene and oxygen bottles shall be secure and in a vertical position. All carts must be equipped with a fire extinguisher. All stored oxygen and acetylene must be separated from each other, by a minimum of 20 feet or a fire-rated barrier, with bottle caps secured in place as required by Cal/OSHA.

## **Crane**

The safe operation and proper maintenance of cranes and rigging on the site shall be the overall responsibility of the trade subcontractor. Each trade subcontractor shall also be held accountable for compliance with CAL/OSHA crane regulations for all cranes or derricks on the site, whether contractor owned, leased or rented. All rigging inspection logs shall be completed and submitted to Webcor/Obayashi Joint Venture SSM monthly.

A thorough inspection by a certified independent 3<sup>rd</sup> party company shall be conducted prior to initial use and post repair of a crane or derrick. Any deficiencies found shall be corrected before the equipment is placed into service. A copy of the annual certification inspection performed by a certified independent 3<sup>rd</sup> party shall be submitted to the Webcor/Obayashi Joint Venture SSM prior to the crane being operated on site.

Each contractor shall designate a competent person who shall inspect all cranes and derricks daily as part of the trade subcontractor's job site inspection program. Such inspections shall be documented and submitted to Webcor/Obayashi Joint Venture SSM weekly. Defective equipment shall be removed from service and repaired; service/repair shall be documented and submitted to Webcor/Obayashi Joint Venture SSM.

Loads shall not be passed or suspended over persons. Routes of suspended loads shall be preplanned to ensure no workers or the public are directly below suspended loads. Lifts shall not be conducted over employees, visitors, or areas occupied by the public. Tag lines shall be used for controlling all loads. Tag lines or guide ropes shall be used to control all loads. Accessible areas within the swing radius of the rotating superstructure shall be properly barricaded to prevent employees from being struck or crushed by the crane.

## **Crane Lift Plan**

A complete, competent and Webcor/Obayashi Joint Venture approved Crane Lift Plan is required prior to any crane lift while working. The Crane Lift Plan must be submitted to Webcor/Obayashi Joint Venture 48 hours (2 business days) prior to mobilization at a minimum. Neither TJPA nor Webcor/Obayashi Joint Venture shall be held responsible for any delay allegations as a result of the trade subcontractor failing to submit Crane Lift Plans on a timely basis. The Trade Subcontractor / Crane Company / Rigging Company is responsible for the accuracy of all calculations and inspections. This planning process has been established to help ensure proper coordination between trade subcontractors and Webcor/Obayashi Joint Venture. No warranty or certification of the suitability of this plan is accepted by Webcor/Obayashi Joint Venture.

The Crane Lift Plans must be based on a “worst case” combination of load weight with chart deductions and lift radius for a specific crane configuration in a specific location. Work that is not anticipated but may arise due to site conditions (moving equipment, loading materials onto floors, etc.) must be reviewed with Webcor/Obayashi Joint Venture prior to hoisting. Changes affecting crane configuration may require the Crane Lift Plan to be amended.

Lifts exceeding 75% of the cranes stability / structural capacity chart, requiring movement of a crane carriage with the load, personnel platforms, critical loads (long lead time, cost), tripping loads, work over occupied facilities, or work involving encroachment on public rights of way, will require the preparation, submittal and review of a specific JHA (Note: These lifts are discouraged). These lifts must be reviewed in advance. The Crane Lift Plan(s) may have to be prepared and stamped by a licensed Professional Engineer to be approved by Webcor/Obayashi Joint Venture.

Attachments to the Crane Lift Plan may include but are not limited to:

- Plot plan with crane location (identify swing path, delivery truck locations, location of any overhead power lines, etc)
- Elevation plan
- Crane load charts and calculations including any notes
- Dimension illustration and specifications for crane and range chart
- Operators license, training information, USDOT medical certificate and OSHA training
- Rigging plan, lists and diagram
- Names and qualifications for designated and competent persons (crane operator, A/D Supervisor, rigger and signal person
- JHA
- Logistics and assembly / dismantle plan
- 3<sup>rd</sup> party annual inspection certification
- Weight of material
- Lighting and wind restrictions (from operators manual)

The Crane Lift Plan may be valid for more than one day, as long as the configuration, location, maximum expected load, and maximum expected radius does not change. Multiple lift plans will be required for multiple locations.

### **Responsibility**

It is the responsibility of the Trade Subcontractor and the Crane Operator to ensure that they and their employees are qualified, competent, properly equipped and properly trained to perform the activities outlined in this plan.

### **Management**

The trade subcontractor is responsible to visit the site prior to the lift date to review documentary information pertaining to the site, which is maintained by Webcor/Obayashi Joint Venture. The trade subcontractor is responsible to obtain all information that is necessary to develop a power line safety plan, if needed. Furthermore, trade subcontractors are responsible for ensuring rigging equipment is in good condition and provided with safety devices as applicable. This includes such things as safety latches on hoisting hooks, chains, wire rope and slings are free from defects and conform to standard load ratings for work being done and eye splices conform to safety standards. Trade subcontractor's employee training is current and each contractor shall ensure that all of its employees involved in crane activities receive

comprehensive training as to their responsibilities. This training shall include hand signals and those authorized to give signals. Said training shall be documented.

Each trade subcontractor shall ensure that its crane operators is not engaged in any practices that may divert their attention while engaged in crane operations, ensure the operator is physically and mentally fit for duty, responds to only clear signals and stop signals. The trade subcontractor shall ensure the operator is intimately familiar with the equipment being used and is empowered to discuss any issues with their Supervisor.

### **Operator**

Each crane operator will be specifically assigned the responsibility for safe operations and shall be given written instructions as applicable. Only designated operators who have been licensed by an approved agency or union and meet the requirements shall be in or on the crane during operations. The crane operator shall be responsible for determining the safe operation of their crane and the safety of each lift. The operator has the authority to refuse a lift due to safety concerns. For example refusing to lift any loads that are not safely rigged. Any manager, supervisor or person attempting to bypass the crane operator's authority on this issue will be immediately removed from the project. The operator shall immediately shut down the crane if the operator suspects any problems with the crane or if any part of the crane, rigging or load strikes any object. Immediately report the issue to Webcor/Obayashi Joint Venture Supervisor and SSM.

The operator is also responsible for assuring that routine maintenance is performed, as well as necessary repairs and to coordinate testing and maintenance personnel when necessary. Daily inspections shall be conducted to include but not limited to condition of brakes, functioning of safety devices and limiting devices, electric power installation, overload controls, conditions of the structural membrane and ensure a fire extinguisher is available and current.

Verification of a current annual inspection certification shall be available for the crane. Verification that manufacturer's rated load capacities, recommended operating speeds, and special warnings or instructions are posted on the crane and are visible from the operator's station. Upon request the operator may be asked to demonstrate their knowledge of the crane and the crane load chart among other items.

Responsibility for assuring that signaling and communications are adequate. This includes making sure that personnel at materials loading and receiving areas use correct hand signals. Where conditions require, radio communications will be used with a clear channel for crane operations. Making sure that adequate clearances exist between operating areas and nearby structures, especially power lines. Ensure that good housekeeping is maintained in and around the equipment. The operator shall never leave the controls while there is a load on the hook.

### **Training Requirements**

Training records must be submitted to Webcor/Obayashi Joint Venture SSM prior to the employee(s) first day on site.

Riggers shall meet the qualified rigger requirements of subpart CC – Cranes and Derricks in Construction, as specified in 29 CFR 1926.1401, 1926.1404, and 1926.1425. These provisions are effective November 8, 2010. The more stringent rule shall apply.

Operators shall meet the qualified operator requirements found in 29 CFR 1926.1427. The operator has been licensed by an approved agency or union and meet the requirements in Chapter 5, ANSI B30 and the operator has passed their physical exam conducted by a license Physician approved by the DOT.

## **Fall Protection**

Work activities that expose worker(s) to fall hazards of six (6) feet or greater measured from the work platform to the bottom of the sole of the foot are activities defined by Webcor/Obayashi Joint Venture to be High Hazard and therefore require detailed, written Job Hazard Analysis (JHA). Webcor/Obayashi Joint Venture maintains a zero tolerance policy for fall protection infractions. Anyone found violating this policy may be removed from the site immediately. All trade subcontractors shall provide appropriate fall protection at the Companies cost.

Possible conditions that may require fall protection:

- Ladders
- Aerial Lifts / Scissor Lifts
- Scaffold work
- Precast erection
- Unprotected Sides & Edges / Leading edges
- Excavations & Trenching
- Wall Openings
- Holes

Trade subcontractor are required to provide training and fall protection for their employees. This can be accomplished through the use of the following systems:

- Guardrail System
- Positioning Device System
- Warning Line System
- Personal Fall Arrest system
- Safety Net System
- Controlled Access Zone

The building perimeter cable is placed as a guardrail protection, and is not provided for tie-off protection.

Webcor/Obayashi Joint Venture does not allow the use of body belts or a Safety Monitor System.

## **Fall Protection Training**

Trade subcontractors and tiered subcontractors must provide, as a minimum, by a competent person, the following training. Documentation of training must be forwarded to Webcor/Obayashi Joint Venture upon request:

- The nature of the fall hazards in the work area.
- The correct procedure for erecting, maintaining, disassembling and inspecting the fall protection systems to be used.
- The use and operations of guardrail systems, personal fall arrest systems, safety net systems, warning line systems, controlled access zones and any other methods of protection to be used.
- The limitations on the use of mechanical equipment.
- The correct procedures for the handling and storage of equipment and materials
- The erection of overhead protection.
- The role of workers in rescue plans.

## **Rail Systems**

A standard railing should consist of a top rail, intermediate/mid-rail, toe board and posts. The top rail should be approximately 42 inches from the upper surface of the rail to the floor, platform, or ramp level. The top rail should have a smooth surface throughout its length and be made of at least 2-inch by 4-inch

stock, 3/8-inch double clamped wire rope or its equivalent. It should be secured to withstand a 200-pound, horizontal force with minimum deflection.

The midrail should be halfway between the top rail and the floor, runway, platform, or ramp. The ends of the rail should not overhang the terminal posts except when it does not constitute a projection hazard. The midrail sill should be made of at least 1-inch by 6-inch stock or its equivalent.

The toe board should have a 4-inch minimum height and should be securely fastened in place with no more than 1/4 inch clearance above the floor level.

Wooden railing posts (verticals) should be made of at least 2-inch by 4-inch stock or its equivalent, and be spaced so as not to exceed 8 feet on center.

Other types, sizes and arrangements of railing construction are acceptable, provided they meet the following requirements. Have a smooth surfaced top rail approximately 42 inches above the floor, strength to withstand the minimum of 200 pound top rail pressure with a minimum of deflection and for specific material requirements, refer to applicable regulations.

### **Guard Rail Openings**

Work that requires the opening of guardrails or the removal of hole covers shall be approved in advance by the Webcor/Obayashi Joint Venture Project Management. Particular attention shall be given to the alternate means of fall protection required to safely perform the work and protect other workers in the vicinity of the fall exposure. Those who remove the rail, are responsible for replacing it in a manner meeting or exceeding local, state, federal, or Webcor/Obayashi Joint Venture practices, whichever may be more stringent.

### **Floor & Wall Openings**

To control conditions where there is a danger of workers or materials falling through floor, roof, perimeter edges or wall openings, such openings shall be securely covered and/or protected, capable of withstand 2x the load, be secured to the floor and shall be inspected daily by the trade subcontractor competent person. Trade subcontractor's Competent Person is responsible for identifying any floor opening or hole requiring to be protected. Covers should be clearly marked "Hole Do Not Remove" in a high visible color and anchored.

For purposes of covering, a floor opening is defined as any opening from 2" up to 16 square feet. All others must be protected with top and intermediate rail and toe board. All protection systems are to be maintained at all times. Any violation that is not rectified immediately will result in removal of the responsible Supervisor. Further violations will result in termination for cause of the responsible subcontractor's contract.

The building perimeter, shafts, and floor openings shall be protected with guard rails and toe boards. Personnel working at a stationary position within 6'-0" of the building perimeter or the edge of a shaft or a floor opening will wear a full body harness and be tied off with an appropriate lifeline. Trade subcontractors and tiered subcontractors shall not remove any guard rail or fall protection device without the express consent of Webcor/Obayashi Joint Venture. Any employee removing such protection without authorization will be removed from the project without recourse. Any area where guardrails and toe boards have been removed shall not be left unattended during a shift. In no case will any guardrail or toe board be left down at the end of a shift.

In locations where temporary protection conflicts with scheduled construction, the trade subcontractor or the tiered subcontractor shall notify Webcor/Obayashi Joint Venture in advance of the work of necessary modifications. The trade subcontractor or the tiered subcontractor shall remove the temporary protection and provide other appropriate temporary measures for the performance of their work.

### **Personal Fall Arrest Systems**

Personal fall arrest systems are designed to control the fall of a worker and minimize the injury once a worker has fallen. Personal fall arrest systems consist of a full body harness, a shock absorbing lanyard or retractable, and a tie off point.

### **General Fall Protection**

- Any safety harness, lifeline or lanyard actually subjected to in-service loading must be immediately removed from service and should not be used again for worker safeguarding
- Fall arrest equipment should be removed from service when evidence of wear is detected.
- All safety harnesses, lifelines and lanyards must have a nominal breaking strength of 5,000 lbs (5,400 lbs in CA).
- All fall protection equipment shall be inspected daily/monthly and before each use, with documentation made available upon request that it is in proper working order.
- Body Harness
  -
- Lanyards
  - Retractable lifelines are preferred where direct anchorage is not available.
  - 
  - All lanyards must be equipped with locking snap hooks.
  - Appropriate shock absorbing lanyards will be used for fall protection when they do not create a greater hazard due to the length of the potential fall.
  - Shock absorbing lanyards are not to be used in combination with a retractable lanyard.
- Anchorage point
  - The anchorage (tie off point) must be capable of withstanding a minimum 5,000 lbs (5,400 lbs in CA) tensile strength per worker attached.
  - Anchorage used for attachment of personal fall arrest equipment should be secured above the point of operation whenever possible
    - Anchorage, tie off, must generally be above the worker's head.
  - Anchorage must be high enough that the worker will not strike any lower level surface or object should a fall occur.

### **Safety Nets**

The use of safety nets may be allowed only after a written fall protection plan, limited to the actual work to be performed, is reviewed and approved by Webcor/Obayashi Joint Venture. Safety nets should be provided by the trade subcontractor or tiered subcontractor when work places are more than 25 feet above the ground or other surfaces where the use of ladders, scaffolds, catch platforms, temporary floors, safety lines or safety harnesses are impractical. When safety net protection is required, operations should not be undertaken until the net is in place and has been thoroughly tested.

Safety nets should extend 8 feet beyond the edge of the work surfaces where workers are exposed and should be installed as close under the work surface as practical. In no case should the safety net be more

than 25 feet below the work surface. Nets should be hung with sufficient clearance to prevent the user's contact with surfaces or structures below. Clearances should be determined by impact load testing. The mesh size of the nets should not exceed six (6) inches by six (6) inches. All nets should meet accepted standards of 17,500 foot pounds minimum impact resistance, as determined and certified by the manufacturer, and should bear a label of proof test. Edge ropes should have a minimum breaking strength of 5,000 pounds. Forged steel safety hooks or shackles should be used to fasten the net to its supports. Connections between net panels should develop the full strength of the net.

### **Rescue Plans**

Specific plans for rescue of worker(s) should be developed and rehearsed prior to initiating work requiring the use of fall protection. Rescue plans and the basic work plan should be submitted to the Webcor/Obayashi Joint Venture Project Management and SSM for review and comment. Concerns expressed by Webcor/Obayashi Joint Venture Project Management and SSM or any other reviewing authority shall be addressed fully prior to exposing any worker to the elevated work area.

### **Falling Object Protection Systems**

Anytime a potential hazard of falling objects exists, suitable systems must be provided to protect workers. Examples of suitable fall object protection systems may include covers, toe boards, canopies and debris nets. Proper barricading shall encompass the entire possible target area.

### **Ladders**

All ladders shall be inspected prior to use and used for its intended purpose.

#### **General Ladder Safety**

- When ascending or descending a ladder, employees shall maintain three-points of contact and not carry anything that could cause them to fall. Pull ropes should be placed at all access ladders to lift tools or equipment from level to level.
- As a minimum, only type 1 or 1-A Heavy/Extra Heavy duty ladders, which carry a minimum of 275 lbs. to 300 lbs., will be allowed on Webcor/Obayashi Joint Venture projects.
- Metal ladders shall not be used on Webcor/Obayashi Joint Venture projects.
- Fall prevention shall be considered by the competent person if an employee works from a ladder 6' or more above a lower level.
- Ladders are not to be painted except for numbering purposes.
- Do not use ladders for skids, braces, workbenches, or any purpose other than climbing.
- Always face the ladder when ascending and descending.
- If you must place a ladder over a doorway, barricade the door to prevent its use and post a warning sign.
- Only one person is allowed on a ladder at a time.
- Do not jump from a ladder when descending.
- All joints between steps, rungs, and side rails must be tight.
- Safety feet must be in good working order and in place.
- Rungs must be free of grease and/or oil.
- Portable ladders must be used at such a pitch that the horizontal distance from the top support to the foot of the ladder is about one-quarter of the working length of the ladder.
- All ladders must be equipped with safety (non-skid) feet.

## Stepladders

- Do not place tools or materials on the steps or platform of a stepladder.
- Do not use the top two steps of a stepladder as a step or stand.
- Always level all four feet and lock spreaders in place.
- Do not use a stepladder as a straight ladder.

## Straight type or extension ladders

- All straight or extension ladders must extend at least three (3) feet beyond the supporting object when used as an access to an elevated work area.
- After raising the extension portion of a two or more stage ladder to the desired height, check to ensure that the safety dogs or latches are engaged.
- All extension or straight ladders must be secured or tied off at the top and bottom.

## **Scaffolds**

All scaffolds shall be constructed and maintained so as to meet all safety requirements of Cal/OSHA and Webcor/Obayashi Joint Venture. Failure to maintain scaffolds in good condition will result in removal by Webcor/Obayashi Joint Venture. All scaffolds must have top rails, mid rails, and toe boards at all platform levels. All scaffolds are to be built under the supervision of a competent person. The person's name and their qualifications shall be submitted in writing to Webcor/Obayashi Joint Venture prior to the start of work. Daily pre-shift inspection checklists shall be performed by a competent person, maintained by the trade subcontractor, available to all who access the scaffold and submitted to Webcor/Obayashi Joint Venture upon request.

A competent person shall determine if it is feasible to use fall protection devices while erecting /dismantling a scaffold. 100% fall protection is required at all heights above 6'. Rolling scaffold wheels shall be locked when in use. A horizontal, diagonal brace shall be in place to prevent the scaffold from "wracking". Cross bracing shall not be used as a top or mid rail.

## **Aerial Lifts**

Only authorized persons should operate an aerial lift, and must be trained on the equipment they will be operating. A spotter may be needed when there is a potential for operator injury due to physical contact with facility systems or structures or in congested areas. Spotters may also be needed when there is a potential for damage to sensitive facility systems or structures.

Lifts should be inspected each day prior to use to verify they are in safe working condition. Any lift that does not meet inspection guidelines shall be removed from service and either returned, replaced, or modified to meet requirements. Boom and basket load limits specified by the manufacture should not be exceeded. The brakes should be locked and when outriggers are used, they should be positioned on pads or a solid surface. Wheel chocks must be used before using an aerial lift on an incline provided they can be safely installed. Aerial lifts should have both upper and lower controls. Upper controls should be in or beside the platform within easy reach of the operator. Lower controls should provide for overriding the upper controls. Controls should be plainly marked as to their function. Lower level controls should not be operated unless permission has been obtained from the employee in the lift, except in case of emergency.

Always stand on the floor of the basket, do not sit or climb on the edge of the basket or use planks, ladders, or other devices for a work position. A body harness should be worn and a shock absorbing lanyard attached to the boom or basket when working from an aerial lift. Tying off only to recommended anchorage points.

An aerial lift truck should not be moved when the boom is elevated with personnel in the basket.

## **Scissor Lifts**

Lifts should be inspected each day prior to use to determine that they are in safe working condition. Only authorized persons should operate a scissor lift, and must be trained on the equipment they will be operating. Lifts should be operated in accordance with manufacturer's recommendations. Any lift that does not meet the required inspection guidelines shall immediately be removed from service and either returned, replaced, or modified to meet this requirement. A spotter may be needed when there is a potential for operator injury due to physical contact with facility systems or structures and in congested areas. Spotters may also be needed when there is a potential for damage to sensitive facility systems or structures.

## **Electrical**

Ground Fault Circuit Interrupter (GFCI) protection is required for all electrical cords and tools. Each trade subcontractor shall provide GFCI protected power strips for use on the site when permanent power has been energized and permanent outlets are placed in service. Each trade subcontractor shall be responsible for providing and maintaining temporary GFCI's for their employees if a GFCI receptacle is not available.

## **Lockout/Tag out Procedures (LOTO)**

Subcontractors shall submit their written LOTO program and documented employee training prior to beginning LOTO procedures. The program must include scope of training, pre-planning and specific LOTO procedures. All individuals who are working in or around the hazardous energy shall place their own lock and tag on the disconnect switch of the energy source. At no time will someone be allowed to remove another employee's lock unless it has been cleared through Webcor/Obayashi Joint Venture Competent Supervision.

## **Powder Actuated Tools**

Only low-velocity-type tools will be allowed on this project. Special permission from Webcor/Obayashi Joint Venture must be obtained before high-velocity types can be used, and then only if the job requires it. All personnel working with powder-actuated tools shall be properly instructed and licensed for operation of the tool and shall be in possession of current certification while using powder-actuated tools. Hearing protection signs, ear plugs and warning signs shall be posted in the work area where powder-actuated tools are in use.

## **Heat Illness Prevention**

Heat related illnesses are avoidable if the employees are trained and the right actions are taken before, during, and after working in either indoor or outdoor hot conditions. High temperatures, humidity, air velocity and radiant heat from the sun or a furnace can stress the body's ability to cool itself making heat illness a big concern during hot weather months. These would be considered environmental risk factors. Every employee whose job duties require them to work in the outdoors during summer months, are exposed to elevated heat conditions and therefore are susceptible to heat illness.

The three major forms of heat illnesses are: heat cramps, heat exhaustion, and heat stroke. Heat stroke can be a life threatening condition. This document will outline those actions as well as describing the three major forms of heat illness, how to recognize them, and what an action to take to provide first aid before medical care is provided. If an employee is experience heat related illness notify their Supervisor and Webcor/Obayashi Joint Venture SSM immediately.

## **Heat Cramps**

Heat cramps are the most common type of heat related injury and probably have been experienced by nearly everyone at one time or another. Heat cramps are muscle spasms which usually affect the arms, legs, or stomach. Frequently they do not occur until sometime later after work, at night, or when relaxing. Heat cramps are caused by heavy sweating, especially when water is not replaced quickly enough. Although heat cramps can be quite painful; they usually don't result in permanent damage.

Prevention/First Aid:

Drink electrolyte solutions such as Gatorade or plenty of water during the day and try eating more fruits such as bananas to help keep your body hydrated during hot weather. Call 911 and contact your supervisor immediately if the Person becomes ill.

### **Heat Exhaustion**

Heat exhaustion is more serious than heat cramps. It occurs when the body's internal temperature regulating system is overworked, but has not completely shut down. In heat exhaustion, the surface blood vessels and capillaries, which originally enlarged to cool the blood, collapse from loss of body fluids and necessary minerals. this happens when you do not drink enough fluids to replace what you are sweating away symptoms Include: Headache, heavy sweating, intense thirst, dizziness, fatigue, loss of coordination, nausea, impaired judgment, loss of appetite, hyperventilation, tingling in hands or feet, Anxiety, cool moist skin, weak and rapid pulse (120-200), and low to normal blood.

#### **Prevention/First Aid:**

The employee suffering these symptoms should be moved to a cool location such as a shaded area or air-conditioned building. Have them lie down with their feet slightly elevated. Loosen their clothing, apply cool, wet clothes or fan them. Have them drink water or electrolyte drinks. Try to cool them down, and have them checked by medical personnel. Victims of heat exhaustion should avoid strenuous activity for at least a day, and they should continue to drink water to replace lost body fluids. Call 911 if the person becomes non-responsive, refuses water, vomits, or loses consciousness.

### **Heat Stroke**

Heat stroke is a life threatening illness with a high death rate. It occurs when the body has depleted its supply of water and salt, and the victim's core body temperature rises to deadly levels. A heat stroke victim may first suffer heat cramps and/or heat exhaustion before progressing into the heat stroke stage, but this is not always the case. It should be noted that, on the job, heat stroke is sometimes mistaken for a heart attack. It is therefore very important to be able to recognize the signs and symptoms of heat stroke and to check for them anytime an employee collapses while working in a hot environment. Symptoms of heat stroke include: A high body temperature (103 degrees F); a distinct absence of sweating (usually); hot red or flushed dry skin; rapid pulse; difficulty breathing; constricted pupils; any/all the signs or symptoms of heat exhaustion such as dizziness, headache, nausea, vomiting, or confusion, and possibly more severe systems including; bizarre behavior; and high blood pressure. Advance symptoms may be seizure or convulsions, collapse, loss of consciousness and a body temperature of over 108 degrees F.

#### **Prevention/First Aid:**

It is vital to lower a heat stroke victim's body temperature. Quick actions can mean the difference between life and death. Pour water on them, fan them, or apply cold packs. Call 911 to get the person medical aid as soon as possible.

### **Guidelines for Preventing Heat Illness**

If an employee is coming back to work from an illness or an extended break or is just starting a job working in the heat, it is important to be aware that they are more vulnerable to heat stress until their body has time to adjust. The employee needs to let their Supervisor know they are not used to the heat. It takes about five (5) to seven (7) days for a body to adjust. Drinking plenty of water frequently is vital to workers exposed to the heat. An individual may produce as much as two (2) to three (3) gallons of sweat per day. In order to replenish that fluid the worker should drink three (3) to four (4) cups of water every hour starting at the beginning of your shift. Taking breaks in a cool shaded area and allowing time for recovery from the heat during the day are effective ways to avoid heat illness. Avoid or limit the use of

alcohol and caffeine during periods of extreme heat, both dehydrate the body. Whenever possible wear clothing that provides protection from the sun but allows airflow to the body. Protect your head and shade your eyes if working outdoors.

During the designated warmer months of the year (April through September) all jobsites are required to incorporate heat illness prevention and awareness training into the Tailgate Safety Meetings. Training documentation shall be submitted to Webcor/Obayashi Joint Venture SSM. Shade and plenty of water shall be provided in sufficient amount to each and every employee. Emergency services must be called when an employee(s) experience a heat related illness

### **Drinking Water**

Trade subcontractors shall provide potable drinking water, cups, and trash receptacles for their employees. All trash receptacles shall be properly emptied on a daily basis.

### **Use of Tools and Equipment**

Each trade subcontractor is responsible to provide proper instructions for their employee's use of all tools and equipment. When the use of portable electric or pneumatic tools is needed, proper safety guards must be in place and operational. Power tool cord "whips" must meet NEC requirements. Air compressor hoses must be "clipped" together and tools are not to be raised or lowered by their cords or air hoses.

### **Hazardous Material**

*This Section will conform to Specification Sections 01 13 50 (1.4B and C) and (1.8D) found in The Transbay Transit Center Contract Number 08-04-CMGC-000*

Currently Webcor/Obayashi Joint Venture does not anticipate, based on the scope of work, to have any excavations that will require special protection. In the event the situation does arise, The Trade Subcontractor will submit all appropriate documentation (protections, support systems, inspection process, access) preceding the activity.

### **Hazardous Communications Program**

All subcontractors are to comply with Webcor/Obayashi Joint Venture's Hazard Communication Standard Policy.

If an employee is allergic to cement, or may be susceptible to lime burns, or skin disorders ensure that employees Supervisor is aware and do not assign that employee to tasks associated with those irritants. If an employee is allergic to or cannot use any other chemicals there Supervisor must be notified.

### **Hazard Communication Standard Policy**

*This Section will conform to Specification Sections 01 15 45 (1.2A1, 1.2A2),(1.13D),(1.4A), (1.4C) found in The Transbay Transit Center Contract Number 08-04-CMGC-000*

The TJPA will not review the HASP for its content, nor will the TJPA be liable for Contractor's failure to have an adequate HASP or implement it. Receipt of the HASP by the TJPA neither constitutes the legality of the HASP nor incurs liability with Trade Sub contractor. Noncompliance with this portion of the Webcor/Obayashi Joint Venture Safety Policy will be written up as a Safety violation and may result in a

Safety fine and/or nonpayment to the subcontractor(s). Webcor/Obayashi Joint Venture is only required to train its employees to comply and observe the policy. It is the responsibility of each trade subcontractor and each tiered subcontractor to train their employees in the implementation and use of the Hazard Communication Policy.

Trade Subcontractors shall submit a Health and Safety Plan (HASP) in accordance with this Contract specification. Upon approval of the HASP, Trade Subcontractor shall provide two (2) copies on compact disc in Portable Document Format (PDF) with properly labeled cases. Safety Data Sheet (SDS) (previously known as Materials Safety Data Sheet (MSDS)) for all chemicals and other hazardous materials to be used.

Trade Subcontractors shall submit a site-specific environmental HASP in accordance with these specifications and 29 CFR 1910.120, 8 CCR 5192. The HASP shall remain in effect throughout the life of the Contract, and a copy of the HASP must be on site at all times. Trade subcontractors shall submit five (5) copies of the HASP at least ten (10) working days before any demolition or any building materials-disturbing activity, and no later than thirty (30) days after the Notice to precede for each Trade Subcontract package.

Each subcontractor must submit a copy of its written Hazard Communication Program to the Webcor/Obayashi Joint Venture SSM. An initial hazardous material/chemical listing for this specific jobsite must accompany the written Hazard Communication Program and all trade subcontractors shall maintain their SDS. A complete file of all SDS submitted is to be located at the jobsite office for review by all workers during job hours. Each trade subcontractor will discuss each new substance introduced on the jobsite at the weekly Safety meetings with their crews and the Superintendents of other trade subcontractors at the weekly Subcontractor Meeting. Each trade subcontractor must label the contents of all containers including secondary containers. The label must clearly identify the substance, hazard warnings, the name and address of the manufacturer and the location of the SDS.

Employees are required to be trained in Hazardous Communication, specifically in the dangers of working with these substances, chemicals, materials, required PPE and medical emergency training. Copies of training certificates shall kept on site and be submitted to Webcor/Obayashi Joint Venture SSM.

Bulk fuel storage is not allowed onsite.

## **Confined Space**

No person shall enter a confined space such as manholes, underground vaults, tanks, pipes, tunnels, or other similar places until it is determined that it is safe to enter the space by an approved method. The trade subcontractors Competent Person is responsible for identifying any potential confined space and shall initially determine if a permit required confined space exists. A pre-planning meeting shall be held if a confined space exists and proper procedures shall be followed to ensure worker safety.

When "Hot Work" is performed in Permit Required Confined Spaces, the applicable Standards will be followed for Permit Required Confined Space work.

## **Equipment**

Machinery and equipment shall be inspected and documented daily. Machinery and equipment shall be operated by authorized, trained personnel only. All operated equipment shall have backup alarms in working order. Operators shall inspect each work area to make sure that it is safe to operate the equipment in that area. Equipment shall not be serviced or repaired while it is in motion or running, unless there are appropriate safeguards in place to prevent injury.

Fuel-operated equipment, such as generators, air compressors, welders, etc., shall have a dedicated fire extinguisher near the equipment at all times when it is in operation. Fire extinguisher shall be rated as a minimum of 10lb ABC.

## **Excavation and Trenching**

Currently Webcor/Obayashi Joint Venture does not anticipate based on the scope of work to have any excavations that will require special protection. In the event the situation does arise, The Trade Subcontractor will submit all appropriate documentation (protections, support systems, inspection process, access) preceding the activity.

*This Section will conform to Specification Sections 00 07 00 (I), 00 08 14(1.2B), 00 08 14(1.4), 00 08 14(1.5B) and 01 35 65 (1.7C) found in The Transbay Transit Center Contract Number 08-04-CMGC-000*

Pursuant to section 6705 of the California Labor Code, excavation for trenches five (5) feet or more in depth shall not begin until Webcor/Obayashi Joint Venture has received acceptance from the TJPA of Webcor/Obayashi Joint Venture detailed plan for worker protection from the hazards of cave-in's during excavation of such trenches. Webcor/Obayashi Joint Venture shoring plan shall be submitted in accordance with the requirements of the Specifications and shall show the details and supporting calculations of the design of shoring, bracing, sloping, or other provisions to be made for worker protection during such excavation. No plan shall allow the use of shoring, sloping or other protective system less effective than that required by the Construction Safety Orders of the Division of Occupational Safety and Health. If Webcor/Obayashi Joint Venture shoring plan varies from the shoring system standards established by the Construction Safety Orders, the plan shall be prepared and sealed by an engineer retained by Webcor/Obayashi Joint Venture who is registered as a civil or structural engineer in the State of California. The TJPA acceptance of Webcor/Obayashi Joint Venture shoring plan shall not be construed to relieve Webcor/Obayashi Joint Venture of its responsibility for damage or injuries related to the excavation resulting from unsafe shoring.

The trade subcontractor will comply with all requirements of Federal OSHA, Cal/OSHA, the California Labor Code, Trade Subcontractor safety requirements, and these Contract Documents. The more stringent requirements shall apply. Prior to commence of earthwork activities the trade subcontractor shall review their safety procedures. Trade subcontractors shall submit for approval a comprehensive and site specific Health and Safety Plan (HASP) prepared by a certified Industrial Hygienist. A health and safety plan shall be certified by the trade subcontractor's Competent Hazardous Materials Supervisor and submitted to the TJPA for review and comment prior to implementation. Daily, pre-shift inspection of excavations, the adjacent areas and protective systems shall be made by the Competent Person for evidence of potential cave-ins, hazardous atmospheres or protective system failure. Daily, pre-shift inspection checklists shall be maintained by the subcontractor and submitted to Webcor/Obayashi Joint Venture weekly. No person shall enter an excavation where protection from ground movement is required until such protection is in place. 100% fall prevention and/or protection is required when working next to excavations greater than

five feet (5') in depth. Ladders or other means of approved access shall be used for all excavations. Stepladders shall not be used in a "leaning" position to enter or exit excavations.

Should trade subcontractors be notified by the TJPA of any unsafe or unhealthy condition associated with the performance of the Work and be required to take remedial action to correct such conditions, trade subcontractors shall take action immediately, if so directed, or within 48 hours after receipt of a notice of violation.

## **Respiratory Protection**

Conditions may exist which require the utilization of respiratory equipment to protect employees against exposure to the inhalation of toxic or harmful gasses, vapors, mists, fumes and dust. Each Contractor must implement and enforce a written respiratory program in accordance with CAL/OSHA standards to protect employees from these types of exposures. Trade subcontracts written Respirator Protection programs shall be submitted to Webcor/Obayashi Joint Venture prior to use of respirators.

Only respirators that are applicable and suitable for the purpose intended shall be used. Respirators and cartridges shall be selected on the basis of the hazards to which the employee may be exposed to. Respiratory protective equipment shall be inspected regularly and maintained in good condition. Cartridges shall be replaced per manufacturer's recommended or calculated filter change-out schedule so as to provide complete protection. Respiratory protective equipment, which has been previously used, shall be cleaned and disinfected before it is issued to another employee.

Dust respirators are to be replaced in accordance with manufacturer specifications.

Employee shall be medically evaluated, Fit Tested and properly trained prior to using a respirator. A copy of the employee's medical approval will be kept on site by their employer. Every employee who wears a respirator must be clean-shaven to ensure the proper fitting of the respirator

## **Concrete Code of Safe Practices**

The Concrete Code of Safe Practices is established to assist in conforming to the requirements for all construction activities involving concrete performed on Webcor/Obayashi Joint Venture projects. This includes, but is not limited to cast in place, shoring & reshoring, formwork/false work, post tensioning, placing & finishing.

### **Definitions**

*Bull float* - a tool used to spread out and smooth concrete.

*Formwork* - the total system of support for freshly placed or partially cured concrete, including the mold or sheeting (form) that is in contact with the concrete as well as all supporting members including shores, reshores, hardware, braces, and related hardware.

*Limited access zone* - an area alongside a masonry wall, which is under construction and which is clearly demarcated to limit access by employees.

*Precast concrete* - concrete members (such as walls, panels, slabs, columns, and beams) which have been formed, cast, and cured prior to final placement in a structure.

*Reshoring* - construction operation in which shoring equipment (also called reshores or reshoring equipment) is placed, as the original forms and shores are removed, in order to support partially cured concrete and construction loads.

*Shore* - a supporting member that resists a compressive force imposed by a load.

## **Fall Protection – Concrete Specific**

- Workers working more than six (6) feet above any adjacent working surface or placing reinforcing steel in walls, piers, columns, etc. should be protected by personal fall arrest system, guardrail system or equivalent device.
- Workers inside a Cunningham beam form, where the form leading edge is less than 39" in height and the worker is greater than 6' above a lower working surface, should be protected by a suitable fall protection system consisting of a catenary or similar pendant type line and personal fall arrest system.
- As soon as practical, a perimeter guardrail system should be established.
- Special attention and consideration should be given to workers on ladders within 6' of leading edge such as when working on columns or wall forms. Additional fall protection measures may be required.
- When working on vertical reinforcing steel columns or false work, fall protection should be set in advance from ladders, manually propelled elevated work platforms, or similar means so that 100% fall protection can be utilized.
- Workers on wall forms greater than six (6) feet above any adjacent working surface should be protected from falling by a personal fall arrest system or equivalent system. Ensure appropriate anchorage points are provided and utilized. Where applicable, a two (2) hook system for 100% fall protection should be utilized.
- Workers who are placing or tying reinforcing steel more than six (6) feet above any adjacent working surface should be protected from falling by personal fall arrest system or equivalent system.
- When workers are exposed to falls greater than six (6) feet above any adjacent working surface while erecting or dismantling shoring systems, they should have suitable fall protection as necessary utilize an appropriate anchorage point
- In addition to the above fall protection requirements, when erecting and dismantling shoring, a minimum of two (2) scaffold grade planks should be used or other similar means, such as mobile scaffolding, lifts, etc. Planks should rest on horizontal frame members and not on cross bracing.
- The use of positioning systems as a sole means of fall protection is not permissible.
- Unless otherwise provided by a site specific fall protection plan:
  - The placing of frames and stringers should be from below via appropriate ladders, temporary work platforms, false decks, scaffolds, or other similar work platforms.
  - The first several joists spread should be from below via appropriate ladders, temporary work platforms, false decks, scaffolds, or other similar work platforms. Once the first several joists are positioned, a work platform (e.g. 4x6 sheet of plywood or similar) should be placed on top of a placed joists and all further spreading of joists should take place from this work platform or successive sheets of plywood laid to extend this platform. Work should take place from the center of the bay, with joists spaced no greater than 24" on center. Any work within 6' of the leading edge and greater than 6' above a lower working surface should be protected by a suitable fall protection system.

## **Formwork/False work**

Formwork, false work and shoring should be designed, fabricated, erected, supported, braced and maintained so that it will be capable of supporting without failure all vertical and lateral loads that may reasonably be anticipated to be applied to the formwork. Formwork which is designed, fabricated, erected, supported, braced and maintained in conformance with ANSI A10.9-1983 Construction and Demolition Operations – concrete and masonry work, will be deemed to meet the requirements of this paragraph.

- Drawings or plans, including all revisions, for the jack layout, formwork including shoring equipment, working decks, and scaffolds, should be available at the jobsite.
- Procedures for safe installation, removal, lifting etc., should be available at the jobsite and all workers appropriately trained in these procedures as applicable.
- Work areas should be clear of all unauthorized personnel during installation, concrete placement and removal. Appropriate barricading, delineation and/or signage should be placed to limit access and alert other workers of hazards associated with the work area.
- At no time should workers place themselves underneath a live load.
- When hoisting material, the worker should be positioned to the side of the hoisted material and never into the pinch point between the hoisting equipment and the material or in the area where an operator would land material in the event of an emergency.
- Appropriate tag lines should be utilized as required and two (2) tag lines may be necessary to help align/control panels or forms.
- Safe means of access and egress should be maintained at all times.

## **Removal of Formwork**

Forms and shores (except those used for slabs on grade and slip forms) should not be removed until the employer determines that the concrete has gained sufficient strength to support its weight and superimposed loads. Such determination should be based on compliance with one of the following:

- The plans and specifications stipulate conditions for removal of forms and shores, and such conditions have been followed, or the concrete has been properly tested with an appropriate ASTM standard test method designed to indicate the concrete compressive strength, and the test results indicate that the concrete has gained sufficient strength to support its weight and superimposed loads.
- Prior to dismantling, the entire system should be inspected to determine if there are any hazards from displacement, weakening, alterations etc. of the shoring and false work.
- Shores, cross braces etc. should only be removed in the immediate work areas and as appropriate.
- All nails should be removed or bent over immediately upon stripping.
- Shoring, formwork and all other equipment being removed should be stacked, consolidated or placed in an orderly manner as soon as practicable during the removal operation and egress/access paths maintained at all times.
- Only appropriate tools should be used for removal of shoring and formwork.

## **Shoring and Reshoring**

- All shoring and reshoring operations should comply with all federal, state local and manufacturers regulations.
- All shoring equipment (including equipment used in reshoring operations) should be inspected prior to erection to determine that the equipment meets the requirements specified in the formwork drawings.

- Shoring equipment found to be damaged, severely rusted, missing locking devices etc. should not be used for shoring. Shoring equipment that is in place and is found to be damaged or weakened, should be immediately reinforced.
- Erected shoring equipment should be inspected immediately prior to, during and immediately after concrete placement.
- The sills for shoring should be sound, rigid and capable of carrying the maximum intended load.
- Base plates should be attached to a minimum of 12' square, 2" plywood or equivalent.
- All base plates, shore heads, extension devices, and adjustment screws should be in firm contact, and secured when necessary, with the foundation and the form.
- Existing ground should be level, adequately compacted and loads distributed. Consideration should be given to adverse weather conditions such as washouts, rain impact to slopes etc. Special precautions such as hardwood wedges or bracing should be utilized on sloped surfaces.
- All clamps, screws, pins and other similar components should be in a closed or engaged position.
- Eccentric loads on shore heads and similar members are prohibited unless these members have been designed for such loading.
  - Ensure stringers are centered on these members to minimize eccentric loading.
- Adequate access should be provided to all form deck surfaces.
- When horizontal shoring is required, these should be engineered and special consideration should be given to installation and conformance to the completed design.
- Ensure all stringers and joists are fully supported and centered over shoring heads/top plates and adequately secured. Further, ensure that all stringers and joists are fully upright and not rolled.
- All horizontal shoring should be installed and erected in compliance with manufacture's requirements as well as federal, state and local regulations.

### **Frame Shoring**

- The design of the shoring should be prepared by a qualified designer and the erected shoring should be inspected by an engineer qualified in structural design.
- The shoring design or layout drawing should be followed with no omissions of required components, or alteration in frame spacing's, types used, towers heights, locations or sizes.
- Shoring loads should be carried on all legs.
- All shoring frames should be plumb and level. This should be checked and corrected at a minimum of during erection and just prior to the pour.
- Adjustment of shoring frames should not be made once the pour begins.
- When shoring height exceeds a minimum of four (4) times the minimum base width, additional bracing and securing of the frames should be performed.
- Cross braces should never be climbed, workers should climb frames from the inside.

### **Screw Jacks**

Screw jacks should not exceed the manufactures recommended extension height at any time. Screw jack extension should be kept to a minimum for maximum load carrying capacity. All screw jacks should be in firm contact with the foundation and frame legs.

### **Post Shoring**

- The single post shores should be vertically aligned/plumbed.
  - This should be checked and corrected at a minimum of during erection and just prior to the pour.

- Adjustment of post shores for any reason should not be made once the pour begins.
- Refer to the manufacture's guidelines for additional stability measures and bracing requirements of each system used.
- Post shores should be adequately secured at top and bottom to prevent displacement.
- Whenever single post shores are used one on top of the other (tiered), they should comply with the following specific guidelines in addition to the general guidelines for formwork:
  - The single post shores should be spliced to prevent misalignment.
  - The single post shores should be adequately braced in two (2) mutually perpendicular directions at the splice level.
  - Each tier should also be diagonally braced in the same two (2) directions.

### **Ellis Shores**

- Ensure shores are erected with the proper length of timbers allowing a minimum of 24" overlap between shore members.
- The shore clamps should be attached 12" apart with the upper clam at a minimum of 2" from the top of the lower shore. Each clamp should be secured with the appropriate number of type of duplex nails.
- Shores should be raised to the desired height by sliding the upper shore member upwards being careful to avoid pinch points.
- Shore hand jacks should not be used to raise decks, lift formwork or elevate concrete.
- Ensure all shores, jacks and clamps are inspected prior to use and any damaged or defective materials are removed or repaired prior to use.
- Safety nails should be secured above each clamp of the upper shore member casting to prevent uplift or movement during vibration.

### **Re-shoring**

- Shores should not be removed, including cross bracing, until the concrete has gained sufficient strength to support its weight and superimposed loads. Such determination shall be based on compliance with one of the following:
- The plans and specifications stipulate conditions for removal of forms and shores, and such conditions have been followed or the concrete has been properly tested with an appropriate ASTM standard test method designed to indicate the concrete compressive strength, and test results indicate that the concrete has gained sufficient strength to support its weight and superimposed loads.
- Stripping and removal of shoring equipment should be performed in conformance to the approved stripping sequencing plan.
- Re-shoring should be erected, as the original forms and shores are removed, whenever the concrete is required to support loads in excess of its capacity.
- The design of the shoring should be prepared by a qualified designer and the erected shoring should be inspected by an engineer qualified in structural design.
- The shoring design or layout drawing should be followed with no omissions of required components, or alterations in spacing's, types used, heights, locations or sizes.
- Re-shores should be placed directly below load carrying legs to avoid punch through, stress reversals or other undesirable forces on the poured concrete.
- Slabs or beams should be allowed to take their permanent deflection before final adjustment of re-shoring equipment is made.
- Horizontal shoring should never be used as part of a re-shoring system.

## **Bracket Scaffolds**

- Bracket scaffolds should only be used through bolted walls, with at least 5/8" diameter bolts.
- Scaffolds should be solidly secured to the walls or the supporting structure.
- Scaffolds should be able to support at least four (4) times the maximum intended working load.
- Spacing of brackets should not be greater than 10' apart.
- Railings should be installed on all scaffolds 6' or greater in height.
- Platforms should consist of at least two 2"x10" planks that extend at least 6" over each bracket and no more than 18".
- Platforms should be solidly planked with no more than 7" gap under the back rail and 14" gap to the face of the form.
- Planking should be scaffold grade lumber or equivalent and should be free from damage, defects, cracks, splits etc. Damaged planks should not be used.

## **Reinforcing Steel**

All protruding reinforcing steel, onto and into which employees could fall, should be guarded to eliminate the hazard of impalement. When working at grade, impalement hazards from 4" to 6' in height, at a minimum, should be protected. Reinforcing steel for walls, piers, columns, and similar vertical structures should be adequately supported to prevent overturning and to prevent collapse. Employers should take measures to prevent unrolled wire mesh from recoiling. Such measures may include by are not limited to securing each end of the roll or turning over the roll. Reinforcing steel should be stockpiled as close as practicable to work areas. Additionally special attention should be taken towards access and egress to work areas, excavations and ensuring work areas are free from tripping hazards or other surface encumbrances.

## **Concrete Placement and Finishing**

Appropriate PPE should be utilized during concrete placement and finishing. This includes but is not limited to safety glasses, fall protection, gloves, boots, hardhat, and long sleeves. Appropriate respiratory protection should be used for all concrete cutting, grinding, sanding, and blasting, dry mixing, jack hammering etc.

The following should be observed while working with concrete:

- When discharging concrete on a slope, the wheels of ready-mix trucks should be blocked, the brakes set to prevent movement and the operator with the vehicle at all times.
- All washout activities should be completed in the designated washout area.
- All concrete cutting, finishing and cleanup should be done in such a manner that all residue or waste water will be properly contained and disposed of.
- Appropriate precautions should be taken for specialty applications (e.g. acid washing, dyes, stains etc.); in their handling, storage use and disposal.
- Powered and rotating type concrete troweling machines that are manually guided should be equipped with a control switch that will automatically shut off the power whenever the hands of the operator are removed from the equipment handles.
- Bull float handles used where they might contact energized electrical conductors, should be constructed of nonconductive material or insulated with nonconductive sheath that's electrical and mechanical characteristics provide the equivalent protection of a handle constructed of nonconductive material.

- Masonry saws should be guarded with a semicircular enclosure over the blade.
- When operation air guns for cleaning off decks, inside forms etc., these guns should have a maximum of 30 psi nozzle pressure and be equipped with a safety release valve.
- Air guns should have pressure valves, and extension tube and the hoses well maintained with appropriate whip checks.
- Employee operating air guns should have appropriate PPE, including but not limited to, chip protection (i.e. face shield, goggles etc.), ear plugs and respiratory protection as required.
- No employee should be permitted to perform maintenance or repair activity on equipment (such as compressors mixers, screens, pumps used for concrete and masonry construction activities) where the inadvertent operation of the equipment could occur and cause injury, unless all potentially hazardous energy sources have been locked out and tagged.

## **Concrete Buckets**

No employee shall be permitted to ride concrete buckets or work under concrete buckets while buckets are being elevated or lowered into position. Elevated concrete buckets shall be routed so that no employee or the fewest number of employees are exposed to the hazards associated with falling concrete or falling buckets. Concrete buckets equipped with hydraulic or pneumatic gates should have positive safety latches or similar safety devices installed to prevent premature or accidental dumping. Concrete buckets should be designed to prevent concrete from hanging up on top of the sides.

## **Pump-Crete Systems**

Concrete pumping systems using discharge pipes should be provided with pipe supports designed for 100% overload. Compressed air hoses used on concrete pumping systems should be provided with positive failsafe joint connectors to prevent separation of sections when pressurized. Movement of concrete hoses should be planned to limit the amount of manual positioning of hose as much as practicable. When necessary, the use of hooks, ropes or other similar devices should be utilized when handling the concrete hose.

## **Buggies & Wheelbarrows**

Concrete buggy handles should not extend beyond the wheels on either side of the buggy. Handles should be guarded or equipped with knuckle guards. All buggies, wheelbarrows or other similar conveyances should be properly maintained and repaired/replaced immediately if damaged, in poor repair or otherwise. Paths of access and travel should be level, free of debris and other surface encumbrances and ramps or other access ways should be appropriately built, maintained, and protected. Buggies, wheelbarrows etc. should not be overloaded.

## **Post-Tensioning Operations**

No employee (except those essential to the post-tensioning operations) should be permitted to be behind the jack during post-tensioning operations. Signs and barriers should be erected to limit employee access to the post-tensioning area during tensioning operations. Appropriate fire protection measures should be taken during burning operations, including but not limited to spark control or blankets, fire extinguishers, wetting formwork etc.

## **Permitting/Documentation**

Before a contractor is on site, the following items should be obtained in writing. A permit for excavation/trenching activities (Cal OSHA Excavation Notification Form as applicable) for all trenches/excavations that are equal to or greater than 5' in depth where an employee is required to enter as

well as a permit for any false work or scaffolding 36' in height or greater total. Excavation and trenching plan, shoring/false work design or plan needs to also be submitted to Webcor/Obayashi Joint Venture in writing. Name(s) of competent person(s), soils analysis report and a copy of the trade subcontractor's safety manual are also required prior to work.

### **General Rigging Equipment Safety:**

Inspect rigging equipment for material handling prior to use on each shift and as necessary during its use to ensure that it is safe. Remove defective rigging equipment from service.

Never load rigging equipment in excess of its recommended safe working load.

Remove rigging equipment when not in use from the immediate work area so as not to present a hazard to employees.

Mark special rigging accessories (i.e., spreader bars, grabs, hooks, clamps, etc.) or other lifting accessories with the rated capacity. Proof tests all components to 125% of the rated load prior to the first use. Maintain permanent records on the job site for all special rigging accessories.

## **Asbestos Abatement Program**

Products that contain Asbestos can be helpful, but they can also be very harmful. Asbestos is a mineral which has many positive qualities. It is fireproof, heat resistant, lightweight, resistant to most chemicals, sound-absorbing and it does not conduct electricity. Asbestos has been used to mix with plaster and wallboard for strength and support, sprayed onto wall, ceilings, and steel girders for fireproofing, wrapped around pipes, boilers and heating ducts for insulation, in floor and ceiling tiles among others. Asbestos can break down into tiny fibers, like grains of sand or rope and can float in the air for long periods of time, allowing them to be easily inhaled. A powerful microscope is needed to see the fibers since they are invisible to the human eye, they have the strength of steel, and one cannot taste or smell them. Asbestos material that a worker may encounter generally fit into two (2) categories: Friable and Non-Friable. Friable asbestos is air born, thin, easily damaged or broken asbestos and is most dangerous to human's respiratory system. Non-friable is asbestos that is not damaged, a complete piece. The three most common materials that contain asbestos are thermal system insulation, floor tiles and sprayed-on materials. Thermal system insulation is the most common type of friable asbestos material, and can be found on boilers, utility pipes, ductwork and heating systems.

This Asbestos Abatement Program is developed to inform workers who don't really work directly with asbestos, but who may have incidental exposure, must receive at least "Asbestos Awareness" training. To help address OSHA's concerns, and provide the awareness training needed by employees under the regulation, employees shall be trained, understand monitoring activities and how to protect against potential asbestos exposure. Employees should understand how long-term exposure to asbestos can harm the human body as well as understand how to avoid potentially hazardous maintenance and custodial activities that could lead to asbestos exposure since custodians, engineers and maintenance workers have the highest chance of exposure to asbestos. Employees should understand which safe work practices should be used when helping with a minor asbestos clean-up and understand why and when there is a potential for exposure to asbestos. Air monitoring and medical surveillance can be important elements in providing a safer workplace.

Exposure to asbestos fibers can lead to a disease known as "Mesothelioma." Mesothelioma is a chronic disease, occurs over time. There is rarely acute side effects when a worker is exposed to asbestos. Symptoms of asbestos exposure may include shortness of breath, enlargement of the heart, scarring of the

lungs, cancer and death. People who smoke are especially vulnerable to Asbestos. Cigarette smoke breaks down the lungs' defensive system, and leaves them vulnerable to Asbestos fibers. Smokers are over 50 times more likely to become sick after long-term exposure to Asbestos.

While working with material that has or potentially has asbestos requires safe handling and proper PPE. Even a small tear in asbestos material can cause serious harm. If an employee suspects a piece of asbestos material is damaged their supervisor shall be notified immediately and secure measures shall be taken to ensure minimal exposure. These measure may include securing the material in a plastic bag secured with duct tape and wetting down the immediate area to ensure the material does not become friable.

## **Proper PPE**

Although asbestos is not a skin contact hazard, by wearing disposable overalls helps reduce the potential of transferring asbestos from the work area to non-contaminated areas.

A respirator and designated filters shall be required to reduce the potential of introducing asbestos fibers into the lungs. A fit test and medical evaluation shall be conducted prior to an employee donning a respirator. The respirator must be the right size and securely fit a clean shaved face. Respirators shall be cleaned and stored as recommended by an Industrial Hygienist.

An Air Sampling Device may, at times, be worn by the employee to measure airborne concentrations of asbestos in the work are. The Air Sampling Device varies in design and appearance, however does include an air pump located near the employees face and a sampling cassette that is secured onto the employee. An Industrial Hygienist will instruct the employee in further details regarding the use of an Air Sampling Device.

## **Medical Surveillance**

A Medical Surveillance program is put in place to monitor employees since asbestos causes chronic illnesses. The program tests the workers lung capacity and x-rays the chest cavity and lungs for any previous damage and to record current conditions. The worker may be asked to return for continued surveying depending on their potential exposure. The Medical Surveillance costs are that of the employer, free service to the employee.

## **Clean up Methods**

The Asbestos Awareness Program is designed to make workers aware of the health hazards, locations and minor cleanup of asbestos, this program does not include Asbestos Work. Large quantities of asbestos required more detail and training than what is provided here. However, if a minor cleanup or containment is required follow these basic steps:

- Proper PPE: respirator, gloves, Tyvek body suit. Don and Done PPE properly
- Appropriate work area: the contaminated area is guarded with access available through the decontaminated area and final access to the non-contaminated area.
- Equipment: wet methods, HEPA vacuum shall be used. Low Abrasion Pad, at speeds less than 300rpm are acceptable.
  - Do not sweep or shovel material contain asbestos.
- Disposal
  - Asbestos materials must be properly bagged and labeled.
    - Use only official Asbestos Disposal Bags.
    - Use a Generator Label which lists the name and address of your facility.

- If an Asbestos Disposal Bag becomes torn, double bag and seal it immediately with tape.
- Asbestos is a regulated waste (it must be hauled to a licensed landfill).

## **Decontamination**

After any work with Asbestos materials, workers must decontaminate themselves and their equipment. This prevents the spread of Asbestos dust and debris. Always use an official decontamination area that is equipped with a HEPA vacuum, as well as a plastic drop cloth (to contain any loose fibers). Never eat, drink or smoke in these decontamination areas, or any other area where asbestos is present. Scrub hands and face with soap and water before leaving work. If possible, shower before leaving your facility as well, if not, instruct the worker to shower immediately when they get home to prevent potential exposure to others. When decontaminating clothing, never brush off dust or debris because asbestos fibers may become airborne. Use a HEPA vacuum to remove materials from clothing before taking it off. Also vacuum equipment and Asbestos Disposal Bags. Tyvek suits will need to be disposed of in an Asbestos Disposal Bag and disposed of as regulated waste.

## **Lead Abatement Program**

This program has been put in place because Webcor/Obayashi Joint Venture recognizes that some of the work we do has the potential to expose our employees to lead. We want to do as much as is practically possible to protect them from lead exposure.

Prior to the start of a project, professionals/Industrial Hygienist in lead detection and abatement will be brought in to do an Exposure Assessment to determine whether the work environments Webcor/Obayashi Joint Venture employees will be operating in has the potential to expose workers to lead. These professionals will be used to give Webcor/Obayashi Joint Venture direction as to how to proceed. It will be our goal to have lead abatement taken care of by licensed lead abatement professionals prior to the arrival of Webcor/Obayashi Joint Venture employees.

Lead can be found in a number of workplace environments. Until recently, lead was a common component in paints of all kinds (which can create exposure whenever sanding, sandblasting, scraping, or even demolition occurs).

Workplace experience and empirical studies have shown that lead is fairly easily absorbed into the body. Breathing airborne lead dust and fumes is the most common route of entry. Lead can also be absorbed if it comes into contact with the mouth or tongue.

Overexposure to lead can occur both on an acute basis, where large amounts of lead are absorbed into the body in a short period of time, or on a chronic basis where small amounts of lead are absorbed at any one time, for a long period eventually accumulating to cause significant health problems.

On May 4, 1993, OSHA published the Interim Final Rule for Lead Exposure in Construction. The Construction Standard establishes “Interim” procedures and work practices that must be followed in construction environments. The OSHA Standard and its compliance requirements are included at the end of this written program. The Lead Standards are “performance based”; the standard will tell you what you have to accomplish.

A General Requirement in the Lead Standards states employers must make sure that no employee is exposed to lead concentrations greater than 50 micrograms per cubic meter of air, averaged over an eight-hour period in any 24-hour day.

Typically, OSHA requires that you use the following methods to protect your employees through engineering controls, work-practice controls, respiratory protection, PPE, hygiene facilities and practices, housekeeping and employee information and training.

OSHA requires that every employer who is covered by these Standards provide information and training. For employers in the Construction Industry, it requires that they meet the training requirements of the Hazard Communication Standard. Information that must be given employees under the Hazard Communication Standard includes the hazards associated with lead exposure, warning signs and labels that can be found on materials containing lead, and how to find information about materials containing lead on Safety Data Sheet (SDS), and use of PPE.

## Respiratory Protection Program

The purpose of this plan is to establish a program and procedures for wearing respiratory protection at the Transbay Transit Center. This program supports compliance with the Occupational Safety and Health Administration Respiratory Protection Standard as found in 29 CFR 1910.134. This program applies to all company employees who work in areas whose exposures to airborne contaminants require the use of respirators.

### **Definitions**

*Dusts:* Particles released during work operations such as grinding and sawing.

*Fit Testing:* The process of making sure that an employee's respirator fits properly and will provide the necessary protection without any leaks.

*Fumes:* Vaporized, condensed metals such as lead that may be present during welding operations.

*Gases:* Examples include nitrogen, methane, and carbon monoxide.

*IDLH:* An OSHA hazard classification: Immediately Dangerous to Life & Health. An atmospheric condition that poses an immediate hazard to life or poses immediate irreversible debilitating effects on health.

*Mists:* Particles of liquid released during operations such as spray painting.

*NIOSH:* National Institute for Occupational Safety and Health; an agency that establishes minimum performance standards for respirators and tests and approves respirators for various uses.

*Vapors:* Gaseous forms of a liquid such as paint solvents.

## **Responsibilities**

### **Program Administrator**

The Program Administrator is responsible for issuing and administering this program and making sure that the program satisfies the requirements of all applicable federal, state, or local respiratory protection requirements. Providing initial and periodic training to employees on respiratory protection requirements. Conducting hazard assessments where respiratory hazards may be present. Assisting managers and supervisors in the selection of appropriate respiratory protection for use on their jobsites. Auditing the respiratory protection program to ensure its continued effectiveness.

### **Purchasing Agent**

The Purchasing Agent will be the Jobsite Superintendent and is responsible for purchasing respiratory protection equipment and assuring that all equipment purchased is approved by NIOSH/MSHA.

### **Superintendent**

Superintendents whose jobsites are required to wear respiratory equipment is responsible for knowing the hazards in their areas that require respiratory protection, knowing the types of respirators that need to be used, enforcing the wearing of respiratory protection in the areas where it is required, making sure employees are knowledgeable about the respiratory requirements for the areas in which they work and providing training on hazardous chemicals to employees.

### **Employees**

Employees who are required to wear respirator protections is responsible for wearing appropriate respiratory protection, properly maintaining their respiratory protection equipment and keeping it in a clean and operable condition and notifying their Supervisor of any additional hazards.

## **Program Activities**

Respiratory hazards will be assessed on the jobsite and appropriate protection will be provided for all affected employees. Employees are required to wear respiratory protection wherever respiratory hazards exist. Respiratory protection is stored and issued from the jobsite office. Efforts will be made to minimize the use of hazardous chemicals in the workplace. If the use of hazardous chemicals creates an imminent-danger situation, the operation will be discontinued.

## **Respirators**

Respirators will be selected according to the type of activity for which they will be used and the type of potential air contaminants associated with these activities. Only NIOSH/MSHA approved respirators will be used. All respirator protection equipment will be used in accordance with the manufacturer's recommendations. In areas in which maintenance and sanitation services are unavailable or respiratory usage is limited, disposable respirators will be used. Non-disposable respirators which are used exclusively by one person will be maintained and cared for by the wearer. All non-disposable respirators which are used by more than one person will be cleaned and sanitized between each use. Chemical cartridge respirators will be stored in airtight, labeled containers between each use. All other respirators will be stored in a clean and sanitary manner and labeled with the wearer's name. Disposable respirators will be used until the cartridge or filter media requires replacement or when the face piece is dirty.

Respirators will be inspected by the wearer prior to each use. Supervisors on jobsites where respirators are used will verify that appropriate respirator protection is being used, inspected, and maintained properly. Non disposable respirators will be inspected according to the manufacturer's instructions.

All users of respirators will be fit tested to ensure a proper face piece-to-face seal. Employees whose facial hair interferes with the face piece-to-face seal will not be allowed to wear negative-pressure air-purifying respirators.

All employees who are required to wear respirators will receive training in their use, selection and appropriate maintenance. Training will provide an opportunity for the employee to handle the respirator, have it fitted properly, test the face piece-to-face seal, wear it in normal air, and wear it in a test atmosphere.

## **Silica Exposure Program**

The purpose of this policy is to establish procedures to protect employees from the health hazards associated with exposure to airborne crystalline silica generated by various construction activities. Due to the amount of work we do with concrete and masonry on almost any project; our workers have the potential for silica exposures through abrasive blasting, chipping, hammering, sawing, grinding or demolition of concrete.

Silicosis is a lung disease marked by hardening of lung tissue and symptoms such as shortness of breath, possible fever, fatigue and eventual respiratory failure. Silicosis also renders a person more susceptible to disease of the lungs, such as tuberculosis. Where there is concrete, there is a potential silica exposure so it is essential to monitor our work activities and take the necessary corrective actions to protect our employees.

### **Responsibilities**

#### **Supervisor**

Project Supervision shall evaluate all work activities for silica exposures, institute engineering controls as a first line of protection to reduce silica exposures, institute all administrative/work practice controls to reduce silica exposures when feasible and when engineering controls have been explored and ruled out. Institute the use of respirators to reduce exposures when the above mentioned controls fail to reduce silica exposure levels, provide training identified in this policy when employees are exposed to silica hazards and provide necessary respirator protection as well as training in its proper use, when deemed necessary.

#### **Employees**

The workers shall follow all work plans that identify engineering and administrative work practice controls to reduce their exposure to crystalline silica. They will wear respiratory protection to reduce their exposure to crystalline silica when deemed necessary by their supervisor and not eat, drink, use tobacco products or apply cosmetics in areas where there is dust containing crystalline silica.

### **Program Activities**

Crystalline silica exposures must be maintained below the OSHA PEL of 10mg/m<sup>3</sup> Percentage Quartz +2. Historical data from similar operations producing silica exposure can be used as exposure monitoring when feasible. Assessment of worker exposure to respirable crystalline silica dust during various tasks associated with concrete finishing and demolition activities is performed annually by an Industrial Hygienist. Specific job tasks monitored include grinding, patching, chipping, demolition, segregation, stockpile, and loading of concrete rubble.

When it has been determined that employees will be exposed to crystalline silica in excess of the PEL, engineering controls will be used as a first line of defense. Engineering controls include, but are not limited to the use of dust collection systems which are available for many dust generating tools and equipment, using wet methods to keep dust particles down, use abrasives with a low silica or no silica content or using local exhaust ventilation to prevent dust from being released into the air. When engineering controls cannot be utilized or are not effective to sufficiently reduce exposure to the inhalation of silica, administrative controls will be used when feasible to reduce the time of exposure for the employees where work crews are of sufficient size, the pool of workers skilled in the operation of applicable tools, and job duration is sufficient to accommodate worker rotation, develop a program to reduce the exposure time of individual workers to silica.

Work tasks that must be monitored for crystalline silica exposure include by are not limited to:

- Jack hammering and chipping
- Grinding concrete
- Tunneling
- Sandblasting
- Dry sweeping or blowing concrete debris, sand or rock dust
- Demolition of concrete/masonry structures
- Crushing, loading, dumping rock or concrete
- Saw cutting concrete or rock

## **Respirators**

Respirators will be selected according to the type of activity for which they will be used and the type of potential air contaminants associated with these activities. Only NIOSH/MSHA approved respirators will be used. All respirator protection equipment will be used in accordance with the manufacturer's recommendations. In areas in which maintenance and sanitation services are unavailable or respiratory usage is limited, disposable respirators will be used. Non-disposable respirators which are used exclusively by one person will be maintained and cared for by the wearer. All non-disposable respirators which are used by more than one person will be cleaned and sanitized between each use. Chemical cartridge respirators will be stored in airtight, labeled containers between each use. All other respirators will be stored in a clean and sanitary manner and labeled with the wearer's name. Disposable respirators will be used until the cartridge or filter media requires replacement or when the face piece is dirty.

Respirators will be inspected by the wearer prior to each use. Supervisors on jobsites where respirators are used will verify that appropriate respirator protection is being used, inspected, and maintained properly. Non disposable respirators will be inspected according to the manufacturer's instructions.

All users of respirators will be fit tested to ensure a proper face piece-to-face seal. Employees whose facial hair interferes with the face piece-to-face seal will not be allowed to wear negative-pressure air-purifying respirators.

All employees who are required to wear respirators will receive training in their use, selection and appropriate maintenance. Training will provide an opportunity for the employee to handle the respirator, have it fitted properly, test the face piece-to-face seal, wear it in normal air, and wear it in a test atmosphere.

Select respirators based on the criteria identified in the respirator protection section of this manual.

## **Air Monitoring**

After the initial assessment and institution of exposure controls, follow-up air monitoring will be conducted to assess the effectiveness of the controls put in place. In the event that the follow-up monitoring reflects that instituted controls have not yet reduced employee exposures, the operations will cease, be re-evaluated and alternative controls will be explored to reduce employee exposures to silica.

## **Training**

Employees will be trained in the hazards of silica exposure, engineering and administrative/work practice controls, if any, that have been instituted to control silica exposures and PPE.

This Webcor/Obayashi JV Contractor Quality Control Plan will be developed incrementally as the trade packages are awarded and trade subcontractors are brought on board. Each trade subcontractors QC plan will become part of the Webcor/Obayashi JV's overall Contractor's Quality Control Plan and will be submitted to the Transbay Joint Power Authority as they are received.

## **1.0** ELEMENT 1 **MANAGEMENT RESPONSIBILITY**

- 1.1** INTRODUCTION PLAN
- 1.2** FEDERAL TRANSIT ADMINISTRATION GUIDELINES
- 1.3** MANAGEMENT RESPONSIBILITY
- 1.4** PROJECT EXECUTIVE QUALITY RESPONSIBILITY
- 1.5** CQC ORGANIZATION CHART

## 1.0 MANAGEMENT RESPONSIBILITY

### 1.1 INTRODUCTION PLAN

Project quality is the responsibility of all members of the project team and starts at the highest level of management. This Quality Control Management Plan details the specific processes by which the Project's quality will be managed and forms the basis upon which Webcor/Obayashi JV will ensure that all quality policy requirements for the Transbay Transit Center are compliant, maintained and continually being evaluated and improved. This Plan integrates the quality management process into the Webcor/Obayashi JV organizational structure and construction management systems.

Key elements of this plan include:

- The commitment of the Webcor/Obayashi JV Senior management to delivering a project that meets the Transbay Transit Center Quality Management System Manual.
- Accepted project specific construction management policies, procedures and tools for the control of project information and the management of the construction documents, submittals and the work of the trade subcontractors.
- A Webcor/Obayashi JV project-specific quality plan that meets the TIPA and FTA quality requirements and contract requirements.
- Trade Subcontractor, site specific, quality plans that meet TIPA and FTA quality requirements and contract requirements.
- Consistent CQC staff oversight- the Webcor/Obayashi JV CQC Manager and the Trade Subcontractors CQC Managers will have a physical presence on site when work is in progress.

### 1.2 FEDERAL TRANSIT ADMINISTRATION GUIDELINES

The Webcor/Obayashi JV Contractor Quality Control Plan incorporates all 15 Essential Elements of the Federal Transit Administrations Quality Assurance and Quality Control Guidelines dated December 2012 as appropriate for Webcor/Obayashi's scope of work:

1. *Management responsibility*
2. *Documented quality management system*

3. *Design control*
4. *Document control*
5. *Purchasing*
6. *Product identification and traceability*
7. *Process control*
8. *Inspection and testing*
9. *Inspection, measuring and test equipment*
10. *Inspection, test and operating status*
11. *Nonconformance*
12. *Corrective action*
13. *Quality records*
14. *Quality audits*
15. *Training*

### **1.3** MANAGEMENT RESPONSIBILITIES

Webcor/Obayashi JV fully integrates this quality management plan into the organizational structure and performance management systems of the project.

- Maintain and follow a documented Quality System consisting of this Site Specific Quality Manual with policies and procedures.
- Establish and implement project management procedures.
- Maintain Quality System documents and records.

### **1.4** PROJECT EXECUTIVE QUALITY RESPONSIBILITIES

The Project Executive of Webcor/Obayashi JV is the one person in the company ultimately responsible for quality control function. Regardless of other duties, quality responsibilities of the Project Executive include:

- Empower the Webcor/Obayashi JV Transbay Transit Center CQC Manager to perform the CQC duties described in the contract documents.
- Oversee the projects quality plan and objectives.
- Ensure the availability of necessary resources and information for effective operation of the CQC System.
- Provide active oversight of the Trade Contractors Quality Control Plans

## **2.0 DOCUMENT QUALITY MANAGEMENT SYSTEM**

### **2.1 INTRODUCTION**

Webcor/Obayashi JV is responsible for developing and maintaining attached written procedures and instructions regularly for activities affecting quality in design, procurement manufacturing and construction as applicable to the work performed. This will include implementing documentation of this Contractor Quality Control Plan and their assuring that Trade Subcontractors prepare, implement document trade package specific QC Plans. Webcor /Obayashi JV CQC Field Specialists will provide day to day oversight of the CQC System to assure Trade Subcontractor work conforms to the requirements of Transbay Transit Center Contract Documents and this Webcor/Obayashi JV CQC Plan.

Webcor/Obayashi JV will direct Trade Subcontractors to execute their CQC plans and maintain compliance with all project requirements as described in the Contract Documents. Contracts with Trade Subcontractors and Sub-tier Subcontractors shall include a requirement to comply with the provisions of this Plan, and to prepare and execute QC plans appropriate for their scope of work. The Trade Subcontractors, Sub-tier Subcontractors are authorized to manage their own QC Plans. All subcontractors, QC Managers, field personnel assigned to that work at the site shall conform to contract including the requirements described in this CQC Plan and their trade package specific QC Plans.

### **2.2 CQC OVERVIEW**

Quality Control Written procedures and instructions have been developed for activities affecting quality in design, procurement, manufacturing, and construction as applicable to the work performed. Procedures and instructions have been developed for control of processes including inspection, testing, nondestructive examination, disposition of nonconforming product, corrective action, maintenance of quality records, quality audits, and training.

The procedures contain a statement of the purpose and scope, and contain any references to appropriate codes, standards, or specifications. In developing the quality approved and future procedures, consideration has been given to identifying and acquiring any inspection equipment, skills, or special quality processes needed to ensure quality performance. Inspection and testing techniques shall be kept up-to-date. Where new techniques are being used for construction or manufacturing, adequate time shall be allowed to develop appropriate quality procedures for the new techniques. The procedures and instructions shall contain formats for the quality records needed to ensure that the procedures and instructions are followed and documentation requirements are understood.

By providing these guideline to Trade Subcontractors and then meeting with them, along with other key members of the project team, W/OJV will assure that each of the subcontractors, whether large or small would be able to develop a CQC Quality plan that satisfies the requirements of the FTA Guidelines, and consistent from plan to plan.

Offsite Quality Control for Bradken Steel Nodes Casting, Skanska Structural Steel Fabrications, Skylight Glass and other offsite systems fabrication and equipment will be inspected in the shop for quality in coordination with special inspections by our trade subcontractors. This will cover all offsite construction operations as required per contract. This is in addition to Quality Assurance by Turner QA team as TJPA Representative.

### 2.3 THREE PHASE QUALITY CONTROL SYSTEM

The three phase of control for the Contractor's quality control is the means by which W/OJV, including Trade Subcontractors and supplier ensure that the construction complies with the requirements of the Contract:

#### PREPARATORY PHASE:

This phase is accomplished prior to beginning work on each definable feature of work, after all required contract submittals, documents, and materials are approved and accepted and after copies are at the work site. This meeting includes:

1. A review of applicable specifications, reference codes, and standards. The Trade Subcontractor QC Manager shall make available during the preparatory inspection a copy of those sections of referenced codes and standards applicable to that portion of the Work to be accomplished in the field. The Trade Subcontractor QC Manager shall maintain and make available in the field for use by TJPA Representative until final acceptance of the Work.
2. Review of the Contract drawings and approved shop drawings (approved as noted shop drawings and record shop drawings) that incorporate all CD details.
3. Identify any submittals that have not been approved.
4. Check to assure that all materials and/or equipment have been pre-tested (if required per specification), submitted, and approved.
5. Review of provisions that have been made to provide required control inspection and testing.
6. Examination of the work area to assure that all required preliminary work has been completed and is in compliance with the Contract.

7. Examination of required materials, equipment, and sample work to assure that they are on hand, conform to approved shop drawings or submitted data, and are properly stored.
8. Review of the appropriate activity hazard analysis to assure environmental requirements are met.
9. Discussion of procedures for controlling quality of the work including repetitive deficiencies. Document construction tolerances and workmanship standards for that feature of work.
10. Check to ensure that the portion of the CQC Plan for the work to be performed has been accepted by the TJPA Representative.
11. Discussion of the initial control phase, set the date, location and scope of activities.
12. Clarification of details may be added as required after work has commenced in the form of RFI's.
13. Review Status of any outstanding RFI's

The TJPA representative shall be notified at least 48 hours in advance of beginning the preparatory control phase. Include a meeting conducted by the CQC System Manager and attended by the Trade Subcontractor's CQC Manager, other CQC personnel (as applicable), and the superintendent responsible for the definable feature of work. CQC System Manager shall document the results of the preparatory phase actions by separate minutes and attach the minutes to the weekly CQC report. CQC System Manager shall instruct applicable workers as to the acceptable level of workmanship required in order to meet Contract requirements (see the "Preparatory Phase Checklist Form" in this section; Tab/Element 7).

#### INITIAL PHASE:

This phase is accomplished at the beginning of each Definable Feature of Work (at least 1-2 days prior to start of work). This phase includes:

1. Reviewing the minutes of the preparatory meeting and ensuring any open issues have been resolved
2. Verifying the adequacy of controls to ensure full contract compliance, inspection and testing.

3. Establishing level of workmanship and verify that it meets minimum acceptable workmanship standards. Compare with required sample panels as appropriate.
4. Resolving all differences.

The CQC System Manager shall prepare separate minutes of this phase and attach the minutes to the daily CQC report. The TJPA shall be notified at least 72 hours in advance of beginning the initial phase. The initial phase shall be repeated for each new definable feature of work (see the "Initial Phase Checklist Form" in this section; Tab/Element 7).

#### FOLLOW-UP PHASE:

CQC System Manager and the Subcontractor QC manager shall perform daily checks to assure that control activities, including control testing, are providing continued compliance with contract requirements until completion of the particular feature of work. Record the checks in the CQC documentation, and file regularly in the appropriate DFOV file folder. Conduct final follow-up checks and correct all deficiencies prior to the start of additional features of work that may be affected by the deficient work. New work shall not be built upon or conceal nonconforming work. Use FCR's on BIM 360 immediately to document deficiencies with materials, installation defects or un-approved shop drawings or products.

## 2.4 TRADE SUBCONTRACTORS QUALITY CONTROL PLAN

After contract award and prior to beginning construction activities each Trade Subcontractor will submit (per specification section 01 13 00 Submittals, paragraph 1.4) to the Webcor/Obayashi Joint Venture CQC Manager their project specific quality control plan for review and approval. Each Trade Subcontractor will designate and provide a project specific Trade Subcontractor Quality Control Manager who reports to the W/OJV CQC Manager and who's primary responsibility will be to implement and manage the Trade Subcontractor's quality control plan and certify the Trade Subcontractor's compliance with the Webcor/Obayashi Joint Venture Quality Control Plan and all quality control requirements contained in the project documents including specification section 01 14 00 Quality Control. The Trade Subcontractors CQC program will be reviewed for compliance to the Contract Documents. In addition to the requirements contained in other sections of this Plan, the Trade Contractors Quality Control Program will include:

- QC Organization chart.
- Procedures for fabrication and installation.
- Procedures for planning and verifying compliance and controlling quality of the work (including checklist forms).
- Procedures for layout verification.

- Coordination with related contractors.
- List of specified tolerances and workmanship standards for each DFOW.
- Daily CQC Reports.
- Program for identifying and correcting defective work.
- Inspection, test and acceptance procedures when specified in the Technical Specifications to be part of the Trade Subcontractors scope
- A quality control Plan that addressed the Federal Transit Administration (FTA Quality Control Guidelines (ref: Transbay Transit Center Quality Management System Manual)

## 2.5 WEBCOR/OBIYASHI JV CQC MANAGER DUTIES AND RESPONSIBILITIES

The CQC Manager, or his approved alternate, oversees the overall implementation of the Webcor /Obayashi JV Quality Control Plan. The CQC manager, will be independent of the “production organization”. The CQC Manager will:

- During performance of the Work will have complete authority to take any action necessary to ensure conformance with the requirements of the Contract Documents. The Webcor/Obayashi CQC Manager or Alternate CQC Manager will have a physical presence on site when work is in progress. In the event of the CQC Managers absence, the Alternate CQC Manager must be present and will have the same authority as the CQC Manager.
- Review for conformance and completeness and approve the Trade Subcontractors QC Plans prior to submittal to the TJPA for acceptance.
- Manage the development and maintenance of the list of Definable Features of Work.
- Meet with the TJPA representative at the Coordination Meeting (Meeting of Mutual Understanding) for each Trade Work Package.
- Provide WOJV management with monthly CQC updates.
- Ensure and document Trade Subcontractor’s application of Three Phases of Control for each Definable Feature of Work.
- Conduct the Preparatory, Initial and Follow-up phase activity meetings.
- Stop and document work that does not comply with requirements of the Contract Documents, and direct removal and replacement of any defective work.
- Ensure and document that all Trade Subcontractor Work performed, on and off the construction site, conforms to requirements of the Contract Documents. Ensure and document that all materials and equipment comply with the

requirements of the Contract Documents. Report any deficiencies and corrective action planned and taken in BIM 360 Systems

- Ensure that all Trade Subcontractors CQC Plans are in conformance with the Webcor /Obayashi JV CQC plan and with the requirements of the Contract Documents.
- Review for conformance, completeness and clarity that all Trade Subcontractors certify their submittals for conformance with the requirements of the Contract Documents.
- Ensure W/O staff document review and approval of submittals prior to transmission to the CMO.
- Review and approve Webcor/Obayashi JV Daily Quality Control reports
- Prepare and submit Weekly Contractor Quality Control reports
- Ensure that all Trade Subcontractors prepare, complete and submit Daily Quality Control reports.
- Maintain copies of all quality control and quality program documents in Constructware.
- Support and facilitate the Audit Process per the QMS and FTA Element 14 (Quality Audits).
- Conduct internal audits
- Ensure that RUP Contractors use preplanning sheets and work plans for improved Quality Control, improved record keeping for M&TE (Measuring and Testing Equipment) and calibration data.
- W/OJV CQC Manager will ensure that CQC team provides a written plan and schedule for resolution of non-conforming work.
- W/OJV CQC team provides a weekly summary and review of CQC activities at the Quality Meeting.

## **2.6 WEBCOR/OBAYASHI JV ALTERNATE CQC MANAGER DUTIES AND RESPONSIBILITIES**

The Alternate CQC Manager performs all duties of the CQC Manager when the CQC Manager is not on-site. The Alternate CQC manager, when performing the duties of the CQC Manager, is independent of the “production organization”. The Alternate CQC Manager’s responsibilities are the same as the CQC Managers

## **2.7 TRADE SUBCONTRACTORS QC MANAGER DUTIES/RESPONSIBILITIES:**

The Trade Subcontractor QC Manager reports to the Webcor /Obayashi JV CQC Manager and oversees the trade specific implementation of the quality control program and whose primary responsibility will be to implement the Trade

Subcontractor's quality control plan. The Trade Subcontractor QC manager will certify that the Trade Subcontractor's work is in compliance with the Contract Documents and complies with the Webcor/Obayashi Joint Venture Quality Control Plan and all quality control requirements contained in the Contract Documents, including specification section 01 14 00 Quality Control. The Trade Subcontractor QC Manager will:

- Manage the Trade Subcontractors Quality Control Program both onsite and offsite.
- Submit a QC Plan that meets the requirements of the Webcor/Obayashi CQC Plan, Specification 01 14 00 Quality Control and the TTC Quality Management System Manual and FTA 15 Essential Elements.
- The Trade Subcontractor QC Manager or alternate QC Manager will have a physical presence on site when work is in progress.
- Designate a qualified Alternate Trade Subcontractor QC Manager to serve in the event of the Trade Subcontractor QC Manager's absence.
- During performance of the Work, will have complete authority to take any action necessary to ensure conformance with the requirements of the Contract Documents.
- Submit daily Quality Control Reports to the Webcor/Obayashi JV CQC Manager.
- Submit Preparatory and Initial Phase Checklists, along with Follow-up Phase documentation for each DFOV to the Webcor/Obayashi JV CQC Manager for review and approval.
- Establish written procedures for Trade Subcontractor document control, submittal management and material procurement.
- Maintain review for conformance and submit copies of all quality control documentation, certifications, and materials delivery receipts as required in the Contract Documents.
- Attend the Coordination meetings (Meeting of Mutual Understanding).
- Manage the Three Phases of Control process for each DFOV, including attending the Preparatory, Initial and Follow-up phase activity meetings for each of the trade subcontractors DFOV.
- Immediately stop any work, for which they are responsible, that does not comply with requirements of the Contract Documents, and direct removal and replacement of any defective work.
- Conduct daily quality inspections of Work performed prior to request for agency or special inspections to ensure compliance with requirements of the Contract Documents.

- Ensure that all Work performed, on and off the construction site, and all materials and equipment conform to requirements of the Contract Documents.

Report nonconformances and corrective action planned and taken in BIM 360 Systems.

- Remove any person from the Project that consistently fails to perform Work properly.
- Ensure that the Trade Subcontractors submittals conform to the requirements of the Contract Documents.

## 2.8 QC SPECIALIST RESPONSIBILITIES

In addition to CQC personnel specified elsewhere in the Contract, Contractor shall provide as part of the CQC organization, QC specialists that are specialized personnel to implement the CQC Plan. The QC specialist will:

- Be responsible to the CQC System Manager
- Be physically present at the construction site during work on their areas of responsibility, and have the necessary education and experience.
- These individuals may perform other duties but must be allowed sufficient time to perform their assigned quality control duties as described in the CQC plan.
- Stop and document work that does not comply with requirement of the Contract documents, and direct removal and replacement of any defective work.

## CONTRACTOR QUALITY CONTROL MANAGER APPOINTMENT LETTER

**To:** Adib Sassine  
Quality Control Manager

**From:** Jes Pederson  
President / CEO Webcor/Obayashi Joint Venture

**Date:** October 24, 2013

**Subject:** Appointment of Quality Control Manager for Transbay Project

---

Please be advised that you are hereby appointed as Quality Control Manager for the Transbay Transit Center Project. Your responsibilities include managing and implementing the Webcor/Obayashi Joint Venture Project Quality Control Plan.

You are assigned the following responsibilities:

- Implementing provisions of the Webcor/Obayashi JV Quality Control Plan as it pertains to the contract Documents.
- Assuring that the Quality Control Plan is established and implemented by persons doing work that impacts quality.
- Assuring that the Quality Control Plan complies to the FTA Guidelines, TJPA Quality Management System and Contract requirements.
- Acting as W/O JV liaison with parties outside of the company on matters relating to quality.
- Reporting to Senior Management on the performance of the Quality Control Plan, including needed improvements.
- Review for conformance, completeness and clarity of the quality control documents.
- Review for conformance, completeness and clarity of quality control records.
- Review for conformance, completeness and clarity of quality related contract submittals.
- Review for conformance, completeness and clarity of project inspection and QC activities.
- Review for conformance, completeness and clarity of subcontractors quality control programs.
- Reporting to the TJPA representative on matters pertaining to quality.
- Reviewing for conformance, completeness, clarity and distributing subcontract QC reports.

I grant you authority for carrying out the above responsibilities including:

- Stopping Work when continuing work may adversely affect quality or cover up a defect.
- To direct the removal and replacement of a nonconforming work or material by any subcontractor or supplier.

President / CEO signature and date:

W/O CQC Plan TTC Rev 1

## ALTERNATE QUALITY CONTROL MANAGER APPOINTMENT LETTER

**To:** Duncan Sinclair  
Alternate Quality Control Manager

**From:** Jes Pederson  
President / CEO Webcor/Obayashi Joint Venture

**Date:** October 24, 2013

**Subject:** Appointment of Alternate Quality Control Manager for Transbay Project

---

Please be advised that you are hereby appointed as Quality Control Manager for the Transbay Transit Center Project. Your responsibilities include managing and implementing the Webcor/Obayashi Joint Venture Project Quality Control Plan.

You are assigned the following responsibilities:

- Implementing provisions of the Webcor/Obayashi JV Quality Control Plan as it pertains to the contract Documents.
- Assuring that the Quality Control Plan is established and implemented by persons doing work that impacts quality.
- Assuring that the Quality Control Plan complies to the FTA Guideline, TJPA Quality Management System and Contract requirements.
- Acting as W/O JV liaison with parties outside of the company on matters relating to quality.
- Reporting to Senior Management on the performance of the Quality Control Plan, including needed improvements.
- Review for conformance, completeness and clarity of the QC documents with contract documents and approval.
- Review for conformance, completeness and clarity of QC records with contract documents and approval.
- Review for conformance, completeness and clarity of quality related contract submittals with contract documents and approval.
- Review for conformance, completeness and clarity of project inspection and QC activities with contract documents and approval.
- Review for conformance, completeness and clarity of subcontractors quality control programs.
- Reporting to the TJPA representative on matters pertaining to quality with contract documents and approval.
- Reviewing for conformance, completeness, clarity and distributing subcontract QC reports and contract documents an approval.

I grant you authority for carrying out the above responsibilities including:

- Stopping Work when continuing work may adversely affect quality or cover up a defect.
- To direct the removal or replacement of and nonconforming work or material by any subcontractor or supplier.

President / CEO signature and date:

W/O CQC Plan TTC Rev 1

**ADIB SASSINE, AIA CA RA**  
**PRECON AND CONSTRUCTION QUALITY**  
**CONTROL MANAGER**

**Design and Construction Experience: 35 years (1978)**

Mr. Sassine is a California licensed architect and has over 35 years of strong experience in diverse large project types, including Construction Quality Control, Pre-construction and Construction Management. His extensive experience includes over 25 years of experience on new and renovated health care facilities primarily OSHPD projects; and balance of experience includes; education, schools, office buildings, public buildings, large airports, hotels and restoration of historic buildings.

**RELEVANT EXPERIENCE**

**Building Envelope Sr. Consultant and Architect – Allana Buick & Bers  
(July 2011 to 7.2013)**

Architect and Quality Control Manager on several projects including the following:

New Stanford Hospital over \$1 billion; Performed peer review of the entire building envelope over 28 systems. (Rafael Vineolli)

9<sup>th</sup> and Broadway 17 story tower in San Diego; Design and construction quality control of the building envelope including several green roof areas. (Thornton Tomasetti)

Palo Alto Mitchell Park Library including several systems and green roof; Design of all building envelope and performed construction QC. (Group 4)

San Jose University Student Center, LA Harbor Science Building Design and construction monitoring of exterior envelope composite mock-up testing and similar other including UC Berkeley restorations. UCSF Parnassus MOB and Hospital forensic work and remediation of two major buildings.

San Mateo Medical Center MOB Exterior skin upgrade design.

And several other projects.

**Healthcare**

**Acute Care Mock-up**

### **Santa Clara Valley Medical Center SCVMC, San Jose, CA – Turner Construction Co (2007 to 2011)**

**OSHDP** – Construction Quality Control Manager on the Bed Building One project which includes the following:

1. A 6 story with Basement and Penthouse nursing tower replacement over 350,000 sf, with 168 beds primarily ICU and Acute Care Units and Rehab Center utilizing SidePlate moment frame system and phased incremental approvals.
2. A 1500 stall Parking Garage with 850 KWp Photovoltaic tracking system over the new garage and retrofit existing Garage for the added solar panel system
3. Design-Build Central Plant upgrade with Site Utilities Loop to include 2-1000 tons absorption chillers, two cooling towers and 2-2000KW generators and two boilers
4. And the Design-Build of Renova Drive intersection relocation
5. Make-ready projects to relocate all underground utilities from the site while the hospital is in operation.

As a QC Manager, Adib is responsible for the construction quality control as well as assisting Purchasing to writing scopes, for all bid packages and reviewing contracts. Some of the quality control responsibilities are to develop the quality control plan and its implementation, pre-inspection of the work before submitting inspection requests by the IOR, reviewing all RFI's, reviewing schedule, reviewing shops and certifying them for compliance with the permitted contract documents, certifying pay applications and certifying milestone completion dates. Adib was involved in providing Pre-construction services such as Sr. Project analyst to provide planning, coordination with all enabling and make-ready projects, scheduling, progress plan check, constructability reviews, report writing and evaluations, phasing plans, cost control and site logistics of the Parking Garage and Solar Power design-build projects and other related hospital projects from Cath Lab to MRI renovation on campus.

### **CHW St Joseph Women and Children Hospital Stockton, CA (\$65M) - Turner**

**OSHDP** – CM at Risk – Pre-construction

Addition of 100,000 sf of 78 beds hospital building with elevated bridge connector and underground parking Garage. Adib provided Constructability Reviews, Site Logistics and Cost Control.

### **Mills-Peninsula Medical Center Hospital, Burlingame, CA (\$400M+) - Turner**

**OSHDP** – CM at Risk – Pre-construction up to NTP

Addition of 440,000 sf six (6) level Hospital designed with base isolation and damper structural systems. Adib provided constructability reviews and purchasing services to include bidding multiple packages, writing scopes and developing bid spread sheets and reviewing all subcontracts for fast-track incremental approvals while project was being reviewed by OSHDP.

### **Historic Laguna Honda Hospital Seismic Upgrade, San Francisco, CA (\$50M) - Turner**

**OSHDP** – CM at Risk – Pre-construction PM

Adib Managed the project through bidding to include Constructability reviews, phasing, scheduling and budgeting for seismic retrofit of Wing H of the original historic Hospital project and coordination with the new Laguna Honda hospital replacement project.

#### **John Muir Medical Center Hospital Expansion, Walnut Creek, CA (\$230M) - Turner**

**OSHDP** – Pre-con services.

Addition of 429,000 sf 5-story tower and remodel of existing regional Trauma hospital including helipad and new Central Plant. Remodel consists of new Emergency Department and phased construction. Provided constructability reviews, phasing plans, cost controls and site logistics.

#### **Lucille Packard Children Hospital Expansion, Palo Alto, CA (\$70M) - Turner**

**OSHDP** – Lump Sum – Constructability review during early construction phase.

#### **CPMC Cathedral Hill Hospital Preconstruction, San Francisco, CA (\$850 M) - Turner**

**OSHDP** – Delivery Method CM at Risk – Adib provided comprehensive Constructability and Estimate Reviews in the latter part of Turner involvement on the project.

Ground up 550 beds for adults and women/children and 2,745,000 SF Women's and Children's Hospital in downtown San Francisco consisting of 19 stories above ground and 6 stories underground with base isolation. This project included a medical office building design-built with a connecting tunnel under Van Ness.

#### **Sr. PM and Healthcare Business Development – Hathaway Dinwiddie (2004-05)**

**OSHDP** – CM at Risk – during Schematics and DD

Responsible for managing small healthcare projects for Stanford ED and UC Clinical Lab. Adib was responsible to provide BD at Hathaway Dinwiddie. Also Adib managed and bid window replacement on 20 story high rise in Nob Hill in SF and performed cursory constructability review for the Millenium condo tower in SF during early design phase.

#### **Sharp Memorial Hospital, San Diego, CA (\$185M) – Gilbane (2000-03)**

**OSHDP** – Project Executive - CM at Risk – during Schematics and DD

This multi-phased project includes the construction of a new six and seven-story, 302 bed patient towers of 315,000 s.f. that include 158 Acute/IMCU beds, 24 SICU/CVICU beds, 64 AC/IMCU beds, 24 CCU/MICU beds, 32 AC/IMCU-Ortho beds and shell space for 32 beds for a total of 334 beds; 14 Operating Rooms and Surgery Suite; New Emergency Department, new Hospital Entrance and Lobby; and administrative spaces. In addition to the new hospital addition, and as part of the SB1953, the Critical Care Areas within the existing hospital will be relocated to the new HMP Addition. This project

also includes the Central Plant Expansion to accommodate new hospital replacement, Coordination with other projects on site such as an Ambulatory Care Center and OSHPD 600 stall parking Garage with Helipad.

#### **UC Davis Medical Center, Sacramento, CA (\$260M) - Gilbane**

**OSHPD** – Project Executive Agency CM - This Surgery and Emergency Services Pavilion addition at the UC Davis Medical Center. (During Schematics and DD)

This pavilion is a major addition to the Main Hospital building at UC Davis Medical Center. The project under construction will include approximately 420,000 s.f. of building construction and ten acres of site development. It includes Emergency Department, Dietary Department, Radiology, Cardiology and a 24-room Operating Room suite.

#### **Kaiser Walnut Creek Hospital, Walnut Creek, CA – BFH (1989-96)**

**OSHPD** – Design and Construction Administration - New multi-phase, three-story with full basement, 123 bed Hospital addition and replacement, 10 Operating Rooms, Surgery Suite, MRI Suite, Central Sterile, Clinical Lab, 4 C-Section Rooms, 24 LDR Rooms, ICN and other ancillary spaces. The Hospital was built while maintaining the entire existing hospital in operation on a 28-acre site with covered running creek and heritage Oak trees over 200 years old. Existing building had to be demolished in sections, and existing tower was later renovated and connected to the new Hospital.

#### **Kaiser Walnut Creek Central Plant Expansion, Walnut Creek, CA – BFH**

**OSHPD** – Design and CA - This Central Plant Expansion, Medical Gas Farm and Emergency Generator Plant. Project involved 3- 350-ton chillers, switchgear room, boiler room and 3-750KW Generators. Enclosure was adjacent to existing Parking garage with utilities running over creek lid in a high density site.

#### **Kaiser Vallejo Medical Center MOB, Vallejo, CA (\$50M) – SOM (1986-89)**

Design and CA - This two-story, 166,645 s.f. Medical Office Building with courtyards to accommodate 123 providers on a 38-acre site with on-site parking built with a connecting site utility loop to CUP.

#### **Kaiser Vallejo Medical Center Central Utility Plant, Vallejo, CA - SOM**

**OSHPD** – Design and CA - This Utility tunnel was added to connect to new Central Plant Expansion. Generator Plant

#### **Kaiser San Rafael Medical Center MOB Renovations, San Rafael, CA (\$12M) - BFH**

Design and CA - This 8,000 s.f. project, including OR, ER renovation, pharmacy and radiology renovations over 4-year plan.

#### **Coalinga Community Hospital, Coalinga, CA (LHR)**

**OSHPD** – Design and CA - This 56,000 s.f. project involving 35-bed hospital and 56-bed skilled nursing facility replacements to earthquake-damaged facility. Site is an approximately 12-acre parcel on a new development area.

### **Office Building**

#### **State Office Building at Butterfield Way, Sacramento, CA (\$171.5M) - Gilbane**

Project Executive - Agency CM - Franchise Tax Board Campus addition and renovation project for the State of California, Department of General Services, and Project Management Branch on this project.

This project involves 1 Million SF of new construction and 843,000 s.f. of renovation on 93 acre site. It is located in Sacramento, California, and consists of phased construction with separate contracts for Sitework, a Central Utility Plant (\$25M), a Warehouse, four Building Office complex, and a Town Center. This project was designed to be a LEED certified project.

#### **Wells Fargo Card Division Relocation Center, Concord, CA - BFH**

Program Manager and Construction Administrator

Fast-track, 265,000 SF Data Center, with 100% access flooring office space and high security project completed without a single change order for the tenant improvement.

### **Office and Commercial Historic/Seismic Upgrade**

#### **Oakland Rotunda Seismic Upgrade, Oakland, CA (\$32M) - AD**

Design and CA - This 265,000 s.f. historic building over 100 year old with elliptical dome and seven-story elliptical atrium sustained serious damage during Loma Prieta earthquake in 1989. The brick and steel building had to be retrofitted seismically, including replacing mechanical, plumbing, and electrical systems including provided complete tenant improvements as part of a design-build team. The building has multiple commercial tenants on the first floor and multiple office tenants on the upper floors.

### **Airports**

#### **SFO International Airport, San Francisco, CA (\$830M) – Skidmore Owings and Merrill – (1996-98)**

Sr. Technical coordinator and Construction Administration as Owner's Rep - Over 1.8 million s.f. of base isolation SFO International Terminal Addition, two five-story office buildings, and light rail, BART station additions and elevated roadway fast-track projects, including coordination with adjacent Boarding Areas A and G. This included VE implementation of over \$35 million while project being bid on a fast track delivery model. Adib was also responsible to coordinate with Boarding Areas A and G of two different architectural firms and elevated roadways for total construction cost of \$2.3 billion.

### **Hotels/Convention Centers**

#### **Marriott Hotel Tower, Santa Clara, CA (\$28M) - JYA**

Design - This 22-story tower consists of new tower with banquet facilities to accommodate 1,500 persons, a restaurant and conference center. Entire tower was designed as reinforced concrete structure with post tension slab and pre-fabricated EIFS system as the exterior skin.

#### **Original Moscone Convention Center, San Francisco, CA – JA/HOK (1980-83)**

CA assistance for the tub design by HOK/IM Pei at 40 feet below Howard and provided punch list for the entire building.

### **Other Education Facilities**

#### **Foothill and De Anza Community Colleges in Los Altos and Cupertino, CA (\$275M) - Gilbane**

Agency CM - Measure "E" Bond improvements for FHDA. This program consists of new building and

existing building renovations over 60 major projects ranging from \$1Million to \$33 Million.

**University of California at Berkeley, Berkeley, CA - JY**

Design - Renovation projects, including Julia Morgan's Hearst Gymnasium, Manville Hall, and Administration renovations.

**EDUCATION/LICENSE**

Bachelor of Science, Architecture, Cogswell College, San Clara, (formerly in SF) CA

California Licensed Architect

UC Berkeley Extension Art and architecture Courses

Construction Management Certificate - Brown University thru Gilbane

## Duncan J Sinclair Quality Alternate

### EDUCATION AND BACKGROUND

---

As the Contractor's Alternate Quality Manager when the W/O JV Quality Manager is not on site, Mr. Sinclair will have the primary responsibility of managing the Contractors Quality Management System. His Duties include ensuring Trade Subcontractor compliance with the projects quality requirements via implementation of specified process controls and acting as the day to day interface between project production and quality management to assure the work conforms to the project requirements. He is responsible for documenting quality compliance and providing senior management with periodic quality reports.

Mr. Sinclair graduated with a BS in Mechanical Engineering from Washington State University in Pullman, Washington in 1971. Mr. Sinclair also earned a Masters in Business Administration from City University of Seattle in 1982. His 30 years of construction management and quality management experience includes implementing project-specific quality management programs for a variety of construction projects.

### RELEVANT EXPERIENCE

---

<b>Transbay Transit Center San Francisco, CA</b>	Pre-Construction on Subcontractor Work Packages and analyze Commissioning Trade Specifications and correlations to Commissioning Coordinator (Cx) Specification on the Transbay Transit Center Project. Public Works; 2011- present. Total Public Works Projects is 17 years.
<b>Lawrence Livermore National Lab Livermore, CA</b>	LLNL Building HVAC Controls and Electrical Smart Meters. Construction Superintendent for Johnson Controls, Inc. (JCI) to manage field operations installing Electrical Power and HVAC DDC Controls in selective buildings at the Lawrence Livermore National Labs (LLNL) under Contract with Nuclear National Security Agency (NNSA). Duncan managed electricians and HVAC Controls Techs and field verified completeness, assured quality program compliance, Safety Program adherence & housekeeping while performing electrical power meter installations and HVAC DDC modifications and tracking. Daily Work Permits were written by JCI and approved by LLNL. Duncan verified the Work Permit was implemented and notified the JCI QC & LLNL Inspectors to witness the final installation. Public Works; 2010-2011 - 1 year.

<b>Lawrence Livermore National Lab Livermore, CA</b>	<p>Construction Manager for Jacobs Engineering Group assigned to National Ignition Facility Laser CM Team at Lawrence Livermore National Lab to manage various improvements including renovation of an adjacent 3 story office use for \$5M lab support facility. Duncan generated all the required Work Permits that includes Safety precautions, specific installation instructions, &amp; Quality management to tie-in MEP Systems to existing Configured Systems under Engineering Management Control. Duncan was responsible for Safety, Facility Access, and interfaced with project QC Inspectors to confirm compliance to Contract Drawings, &amp; Specifications. Coordinated operations with Facility personnel. Public Works; 2009-2010 - 1 year.</p>
<b>Millennium Tower (301 Mission) San Francisco, CA</b>	<p>This project is a high-end condominium/mixed-use project 60 stories tall. It also includes a 12 story condominium/amenity building connected by a 3-level Atrium/Podium. Mechanical, Electrical, Plumbing and Sprinkler (MEPS) Superintendent coordinating MEPS Subcontractors work and quality compliance, \$80M Subcontracts. Monitored, updated and planned the Project schedule for 3 week projections. Reviewed Submittals to confirm compliance with Projects Specifications. Inspect all MEPS installations to insure Quality compliance to Specifications. Managed the RFI process to resolve conflicts in drawings or obtain clarifications. Duncan Coordinated Subs to obtain Temporary Certificate of Occupancy with SFPD. Enforce OSHA, Company Safety and Quality Program requirements. \$348 million.</p>
<b>St. Regis Museum Tower San Francisco, CA</b>	<p>A five-star, 42-story mixed-use hotel and condominium project with 269 luxury hotel rooms and 102 high-end condominiums. The project also incorporates the renovation of the existing 9-story historic Williams Building, built in 1907. The renovation included a seismic upgrade and the building will house the hotel's restaurant and kitchen as well as a portion of the African American Cultural Museum. MEPS Superintendent coordinating with \$80M MEPS Subcontractors, Owners Rep's and project superintendents for Webcor Builders. Duncan monitored, updated and planned the Project schedule for 3 week projections. Reviewed Submittals and field inspected the MEPS installations for Quality compliance. Write RFI's to resolve conflicts in drawings or obtain clarifications. Duncan coordinated Subs to obtain TCO with City Officials. Enforce OSHA and Company Safety Program. \$173 million.</p>
<b>Lawrence Livermore National Lab Livermore, CA</b>	<p>Zone Manager for the Laser Bay for a \$5M contract for LLNL to install the major components used as the base equipment for the Laser Beams in the National Ignition Facility (NIF). Duncan was the Field Manager for the Subcontractor with 45 craft performing the installation. Duncan was responsible for Quality Control Management to assure exactness of tolerances and standards for welding and metal finishes, enforces Safety requirements during the installation process. Public Works; 1999-2000 - 1 year</p>
<b>Lawrence Livermore National Lab Livermore, CA</b>	<p>Field Area Manager for Jacobs' \$185M self performs activities with Union craft to install the Laser Beam Enclosures. Duncan enforced all Safety Regulations, Personal Protective Equipment, Clean Construction Protocol, Project Labor Agreement, and schedule activities. Duncan was the primary field contact with LLNL personnel for schedule coordination, engineering RFI's, Quality Control, managing non-conformance reports, and safety incidents. Conducted daily coordination with Superintendents, Subcontractors, and the Client to control installation activities in each area and avoid craft conflicts to maintain schedule objectives. Public Works; 2000-2003 - 3 years.</p>

<b>San Francisco City Hall Renovation</b> <i>San Francisco, CA</i>	SF City Hall Seismic Retrofit & TI Modification-\$200M, w/GC: Managed MEPS Subcontractors through design coordination, submittal review, sequential scheduling. Quality management, installation, and start-up. Duncan worked closely with TI Architect to incorporate new systems with existing and new architectural designs. Worked hand in hand with SF DBI by pre-inspecting installations and notifying the Inspectors when systems were ready. Public Works; 1995-1999 - 4 years.
<b>Singapore US Embassy</b> <i>Livermore, CA</i>	US Fed Government Embassy at Singapore-\$50M, w/GC; Stateside coordinator controlling mechanical and electrical vendor's submittal documentation for approval for Quality management, construction installation and systems operations. Write requisitions and submittal requirements for mechanical equipment for purchase orders. Resolve conflicts between overseas site and domestic vendors. Public Works; 1993-1995 - 2 years.
<b>Sharks Hockey Arena</b> <i>San Jose, CA</i>	San Jose Sharks Ice Hockey Arena-\$150M, w/CM; Directed mechanical & plumbing subcontractors to comply with the City DPW ICBO Code requirements with project specifications involving wet and dry HVAC and plumbing including seismic bracing systems. Duncan verified all installation met Contract Specifications & Drawings and equipment start-up and systems operational modes. Assisted SJ DPW on completion of ICBO Plumbing Code required pipe testing and clearances. Duncan had an active ICBO Plumbing Certification from 1988 to 1998. Public Works: 1992-1993 - 1 year.
<b>US Postal Service</b> <b>860 Main Street</b> <i>San Francisco, CA</i>	US Postal Service Lost Package Facility and the US Treasury Department. US Post Offices added HVAC & Fire Protection to floors that were modified from open rooms to partitioned offices. US Treasury Dept. upgraded office spaces, Computer Room and Automated check envelope wrapping machine. Duncan performed all Quality Control and code inspections for Fire Protection, plumbing, mechanical and HVAC Controls installations. Public Works: 1991-1992 - 1 year.
<b>Convention Center</b> <i>San Jose, CA</i>	The San Jose Convention Center is the main <a href="#">convention center</a> for the city of <a href="#">San Jose, California</a> . It is located in close proximity to several others of San Jose's convention and cultural structures. The San Jose McEnery Convention Center provides more than 425,000 square feet of space for conventions and events. Its flexible configuration offers 143,000 square feet of divisible, column-free prime exhibit space, a large ballroom, up to 30 meeting rooms with up to 2,400 theater-style seats and banquet facilities for up to 5,000 persons. In addition, the Convention Center has 30-foot-high finished ceilings, 12 loading bays with drive-on access to the exhibit hall floors, recessed utility boxes with electricity, water and drainage capabilities complete audio-visual, sound and lighting services, cellular, standard and ISDN telephony services and fiber optic and copper cabling throughout the facility with DS-3 high-speed Internet access. As the plumbing and mechanical inspector for O'Brien-Kreitzberg Inc., Duncan inspected all plumbing & mechanical installations to insure project Quality, and code compliance in conjunction with the ICBO Plumbing City Inspector. Active in resolving RFI and Code issues with plumbing Inspector. Duncan had an active ICBO Plumbing Certification from 1988 to 1998. Public Works 1987-1990 - 3 years.

CERTIFICATIONS AND PROFESSIONAL MEMBERSHIPS

US Army Corps of Engineers/NAVFAC Quality Certified, 2012

OSHA 10 & 30 Hour Certified

American Society of Mechanical Engineers; Life Member

Professional Profile for Mario B. Saladana,  
Webcor/Obayashi Quality Control Specialist

---

Current Position

Mario B. Saladana serves as a Quality Control Specialist/Senior Superintendent.

Experience

Mario has 35 years of construction experience and 28 years where with Webcor.

Mario has extensive familiarity with construction codes and practices, overseeing subcontractors and with residential, hospitality, and concrete projects.

Mario is familiar with a wide variety of project types and delivery methods.

As a Quality Control Specialist/ Senior Superintendent, Mr. Saldana assumes responsibility for on-site activities including overall coordination and scheduling of subcontractors and self-performed labor, safety, and quality. He develops and manages the schedule to ensure on-time performance. Together with the project management staff, Mr. Saldana collaborates in design, estimating and constructability reviews. He manages subcontractor performance on-site.

Professional Certifications

Professional Profile for Jose Verduzco  
Webcor/Obayashi Quality Control Specialist

---

Current Position

Jose Verduzco serves as a Quality Control Specialist/Assistant Superintendent.

Experience

Jose has extensive familiarity with construction codes and practices.

Jose is familiar with most major construction methods.

As a Quality control Specialist/Assistant Superintendent, Mrs. Verduzco plans, schedules, coordinates, sequences, and monitors procurement and construction activities for field teams. He conducts field reviews to inspect and assure compliance to construction policies, procedures, and standards. He reviews drawings, specifications, and subcontractor submittals and ensures that field staff and subcontractors comply with required safety standards. In addition, Mrs. Verduzco prepares correspondences and reports, generates short interval schedules, and manages self-performed labor. He assumes responsibility for weekly LDR quantities and orders necessary materials and equipment.

Education

Jose holds a Bachelor of Science, Business Management in Commerce, Santa Clara University, Santa Clara, CA 2007

## 2.10 TRADE SUBCONTRACTORS QUALITY CONTROL MEETINGS:

In addition to the Three Phase of Control Meetings, A Trade Subcontractor QC Meeting will be part of the Weekly Trade Subcontractors Meetings held by the Webcor/Obayashi JV Project Superintendent or Project Manager. W/OJV CQC Manager will review with the Trade Subcontractor QC Manager will review current QC issues as a segment of the weekly meeting; addressing the schedule, testing, inspection, re-work log, failed inspection status, short-term schedule of QC activities, project tests, submittal status, factory verification requirements, inspection results and any other QC issues relevant to the current activities.

## 2.11 DEFINITIONS:

- Project As-Built Drawings – All changes and modifications to the Contract work as required by site conditions and inspections in accordance with the requirements of Section 01 17 20.
- **Contractor** - Webcor/Obayashi Joint Venture (**WOJV**)
- **Coordination Meeting (Meeting of Mutual Understanding)** - A meeting held after the pre-construction conference for each Trade Work Package and before start of construction. Contractor shall meet with the TJPA Representative and TJPA QA Manager and discuss the Contractor's quality control system as it relates to the work of the trade package. Submit the CQC Plan a minimum of 15 days prior to the coordination meeting. During the meeting, a mutual understanding of the system details must be developed, including the forms for recording the CQC operations, control activities, testing, administration of the system for both onsite and offsite work, and the interrelationship of Contractor's management and control with the TJPA Representative's quality assurance. Minutes of the meeting will be prepared by the TJPA Representative, signed by both the Contractor and the TJPA Representative and will become a part of the Contract file. There may be occasions when subsequent conferences will be called by either party to confirm mutual understandings and/or address deficiencies in the CQC system or procedures that may require corrective action by the Contractor.
- **Corrective Action Plan** - A plan of action to correct nonconforming work or practices. A written document submitted by the Trade Subcontractor detailing the Trade Contractor's approach to correct an item of work that fails to conform to the project requirements.
- **Corrective Action Request** - A written request from TJPA to develop a Corrective Action Plan for non-conforming work (TJPA form QA-09-01) that establishes a method for ensuring deficiencies in process or implementation

W/O CQC Plan TTC Rev 9.1

adversely affecting quality are identified, cause determined, and an action plan to prevent recurrence is documented.

- **CQC Field Specialist** - specialized personnel to implement the CQC Plan be responsible to the CQC System Manager, be physically present at the construction site during work on their areas of responsibility, and have the necessary education or experience. These individuals may perform other duties but must be allowed sufficient time to perform their assigned quality control duties as described in the CQC Plan.
- **CQC Manager** – The Webcor/Obayashi JV Manager who is responsible for managing the Contractor's CQC System.
- **CQC Manager's Monthly CQC Report** - A section of the Contractors monthly written report prepared and submitted by the CQC Manager which reports monthly CQC activities.
- **CQC Plan** - Webcor/Obayashi JV written quality management plan that meets the requirements of the TJPA Program QMS The means by which Webcor/Obayashi JV (the Contractor/CQC) and its Trade Subcontractors (QC) ensure project quality.
- **Daily Contractor Quality Control Report** - A daily written report providing evidence that required quality control activities and tests have been performed including the work of Trade Subcontractors and Suppliers. These reports shall address deficient features and include a statement that equipment and materials incorporated in the work and workmanship comply with the Contract. These reports shall be within 5 working days after the date covered by the report. Reports shall be reviewed for completeness and accuracy, revised, signed and dated by the CQC System Manager. Reports shall be prepared by all subordinate quality control personnel and be included within the CQC System Manager's report.
- **Definable Feature of Work (DFOW)** - A definable feature of work is a task that is separate and distinct from other tasks, has separate control requirements, and may be identified by different trades or disciplines, or it may be work by the same trade in a different environment. Although each section of the Specifications may generally be considered as a definable feature of work, there are frequently more than one definable feature under a particular section. This list will be agreed upon during the coordination meeting and updated as more packages are awarded.

- **Federal Transit Administration (FTA)** - An administration within the U.S. Department of Transportation that provides stewardship to support a variety of locally planned, constructed, and operated public transportation systems throughout the United States.
- **Initial Phase Checklist** – A checklist prepared for each Definable Feature of Work (DFOW) in the Initial work Phase per 01 14 00 1.9.C.
- **Master Definable Feature of Work List** - The project list definable features of work for all trade subcontractors maintained by the Webcor/Obayashi JV CQC Manager.
- **Nonconformance Report** – A written report entered in BIM 360 Field Systems describing non-conforming Work.
- **Nonconforming Work** – Work that is unsatisfactory, faulty, defective, or deficient; Work that does not conform to the requirements of the Contract Documents; Work that does not meet the requirements of inspection, reference standards, tests, or approval referred to in the Contract Documents; or Work that has been damaged prior to Final Completion.
- **Phase 1: Preparatory Phase** – A controlled activity including a meeting conducted by the Webcor/Obayashi JV CQC Manager and with the Trade Subcontractors CQC Manager, the Subcontractor's Production Team, Trade Subcontractors Representatives, Inspectors, and TIPA representatives. This is the first of the three phases of control where all requirements of the work: drawings, specifications, submittals, RFI's, installation and coordination issues are reviewed before beginning any Definable Feature of Work (DFOW).
- **Phase 2: Initial** – A controlled activity including a meeting conducted by the Webcor/Obayashi JV CQC Manager with the Trade Subcontractors CQC Manager, the Subcontractor's Production Team, Trade Subcontractors Representatives, Inspectors, and TIPA representatives is held immediately prior to the start of the work. Using the meeting minutes from the Preparatory Phase meeting, this meeting transfers the information and requirements and agreements to the crews performing the work.
- **Phase 3: Follow-up Phase** Daily checks performed by the trade subcontractor QC an QC specialists and verified by QC System Manager to assure that control activities, including control testing, are providing compliance with contract requirements, until completion of that particular feature of work. Report the checks in the Daily QC report and upload to the DFOW records.

- **Preparatory Phase Checklist** - A checklist prepared by the CQC Manager for each Definable Feature of Work (DFOW) in the Preparatory Phase per 01 14 00 1.9.B.
- **Quality** - Conformance to the requirements established by the contract documents.
- **Quality Control Plan** - An approved written plan which includes plans, procedures, and organization necessary to produce an end product that complies with the Contract requirements. The plan covers all construction operations, both onsite and offsite, and shall be keyed to the proposed construction sequence
- **Quality Inspection** - An Inspection of the work performed as the work progresses or prior to calling for an Agency, Code or Special Inspection to confirm the work meets the requirements of the Contract Documents. Contractor shall verify all dimensions in the field and shall check all field conditions continuously during construction. Contractor shall inspect related and appurtenant work and report in writing to the TJPA Representative any conditions that will prevent proper completion of the Work in accordance with the requirements of the Contract.
- **Quality Management** — Management of Quality Control and Quality Assurance activities instituted to achieve the quality levels established by the contract documents.
- **Quality Management System Manual** - Provides specific requirements for Program implementation based upon the Program Quality Policy and the FTA Quality Assurance and Quality Control Guidelines and is the guide for all members of the Program Management Team to deliver a project that meets the highest quality standards (reference: Transbay Transit Center QMSM, Introduction, page 1).
- **Submittal Log** - A written list indicating the status of all Submittals required by the Contract Documents, maintained by the Webcor/Obayashi Joint Venture production team.
- **Technical Specifications** – Divisions 01 through 33 of the project specifications.
- **Three Phases of Control** – The three meetings or actions that bring the Trade Subcontractors CQC Managers, Contractor's Production Team, Inspectors, TJPA representatives and/or field crews together to plan and implement project

quality: The three phases of control include: The Preparatory Phase, Initial Phase and Follow-up Phase.

- **TJPA Construction Management Oversight Manager:** - Turner Construction.
- **TJPA:** - Transbay Transit Center Joint Powers Authority.
- **Trade Subcontractor QC Manager** – The Trade Subcontractor employee who is responsible for managing the Trade Subcontractor’s QC System, and reports to the Webcor/Obayashi JV CQC Manager.
- **Trade Subcontractor’s QC Plan** – The Trade Subcontractors written quality control plan that meets the requirements of the TJPA Program QMS as appropriate for the Trade Subcontractors scope of work and is the means by which the Trade Subcontractors ensure project quality.
- **Trade Subcontractor’s Definable Feature of Work List.** - The list of definable features of the work prepared by the Trade Subcontractors and submitted for review and approval to the Webcor/Obayashi JV CQC Manager
- **Trade Subcontractors Daily Quality Control Report** - The Trade Subcontractors Quality Manager’s daily report that describes: the work completed, quality measures implemented, testing and inspections performed, rework items identified, and deliveries received and as-built drawings updated. (See Tab 12 “Forms” Trade Subcontractors Daily Quality Control Report).
- **BIM 360** – Field **Web-Based Data** Management Software for construction. BIM 360 Systems combines mobile technologies and BIM at the point of construction with reporting for management. BIM 360 Field Systems field management software uses a combination of technologies including the Internet, tablets, and email-capable phones. Licensed users must have a high-speed Internet connection in the office and are responsible for procuring the necessary hardware required for field staff to use the software. All Subcontractors are required to use the BIM 360 Field Systems software, as described in Specification Section 01 31 25 (The field management system will be used to manage CM/GC and Subcontractor quality control inspection and test processes including CM/GC and Subcontractor quality control inspection reports, CM/GC and subcontractor quality control inspection request, nonconforming conditions, punch list, and incomplete items list. The field management system will also be used to manage the commission process, documenting the completion of commissioning-related tests and the resolution of any identified deficiencies). Reporting features include Field Condition Reports, Inspection Requests, Nonconformance Reports and Punch lists.

### **3.0 ELEMENT 3 DESIGN CONTROL**

#### **3.1 INTRODUCTION**

#### **3.2 DESIGN/BUILD PACKAGES**

#### **3.3 ROLES & RESPONSIBILITIES OF THE OWNER AND THE DESIGN BUILD TRADE SUBCONTRACTOR**

#### **3.4 AS-BUILT DRAWINGS**

#### **3.5 SUBMITTAL REVIEW**

### 3.0 DESIGN CONTROL

#### 3.1 INTRODUCTION

Design control as implied in this Element is limited to Design-Build packages where applicable, as-build drawings and submittal review and coordination by Webcor/Obayashi is primarily accomplished by QC Management, Oversight and coordination design/build package, where specified and ensuring that the design requirements are understood, planning the design interfaces and design verification activities, executing the design verification activities, and controlling design changes through project completion.

The designer shall prepare a plan for design/built activities. It should also identify the various organizational interfaces required between various groups producing and commenting on the design, and specify the information to be documented, transmitted, and regularly reviewed.

Appropriate procedures shall be established for the identification, documentation, review, and approval of all changes and modifications to the design. This responsibility should extend to those responsible for construction or manufacturing to ensure compliance to design requirements and for development of "as-built" documents as part of the design documentation at the end of the project.

Each group responsible for design/built shall provide its own written QC procedures. These include peer review of drawings and check calculations. QA activities are performed to verify compliance to established QC procedures and to determine the effectiveness of the procedures in meeting quality program objectives.

Specification Section 01-14-00 Quality Control Paragraph 1.6 B. Procedures for scheduling, reviewing, certifying, and managing submittals, including those of Trade Subcontractors, offsite fabricators, Suppliers, and purchasing agents. These procedures must be in accordance with Section 01 13 00, Submittals.

#### 3.2 DESIGN BUILD PACKAGES

W/OJV Shall:

- Clearly define requirements of the QA/QC Program in the contract documents.
- Coordinate with owner agency oversight activities in order to assure effectiveness of the QA/QC Program.

WO0000-011400WO1.10

- Require additional levels of reporting and/or detail by the DB contractor team.
- Clearly define roles and responsibilities of parties involved early in the bid documents.
- Maintain a proactive and systematic quality program that encompasses all the project lifecycle stages.

### **3.3 Roles and Responsibilities of the Owner and the Design-Build Trade Subcontractor**

QC program effectiveness hinges on clear allocation of roles and responsibilities to the involved parties. QA/QC roles and responsibilities shall be defined clearly in the contract documents; and more importantly, are agreed upon by the parties at the outset. It is recommended that the owner agency conduct audits and testing at every stage of the QC process, and retain ownership of the resident database. TJPA has elected to retain the Quality Assurance (QA) role with the design-build contractor performing the Quality Control (QC) activities.

### **3.4 As-Built Drawings**

Trade Subcontractors have design-build responsibilities (such as the access trestle and traffic bridges), their quality control plans shall include design control for their scope of work.

- The Trade Subcontractors shall keep an accurately marked, up-to-date set of as-built drawings for the work actually installed, and accurately indicate on as-built drawings all site conditions, locations of utilities, work scope changes, changes in dimensions, locations, and elevations of the Work, and changes in details as specified herein and as approved by the TJPA Representative. Trade Subcontractor shall keep the as-built drawings current as the Work is performed.
- Prior to acceptance of the Work, Trade Subcontractor shall furnish to the Webcor/Obayashi JV CQC Manager the final as-built drawings, showing all changes in the Contract Drawings neatly in red ink.
- Trade Subcontractors will delegate responsibility for maintenance, coordination, and accuracy of the as-built drawings to one person on their staff.
- Accuracy of as-built drawings shall be such that future searches for items shown on the Contract Documents may rely on information obtained from the approved as-built drawings.
- Trade Subcontractors shall store as-built drawings apart from documents used for performing the work; keep in a dry, legible condition, and in good order. Label each document "AS-BUILT DRAWINGS— JOB SET" in large, neatly printed letters.
- Trade Subcontractors shall record neatly on the as-built drawings all changes made by clarifications, Change Orders, Requests for Information, and other Modifications to the Contract Documents; and changes to reflect the actual

existing conditions and utility locations references to permanent accessible features of the Work.

- Trade Subcontractors shall clearly describe changes on as-built drawings by note as required.
- Trade Subcontractors shall date all entries, calling attention to the entry by a “cloud” drawing around the area or areas affected.
- Trade Subcontractors shall record in each Specification Section the manufacturer, trade name, catalog number, and supplier of each product and equipment item incorporated into the Work.
- Trade Subcontractors shall furnish a copy of the final shop drawings which have been updated to show actual conditions. Furnish additional drawings as necessary to record deviations from the sizes, locations, and other features of the Work and to locate piping, conduit, ductwork, and similar elements of utility installations by dimensions referenced to permanent accessible features of the Work.
- Trade Subcontractors shall show on the job set of as-built drawings, by dimension accurate to within 1 inch, the centerline of each run of conduits, circuits, piping, ducts, and similar items which are shown schematically on the Contract Drawings but where the final physical arrangement is determined by Trade Subcontractor.
- Trade Subcontractors shall keep as-built drawings up to date during the entire progress of the Work, and provide access for monthly. Updates shall be accurate and current and be done at the time work is performed.
- Trade Subcontractors shall also update and include the revised or newly issued drawings as part of the as built drawings. The work of reproducing and issuing Change Order drawings and updating of as built drawings shall be done as incidental work.

### 3.5 SUBMITTAL REVIEW

Submittals will be reviewed for coordination, completeness, clarity and coordination with other trades prior to submitting to the TJP. To obtain approval from the Architect/Engineer/Consultant for all materials, assemblies, equipment and shop drawing submittals required by the contract documents.

The purpose is to install materials, assemblies and equipment only after approval is obtained from the appropriate reviewing Architect/Engineer/Consultant responsible for the particular scope of work.

- Webcor/Obayashi and TJP process submittals using two different types of project management software. Webcor/Obayashi uses internal system and TJP uses ConstructWare.
- In WOJV System submittal packages contain submittals and all of the history of the submittal is tracked at the submittal level. The submittal package is simply the nest of the submittals that are attached to it.

- Submittals are transmitted to TJPA from Webcor/Obayashi via WOJV internal system and ConstructWare.
  - The naming format of the PDF submittal is crucial for the transmission to be successful.
- Submittal Actions Status:

ACTION	STATUS
Received	Open
Sent	Submitted
Returned	No Exceptions Taken, Make Corrections Noted, Revise and Resubmit, or Rejected
Forwarded	Same as Returned Status
<u>For the Record</u>	<u>Submit for record only</u>

## **4.0** ELEMENT 4 **DOCUMENT CONTROL**

### **4.1** INTRODUCTION

### **4.2** SUBMITTAL MANAGEMENT

### **4.3** SUBMITTAL MANAGEMENT AND DOCUMENT CONTROL PROCEDURES

#### **4.3.1** DOCUMENT CONTROL

#### **4.3.2** SUBMITTALS

##### SUBMITTAL REVIEW CHECKLIST

#### **4.3.3** TRANSMITTALS

#### **4.3.4** DISTRIBUTION MATRICES

#### **4.3.5** MASTER PROJECT DOCUMENT LOG

#### **4.3.6** CQC FILE STRUCTURE

## 4.0 DOCUMENT CONTROL

### 4.1 INTRODUCTION

Webcor/Obayashi's Document Control process is the means by which information Specified in the Contract Documents to be in Webcor/Obayashi's and the Trade Subcontractors' control are logged, filed, and updated to assure that the organization's staff is using the most current approved documents and they are following the most recently approved procedures and standards and that are compliance with contract and applicable FTA, 15 Element Guidelines.

Procedures for control of project documents and data have been established and shall be maintained. The document control measures should ensure that all relevant documents are current and available to all users who require them.

Control of project documents includes the review of documents by authorized personnel, the distribution and storage of these documents, the elimination of obsolete documents, and control of changes to the documents. Copies of the documents shall be distributed so that they will be available at all locations that need them for effective functioning of the quality management system. Obsolete documents will be promptly eliminated from each work location. Any superseded documents retained for the record will be clearly identified as such. The same authorized personnel who reviewed and approved the original documents, unless the control procedures specifically allow otherwise, should review changes to the documents and data. Changes will be promptly distributed to all locations, along with a master list enumerating the current revisions of each document.

Following are examples of the types of documents requiring control:

- Drawings
- Specifications
- Inspection procedures
- Test procedures
- Special work instructions
- Operational procedures
- QA program and procedures

## 4.2 SUBMITTAL MANAGEMENT

The Submittal process is designed to assure that all material, assemblies, equipment and shop drawings meet the Transbay Transit Center project requirements and are approved by the TJPA prior to procurement and installation. The Submittal process is the means by which the Trade Subcontractors control product purchasing. This submittal schedule will be developed incrementally and additional submittals will be added as trade packages are awarded and subcontractors are brought on board. Trade Subcontractors will submit their submittal schedules compliance with contract and FTA element guidelines for approval, as required in the Division 00, 01 and technical specifications, prior to the start of work. Element 4 guidelines state that control of project documents includes the review of documents authorized personnel, the distribution and storage of these documents, the elimination of obsolete documents and control of changes to the documents.

## 4.3 SUBMITTAL MANAGEMENT AND DOCUMENT CONTROL PROCEDURES

The Webcor/Obayashi JV Document Control and Submittal management procedures are part of Webcor/Obayashi's Transbay Transit Center Policy and Procedures Guide. The relevant sections of that guide addressing submittal management and document control are listed below and are included in this section of the Webcor/Obayashi JV CQC Manual:

- |                        |                                    |
|------------------------|------------------------------------|
| 4.3.1 Document Control | 4.3.4 Document Distribution matrix |
| 4.3.2 Submittals       | 4.3.5 Master project document log  |
| 4.3.3 Transmittals     | 4.3.6 CQC file structure           |

### 4.3.1 DOCUMENT CONTROL

The purpose of this outline is to provide guidelines for establishing the appropriate D document control system for the management of the Transbay Transit Center project. This will include the review of documents by authorized personnel. All Controlled documents will go through Document Control to be logged and tracked.

**What is a controlled document?** A controlled document is defined for this project as any contract document or correspondence which includes i) contract requirements, or ii) scope definition or requirements, including distribution of all Contract Documents (e.g. addendum, ASI's bulletins, work orders, etc.) either to/from TJPA or Trade Subcontractor. Controlled documents received will be date stamped, logged, saved electronically (in some cases hard copies filed), distributed internally, monitoring response/process time (also referred to as work flow), distribute externally, and track the distribution list.

The following is a list of **controlled document** examples:

- Project Document Distribution – Internal/External
  - Design Documents
  - Construction Document
  - ASI's
  - Sketches- to be issued with ASI's or RFI's and not on their own.
  - Reference Documents
- Submittals, including all LEED submittal requirements and substitutions.
- Design Review Questions (DRQs) - Preconstruction
- Request for Information (RFIs) - Construction
- Daily Reports and Daily Quality Control Reports
- Safety Memos – Logged and tracked
- Schedules and schedule reports
- Permit Inspections
- Payment Applications
- Cash Flow Projections
- Monthly Progress Reports
- Permits
- Original Documents - Custodianship of all original documents in a Master File until they can be boxed and transferred for long term storage.
- Formal Correspondence; including all formal incoming/outgoing correspondence
- Contract Notification Correspondence; delay notification, etc.
- Contract Modifications
- Virtual Building/Models
- Meeting Minutes
- Transmittals
- Requests for Qualification (RFQ)
- Invitation for Bid (IFB)
- Subcontracts & Change Orders
- Long Form/Short Form Purchase Orders (PO)
- SBE/DBE
- Closeout documents

WO0000-011400WO1.10

- Reimbursements

**Uncontrolled Documents:** The following are some examples of uncontrolled documents:

- Email correspondence
- Field Tags – Collected and tracked by Cost Control
- Purchase Order – Managed by Procurement/Cost Control

#### 4.3.2 SUBMITTALS

Submittals will be reviewed for coordination, completeness, clarity and coordination with other trades prior to submitting to the TJPA. To obtain approval from the Architect/Engineer/Consultant for all materials, assemblies, equipment and shop drawing submittals required by the contract documents.

The purpose is to install materials, assemblies and equipment only after approval is obtained from the appropriate reviewing Architect/Engineer/Consultant responsible for the particular scope of work.

- Webcor/Obayashi and TJPA process submittals using two different types of project management software. Webcor/Obayashi uses internal and TJPA uses ConstructWare.
- In WOJV System submittal packages contain submittals and all of the history of the submittal is tracked at the submittal level. The submittal package is simply the nest of the submittals that are attached to it.
- Submittals are transmitted to TJPA from Webcor/Obayashi via WOJV internal system and ConstructWare.
  - The naming format of the PDF submittal is crucial for the transmission to be successful.

- Submittal Actions Status:

ACTION	STATUS
Received	Open
Sent	Submitted
Returned	No Exceptions Taken, Make Corrections Noted, Revise and Resubmit, or Rejected
Forwarded	Same as Returned Status
<i>For the Record</i>	<i>Submit for record only</i>

#### Receive Submittal from Subcontractor – 0-5 days

Was it received on time? If not, have the Trade Scope PM notify the subcontractor that it was late. Is the submittal complete? If not, return the submittal to the subcontractor, transmittal shall include notification that the submittal is incomplete, give a date that the re-submittal is required, and notify them of their potential risk in missing the submittal date.

Review the submittal using the submittal process checklist once the submittal is deemed complete, stamp, (All pages of shop drawings; front page only for product data), distribute to PM, QC and Supt. to review for conformance, completeness, compliance, clarity and transmit to TJPA.

Design Team Review – 12 days Design team will review the submittal. Each layer of review (Architect and Consultants) will stamp ALL pages and return to Webcor/Obayashi's document control manger.

Returned Submittal - 5 days

Reviewed by Document Manager – Notify Author. Document Control will receive e-mail notification that the submittal has been reviewed in ConstructWare. Document Control will forward the e-mail notification along with all attachments to Author.

PM Triage – Notification Sent to Subcontractors

- Revise & Re-submit or Rejected
  - Return R&R or Rejected submittal to author subcontractor. PM will include in the transmittal a due date for re-submittal (5 days). Director will make a case-by-case determination on whether to send a preliminary submittal to other subcontractors for coordination.
- No Exceptions Taken & Make Corrections Noted
  - Email author subcontractor and all affected trade subcontractors the approved submittal. PM will include transmittal with the action required.

Is there a Cost / Schedule Impact or Scope Change?

Subcontractors have 5 days from the returned date to respond with a cost or schedule impact.

Written Notification to Owner, draft RFI to Capture Cost.

Shop drawings, product data, and samples "are not contract documents" per our contract language. Therefore, any change in scope change during submittal review by design team must be captured via ASI. Director should also send written notification to ownership of any scope change incurred from a returned Submittal.

Storing Approved Submittals

Author of submittal will file all documents and correspondence within the storage folder and post the documents electronically.

- Put approved electronic copy of submittal in the designated folder

## SUBMITTAL PROCESS CHECKLIST

Submittal Package No.: \_\_\_\_\_ Date Received: \_\_\_\_\_

Submittal Name: \_\_\_\_\_

- ☐ Review each submittal to:
- ☐ Verify that the submittal's contents match the accompanying transmittal. Did we receive everything listed on the transmittal?
  - ☐ Verify that the submittal's contents are complete per the submittal register. Important: submittal packages need to be complete and should include all information necessary for review. Partial submittals are to be rejected by W/O (if we don't the TJPA will).
  - ☐ Verify that the contents of the submittal are in conformance with the technical specifications and other appropriate contract documents.
  - ☐ Is the Submittal a Substitution?
    - ☒ No- Continue Processing Submittal
    - ☐ Yes -Reject submittals that are substitution requests- There is a separate process for substitutions.
  - ☐ Verify that the trade subcontractor has checked and coordinated all dimensions, materials, field measurements, with the requirements of the Work and the Contract Documents.
  - ☐ Verify that the submittal complies with the requirements of reference specifications –SFDPW, PG&E etc.
  - ☐ Confirm that all professional certifications (stamp) w/license number and expiration date are provided and signed if required.
  - ☐ Note any variations from the Contract requirements (if there are create an issue in CMiC)
- No questions Address all questions raised or noted in the submittals; requests to verify dimensions, etc. If there are questions with the submittal:
- ☐ Can the questions be answered by W/O?
  - ☐ Does an RFI need to be submitted?
  - ☐ Does an issue need to be created in CMiC?
  - ☐ Identify who is responsible for answering the question
- ☐ Identify all affected and adjacent trades that can be potentially impacted by submittal. Develop an action plan to coordinate submittal information with ALL affected and adjacent trades.
- ☐ If the submittal is complete, stamp the first page of each item. If it is shop drawings, all sheets must be stamped.

WO0000-011400WO1.10

#### 4.3.3 TRANSMITTALS

To ensure controlled contract documents leaving this office have a record.

Use and receipt of Transmittals is governed by the information herein.

All controlled contract document exchange with Ownership, Design Team, Subcontractor community and Agencies with Jurisdiction/Authority on the project requires a transmittal. All transmittals are created in CMiC with the reference documents listed and uploaded as attachments in CMiC. All transmittals with incoming documents are date stamped, scanned and uploaded with the documents to the pertinent folder and CMiC.

Below is a listing of all contract documents that require a transmittal to capture the exchange/submission:

- Billing
- Submittals
- Design Review reports
- Schedules & Reports
- Cost Estimates
- Drawings
- Close-out documents
- Attic Stock

Transmittal tracking numbers are auto populated in CMiC.

**Subject (RE):** The subject should be the same description used on other documents (ex. PCI's, Letters, e-mail, etc.) Subject should be descriptive and should include appropriate sub-job, TG Package # and description.

**Remarks:** In the section, the first sentence should read

RE: Transbay Transit Center [Preconstruction/TCB/Utilities/Bus Ramps select one] – 30100.[##]

#### 4.3.4 DISTRIBUTION MATRIX

To establish guidelines for who receives what documents and in what form.

All documents received by Document Control will be distributed according to the matrices.

Distribution Matrices have been established for:

1. Internal Distribution
2. External Distribution

WO0000-011400WO1.10

#### 4.3.5 MASTER PROJECT DOCUMENT LOG AND LIBRARY EXHIBIT

To track and document all drawings and specifications issued throughout the life of the project and where these documents live.

The master project document log will be updated by Document Control as new drawings and specifications are issued.

1. Review master drawing log against drawing log issued with new drawings.
2. Update master drawing log when new documents are received with date, revision number and location of where documents are saved.

NOTE – Master Drawing Log has not been established; PMPC to issue master log.

#### 4.3.6 CQC FILE STRUCTURE

The CQC File Structure is outlined below and will be utilized on this project to store, organize and manage Webcor/Obayashi's CQC Plan, Daily CQC Reports and DFOWs. **This File Structure will mirror that of Constructware.**

Webcor/Obayashi will organize and store CQC documents such as the CQC Plan, Daily CQC Reports and DFOWs on the F:\ drive in a shared folder. **All required quality records** will be uploaded into Constructware as the system of record.

**CQC documents on the F:\ drive may be found at the following location.**

F:\Transbay\WEBCOR\Quality Control

CQC Plans

- CQC Plan Webcor-Obayashi JV:

DFW – Any Reference to a DFW requires filing a copy of each Sub's QC **checklists** to retrieve follow up documents in F/drive and Constructware.

## **5.0** ELEMENT 5 **PURCHASING**

### **5.1** INTRODUCTION

### **5.2** CONTROL OF PURCHASED MATERIALS, PARTS AND COMPONENTS

## 5.0 PURCHASING

### 5.1 INTRODUCTION

The contract requirements will clearly specify the expectations of WOJV, including relevant standards, drawings, specifications, process requirements, inspection instructions, and approval criteria for materials, processes, and product. The purchasing documents will be reviewed and approved by WOJV and TJPA for adequacy of specified requirements prior to release. WOJV will ensure that the supplier fully understands the contract, agrees with the contract, and has the capacity to perform the work as required.

Where construction or equipment procurement is involved, the contract between WOJV and the supplier will specify the right of WOJV or TJPA authorized representatives to carry out as required inspection and testing at the source and upon receipt to verify that the work or product meets specifications.

Where equipment procurement is involved, WOJV will define, as appropriate, the means and methods for handling, storage, packaging, and delivery of product and as required per contract documents. WOJV will establish procedures to receive, inspect, store, and maintain equipment procured. Any equipment that is damaged or is otherwise unsuited for use will be documented and reported to the supplier or Trade Subcontractor.

Purchasing requirements apply to all subcontractors and suppliers, including construction contractors, and manufacturers. The purpose of this element is to ensure that purchasing requirements are clear and complete, that the supplier or trade subcontractor understands them, and that appropriate quality elements are made part of the contract. Additional requirements, such as on-site required inspection and handling and receiving procedures, may be required for construction or equipment procurement contracts.

Specification Section 01-16-00 Material and equipment referenced in this section.

Immediately upon delivery, Contractor shall inspect shipments to assure compliance with the Contract Documents and reviewed submittals, and to verify that products are undamaged and properly protected from potential damage. Undamaged products shall be delivered to the job site in manufacturers' sealed containers or wrappings with legends and labels intact. Contractor shall maintain packaged materials with seals unbroken and labels intact until time of use. "

### 5.2 CONTROL OF PURCHASED MATERIALS, PARTS AND COMPONENTS

- As part of bid package development Webcor/Obayashi JV will prepare trade package specific subcontractor prequalification requirements. These prequalification's are submitted to, and reviewed by the TJPA.

WO0000-011400WO1.10

The pre-qualification requirements are then included in the project bidding manual.

- Prior to contract award Webcor/Obayashi JV verifies that all trade subcontractors and suppliers meet the project requirements as outlined in the project bidding manual and contract documents.
- Schedule work to be tested or inspected to allow test to be performed within reasonable time.

## **6.0** ELEMENT 6 **PRODUCT IDENTIFICATION & TRACEABILITY OF MATERIAL, PARTS & COMPONENTS**

### **6.1** OVERVIEW

### **6.2** MATERIAL IDENTIFICATION

### **6.3** PRODUCT IDENTIFICATION AND TRACEABILITY

## 6.0 PRODUCT IDENTIFICATION AND TRACEABILITY

### 6.1 OVERVIEW

W/OJV and Trade Subcontractors will identify and document material and products delivered to the site using the material checklist. Material and products will be reviewed for deficiencies. Once a deficiency is identified by using the material checklist, there is a systematic method to control the item, correct it, and ensure that project quality is not adversely impacted.

When the material or product is identified as deficient it will immediately be segregated. Segregation may occur by physical isolation and cordoning off of work/materials, or conspicuously identified by tags/markings when physical isolation is not possible. BIM 360 will be used to identify deficient materials on equipment and track resolution and closure.

### 6.2 MATERIAL IDENTIFICATION

Measures shall be established and maintained for identifying and controlling items of production (batch, materials, parts, and components) to prevent the use of incorrect or defective items and to ensure that only correct and acceptable items are used or installed.

Physical identification and control shall be used to the extent possible. Where physical identification is impractical, physical separation, procedural control, or other appropriate means may be employed. Items that fail to possess identification, or items for which record traceability has been lost, or items that do not conform to requirements shall be segregated to prevent use or installation. An item shall be able to be identified by how it is marked or where it is located.

Specification Section 01-16-00 Material and equipment; 1.6 D & E  
Immediately upon delivery, Contractor shall inspect shipments to assure compliance with the Contract Documents and reviewed submittals, and to verify that products are undamaged and properly protected from potential damage.

1. Undamaged products shall be delivered to the job site in manufacturers' sealed containers or wrappings with legends and labels intact. Contractor shall maintain packaged materials with seals unbroken and labels intact until time of use.

2. Contractor shall promptly remove damaged material and unsuitable items from the job site, and promptly replace with material meeting the specified requirements at no increase in Contract Sum without impact to construction schedule.
3. Unsuitable materials and products not removed promptly from the job site by Contractor may be removed by the TJPA. Removal costs shall be paid by Contractor.
4. Contractor shall identify materials and equipment delivered to the Site to permit checking against submittals and shop drawings.

The TJPA may reject as non-complying such material and products that do not bear identification satisfactory to the TJPA as to manufacturer, grade, quality, and other pertinent information.

### 6.3 PRODUCT IDENTIFICATION & TRACEABILITY

Product identification and traceability shall take place during all the various production phases – from receipt of raw materials, components, or subassemblies through the manufacturing process, to delivery of final products or systems. Traceability shall mean traceable to Transbay Terminal Center project, specific warranty, test report, supplier, point in time, purchase order, or through production. Raw materials shall be traceable back to a particular batch number, shipment number, packing slip, or invoice and shall be accompanied by applicable test data sheets and material certifications. Store room or inventory tracking procedures shall allow for items to be traceable back to a particular order number, batch number, date received, test lot, or other pertinent source. Assemblies in production shall be traceable to Transbay Terminal Project through the use of some form of routing documentation. Routing documentation should contain sufficient manufacturing information, including work instructions, manufacturing standards, tooling, etc. Final assemblies should be clearly marked with project numbers, model numbers, serial numbers, bar codes, etc., so that all pertinent information regarding that assembly may be retrieved.

## 7.0 ELEMENT 7 **PROCESS CONTROL**

## 7.0 PROCESS CONTROL

The contractor quality control process is the means by which W/OJV, Trade Subcontractors and Suppliers shall identify and plan the production and installation processes.

Suppliers and Trade Subcontractors process control shall identify and plan the production and installation processes that directly affect quality and shall ensure these processes are performed under controlled conditions. Special processes, the results of which cannot be verified by subsequent inspection and testing of the product, shall be continuously monitored. To achieve accuracy and consistency in production and installation processes, the quality program shall provide for:

- Documented work instructions where such are needed to ensure quality, use of suitable production and installation equipment, a suitable working environment, personnel qualifications, and conformance with referenced standards/codes and Quality Plans
- Monitoring and controlling of processes and product characteristics during production and installation.

Continuous monitoring and/or conformance with documented procedures is required during special processes, such as welding, nondestructive testing, and heat treatment, where the results will impact quality of the final product, but where inspection after the fact will not reveal the deficiencies.

Ensure that work is performed in the proper sequence. For example, welds should be inspected before they are painted. Earth should be compacted before concrete is poured. Documented work instructions can help with sequence control where there is complex work or when there are multi-disciplined interfaces.

Procedures or guidance to be in conformance with contract and FTA Guidelines for Control of special processes by the Trade Contractors.

Sequence of work must be identified by subcontractor prior to final fabrication on installation. Documented work inspections are required per DFOW Preparatory meeting and will be the basis for process control.

## **8.0 ELEMENT 8 INSPECTION AND TESTING**

- 8.1** QUALITY INSPECTIONS
- 8.2** INSPECTION AND TESTING LABORATORY SERVICES
- 8.3** COORDINATION MEETING
- 8.4** TESTS
- 8.5** INDEPENDENT TESTING FIRM REPORTING REQUIREMENTS
- 8.6** TJPA CODE AND AGENCY TESTING AND INSPECTION
- 8.7** TJPA SPECIAL INSPECTION AND TESTING
- 8.8** INSPECTION REQUEST PROCEDURE
- 8.9** TEST AND INSPECTION PROCEDURES BY TRADE SUBCONTRACTORS
- 8.10** CONTROL VERIFICATION AND ACCEPTANCE TESTING PROCEDURE
- 8.11** PUNCH-OUT INSPECTION
- 8.12** PRE-FINAL INSPECTION
- 8.13** FINAL ACCEPTANCE INSPECTION
- 8.14** EXAMPLES OF DFOW CHECKLISTS

## 8.0 INSPECTION AND TESTING

### 8.1 QUALITY INSPECTIONS

The Webcor/Obayashi JV Quality Control Manager or CQC Manager's alternate will verify that Trade Subcontractors are meeting the requirements outlined in the TJPA Quality Management System Manual, sections 8.5.1 Inspection and Test Planning and 8.5.2 Contractor Inspection Requirements, to provide documented evidence of inspections, lab reports and test results as required per contract. The Trade Subcontractors will also perform required inspections of all purchased items, perform source inspections, perform first article inspections and perform end process inspections and testing. Webcor & Trade Subcontractors personnel will receive training on methods to physically inspect and document critical structural DFOW components prior to ISI inspection as TJPA's 3<sup>rd</sup> Party Inspector.

Inspection and Testing- Inspection and testing procedures should be planned and executed as necessary to verify quality. Procedures should be specified, implemented, and the results documented for receiving incoming products, and for final inspection and testing.

When products are delivered to W/OJV, it is the responsibility of W/OJV and trade subcontractor QC Manager to verify they are in conformance with requirements. Verification should be in accordance with the Quality Plan or documented procedures. The extent of receiving inspection can vary with the amount of inspection at the source, the safety criticality of the product, and the confidence in the quality procedures of the supplier.

In process testing and inspection of the work to verify conformance of an item or work activity to specified requirements, should be in a conformance with the Quality Plan on documented procedure process and balance to quality. Both inspection and process monitoring methods shall be performed, as necessary, to ensure that the specified requirements for the control of work processes and the quality of the item are being achieved throughout the duration of the work.

Final inspection and testing should ensure that all specified inspections and tests, including those specified for receipt of product or in-process work, have been carried out and the resulting data meet specifications. Final inspection and testing should be carried out and properly documented to ensure conformance of the finished product to the specifications.

Records should be maintained of the various inspections and tests to provide evidence that the product has passed inspection and/or test with defined acceptance criteria.

## **8.2** INSPECTION AND TESTING LABORATORY SERVICES (SPEC. SECTION 01 14 00)

Where specified, the TJPA Representative will appoint, employ, and pay for services of an independent firm to perform inspections, testing, and other services specified in individual specification sections and as required by the TJPA Representative.

Where specified, trade subcontractors will appoint, employ, and pay for services of an independent firm to perform inspections, testing, and other services specified in individual specification sections.

Control, verification, and acceptance testing procedures for each specific test to include the test name, specification paragraph requiring test, feature of work to be tested, test frequency, and person responsible for each test. (Laboratory facilities approved by the TJPA Representative must be used.)

## **8.3** COORDINATION MEETING ( SPEC. SECTION 01 14 00 - 1.7)

After the pre-construction conference for each Trade Work Package, before start of construction, Contractor and Trade subcontractor shall meet with the TJPA Representative and TJPA QA Manager and discuss the Contractor's quality control system as it relates to the work of the trade package. Submit the CQC Plan a minimum of 15 days prior to the coordination meeting. During the meeting, a mutual understanding of the system details must be developed, including the forms for recording the CQC operations, control activities, testing, administration of the system for both onsite and offsite work, and the interrelationship of Contractor's management and control with the TJPA Representative's quality assurance. Minutes of the meeting will be prepared by the TJPA Representative, signed by both the Contractor and the TJPA Representative and will become a part of the Contract file. There may be occasions when subsequent conferences will be called by either party to confirm mutual understandings and/or address deficiencies in the CQC system or procedures that may require corrective action by the Contractor.

## **8.4** TESTS (SPEC. SECTION 01 14 00 1.10)

Trade subcontractor shall perform specified or required tests to verify that control measures are adequate to provide a product that conforms to Contract requirements. Upon request, Contractor shall furnish to the TJPA duplicate samples of test specimens for possible testing by the TJPA. Testing includes operation and/or acceptance tests when specified. Procure the services of a certified testing laboratory. Perform the following activities and record and provide the following data.

- Verify that testing procedures comply with contract requirements.

- Verify that facilities and testing equipment are available and comply with testing standards.
- Check test instrument calibration data against certified standards.
- Verify that recording forms and test identification control number system, including all of the test documentation requirements, have been prepared.
- Record results of all tests taken, both passing and failing on the CQC report for the date taken. Specify paragraph reference, location where tests were taken, and the sequential control number identifying the test. If approved by the TJPA Representative, actual test reports may be submitted later with a reference to the test number and date taken. Provide an information copy of tests performed by an offsite or commercial test facility directly to the TJPA Representative. Failure to submit timely test reports as stated may result in nonpayment for related work performed and disapproval of the test facility for this Contract.

#### 1.2. B Trade Subcontractor's QC service responsibilities:

- "Cooperate with testing agency personnel.
- Provide access to the Work.
- Obtain and handle samples of materials and equipment as defined in Section 01 13 00, Submittals.
- Furnish storage and assistance as requested.
- Facilitate inspections and tests.
- Notify the TJPA Representative in writing a minimum of 48 hours, excluding weekends and holidays, but not more than 72 hours prior to expected time for operations requiring as needed testing or inspection services.
- Schedule work to be tested or inspected to allow tests to be performed within reasonable time period.
- Where required, deliver samples to testing agency.
- When a specified test or inspection is not performed due to Contractor's failure to notify the TJPA Representative as specified or when material, or workmanship is not ready at the time specified, the TJPA Representative will establish remedial work, and Contractor shall bear the cost of remedy.
- Take steps necessary to ensure no portion of the work requiring testing or inspection is covered prior to acceptance by authorized parties.

- Ensure that no testing or inspection is scheduled until all approvals for the work have been received. This includes welder's certifications, submittals, design/build engineering stamp, and certification".

#### 1.3. A

"Contractor shall verify all dimensions in the field and shall check all field conditions continuously during construction. Contractor shall inspect related and appurtenant work and report in writing to the TJPA Representative any conditions that will prevent proper completion of the Work in accordance with the requirements of the Contract, Trade Subcontractor's QC service responsibilities."

#### 1.3. B

"Contractor shall be responsible for any Work that is non-conforming. Any required removal, repair, or replacement caused by non-conforming work shall be done by Contractor at no cost to the TJPA. Such nonconforming work will be considered as defective and payments will be withheld in accordance with Section 00 07 00, General Conditions, paragraphs 9.05 and 9.08."

#### 1.3. C

"Contractor shall be responsible for recording all changes and modifications to the Contract work as required by site conditions and inspections in accordance with the requirements of Section 01 17 20, Project As-Built Drawings."

### 8.5 INDEPENDENT TESTING FIRM REPORTING REQUIREMENTS

#### 1.5. A

"Where specified, the TJPA Representative will appoint, employ, and pay for services of an independent firm to perform inspections, testing, and other services specified in individual specification sections and as required by the TJPA Representative, or the TJPA Representative will perform the inspection and testing services."

"Inspection reports will be submitted promptly by the independent firm in triplicate and distributed, one copy each, to the TJPA Representative, Webcor/Obayashi JV QC Manager, and the code authority having jurisdiction over the Project and will indicate observations and results of tests and compliance or noncompliance with the requirements as defined in the technical specifications."

### 8.6 TJPA CODE AND AGENCY TESTING AND INSPECTIONS

Work shall be subject to testing and inspection by representatives of the TJPA and other agencies having jurisdiction (Code and Agency Inspections) to assure compliance with all requirements of Section 00 07 00, General Conditions, and Paragraph 8.02 and as per code requirements.

#### **8.7** TJPA SPECIAL INSPECTION AND TESTING

Where specified, the TJPA Representative will appoint, employ, and pay for services of independent firms to perform inspections, testing, and other services specified in individual specification sections and as required by the TJPA Representative or the TJPA Quality Assurance Representative will perform the inspection and testing services.

#### **8.8** INSPECTION REQUEST PROCEDURE

- The Trade Subcontractors CQC Manager will verify that all prerequisites as defined by the contract specifications are completed prior to Code, Agency or Special Inspections. Inspection Request will be submitted to the Webcor/Obayashi JV CQC Manager or CQC Alternate and the TJPA Construction Management Oversight Manager 48 hours and not more than 72 hours prior to the inspection date. Inspection Requests for Code, Agency and Special Inspections require an "Inspection Request Form" to be completed in BIM 360 Systems by Webcor/Obayashi JV or the Trade Subcontractors CQC Manager. The Trade Subcontractor's CQC Manager will facilitate onsite inspections, sampling procedures, test reports, and provide notification to the Webcor/Obayashi JV CQC Manager and TJPA representative when inspections fail or test results fall below specified values. Notify Turner if 48 hour notice cannot be met. Inspections will be submitted 48 hours (by 3:00pm) prior to the inspection date.

- Day 1 3:00pm is cut off time for any inspection on Day 3
- Thursday 3:00pm is cut off time for any inspection on the weekend or following Monday:
- Friday 3:00pm is cut off time for any inspection on the following Tuesday or later.

#### **8.9** TEST AND INSPECTION PROCEDURES BY TRADE SUBCONTRACTORS

When specified, the Trade Subcontractors shall include as part of their scope all tests to verify that the Work conforms to the Contract Documents and to the Quality Control specification section 01 14 00 Rev 0 paragraph 1.10A Tests. Contractor shall perform specified or required tests to verify that control measures are adequate to provide a product that conforms to Contract requirements. Upon request, Contractor shall furnish to the TJPA Representative duplicate samples of

WO0000-011400WO1.10

test specimens for possible testing by the TJPA. Testing includes operation and/or acceptance tests when specified. Procure the services of a certified testing laboratory. Perform the following activities and record and provide the following data:

1. Verify that testing procedures comply with the contract documents-Per Code and Contract Requirements.
2. Verify that all inspection prerequisites are met prior to conducting inspections.
3. Submit a testing and inspection matrix with the design submittals showing all required inspections and the entity responsible for performing the tests or inspections, *per DFOW requirements*.
4. Track inspection and test status.
5. Verify that the facilities and testing equipment are available and comply with the testing standards. As per approved submittals.
6. Trade Contractors and Suppliers shall have documented procedures to ensure test equipment is in calibration and keep updated lists of all equipment requiring calibration. Trade Contractor shall make calibration records available for review.
7. Record results of tests taken, both passing and failing on the trade subcontractor's daily CQC report for the date taken. Specify paragraph reference, location where tests were taken. Maintain a current test results spreadsheet per each different component.
8. When the services of an independent firm are utilized, reports will be submitted promptly by the independent firm in triplicate and distributed, one copy each, for the TJPA Representative, Webcor/Obayashi JV, and the code authority having jurisdiction over the Project and will indicate observations and results of tests and compliance or noncompliance with the Contract.
9. When specified, the Trade Subcontractors shall produce test and inspection plans in accordance with the Program Quality Management System requirements. All testing and measurements specified to be performed by the Trade Subcontractors shall be performed with equipment whose calibration
10. Meets national standards and to documented standards when no national standard exists.
11. Maintain and submit a log indicating the status of the Trade Subcontractors inspections and tests.
12. Verify that facilities and testing equipment are available and comply with testing standards.
13. Check test instrument calibration data against certified standards.

14. Verify that recording forms and the test identification control number system, including all of the test documentation requirements, have been prepared. Upload test records to BIM 360.
15. Record results of all tests taken, both passing and failing, on the CQC report for the date taken. Specify paragraph reference, location where tests were taken, and the sequential control number identifying the test. If approved by the TJPA Representative, actual test reports may be submitted later with a reference to the test number and date taken. Provide directly to the TJPA Representative an information copy of tests performed by an offsite or commercial test facility. Failure to submit timely test reports as stated may result in nonpayment for related work performed and disapproval of the test facility for this Contract.
16. WOJV and Subcontractors must confirm activates are ready for inspection prior to ISI start.
17. Verify to the Webcor/Obayashi JV CQC Manager of Trade Subcontractors task completion prior to the work being inspected.
18. Verify to the Webcor/Obayashi JV CQC Manager of Trade Subcontractors task completion prior to requesting final inspections.
19. Facilitate inspections and tests.
20. Cooperate with testing agency personnel.
21. Provide access to the Work.
22. Obtain and handle samples and equipment as defined in section 01 13 00 Submittals. Furnish storage and assistance as requested.
23. Trade Subcontractor shall include within their quality control plan per Specification Section 01 16 00 Material and Equipment, article 1.3 Quality Assurance, procedures for full protection of Work and materials.
24. Where required, deliver samples to testing agency.
25. Take steps to ensure no portion of the work requiring testing or inspection is covered prior to the acceptance by authorized parties.
26. Ensure that no testing or inspection is scheduled until all approvals for the work have been received. This includes welder's certifications, submittals, design/build engineering stamp and certification.
27. Notify the TJPA Representative in writing a minimum of 48 hours. Excluding weekends and holidays, but not more than 72 hours prior to expect time for operations requiring as needed testing and inspections.
28. DFOV task checklist will be implemented to assist with inspections and comply with the required codes and contract requirements.
  - A. The frequency of checklist reviews and style of checklist will vary for each DFOV task. The DFOV initial phase process will identify which entity (TJPA, W/O, Subcontractor) is performing what type of checklist review, the

frequency for check list reviews during the initial installation and follow up phases, and the style of checklist reviews.. The base understanding is that, each entity shall maintain records.

i. Subcontractor's:

1. Procedural Review Checklist.

- a. Confirm that submittals are approved before starting work, confirm that inspections have been scheduled, confirm that inspections as-builds are being maintained, confirm that protection of material is in place.

2. Material Controls Checklist,

- a. Each sub, for each key sequence, need to identify how they maintain records such that a deficiency in the field can be tracked back to the delivery/fabrication process. A material control checklist is the sub's QC representative review and confirmation that those procedures are being followed.

3. Completed Installation Technical Verification Checklist,

- a. This is the detailed list of installation requirements that the sub confirms prior to calling for an inspection.

ii. W/O QC:

1. Procedural Review Checklist

- a. Has the sub completed their technical check list, are they protecting their materials, have they complete a material controls checklist, etc.

2. Select Installation Technical Verification Checklist

- a. Selected items within a particular W/OJV DFW task checklist are checked by W/OJV and used to spot check/confirm that the sub's detailed checklist is accurate. Why will these vary? Because with some scopes, i.e. Welding we don't have the accreditation to make any technical evaluations – it will be a procedural review for us. On the other hand, Rebar – it's Quantity, spacing, type of bar – things that can be visually confirmed and therefore we will do some technical reviews.

iii. TJP:

WO0000-011400WO1.10

## 1. Procedural Review Checklist

### 8.10 CONTROL VERIFICATION AND ACCEPTANCE TESTING PROCEDURES

When specified, The Trade Subcontractors CQC Managers will provide control, verification, and acceptance testing procedures for each specific test to include the test name, specification paragraph requiring test, feature of work to be tested, test frequency, and person responsible for each test. (Laboratory facilities approved by the TJPA Representative must be used.).

When specified, specific control verification and acceptance testing procedures will be provided by the Trade Subcontractors as part of the Trade Subcontractors CQC plans, and will be completed as the specification sections are defined and the Trade Subcontractors are added to the project

### 8.11 PUNCH-OUT INSPECTION

An inspection of the Work will be conducted by the Trade Subcontractor QC Manager and verified by the Webcor/Obayashi JV CQC Manager, near the end of Trade Subcontractor's work. The punch list, entered into BIM 360 Systems, will include items that do not conform to the approved Drawings and Specifications and the estimated date by which the deficiencies will be corrected. A second inspection by the Trade Subcontractor CQC Manager will ascertain that all deficiencies have been corrected. Once this is accomplished the TJPA Representative will be notified that the facility is ready for the TJPA pre-final inspection.

### 8.12 PRE-FINAL INSPECTION

The TJPA Representative will perform the pre-final inspection to verify that the facility is complete and ready to be occupied. A TJPA Representative pre-final punch list may be developed as a result of this inspection. Webcor/Obayashi JV will ensure that all items on this list have been corrected before notifying the TJPA Representative, so that a final inspection can be scheduled. Items noted on the pre-final inspection will be corrected in a timely manner. These inspections and any deficiency corrections required by this paragraph must be accomplished within the time slated for completion of the entire work or any particular increment of the Work if the Project is divided into increments by separate completion dates.

### 8.13 FINAL ACCEPTANCE INSPECTION

WO0000-011400WO1.10

The CQC System Manager, plus the Contractor's authorized representative and the TJPA Representative must be in attendance at the final acceptance inspection. Additional personnel from affected third parties may also be in attendance. The final acceptance inspection will be formally scheduled by the TJPA Representative based upon results of the pre-final inspection. The TJPA Representative will be notified at least 72 hours prior to the final acceptance inspection and include the Contractor's assurance that all punch list and nonconforming work will be complete and acceptable by the date scheduled for the final acceptance inspection.

Checklist Items

Item #	Item Text	Response	Comments	# Issues
Substrate Sign-Off checklist				
	Enter Review Area			0
C01	Are there any voids greater than .5 inches?	No		0
C02	Is there missing grout around any penetrations?	No		0
C03	Is there loose aggregate?	No		0
C04	Are there sharp protrusions?	No		0
C05	Is there any standing water?	No		0
C06	Is there substrate more than .5" out of alignment for vertical surfaces?	No		0
Membrane Installation:				
F01	Is the temperature below 25 F (-4 C) during installation?	No		0
F02	Did installer fail to use Tape LT during installation when temperature is less than 55 F (13 C)?	No		0
Tape LT Installation on Membrane:				
G01	Was the surface dirty or have debris on it during installation?	No		0
G02	Was the surface wet during installation?	No		0
G03	Is the release liner still in place after installation?	No		0
Membrane Horizontal Applications:				
H01	Is the HDPE film side faced away from substrate?	No		0
H02	Are the end laps missing the stagger?	No		0
Membrane Horizontal Overlap Requirements				
I01	Is the overlap less than 3" along marked seldedge?	No		0
I02	Is/was the underside of succeeding sheet dirty or wet?	No		0
I03	Is the release liner remaining in the overlap?	No		0
I04	Did the overlap fail to achieve a continuous bond?	No		0

PS-60	Was/Is the substrate wet at time of application	No		0
PS-61	Is the penetration missing a bead of ADCOR ES adhesive	No		0
PS-62	Is the bead of ADCOR ES adhesive less than 1/2"	No		0
PS-63	Is the bead un-tooled w/ brush / trowel	No		0
PS-64	Was the Adcor ES applied while adhesive was wet to touch	No		0
<i>Waterstop - ADCOR ES (ES Joints)</i>				
PS-65	Is the ADCOR ES joint missing an overlap	No		0
PS-66	Is the ADCOR ES joint overlap less than 4"	No		0
PS-67	Does overlap fail to achieve full contact between pieces	No		0

WO-CQC0001 - Contractor Quality Control Plan

WO0000-011400W01.10 - Contractor Quality Control Plan

## **9.0 ELEMENT 9 INSPECTION, MEASURING AND TEST EQUIPMENT**

- 9.1** INTRODUCTION
- 9.2** INSPECTION, MEASURING AND TEST EQUIPMENT (M&TE)
- 9.3** CONTROL OF MEASURING AND TEST EQUIPMENT
- 9.4** RESOLUTION OF TESTS RESULTS FROM UN-CALIBRATED EQUIPMENT
- 9.5** TEST REPORTING

## 9.0 INSPECTION, MEASURING AND TEST EQUIPEMENT

### 9.1 INTRODUCTION

Trade Subcontractor and supplier shall comply with this Element as required per contract documents.

### 9.2 INSPECTION, MEASURING AND TEST EQUIPMENT (M&TE)

- Inspection, measuring, and testing equipment required to carry out inspection and testing shall be identified, controlled, calibrated, and maintained in order to demonstrate the conformance of work to the specified requirements. Provisions shall be made for recalibration of such equipment in a timely manner and documented.
- Inspection, measuring, and test equipment used will meet the standards of accuracy for the measurements which are required. The equipment shall be calibrated according to national standards where available, and to documented standards where no national standards exist. The equipment will be recalibrated at regular intervals, and the recalibration properly documented. A record of the equipment calibration status shall be maintained by the Contractor.
- A schedule of testing equipment that needs periodic and regulatory scheduled calibration shall be required of the contractor(s) and be checked by TIPA QA Representative.
- The equipment shall be properly maintained to ensure its fitness for use. When the equipment is in use, the user shall ensure that the environmental conditions are suitable for the use of the equipment. When inspection, measuring, or test equipment is found to be out of calibration, the validity of previous inspection and test results shall be assessed and documented.
- All calibrated gauges and calibrated testing equipment must be calibrated prior to its use on the project. Periodic calibrations must be performed in accordance with certifying agency requirements and industry practice. The equipment will be properly maintained to ensure its fitness for use. When in use, the user shall ensure that the environmental conditions are suitable for the use of the equipment. When inspection, measuring, or test equipment is found to be out of calibration, the validity of previous inspection and test results shall be assessed and documented.

### 9.3 CONTROL OF MEASURING AND TEST EQUIPMENT

Inspection, measuring, and test equipment used shall be identified, controlled, calibrated. M&TE shall be properly calibrated and currently certified.

Calibration records and procedures shall meet the following requirements:

- Measuring and test equipment will be positively identified as to its name, calibration lab, date of last calibration and calibration expiration.
- Measuring and test equipment shall be calibrated against standards that have a known, valid relationship to national standards prior to use, and periodically thereafter, if required, to provide for the accurate reporting of quality testing and inspection results. In case no national standard exists, the basis for calibration will be identified and documented.
- The tolerances used in calibration shall be in accordance with the manufacturer's recommendation or as otherwise specified.
- An independent calibration laboratory shall perform all calibration.
- Environmental conditions for calibration shall be consistent with the location where inspection and testing is performed.
- Each subcontractor must maintain a spreadsheet for all calibrated instruments and their re-calibration dates with reminders on when the next calibration is required.
- Calibration shall be performed in accordance with approved calibration procedures. These procedures shall specify the following:
  - Details of equipment type
  - Identification number
  - Location (as required)
  - Calibration method and frequency
  - Acceptance criteria
  - Action to be taken if results are unsatisfactory

### 9.4 RESOLUTION OF TESTS RESULTS FROM UN-CALIBRATED EQUIPMENT

Results from tests requiring calibrated equipment performed with equipment not currently in calibration shall be suspect. The test equipment used shall be tested and recalibrated. If the equipment is found to be within calibration limits, the test

results shall be accepted. If the equipment is not found to be within calibration limits, the tests results must be verified by other means, or the material in question replaced.

## 9.5 TEST REPORTING

Inspection and test status are documented in BIM 360 and includes the Trade Subcontractors Daily Quality Control reports.

## **10.0** ELEMENT 10 **INSPECTION, TEST AND OPERATING STATUS**

### **10.1** OVERVIEW

### **10.2** PROCEDURE

## **10.0 INSPECTION, TEST AND OPERATING STATUS**

### **10.1 OVERVIEW**

Where required by the contract documents, Trade Subcontractors shall provide means for identifying the inspection and test status of work during production and installation. The purpose of this Element is to ensure that only work that has passed the required inspections and tests are accepted.

### **10.2 PROCEDURE**

The test and inspection status shall be identified by means of markings, stamps, tags, labels, routing cards, inspections records, test software, physical location, or other suitable means.

The status identification indicates the conformance or nonconformance with regard to inspections and tests performed.

The inspection of test status of planning and design documents shall be identified by suitable means that indicate the conformance on nonconformance of product with regard to checking and review performed.

While some operations may be easily tagged in the field, in the testing lab or shop as to their inspection status, most will be recorded in the construction management BIM 360 program through status reports.

## **11.0 ELEMENT 11 NONCONFORMANCES**

- 11.1** OVERVIEW
- 11.2** NON-CONFORMANCE OBSERVATIONS AND REPORTING
- 11.3** NON-CONFORMANCE REPORT (NCR)
- 11.4** FIELD CONDITION REPORT (FCR)
- 11.5** NON-CONFORMANCE AND FIELD CONDITION REPORTS LOG
- 11.6** CONTROL THE CONTINUATION OF WORK

## 11.0 NONCONFORMANCE

### 11.1 OVERVIEW

W/OJV and Trade Subcontractors are responsible to identify and document nonconformance issues with W/OJV expected to use BIM 360 to document QA/QC issues, FCR's and Nonconforming construction. Once a nonconformance is identified by an inspection, there is a systematic method to control the item, correct it, and ensure that project quality is not adversely impacted by the event.

### 11.2 NONCONFORMANCE QA ISSUES, OBSERVATIONS, REPORTING AND FIELD CONDITION REPORTS (FCR)

A Nonconformance is an item that does not meet the requirements of the project Contract Documents. Nonconforming work will be immediately segregated. Segregation may occur by physical isolation and cordoning off of work/materials, or conspicuously identified by tags/markings when physical isolation is not possible. When Nonconforming work is discovered it is determined by the QA/QC and engineer of Record to be a Nonconformance. The Webcor/Obayashi JV CQC Manager or Trade Subcontractor QC Manager will complete a Non-Conformance Report (NCR) and enter the non-conformance issue into BIM 360 for status reporting and resolution/closure tracking.

Procedures will be established and maintained to control nonconforming work, in order to ensure that such work is not inadvertently used or installed. Nonconforming work will be identified, documented, and evaluated to determine appropriate disposition. Where practicable, nonconforming items will be segregated. Those activities affected by the nonconforming work will be notified. The responsibility for review and authority for the disposition of nonconforming work will be defined in documented procedures. Disposition of nonconforming work can include reworking it to meet requirements, accepting it with or without repair, using it for alternative applications, or scrapping it. A determination to accept nonconforming work, as is or with repair, shall have the concurrence of the engineer of record. It may be advantageous to the owner to negotiate some form of compensation for accepting nonconforming work (e.g., additional spare parts).

The TJPA Representative will notify the Contractor of any detected noncompliance. Take immediate corrective action after receipt of such notice. If the Contractor fails or refuses to comply promptly, the TJPA Representative may issue an order stopping all or part of the work until satisfactory corrective action

has been taken. No part of the time lost due to such stop orders will be made the subject of claim for extension of time or for excess costs or damages by the Contractor.

Contractor shall be responsible for any Work that is non-conforming. Any required removal, repair, or replacement caused by non-conforming work shall be done by Contractor at no cost to the TJPA. Such non-conforming work will be considered as defective and payments will be withheld in accordance with Section 00 07 00, General Conditions, paragraphs 9.05 and 9.08.

Retesting required because of non-conformance to specified requirements shall be performed by the same independent firm on instructions by the TJPA representative. Contractor shall bear all costs for such retesting at no additional cost to the TJPA.

Procedures in BIM 360 will be used for tracking construction deficiencies from identification through acceptable corrective action and there the closure of the issue. Established verification procedures that identified deficiencies have been corrected.

Follow-up Phase: CQC System Manager and Trade Subcontractor QC Managers shall perform daily checks to assure control activities, including control testing, are providing continued compliance with contract requirements, until completion of the particular feature of work. Record the checks in the CQC documentation. Conduct final follow-up checks and correct all deficiencies prior to the start of additional features of work that may be affected by the deficient work. Do not build upon or conceal non-conforming work.

### **11.3 NON-CONFORMANCE REPORT (NCR)**

When completing the Nonconformance Report, the W/OJV CQC Manager or Trade Subcontractor QC Manager shall describe the work in detail, its location, a description of the deficiency and the proposed resolution and actions taken to prevent the recurrence of the non-conformance on BIM 360. Supporting documentation shall be attached to clearly describe the issue. The report will be uploaded into BIM 360. Nonconformance Report contents are summarized as follows:

Section 1: Nonconformance identification info: Contractor, location date, etc.

Section 2: Description of Non-conformance

Section 3: Cause

WO0000-011400WO1.10

- Section 4: Recommended Field Engineer Disposition (Trade Subcontractor CQC Manager)
- Section 5: Project Engineering Disposition (TJPA)
- Section 6: Disposition Results
- Section 7: Corrective action and steps taken to prevent recurrence

Process steps when responding to the receipt of an NCR's

Step 1: QC Manager/QC Specialist notifies subcontractor, in writing (email), of NCR:

Step 1a: sub to provide in response:

- Is the NCR accurate?
- No, then what is the actual field condition (w/ supporting documentation)?
- Yes, then
  - What appears to be the root cause?
  - What remedial steps can the sub perform without the engineer's approval?

Step 1b: Project Manager/QC Manager to:

- Determine if a formal RFI or CAP (corrective action plan) needs to be submitted for prior approval?
- Trade subcontractor generates the RFI to seeking direction for remedial action.

Step 2: Webcor superintendent / QC Field Specialist – review condition in comparison w/NCR

- A. Determine if the NCR is accurate,
- B. Determine if there are any field indications for cause of the NCR,
- C. Review sub's field QC procedures and documentation of DFOV task checklist associated with the subject NCR.

Step 3: Webcor pm, qc Manager, & superintendent meet w/ sub's pm, qc Manager, & foreman to review DFOV preparatory meeting and initial install notes to determine:

- A. What step was missed to allow for the NCR?
- B. What lesson's learned need to be applied to avoid future NCR?
- C. Determine if changes need to be made to the frequency and type of qc reviews are done for the subject scope.

Step 4: submit the cap for the NCR based on information gathered from steps 1 - 3

WO0000-011400WO1.10

Step 5: to avoid future NCR of the same type:

- A. Schedule an initial phase review of DFOV CHECKLIST. Each DFOV process shall identify WHAT REVIEW is done by who and when. The frequency and type of reviews for the initial installation should be more intense than the follow up phases. An NCR shall reset the clock and increase the review documentation and confirm the corrective actions have been taken.
- B. Implement additional actions as determined by the cap review process.

Step 6: trade subcontractor completes the required tasks and generates an inspection request.

Step 7: populate all the pertinent blanks on the NCR form and obtain signatures for compliance...

#### 11.4 FIELD CONDITION REPORTS (FCR)

Field Condition Report (FCR) are conditions that deviate from the approved submittals, installed incorrectly or damaged work, but may be resolved without damage to permanent installation. When completing the Field Condition Report, the Trade Subcontractor CQC Manager will describe the work in detail, its location, Specification, a description of the deficiency, and the proposed resolution and actions taken to prevent the recurrence. The Subcontractor can also provide the disposition, and proposes to close the FCR. W/O JV CQC Manager will review proposed resolution on BIM 360 and either request for TJPA to close it or request for additional information from Sub QC Manager till the issue is resolved in a timely Manner.

Process Steps for writing and closing an FCR issue and the process for completing a NCR

Step 1: A FCR is identified and written by:

- a) Observation - Webcor CQC Manager, superintendent/QC Field Specialist or TJPA representative monitoring the work observes a quality issue and create a QC/QA issue in BIM 360.

- b) Task checklist - Webcor superintendent/QC Field Specialist is completing a DFOW checklist and observes an issue and creates FCR issue in BIM 360
- c) Inspection request (Tasks) – When an inspector rejects an inspection request, a FCR is generated in BIM 360 and linked to the Inspection Request.

Step 1a: When FCR escalates to an NCR:

- a. FCR's point to a systemic issue
- b. Ignored FCR's (30, 60, 90 days)
- c. Latent Issue
- d. Corrective Action Plan (CAP) or RFI is required

Step 2: A QC/QA and FCR issue is closed by:

- a) Stating the cause of the issue and proposes a corrective action plan (CAP) and submits the CAP in BIM 360.
- b) Documents the corrective action taken in BIM 360.
- c) Documents the cause and actions taken to prevent recurrence in BIM 360.

Step 2a: A NCR is closed by:

- a. Submit the Corrective Action Plan (CAP) for the NCR,

Step 3: To avoid future NCR of the same type:

- a) Schedule an Initial Phase Review of DFOW checklist. Each DFOW process shall identify what review is done by who and when. The frequency and type of reviews for the initial installation should be more intense than the follow up phases. An NCR shall reset the clock and increase the scrutiny to review documentation and confirm the corrective actions have been taken.
- b) Implement additional action as determined by the CAP review process.

Step 4: Trade Subcontractor completes the required tasks and generates an Inspection Request.

Step 5: QC Manager populate all the pertinent blanks on the NCR Form and obtain signatures for compliance.

#### 11.5 NONCONFORMANCE AND FIELD CONDITION REPORT LOG

The project-wide Non-Conformance Tracking Log in Autodesk BIM 360 is maintained by the TJPA Construction Management Oversight. Webcor/Obayashi JV and the Trade Subcontractors will maintain Non-Conformance logs appropriate for their scope of work.

#### 11.6 CONTROL THE CONTINUATION OF WORK

After the item of work is identified and segregated from all other active work, the W/O JV CQC Manager or Trade Subcontractor QC Manager will determine if work can continue in the affected area. When continuing work can adversely affect quality or hide the defect, work must stop in the affected area until the disposition of the item is resolved. The W/OJV CQC Manager identifies and clearly labels the limits of the affected stop work areas. Non-conforming work may be reworked to meet requirements, accepted as is, repaired, or rejected. If accepted as is or repaired, the Engineer of Record needs to approve the deviation from original specifications. Nonconforming work may require an approved Corrective Action Plan.

## **12.0** ELEMENT 12 **CORRECTIVE ACTION**

### **12.1** INTRODUCTION

### **12.1** CORRECTIVE ACTION AND CORRECTIVE ACTION PLANS

## 12.0 CORRECTIVE ACTION PLAN

### 12.1 INTRODUCTION

The following CAP procedure shall cover all construction operations, both onsite and offsite, including work by Trade Subcontractors and Suppliers. Procedures for tracking construction deficiencies from identification through acceptable corrective action. Establish verification procedures that identified deficiencies have been corrected.”

### 12.2 CORRECTIVE ACTION AND CORRECTIVE ACTION PLANS (CAP)

Corrective action procedures should be established, documented, and maintained. These include procedures for investigation of the cause of nonconforming work and the corrective action needed to prevent recurrence, and procedures for analysis to detect and eliminate potential causes of nonconforming work. This element also includes implementing and recording changes in procedures resulting from corrective action.

Once a NCR cause has been determined, a written Corrective Action Plan (CAP) will be submitted by W/OJV in order to resolve and close the NCR. The CAP will be written by the Trade Subcontractor QC Manager and submitted to W/OJV’s CQC Manager who will review and post to Constructware after sign-off. W/OJV QC Manager or Trade Subcontractor QC Manager will attach the submitted CAP to the NCR in BIM 360 Systems for tracking. Once CAP is approved, the CAP will be implemented by the Trade Subcontractor.

Corrective action procedures shall be established for:

- Investigating the cause of the nonconforming work and taking the corrective actions needed to prevent recurrence
- Analyzing the CAP processes to detect and eliminate potential causes of nonconforming products.
- Initiating preventative actions to deal with problems to a level corresponding to the risks encountered
- Ensuring that corrective actions are taken and that they are effective

WO0000-011400WO1.10

- Implementing and recording changes in procedures resulting from corrective action

## **13.0** ELEMENT13 **QUALITY RECORDS**

### **13.1** INTRODUCTION

### **13.2** DOCUMENTATION

### **13.3** REPORTING

DAILY REPORTS

MONTHLY REPORTS

PERIODIC FORMS, REPORTS AND LISTS

### **13.4** DFW QC REPORTING FOLDER FILES STRUCTURE FOR CONSTRUCTWARE

W/OJV DAILY CQC REPORT FORM

NONCONFORMANCE REPORT FORM

## 13.0 QUALITY RECORDS

### 13.1 Introduction

Procedures are established and will be maintained for quality records. These procedures will identify which records shall be kept, responsibility for production and collection, and responsibility for indexing, filing, storage, maintenance, and disposition of quality records..

Quality records shall be maintained to show achievement of quality objectives and appropriate functioning of the Quality Management System. Supplier, contractor, and subcontractor quality records shall be included when pertinent, as defined by requirements agreed upon during DFOV Preparatory Meeting, based Specifications and Codes. Quality records shall be legible and specify the work involved. They shall be kept in an environment to minimize deterioration and damage. Retention times and final disposition shall be established and recorded.

The following types of Quality records requiring control:

- Inspection reports – (Code required inspection reports are uploaded by TIPA's QA team to BIM 360 and Constructware.) Trade subcontractors Reports are attached to Daily QC reports.
- Test Data – Code test uploaded by TIPA to BIM 360. Non-code tests are required per specs are included as part of Daily QC reports.
- Qualification records (BIM 360)
- Calibration Records (BIM360)
- Nonconformance (BIM 360)
- Corrective Actions (BIM 360)
- Daily QC reports with back up data and Documentation
- Material identification / batch tickets

### 13.2 Documentation

Each Subcontractor is required to produce a QC Daily Report within 3-4 days must include all sub tier documentation (Delivery tags, material traceability and heat number tags). W/O JV shall generate CQC Daily Reports that indicates interaction with Subcontractor's process in establishing Quality installation, inspection,

and documentation. DFWO checklists are used to identify items that require special attention and document any daily occurrences in QC Daily Reports

Maintain current and complete QC reports providing evidence that required quality control activities and tests have been performed. Include in these records the work of Trade Subcontractors and Suppliers on an acceptable form.

Address deficient features and include a statement that equipment and materials incorporated in the Work and workmanship comply with the Contract. Furnish these reports to the TJPA Representative daily within 5 working days after the date covered by the report. Reports must be signed and dated by the CQC System Manager. Include copies of reports prepared by all subordinate quality control personnel within the CQC System Manager's report

The W/OJV CQC will review for completeness, clarity and accuracy of W/O CQC staff or Trade Subcontractor reports.

Weekly meeting with key Trade subcontractors QC Manager will go over key QC issues to ensure timely QC reports are submitted on regular bases.

### 13.3 REPORTING

#### Daily Reports

- Webcor/Obayashi JV Daily CQC reports (see attached)
- Trade Subcontractors Daily CQC reports

#### Monthly Reports

- Webcor/Obayashi JV Construction Monthly Report
- Webcor/Obayashi JV CQC Managers Monthly Status Report (included in the Construction Monthly Report)

#### Periodic forms, reports and lists

- Definable Features of Work (DFWO) list per Trade Subcontractor (in W/OJV F: drive, Constructware and hard copies in section: Tab/Element 7).
- Non-Conformance Report (see attached)

#### 13.4 DFOW QC REPORTING FOLDER FILES STRUCTURE FOR CONSTRUCTWARE

The CQC File Structure is outlined below and will be utilized on this project to store, organize and manage W/OJV Daily CQC Reports and DFOWs. In Constructware

DFOW folder and file structure:

Each trade package has a folder and each DFOW has a subfolder with subsequent subfolders. The folders and files are managed by CM/GC Quality Control Manager and CM/GC Document Control. Files are located in File Management/File Director by Project. This arrangement puts all the records for each DFOW in one folder. It becomes the quality record for that DFOW.

- 10 Quality
  - 13 Definable Feature of Work (DFOW)
    - BSE- TG03- BBI
    - DFOW log
    - DFOW (By Number and Title)
      - Preparatory Phase  
Preparatory Phase documents are filed in this folder.
      - Initial Phase  
Initial Phase documents are filed in this folder.
      - Follow-up Phase  
Follow-up documentation is appended to Daily QC Reports and filed in this folder by number and date.
      - DFOW Record Documents  
As the work is completed but no later than after completion of the DFOW all quality records would be assembled and filed in this folder. In the event of an audit or record search this folder would contain all the records. Subfolders may be added as needed.
        - Material Records
        - Installation Records

CQC Daily Reports folder and file structure:

WO0000-011400WO1.10

Daily CQC Reports are prepared and filed in folders by date. Each folder contains the CM/GC QC Manager's Daily Report and all the Trade Contractors' QC Managers' Daily Reports. The folders and files are managed by CM/GC Quality Control Manager and CM/GC Document Control. Files are located in File Management/File Director by Project. This arrangement puts all the Daily QC reports for each day in one folder. It becomes the quality record for that day.

- 10 Quality
- 12 CQC Reports
- Year
  - Month
    - Day (By Contractor- year/month/day (i.e. BBI-13/08/29 OR 20130829)
    - CM/GC QC Daily Report  
This report is prepared by the CM/GC QC Manager
    - TCQM Daily Report (Identified by Trade Package)  
This report is prepared by each Trade Contractor QC Manager and submitted to the CM/GC Quality Control Manager for review and filing.

## 14.0 ELEMENT14. QUALITY AUDITS

## **14.0** QUALITY AUDITS

### **14.1** QUALITY AUDITS

The Trade Subcontractor QC Manager reports to the Webcor /Obayashi JV CQC Manager and oversees the trade specific implementation of the quality control program and whose primary responsibility will be to implement the Trade Subcontractor's quality control plan. The Trade Subcontractor QC manager will certify that the Trade Subcontractor's work is in compliance with the Contract Documents and complies with the Webcor/Obayashi Joint Venture Quality Control Plan and all quality control requirements contained in the Contract Documents, including specification section 01 14 00 Quality Control. The Trade Subcontractor QC Manager shall:

- Support and facilitate QMS Audit process by TJPA, FTA, and Agency Audits.

## **15.0** ELEMENT 15 **TRAINING**

### **15.1** TRAINING

WO0000-011400WO1.10

## 15.0 TRAINING

### 15.1 TRAINING

Webcor/Obayashi JV will ensure that only knowledgeable capable employees carry out the planning and execution of the work.

- **The W/OJV CQC Manager will provide and document training.**  
Under the Direction of the W/OJV CQC manager the Trade Subcontractor QC Managers will provide training on the elements of the W/O JV and Trade Subcontractors site specific Contractor's Quality Control Plans to all trade subcontractor staff having CQC responsibilities.
- When specified in the Contract Documents, Trade Subcontractor CQC Managers will submit proof of tradespersons qualifications including licensing requirements, certifications or other required training qualifications for the specified task to Webcor /Obayashi JV and the TJPA.
- When specified in the Contract Documents, project or task specific training will be documented by the Trade Subcontractor. The Trade Subcontractor will provide Webcor/Obayashi JV with a copy of the training syllabus and list of attendees.
- Webcor/Obayashi JV Quality Control personnel will complete the U.S. Army Corps of Engineers/U.S. Navy Facilities Engineering Command, Construction Quality Management for Contractors
- The Trade Subcontractor QC Managers will maintain records of quality training for their personnel. The Webcor/Obayashi JV CQC Manager will maintain records of quality training for Webcor/Obayashi JV personnel.
- W/OJV continues to revise Superintendents and QC field staff procedures to improve on records and reports for field issues such as Material, installation, FCR's, and NCR's.
- As part of each DFOV's meeting process a DFOV checklist will be established and will determine the requirements for each DFOV checklists.
- W/OJV shall conduct training for Superintendent and QC staff to clarify DFOV requirements as well as what issues should be tracked and raised to the status of Field Condition Reports.
- W/OJV will conduct work sessions with TJPA QC representative and W/O Superintendents to clarify, when and who shall issue FCR's and/or NCR's.

WO0000-011400WO1.10

- Training of personal on the proper procedures to complete a DQC report.

# Construction Stormwater Pollution Control/Compliance Plan

## Transbay Transit Center Project San Francisco, California

Appendix B	Construction Stormwater Controls Monitoring Checklist
Appendix C	SFPUC Construction Pollution Prevention Guide

# 1 REGULATORY SETTING

The Transbay Transit Center Project (Project) meets federal Clean Water Act (CWA) and State Porter – Cologne Water Quality Control requirements via connection to the combined wastewater and stormwater sewer system operated by the San Francisco Public Utilities Commission (SFPUC) under a State Water Resources Control Board-issued National Pollutant Discharge Elimination System (NPDES) permit (Order No. R2-2002-0073, NPDES Permit No CA0037664). The Project is therefore not subject to coverage under the California Construction General Stormwater Permit (Order 2009-0009-DWG), that became effective on July 1, 2010; however, the construction site must implement Best Management Practices (BMPs) to prevent pollutant discharge into the combined sewer to comply with the San Francisco municipal ordinances and codes described below. This Construction Stormwater Pollution Control/Compliance Plan provides a delegation strategy along with best management practice (BMP) categories for compliance with stormwater regulations covering construction activities at the Project.

## **San Francisco Ordinance**

San Francisco has a Stormwater Discharge Controls Ordinance requiring Pollution Prevention Procedures during any construction conducted in the City of San Francisco. In general the ordinance discusses long term BMPs such as rain gardens and green roofs particularly applicable to redevelopment areas and sections of the City serviced by small municipal separate storm sewer systems (MS4); however aspects of the ordinance apply to construction activities. For example, although coverage under the NPDES General Construction Permit (Water Board Order No. 99-08-DWQ) is not required for projects in those areas of the city that drain to the combined sewer system; all construction sites must implement BMPs to prevent illicit discharge into the combined sewer. Generally, City requirements include the development of a Storm Water Pollution Prevention Plan (SWPPP), SWPPP plan review by SFPUC, stormwater treatment measures, runoff monitoring, and frequent site inspections. The regulations also require the use of construction period (and operational period) BMPs on construction sites to keep pollutants (sediment and construction site debris), out of water conveyance systems, the treatment plants, and discharge points.

## **San Francisco Public Works Code**

The federal CWA requires that publicly-owned treatment works (POTW) regulate the discharge of industrial wastes into a sewer system subject to NPDES permit requirements, and since construction activity is regulated under the industrial category, San Francisco's department of public works (DPW) has adopted requirements for construction discharges to the combined sewer system. Under DPW regulations, discharges of construction storm water as well as any wastewater (such as dewatering from construction sites) is subject to the requirements of Article 4.1 of the San Francisco Public Works Code, which regulates the quantity and quality of discharges to the combined sewer system. Projects that conduct any dewatering activity are required to apply for a Wastewater Batch Discharge Permit from the SF PUC WWC\_CSD. Information on the Batch Discharge Permit and pre-treatment can be found online at: [http://sfwater.org/msc\\_main.cfm/MC\\_ID/14/MSC\\_ID/445](http://sfwater.org/msc_main.cfm/MC_ID/14/MSC_ID/445).

Order No. 158170 of the San Francisco DPW provides additional pre-treatment industrial waste discharge limits to augment those listed in Article 4.1. The San Francisco Municipal Code requires contractors to have a Sediment and Erosion Control Plan for projects that discharge to the Combined Sewer System.

## **RESPONSIBLE PARTIES**

The legally Responsible Party for the Project is the Transbay Joint Powers Authority (TJPA). The TJPA consists of a collaboration of Bay Area government and transportation agencies, and is managed by TJPA staff and overseen by a Board of Directors. For site-specific concerns that can be addressed by TJPA, please call **415.409.TJPA (8572)**.

Webcor /Obayashi is a joint venture contracting group hired by TJPA as general contractor for the Transbay Terminal Center Phase of the Project. Webcor /Obayashi will be subcontracting construction to Trade Subcontractors who will be responsible for preparing SWPPPs specific to their construction activity, schedule, discharge points, types of pollutants and construction boundaries. The Trade Subcontractors will be responsible for preparing and submitting for approval a SWPPP including furnishing, installing, maintaining and removing BMPs such as silt fence, filter boxes, construction entrances, sediment traps, dust control, dewatering and other erosion and sediment control measures during construction to prevent contamination of storm water from construction activities and to maintain compliance with the SF storm water ordinance and codes. For site-specific NPDES concerns that can be addressed by Webcor/Obayashi, please call **415.978.5726**.

## **2 PROJECT INFORMATION**

### **2.2 Project Description**

The Project is located generally between Second Street in the west, Beale Street in the east, Natoma Street in the south and Minna Street in the north (Figure 1). The Project is part of a larger \$4 billion transportation and housing expansion/redevelopment effort that will replace an old Transbay Terminal at First and Mission streets with a modern regional transit hub connecting eight Bay Area counties and the State of California through 11 transit systems: AC Transit, BART, Caltrain, Golden Gate Transit, Greyhound, Muni, SamTrans, WestCAT Lynx, Amtrak, Paratransit and future High Speed Rail from San Francisco to Los Angeles/Anaheim.

The entire Project consists of three broad activities as noted below. Webcor /Obayashi are the general contractors and have prepared this Construction Stormwater Pollution Control/Compliance Plan to provide for compliance with stormwater regulations covering construction activities.

- **Utility Relocation**
- **Train Box and Transit Center Building Construction**
- **Bus Ramp Construction**

## 2.3 Project Size and Total Disturbed Area

The estimated total disturbed soil area (DSA) for the Project is approximately 12.3 acres and includes the areas where the soil might be potentially disturbed by construction activities, as follows:

**Table 1. Total Land Disturbance**

<b>Area Name</b>	<b>Approximate Area Disturbed (Acres)</b>
Zone 1	2
Zone 2	1.8
Zone 3	1.5
Zone 4	4
Linear Utility Relocation	2.5
Additional Staging/Disturbance	3
<b>Total</b>	<b>12.3</b>

Figures 2 and 3 show general locations for the DSA construction zones and linear utility relocation trade packages. Several staging areas are anticipated during the life of the Project as shown in Figure 4.

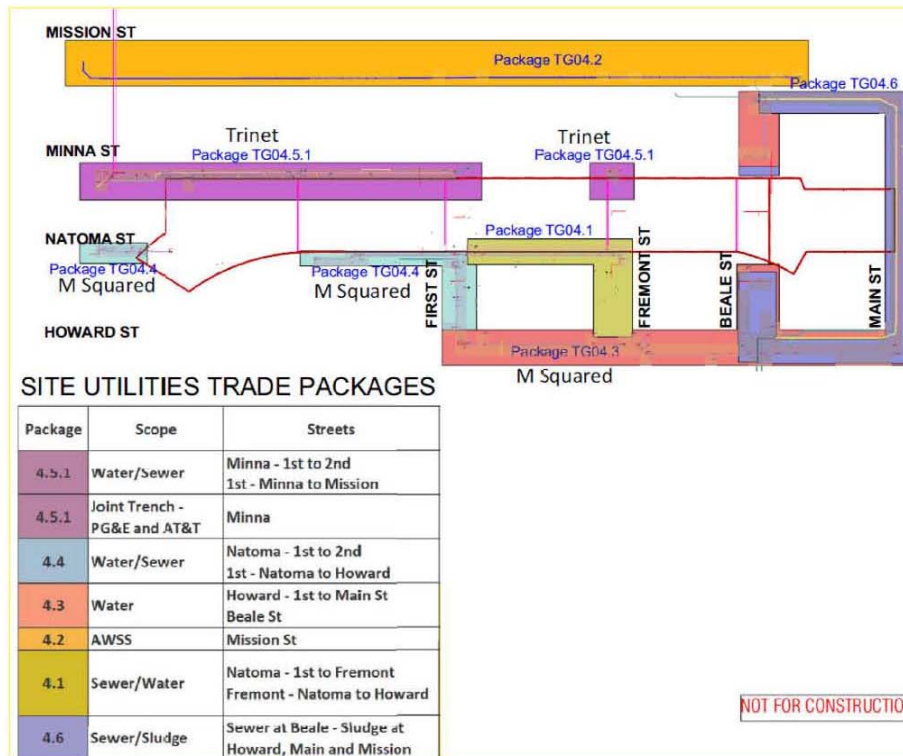

Figure 2. Construction Zone Locations

------	------	----------	-------	--	--	--	---	--

Figure 3. Utilities DSA Map

## **2.4 Receiving Waters and Environmentally Sensitive Areas**

The Project is located within the northeastern section of the City of San Francisco. The Project does not discharge directly to jurisdictional “receiving water.” The San Francisco combined sanitary/storm water sewer system collects all storm and waste water discharging in the Project vicinity and pipes the water to the Southeast Water Pollution Control Plant for processing and discharging under NPDES Permit No CA0037664. The SE plant currently treats runoff to secondary treatment standards established by the USEPA, meeting or exceeding water quality objectives in San Francisco Bay.

The San Francisco Bay Area has a climate characterized by wet winters and dry summers. Average annual rainfall in the area is approximately 20 inches. The majority of this rainfall generally occurs from November through April with little rainfall during the remaining months of the year. Construction for the Project will span a period of several years including both wet and dry seasons. The project does not impact any known environmentally or culturally sensitive areas. For information regarding any environmentally sensitive habitat concerns, please refer to the Biological Resource Assessment. For information on cultural or other CEQA or NEPA requirements, please refer to the appropriate State or Federal Agency.

## **2.5 Construction Activities and Schedule**

The Project activities include but are not limited to clearing, excavation and backfill, construction and finishing work within a busy city environment with established infrastructure. Several staging areas are anticipated during the life of the Project. Construction equipment and materials will be stored both onsite and at staging areas. As a result, fueling and maintenance, as well as welding and fabrication, may take place onsite. A discussion of the pollutants with potential to contact storm water as a result of these activities is included below. Since demolition of the existing ramps and terminal is currently underway by another contractor (Evans Bros Inc), the first phase of the Webcor-Obayashi Project includes utility relocation, followed by subexcavation in preparation for construction of the Transit Center Building/Train Box. Construction overseen by Webcor-Obayashi will create a new five-story Transit Center with one above-grade bus level, ground-floor, concourse, and two below-grade rail levels serving Caltrain and future California High Speed Rail, and includes new bus ramps to connect the Transit Center to a new off-site bus storage facility and the SF-Oakland Bay Bridge. Construction of the Project should be completed within or near the year 2017.

The following list generally outlines the expected Project construction schedule:

1. Utility relocation November 2010-September 2011.
2. Protection of perimeter: March 2011.
3. Trade Subcontractors awarded contracts: April 2011.
4. Activity specific SWPPPs submitted by Trade Subcontractors: April 2011.
5. Sediment control products ordered and stored on site by Trade Subcontractors: May 2011.
6. Stabilized construction entrance, equipment parking, covered storage and any concrete wash areas constructed by Trade Subcontractors: May 2011.
7. Excavation and Dewatering by Trade Subcontractors: May 2011-April 2014.

8. Transit Center Building Construction: May 2013-August 2017.
9. Bus Ramps: 4th quarter 2012-4th quarter 2014.
10. Construction of the concrete form box and train box by Trade Subcontractors: TBD.
11. Vertical Construction by Trade Subcontractors: 2013-2017.
12. Monitoring and Maintenance of BMPs: Entire construction timeline by Trade Subcontractors.
13. All BMPs functional: Entire construction timeline.

## **2.6 Potential Construction Site Pollutant Sources**

Potential materials expected from the project include, but are not limited to, excavated soil, oil products (gasoline, diesel, hydraulic oil, and kerosene), solvents, concrete and curing compounds, and other construction materials. Construction on the project site will require temporary disturbance of surface soils and removal of existing on-site pavements and subsurface structures. During the construction period, excavation and grading activities will result in exposure of soil to water runoff, and the use of haul trucks that could track material away from the construction site. Much of the excavated material will be typical of coarser sandy soil particles that do not mobilize easily. However, some of the material may consist of relatively mobile fine sediments (silt and clay). Most excavation will occur in a below-grade pit which will drain internally and contain storm water; however construction activities will impact areas outside of the excavation areas that drain toward the San Francisco combined sewer drain inlets. Water in excavation pits from rainfall and groundwater seepage would contain sediment. Removal of the pit water will probably require sediment removal before it can be discharged into the storm drains (see SF PW Code paragraph above).

Soil and debris on the haul truck tires exiting the site could be deposited on local streets and Transport in storm water into the storm drain. The majority of construction debris and materials would be loaded onto trucks within the interior of the construction boundaries, rather than from public sidewalks or streets bordering the project site. The construction debris and materials would then be hauled off site. Therefore, soil stockpiles would be minimized on site.

In addition to sediment, Table 2 lists expected construction materials that could generate pollutants, describes their chemical and physical properties, and identifies potential pollutants associated with them. This list should be updated as the project proceeds and additional phases begin.

**Table 2. Potential Stormwater Pollutants**

Source	Chemical/Physical Description	Storm Water Pollutants*
Diesel Fuel	Clear, blue-green to yellow liquid	TPH-diesel, benzene, toluene, ethylbenzene, xylenes, naphthalene
Concrete Work	Cement, fly ash, aggregate	pH
Oil and Grease	Brown oily petroleum	TPH-motor oil, oil and grease
Used Oil (oil only)	Brown oily petroleum	TPH-motor oil, oil and grease, LUFT 5 metals (cadmium, chromium, lead, nickel, and zinc)
Excavated and Stockpiled Soil	Solid particles	Soil, sediment
Gasoline	Colorless, pale brown or pink petroleum hydrocarbon	TPH-gasoline, benzene, toluene, ethylbenzene, xylenes. For “old” releases, include DIPE; ETBE; MTBE; TAME; TBA; 1,2-dibromoethane (1,2-DBA); and 1,2-dichloroethane (1,2-DCA)
Hydraulic Oil/Fluids	Brown oily petroleum hydrocarbon	TPH-hydraulic oil, benzene, toluene, ethylbenzene, xylenes, LUFT 5 metals (cadmium, chromium, lead, nickel, and zinc)
Sanitary/Septic Waste	Sewage products	Coliform, <i>E. coli</i> , viruses, solvents (i.e. volatile organic compounds such as trihalomethanes and the dichlorobenzene isomers), nitrate
Trash; Windblown and Other	Paper, pipe, electrical wires etc.	Paper, pipe, electrical wires etc.

Notes: \*TPH-gasoline = total petroleum hydrocarbons quantified as gasoline (the same pattern for TPH-diesel, TPH-motor oil, TPH-hydraulic oil)  
BTEX = benzene, toluene, ethylbenzene, and xylenes  
DIPE = di-isopropyl ether  
ETBE = ethyl tertiary butyl ether  
MTBE = methyl tertiary butyl ether  
TAME = tertiary amyl methyl ether  
TBA = tertiary butyl alcohol  
LUFT = leaking underground fuel tank  
PCBs = polychlorinated biphenyls

Pollutants of concern in the San Francisco Bay include, but are not limited to, mercury, diazinon and Polychlorinated Biphenyls (PCBs). These chemicals are not easily broken down and they tend to adhere to particles of sediment, so can be removed from stormwater in BMPs that trap sediment. For this reason, sediment trapping BMPs are highlighted in the treatment controls listed for the project. Additional pollutant categories that can be anticipated in stormwater leaving the project include oil and grease, trash, sediment, organic compounds, pesticides, nutrients and metals.

## 2.7 Identification of Non-Storm Water Discharges

Non-storm water discharges include a wide variety of sources and may contribute pollutant loads if not controlled. They can include, but are not limited to:

- discharges of process water
- saw cutting slurry
- air conditioner condensate
- non-contact cooling water
- vehicle wash water
- sanitary wastes concrete washout water
- paint wash water
- irrigation water
- pipe testing water
- natural groundwater seepage

Measures to control spills, leakage, and dumping, and to prevent illicit connections during construction must be addressed through structural as well as non-structural BMPs. Certain non-storm water discharges may be necessary for the completion of construction projects. Authorized non-storm water discharges may include those from de-chlorinated potable water sources such as: fire hydrant flushing, irrigation of vegetative erosion control measures, pipe flushing and testing, water to control dust, uncontaminated ground water dewatering, and other discharges not subject to a separate general NPDES permit adopted by a region. Authorized non-storm water dewatering discharges require a permit. Information can be found online at: [http://sfwater.org/msc\\_main.cfm/MC\\_ID/14/MSC\\_ID/445](http://sfwater.org/msc_main.cfm/MC_ID/14/MSC_ID/445).

Each Trade Subcontractor is responsible for procuring the necessary dewatering permits for construction activities undertaken. The SFPUC prohibits the discharge of storm water that causes or threatens to cause pollution, contamination, or nuisance.

Additionally, all SWPPPs prepared by Trade Subcontractors must include procedures and practices designed to minimize or eliminate the discharge offsite of pollutants from vehicle and equipment cleaning, fueling, maintenance operations and other non-storm water. Project monitoring by trade Subcontractors will include a visual check for non-storm water discharges and non-storm water discharge potential.

### **3 BEST MANAGEMENT PRACTICES (BMPS)**

BMPs shall be implemented as listed in this Plan and additionally as necessary to adequately minimize erosion on site and limit sediment transport off site to an acceptable level in accordance with the SFPUC regulations and all City Codes and Ordinances.

Erosion and sediment control measures are needed throughout the year on the Project. In particular, stormwater catch basins must be protected year round. During dry season development, BMPs will be primarily designed to mitigate the movement of sediment and pollutants off site by tracking from grading equipment and from wind. Wet season BMPs are designed to prevent soil from washing off graded areas during rainy periods, tracking of soil and pollutants off site by vehicles and any other movement of pollutants from the Project.

#### **3.2 BMP Objectives**

This Construction Stormwater Pollution Control/Compliance Plan provides the following BMP objectives:

- Provide overall guidance to Trade Subcontractors in preparing SWPPPs and dewatering plans specific to their construction activities, construction timelines and drainage areas for submittal to the SFPUC.
- Delineate typical construction pollutants and their sources, including sources of sediment associated with construction, construction site erosion and other activities associated with anticipated construction activity. Trade Subcontractors are expected to expand and amend the information provided here within to tailor their SWPPPs to their activities.
- Outline best management practice (BMP) categories that need to be included in the SWPPPs prepared, submitted and maintained by the Trade Subcontractors to a level that results in the reduction or elimination of pollutants in storm water discharges and authorized non-storm water discharges from construction activity to the standard required by the SFPUC.

BMPs categories listed in this Construction Stormwater Pollution Control/Compliance Plan should be reviewed by the Trade Subcontractors, added to their SWPPPs as applicable and additionally installed, maintained, monitored and reported as practicable to adequately minimize erosion on site and limit sediment transport off site to an acceptable level. Adjustments and modifications to the BMPs identified in this Plan need to be implemented by the Trade Subcontractors as necessary to maintain the construction site in accordance with the provisions of the SFPUC regulations and all City Codes and Ordinances.

The SFPUC identifies the following list of BMPs and pollution prevention measures that must be implemented at all construction sites:

- Identify all storm drains and catch basins near the construction site and ensure all workers are aware of their locations to prevent pollutants from entering them.
- Protect all storm drain and catch basin inlets.
- Develop an erosion control and sediment control plan for wind and rain.
- Develop spill response and containment procedures.
- Inspect site regularly to ensure that BMPs are intact.

- Conduct daily site cleanings as needed.
- Educate employees and subcontractors about BMPs.
- Regularly maintain all BMPs at project site.

### 3.2.1 Erosion Control BMPs

Erosion control practices consist of source control measures designed to prevent soil particles from becoming dislodged and transported in storm water runoff, while sediment control measures filter and otherwise recover soil particles from runoff. Erosion control BMPs protect the soil surface by covering and/or binding soil particles and in many cases, are more effective, less expensive, and require less maintenance and repair. Although they typically function by protecting the surface of exposed soil, erosion control measures cannot be effectively applied until grading activities are complete or idle.

At the Project, erosion is expected to occur primarily as a result of pavement removal, soil disturbance and subsequent wind or rain. For this reason, BMPs to limit the timing of soil disturbance and provide timely stabilization for the disturbed soil surface should be the focus of erosion control efforts for the site. Erosion control BMPs such as scheduling and non-vegetative soil stabilization (soil binders) should be considered by each Trade Subcontractor (TS) and added to their SWPPPS to control soil erosion on the construction site. Modifications to the BMPs may be necessary should construction activities or the construction schedule be altered. If modifications are needed to the BMPs, the Trade Subcontractor should work with the SFPUC to amend the SWPPP and Erosion Control BMPs to satisfactorily meet City storm water regulations.

Scheduling should be implemented throughout the project as a means of ensuring that significant earth-disturbing activities are avoided if rain is forecasted. If there are exposed areas that are not being actively worked the trade Subcontractors should consider stabilizing all areas as practical. If additional information or instructions are needed for BMP installations, the CASQA website and cutsheets can be found at: **[www.casqa.org](http://www.casqa.org)**.

### 3.2.2 Sediment Control BMPs

Sediment control is any practice that traps soil particles after they have been detached and moved by rain, flowing water, or wind. Sediment control measures are usually passive systems that rely on filtering or settling the particles. Sediment control, or capturing the sediment once it is mobilized, is considered back up or secondary to good erosion control.

Table 3 indicates the BMPs for sediment control that should be considered and included in SWPPPs by trade Subcontractors as applicable on the construction site.

**Table 3. Construction Sediment Control BMPs**

<b>BMP Name</b>
Silt Fence
Fiber Rolls
Gravel Bag Berm
Sand Bag Barrier
Storm Drain Inlet Protection
Stockpile Management

If additional information or instructions are needed for BMP installations, the CASQA website and Cutsheets can be found at: **[www.casqa.org](http://www.casqa.org)**.

### 3.2.3 Tracking Control BMPs

Tracking control consists of preventing or reducing the tracking of sediment off site by vehicles. Daily inspections will be conducted at the construction entrances and if track-out is observed, the area will be swept by the Trade Subcontractors. If additional information or instructions are needed for BMP installations, the CASQA website and cutsheets can be found at: **[www.casqa.org](http://www.casqa.org)**.

### 3.2.4 Wind Erosion Control BMPs

Wind Erosion Control is a very important BMP for the Project. All Trade Subcontractors are required to comply with the regulations specified by the local Air Quality Control District. Construction will be halted if required to do so due to high wind conditions as specified by the local Air Quality Control District, and/or common sense. Alternative forms of wind erosion control such as tackifiers and covers will be utilized as necessary to avoid and minimize windblown dust from leaving the project site. If additional information or instructions are needed for BMP installations, the CASQA website and cutsheets can be found at: **[www.casqa.org](http://www.casqa.org)**.

### 3.2.5 Non-Storm Water Control BMPs

Non-storm water management BMPs are source control BMPs that prevent pollution by limiting or reducing potential non-storm water pollutants at their source or eliminating offsite discharge. These practices involve day-to-day operations of the construction site and are also referred to as “good housekeeping practices” which involve keeping a clean, orderly construction site.

Non-storm water management BMPs includes procedures and practices designed to minimize or eliminate the discharge of pollutants from vehicle and equipment cleaning, saw cutting, pipe testing and other activities that generate liquid slurry or water based effluent. All storm/sanitary drain inlets should be located and protected during construction such that non-storm water carrying pollutants does not enter the inlets. Paving and concrete work should be undertaken during dry weather and drain inlets covered

during these activities. During wet weather construction, the drain inlets should be protected with a BMP that filters water such as sediment traps, silt bags and straw wattle.

### 3.2.6 Waste Management/Materials Control BMPs

Waste management and materials pollution control BMPs, like non-storm water management BMPs, are source control BMPs that prevent pollution by limiting or reducing potential pollutants at their source before they come in contact with storm water.

These BMPs also involve day-to-day operations of the construction site, are under the control of the Trade Subcontractors, and are additional “good housekeeping practices” which involve keeping a clean, orderly construction site. Waste management consists of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project. The objective is to prevent the release of waste materials into storm water runoff or discharges through proper management of the following types of wastes:

- Solid
- Sanitary
- Concrete
- Hazardous
- Equipment – related wastes

Materials pollution control (also called materials handling) consists of implementing procedural and structural BMPs in the handling, storing, and the use of construction materials. The BMPs are intended to prevent the release of pollutants during storm water and non-storm water discharges. The objective is to prevent or reduce the opportunity for contamination of storm water runoff from construction materials by covering and/or providing secondary containment of storage areas, and by taking adequate precautions when handling materials. Material Safety Data Sheets, covered and secondary containment and employee training are important examples of materials pollution control. These controls must be implemented for all applicable activities, material usage, and site conditions by each Trade Subcontractor working on the Project.

The following BMP Table 4 indicates the BMPs for Trade Subcontractors to utilize to control construction site wastes and materials for the project.

**Table 4. Waste Management and Material Handling Control BMPs**

<b>BMP Name</b>
Material Delivery & Storage
Material Use
Spill Control
Solid Waste Management
Hazardous Materials/ Waste Management
Concrete Waste Management
Sanitary/Septic Waste Management
Liquid Waste Management

Fuel (gasoline/diesel), hydraulic oil, motor oil, and other liquid or hazardous waste materials used for vehicle and equipment maintenance may be used on the construction site and at the lay down areas if applicable permits are obtained and spill/response measures are adhered to. Minor amounts of lubricants and hydraulic fluid may be stored in vehicles. Spill response equipment will also be located onsite and near active construction.

Waste management BMPs includes procedures and practices designed to minimize or eliminate the discharge of pollutants from vehicle and equipment use, as well as fueling and maintenance operations to storm water drainage systems or to watercourses. Drip pans, diapers or alternative containment will be placed under equipment and vehicles (as applicable during maintenance or if leaking is suspected) while not in use, to catch and/or contain drips and leaks and prevent soil contamination. Construction crews will be educated to check parking areas visually for signs of leaking liquids; any vehicles found to be leaking onto the soil surface will be provided with temporary drip pans while at the project site. Fueling may be conducted on the job site and at the lay down area if fueling BMPs are implemented, appropriate permits are obtained and proper spill control policies and procedures are followed.

It is important that Trade Subcontractors minimize or abate the exposure of materials stored or spilled at the site. Spill Response Procedures for smaller spills are presented in BMPs. If a larger spill or discharge offsite occurs, or if the project receives a written notice or order from any regulatory agency, Trade Subcontractors will follow their Health & Safety Plan and Spill Prevention Countermeasure and Control Plan (SPCC) as well as comply with all Federal, State and local spill reporting regulations.

## 4 BMP INSPECTION, MAINTENANCE AND RECORD KEEPING

Inspection and maintenance of BMPs are an integral part of the Project and will be followed by the Trade Subcontractors. During visual inspections, if any BMP deficiencies or any storm water compliance issues are observed, the Trade Subcontractor's Construction Supervisor will be notified immediately and the deficiencies will be corrected as soon as possible. The Trade Subcontractors are responsible for maintaining and/or submitting any required monitoring records as required by regulatory agencies in accordance with current regulatory guidelines.

**Table 5. Trade Subcontractor Maintenance, Monitoring and Repair Procedures**

PRACTICE	MONITORING, MAINTENANCE AND REPAIR PROCEDURES
Erosion Control	Check all soil protection including fabric, plastic, rock, hydroseed, mulch and velocity dissipation before, during and after rain events. Repair or replace as necessary to maintain proper function.
Street Cleaning	Streets must be periodically cleaned. Large quantities of soil tracked onto the street will be picked up by a loader bucket and/or hand shoveled back onto the pad. Streets must also be swept on an as-needed basis to maintain continuous sediment and litter control. Street washing shall not be done.
Sediment Control	Check integrity and functioning of berms, straw bales, check dams, and silt fences. Repair any eroded areas and remove accumulated debris.
Inlet Protection	Monitor installation and maintenance of sediment barriers and inlet protection devices. Check periodically during storms and repair or remove sediment as necessary to maintain appropriate functioning.
Temporary Basins	Remove accumulated sediment when sediment accumulates to within one foot of the outlet elevation and restore original dimensions of the basin. Obtain dewatering discharge permit from SFPUC prior to any dewatering of stored surface or groundwater.
Materials/ Equipment Storage	<ul style="list-style-type: none"> <li>Petroleum products shall be stored out of the rain and waste materials shall be stored in secured containers. Paints, solvents, enamels, sealers, bonding agents, and other chemicals shall be stored inside a covered, secure area.</li> <li>Keep designated storage areas clean and well organized. Conduct weekly monitoring to check for damaged containers, leaks, etc.</li> <li>Keep chemicals in original containers and keep them labeled.</li> <li>Train employees and subcontractors on the use of the storage area.</li> </ul>
Fueling Practices	<ul style="list-style-type: none"> <li>If refueling of equipment is conducted on site, make sure that</li> </ul>

PRACTICE	MONITORING, MAINTENANCE AND REPAIR PROCEDURES
	<p>fueling is occurring in designated areas and that secondary containment items such as drain pan or drop cloth are nearby to catch fuels/leaks.</p> <ul style="list-style-type: none"> <li>• Inspect and maintain vehicles and equipment regularly to minimize leaks and drips.</li> <li>• Comply with Federal, State and local requirements for fuel storage tanks.</li> </ul>
Herbicide/ Pesticide Application	Provide the landscape contractor with knowledge about proper procedures for application of designated chemicals.
Waste Disposal	Provide proper disposal procedures for specific materials
Litter Control	Place trash bins in appropriate locations and are being used properly. Pets will not be allowed on the Project during construction.
Equipment Cleaning	If equipment cleaning is done on site, make sure contractors are using designated, bermed wash areas to prevent wash water from entering storm drain system.

## 5 LIST OF CONTRACTORS/SUBCONTRACTORS

The following is a partial list of Trade Subcontractors, suppliers and consultants that may be employed on the Project. Names and contact numbers for each activity on the list can be obtained from Webcor /Obayashi upon request. This list is to be updated as necessary. This plan can be utilized as part of a subcontractor notification letter to document Subcontractors notification of their obligation to uphold applicable storm water pollution control regulations.

TRADE	NAME	Signature Indicating Willingness To Provide, Maintain, and Implement SWPPP in compliance with all applicable City Ordinances and Codes
Architect		
Bricklayers		
Cabinet Makers		
Carpenters (finish)		
Carpenters (rough)

## **6 INSTRUCTIONS TO FIELD PERSONNEL**

Webcor /Obayashi will be responsible for mandating that SWPPP documents be prepared by Trade Subcontractors and also for observing the site on a regular basis in keeping with the standard of care for a General Contractor. Webcor /Obayashi will coordinate day to day oversight of the Project as a whole, track compliance with their contract obligations as well as Trade Subcontractor costs, direct Trade Subcontractors to maintain the Project site in accordance with all applicable regulations, and attend to discussions with the City regarding compliance concerns. Contracts with Trade Subcontractors and Sub tier Subcontractors shall include a requirement to comply with the provisions of this Plan and to maintain compliance with all applicable City Ordinances and Codes. The Trade Subcontractors, Sub tier Subcontractors and their Project Superintendents for this project are hereby authorized to uphold, certify, and maintain their own SWPPPs and to distribute it to all field personnel responsible for monitoring the site and maintaining compliance with storm water regulations. All subcontractors, field personnel and their assigns that work at the site must conform to the requirements described in this Plan and the SWPPP developed for Trade Subcontractor activities and any alterations thereof made at the time and in the manner herein specified, and in all respects according to its intent and meaning, and shall indemnify and hold harmless Webcor /Obayashi, its officers and agents, if failure to conform results in legal action or any other action by the Regional Water Quality Control Board or City. Duties of the Trade Subcontractors include but are not limited to:

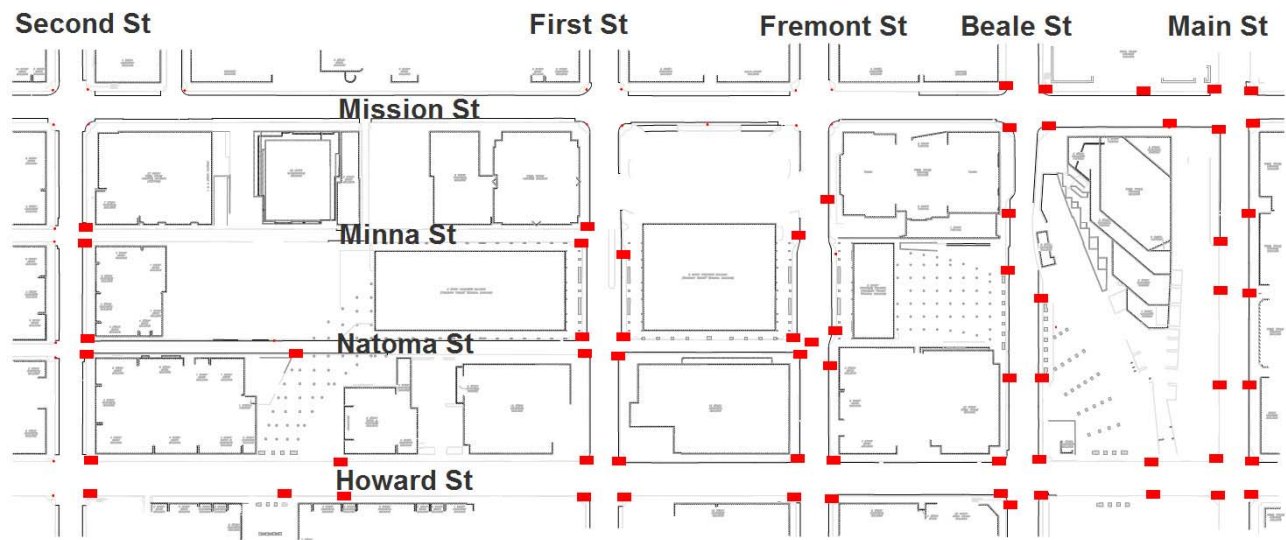

- Maintaining full compliance with their SWPPP and all City Codes and Ordinances.
- To this effect, the Trade Subcontractors shall have authority to mobilize their own crews for:
  - BMP Installation, monitoring and maintenance.
  - Obtaining dewatering and other applicable permits necessary for the satisfactory completion of their contract.
  - Providing for elimination of all unauthorized discharges.
  - Coordinating with the City such that all updates, amendments, corrections and/or repairs are made in a timely fashion.
  - Stopping any construction activity that is in violation of municipal ordinances or codes or that is inconsistent with the provisions of the Trade Subcontractors SWPPP.

## 7 CLOSING

The Project will comply with the storm water discharge regulatory framework in the site vicinity through implementation of this Construction Stormwater Pollution Control/Compliance Plan. This Plan indicates that each Trade Subcontractor is responsible for preparing, submitting for approval, installing and maintaining a SWPPP with BMPs for protecting inlets to the SF combined sewer system from construction activities. BMPs included in the SWPPPs prepared by each Trade Subcontractor should include practices from the BMP categories outlined in this Plan. The SWPPP shall be implemented concurrently with the commencement of Trade Subcontractor construction activities and maintained by the Trade Subcontractor in a form that provides the Project with full compliance throughout the construction schedule for activities undertaken by the Trade Subcontractor. Though projects such as the subject Project that are serviced by the combined sewer system in San Francisco are not subject to the terms of the State Construction General Permit, Section A of the Construction General Permit describes in detail the requirements for a SWPPP, and the City and County San Francisco specifies that it should be used as a design guide. All construction sites must prevent illicit discharge into the SF combined sewer system.

# Keep it on Site

## Pollution Prevention Guide

for the

### Construction Industry

## Keep it on Site

The San Francisco Public Utilities Commission (SFPUC) is pleased to announce **Keep it on Site**, as part of its new program to prevent water pollution at construction sites.

Runoff from construction sites is a major source of water pollution, and is subject to requirements such as the development of a stormwater pollution prevention plan, a plan review, stormwater treatment measures, runoff monitoring and increased site inspections.

As part of our Construction Site Water Pollution Prevention Program, this brochure will assist construction professionals understand and comply with the new State and Federal laws. Here, you will find valuable information on methods used on construction sites to keep pollution, such as dirt and construction site debris out of our sewage treatment system and sensitive local water bodies.

We hope to make your job easier while keeping our city clean by providing you with the information to create an efficient and environmentally safe construction site.

Together, we have the ability to preserve the quality of life in San Francisco.

Water Pollution Prevention Program  
San Francisco Public Utilities Commission  
City and County of San Francisco  
3801 3rd Street, Suite 600  
San Francisco CA, 94124

Construction Site Runoff: (415) 695-7310  
<http://pollutionprevention.sfwater.org>

## Water Pollution Prevention Program

The goal of the Water Pollution Program is to control pollution at its source in order to protect the Bay, ocean, creeks and lakes.

### Emergency Phone Numbers

To report illegal dumping of hazardous materials or wastes to the storm drain or sewer system, call San Francisco Water Pollution Prevention Program hotline: (415) 695-2020

### Hazardous Spills: 911

### Inspection and Enforcement Program

The Construction Site Inspection and Enforcement Program was established to ensure that all businesses operate in compliance with all appropriate stormwater laws and other City requirements. Contractors, site supervisors and property owners can be held responsible for violations, which may lead to a civil penalty of up to \$25,000 per day and reimbursing the City for all expenses associated with clean up<sup>1</sup>.

Construction materials such as paint, dirt, and trash often find their way into our storm drains,

<sup>1</sup> San Francisco Sewer Use Ordinance Article 4.1, Public Works Codes

## Best Management Practices

jeopardizing San Francisco's sewer system, and polluting surrounding local water bodies.

Contractors are now required to implement what are known as Best Management Practices (BMPs) on all construction sites. BMPs are methods used to keep pollution out of our storm drains and catch basins and off of City property such as sidewalks, streets, and alleys. Installing and maintaining these BMPs on the construction site is critical to protecting our sensitive water bodies.

If your project is greater than 1 acre, you are required to prepare a formal Stormwater Pollution Prevention Plan (SWPPP). Please contact SFPUC's Environmental Regulation and Management for more information at (415) 695-7310.

The following is a list of BMPs and pollution prevention measures that must be implemented at all construction sites.

- Identify all storm drains and catch basins near the construction site and ensure all workers are aware of their locations to prevent pollutants from entering them.
- Protect all storm drain and catch basin inlets.
- Develop an erosion control and sediment control plan for wind and rain.
- Develop spill response and containment procedures.
- Inspect site regularly to ensure that BMPs are intact.
- Conduct daily site cleanings as needed.
- Educate employees and subcontractors about BMPs.
- Regularly maintain all BMPs at project site.

# BEST MANAGEMENT PRACTICES

## Site Overview

This drawing illustrates Best Management Practices (BMPs) that must be followed at all construction sites in San Francisco.

## Preserve existing vegetation

Preserving existing trees and vegetation where possible will prevent erosion.

## Paint and Stucco

All paint and stucco materials stored on the site must be contained and covered. It is illegal for contractors to wash out paintbrushes in the street or dump any residues in the sewer or the storm drain. Paintbrushes and spray guns shall be washed/cleaned out into a hazardous materials barrel or put back into its original container and disposed of properly. Latex paint should be dried in its container and placed in the garbage. Oil paint and thinners need to be recycled as hazardous wastes.

## Perimeter Controls

Gravel bags, silt fences, and fiber rolls are acceptable perimeter controls, and shall be used to surround the entire site. Upstream perimeter controls prevent water from running into your site and downstream controls prevent sediment from leaving your site. Avoid running over perimeter controls with vehicles or heavy equipment, as they can damage the materials. Replace any damaged perimeter controls immediately. Keep extra absorbent materials and/or a wet/dry vacuum on site to quickly pick up unintended spills. Sites must also be checked and maintained daily.

## Building Materials / Staging areas

Construction materials must be stored onsite at all times. The only exception is if you have a right-way-permit. Building materials should always be covered when not in use to prevent runoff caused by wind or rain. To apply for a right-of-way permit, contact the Bureau of Streets Use and Mapping at (415) 554-5810.

## Storm Drains and Catch Basins

Storm drains must be protected at all times with perimeter controls, such as fiber rolls or gravel bags.

## Concrete Trucks / Pumpers

Any concrete pumpers parked in public streets or alleys must be surrounded by perimeter controls, such as berms, gravel bags or fiber rolls. Tarps also must be placed beneath concrete pumpers at all times. Residual materials must be cleaned up as well.

## Washout Area

The disposal of "wet" construction materials should be handled in the washout area. This includes paint, stucco, and concrete. Use a gravel bag or fiber roll and tarp to collect evaporation and prevent run-off in nearby areas. The washout area must be checked and maintained daily to ensure compliance.

## Dirt and Grading

Mounds of dirt or gravel should be stored on site and covered each day with a tarp. When in use, all exposed dirt piles should be sprayed with water to prevent excessive dust. Tarps must be available and onsite to cover 125% of exposed areas during the rainy season (October-April).

## Earthmoving Equipment

All earthmoving equipment should be stored onsite. Maintenance and repair should never be conducted on the site. All tracks and trails left by equipment leading to and from the site should be cleaned up immediately.

## Construction site stone or rock access drives

Stone or rock access drives at any construction site should be made of 3-4 inch fractured stone aggregate with a geo-textile liner below the grade of the road. This is to be used by all vehicles to limit tracks of mud onto the streets.

## Dewatering Activities

A batch discharge permit is required before releasing any construction site wastewater. Call 415-695-7310 for more information.

## Dumpsters

Keep dumpsters covered. Areas around dumpsters should be swept daily.

**Hazardous Materials Management Plan**  
**TRANSBAY TRANSIT CENTER**  
**San Francisco, California**

Webcor/Obayashi Joint Venture will be responsible for mandating that Hazardous Materials Procedures documents shall be prepared by Trade Subcontractors and also for observing the Trans Bay Transit Center site on a regular basis in keeping with the standard of care for a General Contractor. Webcor/Obayashi Joint Venture will also coordinate the day to day oversight of the Project as a whole, compliance with their contract obligations, the tracking of Trade Subcontractor costs, directing Trade Subcontractors to maintain the Project site in accordance with all applicable regulations, and for discussions with the City regarding compliance concerns. Contracts with Trade Subcontractors and Sub tier Subcontractors shall include a requirement to comply with the provisions of this Plan and to maintain compliance with all applicable City Ordinances and Codes. The Trade Subcontractors, Sub tier Subcontractors and their Project Superintendents for this project are hereby authorized to uphold, certify, and maintain their own Hazardous Materials Procedures Plans and to distribute it to all field personnel responsible for monitoring the site and maintaining compliance with Federal State and local regulations. All subcontractors, field personnel and their assigns that work at the site must conform to the requirements described in this Hazardous Materials Procedures developed for Trade Subcontractor activities and any alterations thereof made at the time and in the manner herein specified, and in all respects according to its intent and meaning, and shall indemnify and hold harmless Webcor Builders-Obayashi, its officers and agents, if failure to conform results in legal action or any other action. Duties of the Trade Subcontractors include but are not limited to:

- Maintaining full compliance with their Hazardous Materials Procedures plan and all City Codes and Ordinances.
- To this effect, the Trade Subcontractors shall have authority to mobilize their own crews for: monitoring and maintenance.
- Obtaining dewatering and other applicable permits necessary for the satisfactory completion of their contract.
- Stopping any construction activity that is in violation of municipal ordinances or codes or that is inconsistent with the provisions of the Trade Subcontractors Hazardous Materials Procedures plan.

The Transbay existing Terminal Building has been demolished and replaced with a multimodal Transit Center that includes an underground rail station. The depth of the excavation will be approximately 65 feet. A soil-cement shoring wall extending approximately 120 feet below ground surface (bgs) will form the perimeter of the Transit Center. A concrete buttress will be placed under the Transit Center adjacent to 301 Mission Street extending down to bedrock, approximately 240 feet.

This HMMP includes the requirement to mitigate potential health and safety (H&S) risks to the environment, workers, and site-user associated with the presence of certain constituents in the soil at the Site.

## **ENVIRONMENTAL REPORTS**

Webcor /Obayashi Joint Venture have reviewed environmental reports prepared for the site. The following is a summary of the previous reports:

### **Phase I Environmental Site Assessment**

The eastern portion of the Site is located in an area historically known as the Tar Flat which was a former industrial area developed during the Gold Rush Era of the 1850's. The Site has been occupied by numerous buildings involved in metal work facilities, foundries, and a coal yard. Also, the San Francisco Gas Light Company was located on the south central and south eastern edge Site. Coal tar waste is believed to have been discharged into the surrounding tidelands which include the eastern portion of the Site. The Transbay Terminal Building was constructed between the years of 1936 ad 1938 and was used as a passenger rail station. In 1958, the train tracks were removed and/or paved over and the Site has been used by buses since. In the 1950's, elevated concrete roadways were built on the Site as part of the Transbay Terminal and the Embarcadero Freeway. The Embarcadero Freeway was damaged during the 1989 Loma Prieta earthquake and was subsequently demolished. Since the 1990's, the Site has remained largely unchanged.

Significant findings included:

- The subsurface fill material at the Site may contain elevated concentrations of heavy metals and other residual petroleum hydrocarbons. These concentrations are likely associated with the presence of 1906 earthquake fill material located below the ground surface. Special soil handling and/or sampling will likely be required during any construction activities.

- Due to the proximity of the former San Francisco Gas and Light Plant (bounded by First, Fremont, Howard, and Natoma Streets) and the presence of manufactured gas by-product waste found on nearby properties, hazardous materials may exist in the subsurface beneath the Site. Special soil handling and/or sampling will likely be required during any construction activity.
- The soil and groundwater near the West section of the Transbay Terminal Building may contain petroleum hydrocarbons and VOCs associated with the former USTs release. Special soil and groundwater handling and/or sampling will likely be required during any construction activities.

### **Site Investigations**

Limited soil and groundwater sampling has been performed beneath the ramps and near the Transbay Terminal building in 1999 and 2008 by Treadwell & Rollo. Also, they performed an Environmental Site Characterization (ESC) in 2009 at the Transbay Terminal which included collecting soil samples of the fill material and underlying sand from 23 exploratory borings, chemical testing of selected samples, and evaluating the results. Treadwell & Rollo collected groundwater grab samples from four of the exploratory borings for chemical analysis. The objective of the ESC was to assess the presence of petroleum hydrocarbon and metal contamination in the soil and groundwater beneath the Site that will be removed and disposed during the proposed construction activities. Concentrations of chemical compounds and metals detected in the soil and groundwater samples were compared to state and federal criteria for hazardous waste and disposal options.

The results of our environmental site characterization and other available subsurface information in the vicinity indicate the Site is generally underlain by approximately 5 to 16 feet of fill material, composed of loose to medium dense silty sand with varying amounts of brick, wood, tar, and glass fragments. The presence of fill material underlying the Site is likely associated with the 1906 earthquake and fire. A sand layer consisting of medium dense to very dense sand with variable amounts of silt approximately 15 to 18 feet thick underlies the fill material. Bay Mud is present beneath the sand layer.

### **Soil Results**

TPHg was detected above the method reporting limit (0.1 mg/kg) in 3 of the 88 samples analyzed at concentrations ranging from 0.29 mg/kg to 26 mg/kg. TPHd was detected above the method reporting limit (2 mg/kg) in 9 of the 87 samples analyzed at concentrations ranging from 2.01 mg/kg to 54.8 mg/kg. TPHmo was detected above the method reporting limit (4 mg/kg) in 49 of the 88 samples

analyzed at concentrations ranging from 4.09 mg/kg to 137 mg/kg. Methylene chloride was detected in 3 of the 14 samples analyzed at concentrations ranging from 0.056 mg/kg to 0.24 mg/kg. No other VOCs were detected at or above methods reporting limits.

Total cyanide was not detected above the method reporting limit (1 mg/kg) in any of the 5 samples analyzed. No SVOCs, Pesticides, PCBs, Sulfide, or Cyanide were detected at or above method reporting limits in the samples analyzed. The pH measured in five samples ranged from 6.70 standard units (S.U.) to 8.66 S.U.

Total lead was detected in each of the samples analyzed at concentrations ranging from 1.2 mg/kg to 1,000 mg/kg (Table 2). Total lead was detected at concentrations at or above 50 mg/kg but below 1,000 mg/kg in 33 soil samples. Each of these soil samples was subsequently run for STLC and TCLP lead to determine soluble lead levels. One soil sample (TR-21-5) matched the State of California hazardous waste criteria of 1,000 mg/kg for total lead and subsequently run for TCLP lead to determine if this soil represents a federal RCRA hazardous waste. The TCLP result was 0.83 milligrams per liter (mg/L) so less than the federal RCRA hazardous waste criteria of 5 mg/L.

STLC lead was detected at or above the method reporting limits in 33 of the 34 samples analyzed at concentrations ranging from 0.13 mg/L to 52.1 mg/L. A total of 19 soil samples exceeded the State of California hazardous waste criteria of 5 mg/L. TCLP lead was detected at or above the method reporting limits in 22 of the 36 samples analyzed at concentrations ranging from 0.13 milligrams per liter (mg/L) to 14.5 mg/L. A total of one soil sample (TR-21-5) exceeded the Federal hazardous waste criteria of 5 mg/L.

The remaining metal concentrations were within normal<sup>1</sup> background ranges found in the western United States with the exception of zinc in sample TR-2-1.5 which was detected at a concentration of 5,600 mg/kg.

## **Groundwater Results**

No oil and grease, TRPH, or SVOCs were detected above method reporting limits in any of the four samples. TSS was detected in all the samples with concentrations ranging from 110 mg/L to 160,000 mg/L. COD was detected in TR-19-GW, TR-20-GW, and TR-24-GW with concentrations of 24 mg/L, 20

---

<sup>1</sup> "U.S.G.S. Professional Paper 1270, Element Concentrations in Soils and Other Surficial Materials of the Conterminous United States," 1984.

mg/L, and 64 mg/L, respectively. Phenolics were detected in TR-24-GW at a concentration of 0.074 mg/L. TR-19-GW, TR-20-GW, and TR-24-GW were tested for pH with concentrations of 7.41 S.U., 7.07 S.U., and 7.45 S.U., respectively.

Trichloroethylene was detected in TR-8-GW at a concentration of 1.58 mg/L. 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, benzene, ethylbenzene, isopropyl benzene, n-propylbenzene, styrene, toluene, and total xylenes were detected in TR-19-GW with concentrations of 0.0223 mg/L, 0.00568 mg/L, 0.0251 mg/L, 0.011 mg/L, 0.00561 mg/L, 0.00138 mg/L, 0.00143 mg/L, 0.0171 mg/L, and 0.0591 mg/L, respectively. Methyl tert-butyl ether (MTBE) was detected in TR-20-GW at a concentration of 0.00078 mg/L. Naphthalene was detected in TR-19-GW, TR-20-GW, and TR-24-GW at concentrations of 0.417 mg/L, 0.00371 mg/L, and 0.0548 mg/L, respectively. No other VOCs were detected in any of the samples.

Antimony was detected in TR-20-GW at a concentration of 0.012 mg/L. Arsenic was detected in TR-24-GW at a concentration of 0.024 mg/L. Barium was detected in TR-8-GW, TR-19-GW, TR-20-GW, and TR-24-GW at concentrations of 0.066 mg/L, 0.052 mg/L, 0.085 mg/L, and 0.022 mg/L, respectively. Chromium was detected in TR-8-GW and TR-20-GW at concentrations of 0.032 mg/L and 0.008 mg/L, respectively. Cobalt was detected in TR-8-GW and TR-20-GW at concentrations of 0.011 mg/L and 0.006 mg/L, respectively. Molybdenum was detected in TR-8-GW, TR-20-GW, and TR-24-GW at concentrations of 0.01 mg/L, 0.024 mg/L, and 0.009 mg/L, respectively. Nickel was detected in TR-8-GW, TR-20-GW, and TR-24-GW at concentrations of 0.054 mg/L, 0.052 mg/L, and 0.013 mg/L, respectively. Vanadium was detected in TR-8-GW, TR-19-GW, TR-20-GW, and TR-24-GW at concentrations of 0.032 mg/L, 0.012 mg/L, 0.012 mg/L, and 0.021 mg/L, respectively. Zinc was detected in TR-8-GW, TR-20-GW, and TR-24-GW at concentrations of 1.1 mg/L, 0.013 mg/L, and 0.011 mg/L, respectively. No other metals were detected in any of the samples.

## **SUBSURFACE CONDITIONS**

The results of previous site investigations and other available subsurface information in the vicinity indicate the Site is generally underlain by approximately 5 to 16 feet of fill material, composed of loose to medium dense silty sand with varying amounts of brick, wood, tar, and glass fragments. The presence of fill material underlying the Site is likely associated with the 1906 earthquake and fire. A sand layer consisting of medium dense to very dense sand with variable amounts of silt approximately 15 to 18 feet thick underlies the fill material. Bay Mud is present beneath the sand layer.

Groundwater was encountered at the time of the investigation at depths ranging from 13 to 20 feet bgs. Groundwater levels may fluctuate depending on the season. The groundwater flow direction is likely to the northeast towards San Francisco Bay.

## **DISCUSSION**

Based on the analytical results from the Site subsurface investigation and previous analytical results, some of the fill material contains elevated total and soluble lead levels at concentrations exceeding Federal and State of California hazardous waste criteria. The remaining fill material will most likely be accepted at a regulated Class II and/or Class III landfill. Based on previous environmental investigations at the Site and vicinity, the sand underlying the fill would likely be disposed of as unrestricted waste.

The area of fill material containing soluble lead concentrations exceeding the Federal hazardous waste criteria are near boring TR-21 at a depth of 5 feet bgs. The areas of fill material containing total and soluble lead concentrations exceeding the State of California waste criteria are located near borings TR-1 at depths of 1.5 and 5 feet bgs, TR-2 at depths of 1.5, 3 and 5 feet bgs, TR-4 at depths of 3 and 5 feet bgs, TR-8 at depths of 1.5 and 3 feet bgs, TR-14 at a depth of 3 feet bgs, TR-15 at a depth of 3 feet bgs, TR-16 at a depth of 5 feet bgs and 10 bgs, TR-17 at depths of 1.5, 3 and 5 feet bgs, TR-19 at a depth of 7.5 feet bgs, TR-20 at a depth of 7.5 feet bgs, and TR-21 at a depth of 3 feet bgs. The remaining fill material will be disposed as Class II non-hazardous waste.

Groundwater is encountered at depths ranging from approximately 13 to 20 feet bgs across the Site. The proposed construction activities most likely will encounter groundwater in quantities that will require its removal from the subsurface. Prior to discharge into the sanitary sewer system, the dewatering contractor will obtain a batch groundwater discharge permit from the San Francisco Public Utilities Commission (SFPUC).

Because hazardous materials were detected at the Site, a SMP and a HASP will be required prior to construction. The Subcontractor HASP will outline proper soil handling procedures and H&S requirements to minimize worker and public exposure to hazardous materials during construction.

## **RECOMMENDATIONS FOR MITIGATIVE ACTIONS**

The results of previous environmental investigations at and near the Site indicate the fill material beneath the Site contains elevated concentrations of heavy metals and petroleum hydrocarbons. The presence of these compounds poses soil management and potential H&S issues to be addressed as part of the Site

development activities. The soil management objectives for the Site are to minimize exposure to construction workers at the Site, nearby residents and/or pedestrians, and future users of the Site to constituents in the soil.

### **Health and Safety Issues**

There may be a potential H&S risks associated with the heavy metals and petroleum hydrocarbons detected at the Site. There also may be a potential for this soil to affect construction workers at the Site, nearby residents and/or pedestrians, and future users of the Site. The routes of potential exposure to the petroleum hydrocarbons and metals could be through three pathways: 1) dermal (skin) contact with the soil, 2) inhalation of dusts, and 3) ingestion of the soil.

The most likely potential for human exposure to the petroleum hydrocarbons and metals in the soil will be during soil excavation operations. Because on-site materials contain concentrations of petroleum hydrocarbons and lead in excess of the Proposition 65 guidelines, there is a requirement that appropriate health and safety procedures, as well as warning requirements, be implemented during construction. The trade sub contractor will be responsible for establishing and maintaining proper H&S procedures to minimize worker and public exposure to Site contaminants during construction. Webcor/Obayashi Joint Venture will oversee this process and require the development and implementation of a comprehensive HASP, which should be prepared by a certified industrial hygienist that represents each subcontractor or its sub tier contractor.

The H&S training requirements, i.e. trained in accordance with Section 1910.120 of 29 Code of Federal Regulations (HazWoper training), specific personal hygiene, and monitoring equipment that will be used during construction to protect and verify the H&S of the construction workers and the general public from exposure to constituents in the soil. Air monitoring to evaluate the amount of airborne particles during excavation will be required by the tub trade contractors. All reports will be kept in a central location managed by Webcor/Obayashi Joint Venture.

A representative of Webcor/Obayashi Joint Venture and the Site health and safety officer (HASO) representing the trade subcontractor will be on site at all times during excavation activities to ensure that all health and safety measures are maintained. The Webcor/Obayashi Joint Venture representative or HASO will have authority to direct and stop (if necessary) all construction activities in order to ensure compliance with the HASP.

The purpose of the HASP is to provide field personnel with an understanding of the potential chemical and physical hazards, protection of any off-site receptors, procedures for entering the project Site, H&S procedures, and emergency response to hazards should they occur. All project personnel shall read and adhere to the procedures established in this HASP. A copy of all plans will be kept on site during field activities and will be reviewed and updated as necessary.

The general public will be protected through the following measures maintained by trade subcontractors and monitored by Webcor/Obayashi Joint Venture:

- the Site will be fenced;
- exposed soil at the construction Site will be watered as necessary to prevent visible dust from migrating off-site;
- soil stockpiles will be covered;
- water will be misted or sprayed during the loading of soil onto trucks for off haul;
- trucks transporting contaminated soil will be covered with a tarpaulin or other cover;
- the wheels of the trucks exiting the Site will be cleaned prior to entering public streets;
- public streets will be swept daily if soil is visible; and
- Excavation and loading activities will be suspended if winds exceed 20 miles per hour.

### **Soil Management**

The proposed construction activities will disturb soil during the excavation activities including: soil handling during archeological investigations, shoring wall installation, construction of a buttress for the adjoining 301 Mission Street property, timber pile removal and disposal, utility relocation and the mass excavation for the new Transbay Transit Center. During all excavation activities, dust control measures will be implemented to reduce potential exposure. These measures shall include moisture-conditioning the soil using dust suppressants and covering the exposed soil and stockpiles with weighed down plastic sheeting to prevent exposure of the soil.

Since all the contaminated fill material will be excavated and disposed of off-site, there will be no risk of direct contact with the underlying fill material by future Site users.

The Site's HASP (prepared by the trade sub contractor) will contain additional dust monitoring, action levels, dust control measures, and work stoppage provisions that will be followed during construction activities.

### **Soil Segregation and Disposal**

Before any excavation activities begin at the Site, a TJPA representative shall be provided documentation from the excavation contractor that the accepting landfill facility for the soil from Transbay Terminal project has been provided with and has reviewed all analytical data collected from the Site. TJPA shall approve all off-site disposal facilities and soil transportation contractors, including, without limitation, available insurable coverage, and prior to the shipment of any soil or other waste materials. The TJPA representative will provide testing and schedule the intervals that testing shall occur.

The results of previous soil analytical testing indicate that some of the soil located at the Site will be disposed off-site at a Class I landfill, however additional chemical testing of the soil may be required by the landfill prior to disposal. The excavation contractor shall be responsible for tracking the disposition of soil removed from the Site. Any excavated soil characterized as a hazardous waste shall be tracked using the Uniform Hazardous Waste Manifest System (USEPA Form 8700-22), as applicable. Soil not characterized as a hazardous waste shall be tracked using non-hazardous bills of lading. All documentation will be provided to TJPA during the excavation activities.

If soil stockpiling of suspected contaminated soil is to be performed, the excavation contractor shall establish appropriate soil stockpile locations on the Site to properly segregate, cover, control dust, profile, and manage the excavated soil. Stockpiled soils are to be placed on top of one layer of 10-mil polyethylene sheeting (or equivalent), such as Visqueen. When stockpiled soil is not actively being handled, top sheeting will be adequately secured so that all surface areas are covered.

### **Soil Disposition**

The Trade Sub contractor will establish appropriate off-site soil disposal locations and direct truck loading scheduling and/or soil stockpile locations on the Site to properly segregate, cover, moisture control, and profile the excavated soil. Soil profiling criteria will ultimately depend on the acceptance criteria of the landfills receiving the soil. These procedures will be established by the excavation contractor and coordinated with the proposed landfills prior to initiating soil excavation. It is not anticipated that soil will be reused at the Site for construction-related activities.

The Webcor Obayashi JV will, on behalf of TJPA, will be responsible for tracking final soil dispositions and turn that information to the TJPA representative. Any excavated soil considered hazardous waste will be tracked using the Uniform Hazardous Waste Manifest System (USEPA Form 8700-22), as applicable. Soil not considered hazardous waste will be tracked using non-hazardous bills of lading. These two systems will be used to comply with appropriate state and local requirements.

The contractor will arrange for transportation of all wastes off-site. Hazardous and non-hazardous waste will be transported to the appropriate disposal facility using a permitted, licensed, and insured transportation company. Transporters of hazardous waste must meet the requirements of 40 CFR 263 and 22 CCR 66263. All trucks transporting bulk hazardous waste will be properly lined and covered with compatible materials. Trucks will be decontaminated prior to any use other than hauling contaminated materials unless the contaminated material was already double-contained. The contractor will be responsible for preparing and submitting traffic control plans for trucks entering and leaving the Site. A decontamination pad location plan and decontamination procedures will be prepared. A route plan will also be prepared showing the expected route each truck will use to reach each landfill.

For soil that is to be exported off-site that is characterized as a hazardous waste, an appropriate USEPA Generator Identification Number will be recorded on the hazardous waste manifests used to document transport of hazardous waste off-site. The hazardous waste transporter, disposal facility, and U.S. Department of Transportation (DOT) waste description required for each manifest will be determined on a case-by-case basis. A description of the number of containers being shipped, the type of container, and the total quantity of waste being shipped will also be included on each manifest.

Webcor/Obayashi Joint Venture representative will be responsible for overseeing the sub trade provides accurate completion of the hazardous waste manifests and nonhazardous bills of lading. Records of all wastes shipped off-site will be maintained by TJPA and will be made available for inspection on request. The final destination of wastes transported off-site will be documented in the Site Closure Report that will be prepared by others.

### **Soil Sampling**

If needed, chemical testing of the stockpiled soil will be performed to profile the soil for disposal. Soil profiling criteria depends on the proposed landfill location or off-site receiving facility. These procedures shall be established by the excavation contractor and coordinated with the proposed landfills prior to initiating soil excavation. Typical soil profiling requirements are one four-point composite sample per 500 to 750 cubic yards to be disposed.

If soil samples are required for analysis, the samples shall be collected by the TJPA representative and tracked.

### **Timber Pile Removal and Disposal**

Part of the foundation system for the Transbay Terminal building includes timber piles beneath the basement slab. During the excavation activities these timber piles will be removed and disposed of. The timber piles will be extracted from the subsurface and as much as possible removal of all the soil which is attached to the timber pile will need to be performed. The extracted timber piles will be segregated, tested by the TJPA representative and transported. If disposed of as a Treated Wood at a Class II non-hazardous waste with copies of the Bill of Ladings will be submitted to TJPA representative.

### **Underground Storage Tank Removal and Disposal**

If a underground storage tank (UST) and/or and associated product lines are found, arrange for a licensed tank removal contractor to properly remove and dispose of the UST. Proper permits and notifications should be in place prior to removing the UST. If soil staining is observed, place the affected soil into a stockpile onto plastic sheets and cover with plastic sheets. The Environmental Consultant will complete soil sampling and analysis tasks for UST closure in accordance with San Francisco Fire Department (SFFD) and SFDPH.

### **Coal Gasification Residual Material**

The former San Francisco Gas Light Company was located on the south central and south eastern edge of the Site. Coal tar waste is believed to have been discharged into the surrounding tidelands which include the eastern portion of the Site. Excavation in this area of the Site will most likely encounter residual coal tar waste. Some of the coal gasification residual material encountered may be former piping, coal tar, phenols, heavy metals, and polynuclear aromatic hydrocarbons. If any coal gasification residual material is encountered during the excavation, the material will be stockpiled onto plastic sheeting and covered with plastic sheeting. The TJPA representative will collect soil samples and analyzed the material to determine proper disposal of the material.

### **Groundwater Management**

Groundwater is encountered at depths ranging from approximately 13 to 20 feet bgs across the Site. The proposed construction activities most likely will encounter groundwater in quantities that will require its removal from the subsurface. Prior to discharge into the sanitary sewer system, the dewatering Trade Subcontractors will obtain a batch groundwater discharge permit from the San Francisco Public Utilities

Commission (SFPUC). Based on analytical results of the groundwater samples analyzed during previous Site investigations, approval of the groundwater discharge from the dewatering system would be granted by SFPUC.

### **Dust Control**

Prior to initiating construction activities, a dust control plan (prepared by Trade Subcontractor and specific to this project) will be implemented to reduce potential exposure during excavation and loading operations. This document will contain measures to protect construction workers and the public including: dust monitoring, action levels, dust control measures, and work stoppage provisions that will be followed during construction activities.

Dust control will be accomplished through implementation of engineering controls, including light water spraying or misting of stockpiled soil, truck loading areas and work areas. Misting or spraying will be performed to sufficiently reduce fugitive dust emissions, but limited to prevent water runoff. Efforts will also be made to minimize the soil drop height from an excavator's bucket onto soil piles or into transport trucks. The site-specific dust control plan will as needed, include some or all of the following procedures: site fencing; wetting soil; analysis of wind direction; dust monitors at the work zone and at the Site perimeter and appropriate record keeping, visible inspection; establishing a hotline for community response; limiting excavation area; soil storage regulations (e.g. covering stockpiles); windbreaks; paving; truck loading requirements (e.g. covering vehicles or excavator bucket drop heights); Site vehicle speed limits; wheel washing; street sweeping; termination of excavation if winds exceed 20 mph; and/or addition of soil stabilizers; or other responses as needed.

### **Contingency Procedures**

Hazardous materials including; sumps and/or vaults, asbestos piping, former monitoring wells, and soil with petroleum hydrocarbon odors and/or stains may be encountered during excavation activities. If unanticipated hazardous materials are encountered, the following procedures will be maintained by trade subcontractors and monitored by Webcor/Obayashi Joint Venture:

- stop work in the area where the suspect material was encountered and cover it with plastic sheets;
- notify the Webcor/Obayashi Joint Venture representative, the TJPA Environmental Consultant for Site a inspection and appropriate action in the suspect area; and
- review the existing H&S plan and make revisions, if necessary; and

- Have appropriately trained personnel on Site to work with the affected materials, once directed by Webcor/Obayashi Joint Venture.

If a sump and/or vaults are encountered during excavation activities, contact the TJPA Environmental Consultant for inspection and appropriate action. If no liquid, obvious staining or odors are observed, sump and/or vaults will likely be destroyed and disposed of. If liquid is present within the sump and/or vault and/or obvious staining and odors are observed, the TJPA, Environmental Consultant will collect samples for analyses to determine how to properly disposal of the material.

If stained soil or odors are observed, plastic sheeting will be placed over the affected area and the TJPA Environmental Consultant will be contacted for inspection and appropriate action. If the material is to be excavated, the material will be stockpiled onto plastic sheeting and covered with plastic sheeting. Soil samples will be collected and analyzed to determine proper disposal of the material.

REQUEST:			SUGGESTION:		ANSWER:		
Bracing removal sequence on the East end of Zone 4 WOJV is proposing the following sequence for the bracing removal for the east side of Zone 4. See sketch SK1, attached.					Accept Suggestion: <input type="checkbox"/>		
Sequence 1. Remove level D struts and walers from within the green clouded area up to GL- 32.2 once the mat slab beneath has reached adequate strength. 2. Remove level D struts within the Blue clouded area STD-65 to 74, 82 & 83 and all corresponding walers once the mat slab beneath has reached adequate strength, the sequence for de-stressing will be the diagonals struts should be all de-stressing prior to the 4 remaining cross lot struts (STD-65,66,67 & 68).							
For the remaining levels A, B and C WOJV is proposing to follow a similar removal sequence as Level D							
Please confirm if this sequence would be acceptable.

0010	BRP - Number of Barrette Pile Tremies	Void	09/18/2014	09/28/2014		Potentially	<input type="checkbox"/>
<div><div>From: Webcor Construction LP</div><div>Claude Titché</div><div>To: Turner Construction Company PHIL MILITELLO</div><div>Answered By:</div></div>							
<div>Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent</div>							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
<p>Contract drawing S-3191 indicates two openings (for two tremies) in each Barrette's rebar cage. This drawing is in conflict with Contract Specification 31 63 32 3.4 D 3 that indicates that three tremies are needed for each Barrette (one tremie for each 7 feet of wall length). Please note that the Response to RFI-0050 allowed for the length of the barrette piles to be increased from 20'-0" to 21 '-0".</p> <p>The European Standard EN 1538 indicates two tremies (properly spaced so that the concrete does not have to travel more than 8 feet) is sufficient for each Barrette. Additionally, in reference to RFI BRP-0055 and, in an effort to reduce rebar congestion, 2 tremies are preferred.</p> <p>Please confirm that two tremie pipes per Barrette are acceptable.</p>

1205.1	BGP - Lower Concourse Blockouts to Pour Train Level Partition Walls	Closed	03/22/2014	04/01/2014	04/09/2014	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP Claude Titcher <b>To:</b> Turner Construction Company PHIL MILITELLO <b>Co-Author:</b> Transbay Joint Powers Authority Sylvia Wong			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>REQUEST:</b> Please see attached drawing for the general layout of Lower Concourse blockouts taking into account the response to RFI T-1205. Due to limited site access to the Train Level once the Lower Concourse is poured, the partition walls will have to be poured in 2 lifts, except for the tank walls which will be poured monolithically. In the case where a blockout coincides with features above or below (ie beam below or future partition wall above) the blockout will be offset and the train level partition wall be poured using the "Bird's Mouth" method (see Detail 3 on attached drawings). To ensure consolidation in differing height wall pours, SCCI will install top bulkheads on walls with lower heights due to overhead beams. SCCI will maintain minimum separation gap between the top of partition wall and Lower Concourse elements as detailed. The blockouts will be installed with styrofoam per Detail 4 in the attached drawings, prior to the Lower Concourse being poured. The blackouts will have a keyway on each side with top and bottom rebar bisecting the blockouts per Details 1 and 2 in the attached drawings. Once the partition walls have been poured, the blockouts will be poured back with the same grout that will be used to pour back the trestle pile blockouts. Please confirm this is acceptable.			<b>SUGGESTION:</b>				
			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Where the RFI states that walls will be poured in "two lifts", this is interpreted to mean "two phases". Blockouts shall be poured back with concrete or product approved through the submittal process. Coordinate layouts and phasing plan with comments noted on Submittal TG0600-907.0 BGP - Construction Joint Layout - Partition Walls Area 3 and 4. RFI is confirmed in other regards.				
1503.1	BGP - Lower Concourse Grounding Grid Alternate Detail - North Electrical Room E	Closed	08/08/2014	08/18/2014	08/18/2014	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP Claude Titcher <b>To:</b> Turner Construction Company PHIL MILITELLO <b>Co-Author:</b>			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>REQUEST:</b> As a follow up to RFI T-1503, attached. Please confirm the below detail, similar to PUC approved detail shown in RFI T-1503 is acceptable and will be incorporated into lower concourse electrical room B1289, Grid Line 1.5/B. Please note all parameters and inspection requirements as confirmed in RFI T-1503 will remain consistent.			<b>SUGGESTION:</b>				
			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> WSP has no exceptions, subject to SFPUC acceptance.  Judy Long 8/20/14: Please see the attached response for the ground grid. The ground grid was reviewed and approved for the first electrical switchboard service room. The ground grid for the second room is essentially the same.

B-0001.1	BRP - Project Alignment Coordinates	Closed	06/16/2014	06/26/2014	06/20/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titché		To: Turner Construction Company PHIL MILITELLO	Answered By: Arup		Kevin Clinch		
Co-Author: Shimmick Construction Company, Inc. Ben Gordon							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
SCCI has received the response to RFI #0001 which provided a way to determine coordinates of the end of the "BBTT" alignment. However, no begin of curve (BC) or end of curve (EC) coordinates were given as requested. In order to properly lay out the alignments, SCCI will have to rely on CAD drawings provided in Transmittal No. 150-00268 from Jon Valencia (PMPC). SCCI would like to confirm that the CAD drawings provided in this transmittal are warranted to be used for construction.				Coordinates of the begin and end of curves (BC and EC) can be calculated with the alignment data presented in the drawing. The distance and bearing to and from the survey control points can be used for checking the alignment layout.			
Please confirm.							
B-0002	BRP - Hazardous and Contaminated Materials Location	Closed	05/29/2014	06/08/2014	06/03/2014	Potentially	<input type="checkbox"/>

B-0007.3	on 6/20/14, indicate that the Class I material was found in borings SB-04 through SB-09 as well as S-3 through S-5. These borings are identified as Class II material on the map provided. Borings SB-10 through SB-12 and S-1 /2 contained Class II material. It appears the colors in the legend are reversed. Please provide map with a revised legend.						
	<b>BRP - Hazardous Materials Location Follow Up</b>	<b>Closed</b>	<b>07/22/2014</b>	<b>08/01/2014</b>			<b>Potentially</b> <input type="checkbox"/>
	<b>From:</b> Webcor Construction LP Claude Titcher <b>To:</b> Turner Construction Company PHIL MILITELLO <b>Co-Author:</b> Shimmick Construction Company, Inc. Ben Gordon		<b>Answered By:</b>				
	<b>REQUEST:</b> Per RFI-0007.2 Response, a map of locations of Class I and Class II contaminated soils located on the Bus Ramps site was provided by Treadwell & Rollo for use by SCCI. During the meeting held 6/20/2014 at the Webcor Offices to discuss the hazardous materials on site and development of a hazardous materials location map, it was indicated that there would be no federal RCRA material encountered on the site and that Class I and Class II contamination depths would vary between 1' and 2' below grade.  During waste profiling with our disposal site, SCCI has encountered the following discrepancies:  Per the T &R map, the area around sample SB-05 should be Class I material. Per the soil test analytics provided in the Bus Ramps Site Mitigation Plan and the ERM-West Phase II Soils Report, samples SB- 5-3 and SB-5-6 test over the Class I limit for Lead and Barium, respectively. Without the STLC (Soluble Threshold Limit Concentration) and TCLP (Toxicity Characteristic Leaching Procedure) test results to confirm otherwise, material with these TTLC (Total Threshold Limit Concentration) results would have to be classified and disposed of as a federal RCRA material which is in conflict with the direction provided by the T &R map and the 6/20 meeting discussion.  Per the T&R map and meeting discussion, areas	<b>SUGGESTION:</b>		<b>ANSWER:</b> Peter Cusak 8/12/14:  As requested, additional samples were taken at deeper depths and tested including STLC and TCLP. The test results show soils locations and depths below 2' are Class II and as Class I Non-RCRA (See attached map dated 8/5/14).  Based on the recent samples taken at various location mentioned in the tables 1 & 2, and recent analytical report (copies attached), the results confirmed presence of Class I & Class II contaminations, and no Federal RCRA material encountered on site (map provided)  The abovementioned information is consistent with the Bid documents.	<b>Accept Suggestion:</b> <input type="checkbox"/>		

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>
	<p>approximately north of Folsom Street would be contaminated with Class I material to a depth of 2' below grade, and areas approximately south of Folsom Street would be contaminated with Class II material to a depth of 1' below grade. A small portion of the area east of the Sterling substation would be contaminated with Class I material to a depth of 1 '. Per the soil test analytics provided in the Bus Ramps Site Mitigation Plan and the ERM-West Phase II Soils Report, samples SB-5-3 and SB-5-6 are both potentially contaminated to a Class I or federal RCRA classification level at depths below 2', which is in conflict with the direction provided by the T &amp;R map and the 6/20 meeting discussion.</p> <p>The following is a list of possible soil samples provided which may be in conflict with the T &amp;R map and 6/20 meeting discussion direction and may require additional testing to confirm soil classification:</p> <p>SB-4-3 Need STLC and TCLP for Lead SB-4-28 Need STLC for Chromium SB-5-3 Need STLC and TCLP For Lead SB-5-6 Need STLC and TCLP for Barium SB-7-3 Need STLC and TCLP for Lead SB-7-5 Need STLC for Chromium, Need STLC for Copper, Need STLC and TCLP for Lead SB-8-3 Need STLC and TCLP for Lead SB-8-21 Need STLC for Chromium SB-9-3 Need STLC for Chromium, Need STLC and TCLP for Lead SB-9-6 Need STLC for Chromium, Need STLC for Nickel SB-10-12.5 Need STLC for Chromium</p> <p>Please advise on discrepancies and additional test results and provide additional detail on location and depth of contamination on the site map.</p> <p>Also, all soil samples begin at 3' or greater depth below grade - please advise how contamination classification was determined for 1-2' depths below grade as the landfill will not accept the information as currently provided.</p>

Reference attached Contract Documents.				The elevation discrepancy within the Bus Ramp drawings (Sheets S-2063 and C-2202) shall be governed by the elevation shown on C-2202.			
Elevation discrepancy's exist between the Transbay Transit Center drawings and the Bus Ramp Bridge drawings, see below.				The elevation discrepane within the TTC Building drawings (Sheets A1-2502 and A1-6102) shall be addressed by the Architect.			
TTC building drawing A1-2502: 57' - 11 1/4" (57.938') [HP of Bus Deck Level] A1-6102: 57' - 10" (57.833') [Bus Deck Level]				The elevation discrepancy between the Bus Ramp drawings and the TTC Building drawing appears to be citing elevations from different locations. BBTT STA 29+04.81 does not			
Bus Ramp drawing S-2063: 56' - 1 3/16" (56.10') ["BBTT" STA 29+04.81 FB] C-2202: 57' - 11 3/4 (57.98') [Calculated at STA 29+04.81 per vertical curve information]				appear to coincide with the location of the 57'-11 1/4" elevation along the TTC Building bus deck. The elevations cited for this discrepancy should be checked.			
Please confirm which elevation governs.							

B-0009	BRP - Exist Bent 20 Demolition	Closed	06/18/2014	06/18/2014	06/25/2014	Potentially	<input type="checkbox"/>	
From: Webcor Construction LP			Claude Titcher		To: Turner Construction Company PHIL MILITELLO			
Co-Author: Shimmick Construction Company, Inc. Ben Gordon			Answered By: Arup					Kevin Clinch
REQUEST:			SUGGESTION:			ANSWER:		Accept Suggestion: <input type="checkbox"/>
As shown in Contract Drawing D-1005, the entire existing Bent 20 foundation is to be removed. However, USA North ticket #219688 located two ATT duct banks 3' away from, and running parallel to, the property line on the south sidewalk of Clementina St. This utility is not shown on the Contract Drawings. The utility is located directly on top of the Bent 20 foundation as shown on the attached sketch.						SCCI's proposal is acceptable.		
Per SCCI's understanding, the reason to remove Bent 20 is to facilitate the installation of CIDH B4-3 and the drainage system shown on Contract Drawings U-1005 and C-4102. Shimmick proposes to remove the Bent 20 foundation only to the extent needed to enable the installation of CIDH B4-3 and the drainage system (the catch basin and sewer manhole will still be protected and supported in place). The extent of demolition should end roughly 4'-8" north of the CIDH pile to allow sufficient room for shoring yet not intrude on the utility. See attached

	<b>REQUEST:</b> Section 1.6H1 of Contract Specification Section 02 41 06 - Selective Site Demolition - Bus Ramps states that the "removal plan shall be prepared, wet-signed, and stamped by an engineer who is registered as a Structural Engineer in the State of California". This specification also applies to the design of temporary shoring for use in the demolition of existing foundations.  Per California Business and Professions Code, licensed Professional Civil Engineers may design structures except for public schools and hospitals. Therefore, SCCI proposes to allow the design of temporary shoring for demolition of existing foundations to be prepared, wet-signed and stamped by a licensed Professional Civil Engineer deemed by SCCI to have the qualifications and experience necessary for this work.  Is this acceptable?	<b>SUGGESTION:</b>			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> SCCI's proposal to allow the design of temporary shoring for demolition of existing foundations by a licensed Professional Civil Engineer deemed qualified by SCCI to have the qualifications and experience necessary for this work would be acceptable.		
<b>B-0013</b>	<b>BRP - Existing Conditions As-Built Utility Drawings</b>	<b>Closed</b>	<b>06/26/2014</b>	<b>07/06/2014</b>	<b>07/18/2014</b>	<b>Potentially</b>	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Claude Titche		<b>To:</b> Turner Construction Company PHIL MILITELLO		<b>Answered By:</b> AECOM Technical Service Tsu Ling Peng			
<b>Co-Author:</b> Shimmick Construction Company, Inc. Ben Gordon							
	<b>REQUEST:</b> SCCI requests existing condition as-built utility drawings for TG 18.1. Existing utilities have been provided for Howard St in Contract Drawing U-1006, however, U-1003, U-1004 and U-1005 do not include any utilities (Harrison St, Folsom St, Clementina St and Tehama St).  SCCI requests that Contract Drawings U-1003, U-1004 and U-1005 be updated, or new drawings issued, to reflect all existing utility locations similar those shown in Contract Drawing U-1006. As-built utility drawings are needed for Harrison St, Folsom St, Clementina St, Tehama St and Howard St in between 1st St and 2nd St. This includes, but is not limited to, the roadway and adjacent sidewalks, the area surrounding the Caltrans Sterling Substation adjacent to Interstate 80, as well as all areas and lots in between the above mentioned streets.	<b>SUGGESTION:</b>			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The available information of existing utilities during the design are shown on the contract drawings. Contractor shall perform site investigation, potholing and other requirements per specifications and the General Notes - Existing Utilities on sheet U-1001.

B-0017	BRP - Frame 5 Dimension Discrepancy	Closed	<b>REQUEST:</b> Can the TJPA provide SCCI with ARUP's Frame 5 design calculations? This will allow OPAC to ensure that Frame 5 redesign will provide the same response characteristics, at the cable-stayed bridge and Transbay Terminal building interfaces, as were intended.				
			<b>SUGGESTION:</b>				
			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Calculations for Frame 5 (the drop-in span) are attached.				
B-0017	BRP - Frame 5 Dimension Discrepancy	Closed	07/11/2014	07/21/2014	07/24/2014	Potentially	<input type="checkbox"/>
			<b>From:</b> Webcor Construction LP      Claude Titcher <b>To:</b> Turner Construction Company PHIL MILITELLO <b>Co-Author:</b> Shimmick Construction Company, Inc. Ben Gordon				
			<b>Answered By:</b> Arup      Kevin Clinch				
B-0017	BRP - Frame 5 Dimension Discrepancy	Closed	<b>REQUEST:</b> 1) Distance from RDS line to centerline bearing is shown to be 1'-3". Distance from centerline bearing to "TTBB" STA 29+07.235 is shown to be 3'-0". So the distance from RD5 to "TTBB" STA 29+07.235 should be 4'-3". However RD5 is shown to be at "TTBB" STA 29+03.000 which is only 4.235' or 4'-2 13/16" from "TTBB" STA 29+07.235. Please explain why there is a discrepancy of 0.015' or 3/16".  2) LD5 is shown to intersect the left edge of deck at "BBTT" STA 29+02.21, 10.51' left. LD5 is shown to intersect the right edge of deck at "BBTT" STA 29+02.67, 13.00' right. SCCI took the "BBTT" and "TTBB" alignments shown on sheet C-2101 and drew in the RD5 line at "TTBB" STA 29+03.00. SCCI then extended the RD5 line to create the LD5 line. When doing so, SCCI found that the LD5 line intersects the left edge of deck at "BBTT" STA 29+03.135, 10.51' left and intersects the right edge of deck at "BBTT" STA 29+02.594, 13.00' right. Please clarify whether the LD5 stations shown at edge of deck are correct.				
			<b>SUGGESTION:</b>				
			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Please see attached design sketch for clarification.

B-0018	BRP - Bottom of Existing Footing Elevations	Closed	07/17/2014	07/27/2014	07/24/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher			To: Turner Construction Company PHIL MILITELLO			Answered By: Arup Kevin Clinch	

Co-Author: Shimmick Construction Company, Inc. Ben Gordon

REQUEST:

SCCI bid and planned the shoring necessary for demolition of the existing footings per the response to Question TG18.1-037 of IFB Questions & Answers TG18.1 Set #3 which included the statement that the bents north of Folsom Street were similar to Section P on Contract Drawing D-1106. This section shows a footing that is immediately below existing grade and is eight feet thick.

Additionally, SCCI reviewed the reference documents to confirm the bottom of footing elevations for these footings. Supplemental Drawing Nos. 7A and 8A of the San Francisco-Oakland Bay Bridge Railway Facilities drawings show the elevations of the bottom of footings. The first note on the Supplemental Drawing No. F-112 of the SFO Bay Bridge Railway Facilities drawings states to subtract 11 . 71' from these elevations to correct them to the city datum. SCCI has done this and compiled these elevations below.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

Arup does not have any more information than the Contractor has. We could not find a datum correction on the 1937 Contract R2 drawings, only on the 1939 Contract R3 drawings. For the purpose of proceeding with the work, we recommend that the contractor apply the datum correction from the Contract R3 drawings to the Contract R2 drawings and determine the existing foundation elevations based on this. Note the datum correction on Contract R3 drawing F-112 is from San Francisco-Oakland Bay Bridge Datum to City Datum. Refer to the survey drawings prepared by Martin M. Ron (specifically sheet 1 of 10) in the Contract Documents for the datum correction from NAVD88 to City datum.

This RFI will use the Bent 5 footing for example to show why SCCI does not believe that this is the correct datum correction to use. Section P on Contract Drawing D-1106 shows the Bent 5 footing immediately below grade and eight feet thick with a bottom of footing elevation of 53'-8". As shown in the table above, the elevation shown for this bottom of footing elevation on Supplemental Drawing 8A and correcting it to the city datum would provide an elevation of 29.29'. The same issue is easily seen using the section views on Bent 2 and 3 on the same Contract

Co-Author: Shimmick Construction Company, Inc. Ben Gordon							
REQUEST:		SUGGESTION:	ANSWER: Accept Suggestion: <input type="checkbox"/>				
<p>On July 11, SCCI performed potholing for the existing foundations to be demolished and discovered that the depths of these foundations are significantly deeper than expected due to contradictory information provided in the responses to Bidder Questions and Reference Documents at bid time. The results of the potholing has allowed SCCI to eliminate certain information from these documents and is now proceeding under the assumption that the elevations provided in the San Francisco-Oakland Bay Bridge Railway Facilities and SFO Bay Bridge Railway Facilities are correct. These drawings indicate that these foundations are at depths as great as 34.5' from grade. SCCI requested that these elevations be confirmed in RFI B-0018 - Bottom of Existing Footing Elevations, submitted July 14.</p> <p>The foundations to be removed are located adjacent to major San Francisco thoroughfares and buildings of up to ten stories. SCCI believes that large excavations next to these structures could potentially undermine these streets and the foundations of these buildings. SCCI also believes that it is possible to reduce the number of these large excavations by reducing the volume of concrete to be removed from these foundations.</p> <p>SCCI has reviewed Contract Drawings D 1000 through D 1106 and has determined that the existing foundations Bent 5, 7 and 11 need only to be partially removed to facilitate the installation of CIDH piles. Additionally, SCCI</p>			<p>This is acceptable. The extent of existing footing to be removed shall equal the radius of the CIDH plus 1'-0" plus the maximum allowed tolerance (alignment and verticality) for the CIDH installation. Following removal, the excavation shall be backfilled and compacted in accordance with the requirements in Specification Section 31 00 06.</p>

B-0020	BRP - Building Foundations at Pylon 9	Closed	07/17/2014	07/27/2014	07/24/2014	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP Claude Titcher		<b>To:</b> Turner Construction Company PHIL MILITELLO	<b>Answered By:</b> Arup		Kevin Clinch		
<b>Co-Author:</b> Shimmick Construction Company, Inc. Ben Gordon							
<b>REQUEST:</b> Contract Drawing D-1006 has a callout pointed at the Pylon 9 foundation that states "Remove existing building foundation and basement slab to place new foundation". SCCI found drawings in the Reference Document Transbay Transit Center Program Existing Terminal & Ramps Demo Plans - REVISIONS that show that the foundations under 564 Howard and 568 Howard, the buildings with foundation conflicts with Pylon 9, had been removed in a previous contract. SCCI, therefore, engineered and planned the work as if these foundations did not exist.  This reference drawing set also shows that the Bent 17 foundation on the south side of Howard was also removed in this same previous contract. Recent potholing for this foundation has led SCCI to believe that this foundation has not been removed. If the Bent 17 foundation was not removed, it is possible that building foundations in conflict with Pylon 9 may also not have been removed.  Please confirm that the foundations of 564 Howard and 568 Howard have been removed per the Reference Drawings.			<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> It is Arup's understanding that the drawings attached to the RFI which show the extent of demolition of 564 Howard and 568 Howard are correct.

B-0029	BRP - Clementina Pedestrian Access	Closed	07/23/2014	08/02/2014	07/24/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher		To: Turner Construction Company PHIL MILITELLO		Answered By: Arup		Kevin Clinch	
Co-Author: Shimmick Construction Company, Inc. Ben Gordon							
REQUEST: SCCI has found a conflict between demolition drawing D-1005 and specification section 011570 3.2G.  According to drawing D-1005, existing Bent 22 extends underneath the entire south Clementina sidewalk width and 3' into the street. The shoring required to remove this footing along with the water barriers will extend another 5' into the street totaling to 8' intrusion into the street. The street is 18' wide at this bent location leaving a 10' for vehicle traffic as noted in approved traffic control plan 002 (TG 1801-036.1 ).  Specification section 011570 3.2G requires a 5' pedestrian walkway on the north and south side of Clementina. This is not possible due to the demolition of Bent 22 described above. SCCI proposes to keep the sidewalk on the south		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/> According to drawing D-1005, existing Bent 22 is not demolished and is to remain - please resubmit RFI with correct information.  If the Contractor is referring to drawing D-1005 Bent 20 which does have a portion of the demolition beneath the Clementina Street south sidewalk, there is no conflict.  If the Contractor determines that a section of the sidewalk must be closed for any reason, obtain STP from SFMTA before closing sidewalk.  For example; even with an approved Traffic Control Plan, to close the sidewalk requires an approved STP Special Traffic Permit. If during potholing and

	side of Clementina closed during demolition and re-open it to pedestrians once the footing and shoring has been removed.						
	Please confirm this is acceptable.						
				investigative work or during construction activity you wish to close the sidewalk, it is the expectation of the City and specification section 01 15 70, 3.2G that pedestrians have the use of the sidewalk at all times when construction is not in progress.			
				As was discussed last week in the field, there are options such that the sidewalk can be re-opened at end of shift or peds diverted into a sidewalk using part of Clementina Street if necessary.			
B-0030	BRP - Construction of Pylon 9 and Link Beam	Closed	07/28/2014	08/07/2014	07/29/2014	Potentially	<input type="checkbox"/>
	From: Webcor Construction LP Claude Titcher	To: Turner Construction Company PHIL MILITELLO	Answered By: Arup			Kevin Clinch	
	Co-Author: Shimmick Construction Company, Inc. Ben Gordon						
	REQUEST:	SUGGESTION:	ANSWER:	Accept Suggestion:	<input type="checkbox"/>		
	Contract drawings S-3174 through S-3182 show the details for Pylon 9. As per S-3175 and S-3176, the link beam has reinforcement through the Pylon 9. SCCI proposes to pour Pylon 9 using perimeter steel forms and double ended form savers to avoid running rebar through the steel form and compromising the structural integrity of the steel Pylon forms.			This is not acceptable. Continuity of the reinforcement at this critical connection is important. The drawings show the bars continuous through the pylon with a splice 20 feet from the centerline of the pylon.			
	Is it acceptable to use double ended form savers for the horizontal link beam rebar that extends beyond the width of Pylon 9?

B-0030.1	BRP - Construction of Pylon 9 and Link Beam	Closed	08/04/2014	08/14/2014	08/05/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titché To: Turner Construction Company PHIL MILITELLO			Answered By:Arup		Kevin Clinch		
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							
REQUEST: Further to RFI 0030, SCCI is proposing to pour Pylon 9 and the link beam in 3 separate pours and have 2 construction joints at the locations shown on the attached drawings. All horizontal rebar will remain as per the contract drawings and will be continuous at the link beam & Pylon 9 connection.  Pour # 1 will be Pylon 9 and the center section of link beam, to the extent of Section B and Pylon 9 (see attached drawings).  Pour #2 and #3 will be the left and right sections of link beam (see attached drawings).  Is this acceptable?			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> This is not acceptable. Refer to note 1 on S-3176: "Construction joint is not allowed in Pylon 9 link beam."		
<hr/>							
B-0031	BRP - Harrison and Folsom Falsework Design	Closed	07/30/2014	08/09/2014	07/30/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titché To: Turner Construction Company PHIL MILITELLO			Answered By:Arup		Kevin Clinch		
Co-Author: Shimmick Construction Company, Inc. Ben Gordon							
REQUEST: SCCI has received the rejection of Traffic Control Plan numbers 007 (Folsom) and 008 (Harrison) and has attempted to design the falsework to span the entire width of the roads. Upon review by SCCI and VAK Construction Engineering Services, this design does not comply with the project specifications.  Please see our concerns with spanning the full length below: - In order to cross Harrison without a center falsework support, our required span is 79'-6". Per specification section 03 11 14 1.7-A4, the maximum allowable falsework span is 60'-9".  -In order to cross Folsom without a center falsework support, our required span is 76'-8". Per specification section 03 11 14 1.7-A4, the maximum allowable falsework span is 50'.  - The minimum possible depth of the falsework is 3'6" (36"			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> WOJV to confirm the spans that are reported in the RFI as they are considerably longer than those listed in the August 10, 2012 memo from Sandis to WOJV.  Please provide all dimensions including sidewalks and parking lanes which may be able to be used for Falsework.

	<p>beam + 4x4s + plywood). The vertical clearance would be 14'-2" which is under the required 15' clearance.</p> <p>- Reference VAK's memo and Folsom Falsework Schematics attached</p> <p>Due to these design issues, SCCI proposes to use traffic islands to give the falsework a center support. This will divert traffic into the parking and maintain the same number of open lanes as shown in Traffic Control Plans 007 and 008. Is this acceptable?</p>						
B-0032	BRP - Barrette Acceptance Criteria	Closed	07/30/2014	08/09/2014	08/01/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher		To: Turner Construction Company PHIL MILITELLO		Answered By: Arup		Kevin Clinch	
Co-Author: Shimmick Construction Company, Inc. Ben Gordon							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
<p>Please see attached Memo from Bencor, SCCI's Barrette subcontractor. In light of the recent issues they have encountered at a nearby project with similar design and specifications and the fact that we only have two production barrettes, restricting us having test barrettes, SCCI asks the following questions:</p> <p>1. Can the drill core verification process be substituted for the Crosshole Sonic Logging as the post installation acceptance criteria?</p> <p>2. If not, please provide actual acceptance criteria for the Crosshole Sonic Logging. 31 63 32 does not provide any criteria for what defines a rejected pile. The specification only references ASTM 06760, which SCCI understands only provides how to do the test and provide results, but not acceptance criteria.</p> <p>3. Can the #6 cross-tie rebar spacing be opened up? Possibly even increasing the rebar size, as remediation for the increased spacing.</p>				<p>Specification Section 31 63 32 1.7 A requires the Contractor to submit qualifications for the contractor / subcontractors performing the barrette foundation work. Arup has not yet received this.</p> <p>In response to the questions listed in the RFI:</p> <p>1. No. Specification Section 31 63 32 1.8 D 1 a states "Crosshole sonic logging will be used to test the concrete density of the pile for homogeneity."</p> <p>2. The test results will be reviewed for anomalies. An anomaly will be indicated by the CSL test if the first arrival time increases significantly, or if the energy reduces significantly, relative to a moving baseline. The evaluation of the test results will include the location, extent and quantity of anomalies. Acceptance or rejection of a pile will be based on the evaluation of the CSL test results, pile construction reports (see Specification Section 31 63 32 1.5 E), the results of additional testing if deemed necessary by the TJPA (see Specification Section 31 63 32 1.8 D 4) and any other information or observations which indicate conformance / nonconformance of the installed work</p>

B-0037	BRP - Monitoring of CDSM Wall Tieback Detensioning	Closed	08/12/2014	08/22/2014	08/14/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Claude Titché		To: Turner Construction Company PHIL MILITELLO		Answered By: Arup		Kevin Clinch	
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
Note 4 on Contract Drawing D-1006 states:				Arup has no issue with the plan proposed by SCCI in RFI B-0037 as Arup commented in the Submittal TG1801-208.1 Selective Site Demolition - Pylon 9 Temporary Shoring.			
"De-tension and remove existing tiebacks which interfere with construction of the pylon foundation. Do not de-tension the tiebacks until the TTC mat slab in Zone 1 has been placed and has reached its 28 day strength."				In response to WOJV/SCCI email dated 8/18/14 (attached) Arup has no issue with the plan proposed:			
The mat slab in Zone 1 has been placed and has reached its 28 day design strength.				The proposed baseline survey of the CDSM wall at the tieback locations with "all surveying/monitoring will be done [by Shimmick] with a Total Station".			
SCCI submitted Submittal TG 1801-208.1 Selective Site Demolition - Pylon 9 Temporary Shoring which included the memo De-tensioning of Existing Tiebacks at TTC South CDSM Wall for Pylon 9 Foundation Construction. This memo provided a procedure for de-tensioning these tiebacks. The response to this submittal stated that the tiebacks were to be de-tensioned and removed one at a time and that "instrumentation placed at the adjacent TTC excavation shall be reviewed for movements".				The de-tensioning and cutting of the first two (2) of the tie backs, at the end of the first day shift, and monitoring [by Shimmick] during the next day using the benchmarks with a Total Station.			
In response to the submittal comments received, SCCI plans to establish a baseline survey of the CDSM wall at the tieback locations and to monitor these benchmarks after each tieback is de-tensioned. All surveying/monitoring will be done with a Total Station. If no movement is detected at the time of monitoring, SCCI will proceed with de-tensioning of the next tieback. Is this acceptable?				The proposed "If no movement is detected at the time of monitoring", SCCI will proceed with de-tensioning of the next (3) tiebacks at the end of the second day's shift. This "will allow a cold cycle" prior to de-tension the remaining (3) tiebacks.			
				It is assumed that WOJV and the Internal Bracing contractor will continue monitoring movement as per contract. If movement is detected at the time of monitoring, and MRP meeting will be held to determine next steps in accord with contract.

B-0040	BRP - Existing Column Foundation Removal for CIDH C1	Closed	08/15/2014	08/25/2014	09/03/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher		To: Turner Construction Company PHIL MILITELLO		Answered By: Arup		Kevin Clinch	
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
<p>Contract Drawing D-1005 calls for the removal of an existing column foundation at the location of new CIDH C1. The detail on this drawing shows a column coming up from a spread footing. Therefore, SCCI expected this bottom of this spread footing to be at a reasonable depth similar to other foundation to be removed. No as-builts of this footing have been provided. Potholing performed by SCCI on August 14 determined that no spread footing exists within 40 feet from grade. Without additional drawings or information about this footing, SCCI believes it is possible that this foundation is actually a CIDH installed in a retrofit contract.</p>				<p>Demolish the existing CIDH to an elevation of +14.00 (NAVD88). The location of column C1 will shift to clear the remaining portion of the existing CIDH. This will be issued in an upcoming ASI.</p>			
<p>If this foundation is indeed a CIDH pile and extends as deep as to bedrock, its removal would be both cost and time intensive if it is possible at all. As shown on the attached picture, the edge of CIDH C1 is in conflict with the existing foundation at grade. This condition will prevent the installation of CIDH C1. Possible solutions include decreasing the diameter of the CIDH or moving the CIDH and column away from the existing foundation.</p>							
<p>Please advise on how to proceed.</p>							
B-0040.1	BRP - Additional Foundation Adjacent to Existing Bent 5 CIDH	Closed	08/27/2014	09/06/2014	09/09/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher		To: Turner Construction Company PHIL MILITELLO		Answered By: Arup		Kevin Clinch	
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
<p>SCCI previously submitted Rfl B- 040 which stated that the footing to be demolished adjacent to new CIDH C1 appeared to be a CIDH pile. SCCI has since received Reference Drawings SFOBB - San Francisco Approach Replace which appears to confirm that this footing is actually the CIDH at Bent 5 installed in this 2004 retrofit.</p>				<p>See attached sketch SK-S-0007 for zone of removal.</p>			
<p>While doing hazardous material removal for new CIDH C1 on August 27, SCCI encountered an additional footing adjacent to the Bent 5 CIDH. Pictures of this footing are attached. Also attached are sketches for clarification that show the footing as currently exposed.</p>

B-0042	BRP - Existing Bent 16 Retrofit Anchor Tiedown Length	Closed	08/19/2014	08/29/2014	09/03/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher		To: Turner Construction Company PHIL MILITELLO	Answered By:Arup		Kevin Clinch		
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Contract Drawing D-1005 calls for the existing Bent 16 foundation to be removed to allow for the installation of the new Bent 8 CIDH piles and pile cap. The response to RFI B-0019.1 Selective Demolition - Additional Foundations stated that it was acceptable to demolish the Bent 16 foundation one foot plus the maximum tolerance outside of the CIDH footprint.				See enclosed Requested Tie-Back As-Built.			
After reviewing the Reference Drawings Seismic Retrofit No. 14B, TT Ramps, SCCI has determined that CIDH B8-3 is in direct conflict with one of the anchor tiedowns installed at the Bent 16 retrofit as shown on the attached drawing. Sheet 23 of this Reference Drawing set shows the minimum unbonded length of this anchor tiedown to be 20 feet but does not specify the bonded length. SCCI needs to know the bonded length used for this tiedown to determine the appropriate removal method.							
Please provide complete as-builts of this retrofit that show the total depth of these anchor tiedowns.							
<hr/>							
B-0043	BRP - CIDH Permanent Casing	Closed	08/21/2014	08/31/2014	08/27/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher		To: Turner Construction Company PHIL MILITELLO	Answered By:Arup		Kevin Clinch		
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
SCCI proposes to use corrugated metal pipe (CMP) as permanent steel casing for the CIDHs when using the optional construction joint, is this acceptable? The specifications are confusing on this subject.				The use of corrugated metal pipe (CMP) as permanent steel casing for the CIDHs when using the optional construction joint is acceptable provided the following:			
Per Specification Section 31 63 30 3.5-B, " ... The permanent casing must:" then in section 3.5-B-5 " ... must comply with article 3.3." Per 31 63 30 3.3-C,"Temporary casings must be:" then in section 3.3- C-2; "noncorrugated with smooth surfaces." Since we are discussing a permanent casing and this section applies to temporary casings, does the noncorrugated rule apply?				- The casing complies with Specification Section 31 63 30 3.5-B. In regard to paragraph 5 in Section 31 63 30 3.5-B, casings placed in a drilled hole must comply with Caltrans Standard Specifications section 49-3.02C(5) "Permanent Steel Casing Installation".			
Project Specification 31 63 30 appears to be based on the Caltrans Standard Specification. Using the 2010 version of				- Contractor submits for record stamped calculations demonstrating that the CMP is capable of withstanding loads from installation, lateral concrete pressures and earth pressures, and will support personnel working

	<p>the CTSS, 49-3.02C(6)-5 is similar to the project specification 31 63 30 3.5, except it refers the "must comply" to a section on "Permanent Steel Casing Installation" {49-3.02C(5)}. As SCCI's Project Specification does not include a section on permanent steel casing materials, SCCI believes the reference to the Temporary Steel Casing to be inadvertent.</p> <p>If safety and/or quality is a concern, SCCI can provide stamped engineering to stating that the CMP is capable of withstanding loads from installation, lateral concrete pressures and earth pressures and will support personnel working inside the casing after the CIDH installation is complete.</p>

B-0051	BRP - Intumescent For Frame 5	Closed	09/08/2014	09/18/2014	09/11/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titché			To: Turner Construction Company PHIL MILITELLO			Answered By: Arup Kevin Clinch	
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							
REQUEST:			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>		
SCCI is actively pricing and re-designing the frame 5, drop-in span as part of CR B-005 and needs to better understand the original design intent for this bridge section as it relates to the intumescent paint.			The response to this question contains Sensitive Security Information and is available only to individuals who have been granted access to the document that is the basis for the question.				
1. The only drawings SCCI see reference to intumescent are S-5068, S-6111 Detail B, S-6112 Detail D, S-6113 Detail H and K, and S-6114 Detail N. Per these it appears the design intent is to install intumescent on the underside of the "tub" (S-5068), the additional "Tub" piece (N/S-6114), and all of the exposed steel on the frame 4 side, except the lowest horizontal steel (B/S-6111 and C/S6-112). At the building side, it is confusing as only H/S-6113 shows intumescent similar to the frame 5 side. K/S-6113 only shows the intumescent on the bottom of the restraining rod steel box. J/S-6113 and L/S-6114 do not show intumescent. Also of note, the steel link beam on details D and B of S-6115 do not show intumescent. Please confirm design intent of intumescent coverage.							
2. Per specification 09 96 46 Intumescent Paint ȳ Bus Ramps, SCCI is to "provide the specified fire resistance classification approved by Authorities having Jurisdiction" Who are the authorities having jurisdiction? What is the fire resistance classification for frame 5? SCCI assumed during bid time and currently a 1- hour rating.

B-0054	BRP - Barrette Pile Concrete Cover	Closed	09/12/2014	09/22/2014	09/25/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher		To: Turner Construction Company PHIL MILITELLO		Answered By: Arup		Kevin Clinch	
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							

REQUEST:

Section A and B of Contract Drawings S-3191 call for 6" concrete cover around the reinforcing cage in the barrette piles. Per Nicholson Construction Company's experience, given the rebar congestion of the reinforcement cage, the 6" concrete cover allows for a path of least resistance for the concrete to rise faster on the outside of the cage and increase the risks of having bentonite being trapped inside the cage during the concreteting operation. Nicholson believes that reducing the concrete cover to 3" will decrease the risk of this happening. SCCI's proposal will not change the width of the barrette pile, it will increase the width of the rebar cage by 6". Please note that the response to RFI B-0050 allowed for the barrette pile to be on foot longer in length. These changes will be shown on the shop drawings, to be submitted in a forthcoming submittal.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

Arup does not believe that the 6" clearance will allow for a path of least resistance for the concrete to rise faster on the outside of the cage and, therefore, increase the risk of bentonite being trapped inside the cage during the concreteting operation as posited in the RFI. The rate of placement of concrete, i.e., the velocity, is very low at the perimeter. If anything, fresh concrete tends to flow around the tremie annulus. However, if SCCI believes that reducing the clearance will reduce the risk of defects, then Arup takes no exception to reducing the clearance to 4", provided there is no additional cost to the TJPA.

Is this acceptable?

B-0055	BRP - Barrette Pile Reinforcement Cage	Closed	09/15/2014	09/25/2014	09/25/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher		To: Turner Construction Company PHIL MILITELLO		Answered By: Arup		Kevin Clinch	
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
<p>Contract Drawing S-3191 details the reinforcement needed for the Barrettes. The current reinforcement details indicate a clear space between rebar as low as 3.75" in some areas. Per Nicholson's experience and several codes (such as EN 1534 and US FHW A), a larger clear space is recommended as small clear spaces may impede the flow of concrete inside the cage and increase the risks of concrete anomalies.</p> <p>As a result, Nicholson proposes to increase the bar sizes and use anchor heads (in lieu of hooks) in order to increase the clear space between rebar. Please see attached sketches SD-02 and SD-03. Note that the section of steel remains similar in any direction in order to avoid impacting the structural capacity of the Barrette.</p> <p>Furthermore, due to space constraints at the site the cage will be built in two (2) 10ft wide by three (3) 60ft long sections approximately (the length will vary depending on the reinforcement requirement by elevation). Each 10ft x 60ft section will be prefabricated and transported to the site. Two 10ft sections will be joined together to form a 20ft section. Our sketches include the required horizontal reinforcement to join the sections. The three 20ft by 60ft sections will be lifted and installed in the trench.</p> <p>Please confirm the reinforcement cage proposed is acceptable.</p>				<p>SCCI's proposed reinforcement layout included with this RFI is not acceptable as it does not satisfy the requirements of AASHTO LRFD Bridge Design Specifications, Fourth Edition (2007) with 2008 Interim Revisions which is the governing Code for this project as noted on drawing S-0005. According to AASHTO 5.10.6.3, #11 bars shall be tied at a maximum 6" o.c.. The proposed layout shows spacing of the ties as 10.5" and 5'-0" o.c. .</p> <p>Additionally, the horizontal bars which link the two cages, as proposed by SCCI, must have hooks to develop their capacity to make them effective in resisting the applied load.</p> <p>The clear spacing between reinforcement is measured and codified along a distance normal to the length of the bar, not at hooks and not at two bars crossing perpendicular to each other, which is presumably where the quoted distance of 3.75" is measured. The clear spacing between bars in the reinforcement layout on Contract Drawing S-3191 is as follows:</p> <p>Horizontal distance between ties: 8.9"</p> <p>Vertical distance between ties: 5.4"</p> <p>Horizontal distance between longitudinal bars: 6.4"</p> <p>SCCI's proposed layout included with the RFI increases the horizontal clearances by only 0.48 inches.</p> <p>The reinforcement layout on Contract Drawing S-3191 satisfies the requirements of EN-1538 (we believe the standard quoted in the RFI, EN 1534, is incorrect as this standard pertains to parquet flooring) which is a reference document, not a Code that applies to this project.</p> <p>Arup has worked with the Nicholson, SCCI's subcontractor, in recent days to develop alternates to their proposal which satisfy the Code, which provide the same structural capacity as the layout shown on Contract Drawing S-3191, and which increase the</p>

B-0056	BRP - Stay Cable Strand Size	Closed	09/15/2014	09/25/2014	09/18/2014	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP Claude Titcher  <b>Co-Author:</b> Shimmick Construction Company, Inc. Jeremiah Kent		<b>To:</b> Turner Construction Company PHIL MILITELLO		<b>Answered By:</b> Arup		Kevin Clinch	
<b>REQUEST:</b> <p>SCCI has received the following RFI from VStrutural LLC (VSL):</p> <p>"The contract documents for the Transbay Transit Center Bus Ramp project (ASI 150-003) specify that the steel strand for the stay cables be 0.6" diameter, 270 ksi, weldless low-relaxation seven-wire strand with fy=0.9fs, conforming to the requirements of ASTM A416. The majority of VSL's recent and ongoing stay cable projects have used or are using strand with the same overall properties, but with a slightly larger diameter of 0.62". Some of the projects using the 0.62" diameter strand include:</p> <ul style="list-style-type: none"> <li>St. Croix River Crossing project in Stillwater, Minnesota (ongoing)</li> <li>Tappan Zee Bridge Replacement project in Tarrytown, New York (ongoing)</li> <li>Gerald Desmond Bridge Replacement project in Long Beach, California (ongoing)</li> </ul>		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> <p>This is acceptable provided that the 0.62" diameter strand is tested in accordance with the project specifications and that there is no additional cost to the TJPA.</p>			

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>
	<p>Ironton-Russell Bridge project in Ironton, Ohio (ongoing) Audubon Bridge project in St. Francisville, Louisiana (recent) A25 Bridge project near Montreal, Quebec, Canada (recent)</p> <p>In addition to being more widely utilized on recent stay cable projects than its 0.6" diameter counterpart, the 0.62" diameter strand has a slightly larger cross-sectional steel area (0.2325 sq in vs. 0.217 sq in for the 0.6" diameter strand). Using the larger individual strand steel area allows for the overall steel area in a particular stay cable to be achieved using fewer strands. Using fewer strands in a stay cable allows for extra unused holes in the cable anchorages, which allows for future expansion of load capacity within the stay. VSL's stay cable anchorages are designed to use either 0.6" or 0.62" diameter strand.</p> <p>To illustrate the principle described above on the Transbay project, the currently project parameters specify that VSL's 109-strand anchorages be utilized with 109 EA, 0.6" diameter strands. In this configuration, the anchorages are completely filled with strand and thus cannot allow for future expansion of load capacity within the stays. The total required steel area for each cable is: 0.217 sq in x 109 = 23.653 sq in. By using 0.62" diameter strands, the strand count for each anchorage could be reduced to 102 EA (0.2325 sq in x 102 = 23.715 sq in &gt; 23.653 sq in). Using 102 EA strands in each cable leaves seven open holes in each anchorage, allowing for a significant expansion of load capacity should the need arise in the future. As noted above, VSL's stay cable anchorages are designed to be used with either strand size, and therefore the anchorages could sustain the extra loading that would come with any future addition of 0.62" diameter strands.</p> <p>As one can see from the list above, 0.62" diameter strand has also become the norm for current and recent projects that VSL has worked on here in the USA. As such, it is more readily available from domestic strand suppliers.</p> <p>VSL therefore proposes to use 0.62" diameter strands on the Transbay Transit Center Bus Ramp project stay cables in lieu of 0.6" diameter strands. The 0.62" diameter strand</p>

B-0065	BRP - Use of Non-Domestic Stay Cable Wedges	Closed	09/30/2014	10/10/2014	10/09/2014	Potentially	<input type="checkbox"/>	
From: Webcor Construction LP		Claude Titcher	To: Turner Construction Company PHIL MILITELLO		Answered By: Arup			Kevin Clinch
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent								
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>		
VSL is proposing to use non-domestic wedges for the stay cable system to be supplied on the Transbay Bus Ramp Project. This request is based on the following:				TJPA please respond.				
				See attached				
-The wedges make up a very small portion of the total steel quantity on the project, yet serve a critical role in anchoring the cables of the stay cable system.								
- VSL has used the same proprietary stay wedges (VSL Switzerland) on all US stay cable projects for more than a decade, including projects that were governed by the "Buy America" provisions.								
- All VSL stay cable projects worldwide utilize stay wedges supplied by VSL Switzerland.								
- Stay cable wedges are a specialty item, and at the present time are produced solely by VSL Switzerland exclusively for use with the VSL Stay Cable System.								
- 100% of the wedges are inspected and approved by VSL Switzerland as part of our quality process prior to shipment to the projects.								
- All fatigue and static strength tests on VSL's stay cable systems have utilized wedges produced by VSL Switzerland.								
- The wedges cannot be produced in sufficient and reasonable quantities in the USA and there is no domestic product that is equal in quality to the wedges VSL is proposing.								
Pursuant to the "Buy American Provisions" as well as the guidelines in Subpart 25.3 of the "Federal Acquisition Regulation," a waiver for non-domestic materials may be granted if it is determined that (1) "the application of 'Buy American Provisions' would be inconsistent with the public interest and/or (2) such materials are not produced in sufficient and reasonably available quantities and of a satisfactory quality."								
VSL proposes that wedges be manufactured in either Spain or Brazil and heat treated in Switzerland for the Transbay Project. The total cost of these materials is \$5,250.00.								
Is this acceptable?

B-0080	BRP - Anti Ram Barrier Specification	Open	10/28/2014	11/07/2014		Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Claude Titcher <b>Co-Author:</b> Shimmick Construction Company, Inc. Jeremiah Kent		<b>To:</b> Turner Construction Company PHIL MILITELLO  <b>ANSWERED BY:</b>		<b>Answered By:</b>			
<b>REQUEST:</b> SENSITIVE SECURITY INFORMATION  Please see below questions from Shimmick's Anti-Ram Barrier subcontractor, FutureNet.  Question 1 Spec Section 28 16 34, 2.1 A 3 states "the design and structural materials of the vehicle barrier shall be the same as those used in the crash test."  Discrepancy: The original crash tested barriers are installed in dirt for a permanent in-ground installation. This project requires the barrier be installed into a bridge section. The barrier foundation will need to be modified to fit into and react with the bridge section. Dirt reacts differently than a concrete bridge section during impact and the bridge section has space restrictions. Therefore we need to provide a foundation design that varies from the original crash tested design for both fit and function.  Proposed Solution: Allow a modified foundation design, proven to absorb the minimum force via engineering calculations.  Is this acceptable?		<b>SUGGESTION:</b>		<b>ANSWER:</b> Accept Suggestion: <input type="checkbox"/>			
Question 2 Spec Section 28 16 34, 2.1 B. I. states "the barrier shall fail when subjected to the maximum input force."  Discrepancy: Anti-ram barriers are not designed to fail. The industry designs to protect against a defined force and to meet or exceed that rating. No barrier company has defined a systems to fail completely. If the barrier absolutely must fail and allow a vehicle access, then we are back to discrepancy #1 which causes a variation from the barrier design as originally crash tested.  Proposed Solution: Remove reference to barrier failure (allowing vehicle access above x weight and speed). The GRAB-300 system currently uses shear pins and energy absorption devises which may mitigate the requirement for barrier failure.

REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Reference Project Bidding Manual (Exhibit A)							
Per the requirements outlined in the project bidding manual (Exhibit A), BBII has developed our trestle design to provide access for Natoma street extending from gridline 11.5 at the center of the excavation (grid line E) to gridline 10 at the centerline of the shoring wall. After staking out this point on the shoring wall, it is apparent that the 530 Howard St. building is in conflict with the access point. See the attached sketch and photos indicating the approximate location of 530 Howard in relation to the trestle access. Please advise if the Natoma St. access point should be changed to a more suitable location.		The geometric requirements for Access Trestle in Exhibit A, A3 and SL-001 are schematic and minor adjustments can be acceptable based on the actual site conditions. For this particular item, it is acceptable to shift the Natoma Access of the Access Trestle to west by approximately 30 ft.

Reference Specification 01 10 50 and Drawing GT-0100				Please refer to IFB Documents for TG05.1 Survey Package contained in the compact disk, which sent to BBII on 04/22/2011, Transmittal No. 2011.04.22-0006. After review and define the scope for TG05.1 Survey Package, please identify missing bench marks specified in your specification and TG05.1 Package.			
Drawing GT-0100 indicates four points established for control. Our surveyors, KCA Engineers, are concerned about maintaining consistent control between various contractors on the project with such extensive distance

Co-Author:							
REQUEST: Reference Specification Section 31 56 13  In reference to the CDSM Shoring Wall DFOW QC meeting held in BBII's office on June 1, 2011, please find below the following RFI submitted by BBII's sub-contractor DND Construction:  "The reference specifications for tolerance relative to centerline of wall for both the CDSM and steel soldier beams are extremely strict compared to what is common for this nature of work, particularly given the depth of the work. It is also more strict than if the verticality tolerance (1:150 CDSM/1:200 pile) is applied at a conservative excavation depth of 60 feet. Can the tolerance be changed from 0" in/2" out (CDSM) & 0" in/3" out (piles) to a uniform 0" in/4" out"?		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> The Trade Subcontractor is responsible for the necessary means and methods to install the CDSM Shoring Wall within the tolerances specified in Specification section 31 56 13.

REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Reference RFI #T-0251.1 and Specification Section 01 53 13				Please consider the following the response to BBII's RFI(s) 243 & 251.			
In order to avoid conflicts with both the Thornton Tomasetti "pile exclusion zones" provided in response to RFI T-0251.1, the first trestle pier near gridline 3 must be relocated. BBII Proposes two options:				Please refer to marked-up sheets SH-2202 & SH-2200 for the revised trestle configuration. The depicted configuration is to be effective immediate.			
Option A - Move the last pier East to clear the pile exclusion zones and adjacent bracing struts, resulting in a trestle deck that ends approximately 15' East of gridline 3. The capacity of this end span would be increased to allow for the additional reach.							
Option B - Move the last pier West and extend the end span to clear the pile exclusion zones and adjacent bracing struts, resulting in a trestle deck that ends approximately 20' West of gridline 3.							
Please advise how BBII should proceed.

BALFO900-0024	BSE - Relocate Zone 3 Dewatering and Electrical Equipment	Closed	02/27/2013	03/09/2013	02/27/2013	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Lynn Kowallis      To: Turner Construction Company Gary Kruttsch			Answered By: Webcor Construction LP      Kirk Nielsen				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
BBII will be relocating equipment along the North perimeter wall in Zone 3 per W/O and TCCO direction. Items to be relocated include but are not limited to dewatering header pipe, dewatering control boxes, site electrical, monitoring equipment, etc. Please see the attached photos and sketches and for approval to proceed with relocation of said equipment.					Accept Suggestion: <input type="checkbox"/>		
Please confirm the utility locations shown herein do not conflict with other trade subcontractors and can remain for the duration of the dewatering system.					1. The direction to evacuate the Muni Hump was provided by QBD #TG0300-0162. 2. WOJV recommends relocating the utilities consistent with BBII's RFI #352 SK(s) 1/2 & 2/2. 3. While WOJV will coordinate as necessary to avoid utility relocation(s) WOJV cannot confirm the utilities may remain the duration of the dewatering system, nor is WOJV obligated to: a. Specification section 31 23 19.1.3.C instructed bidders to "Locate system components to allow continuous dewatering operations without interfering with installation of permanent Work and existing public right-of-way, sidewalks, and adjacent buildings, structures, improvements and construction operations performed under this Contract or other contracts." b. Exhibit-A. Section IV.C.15 instructed bidders to "he design and the installation sequence shall be coordinated with Permanent Structure construction, Temporary Structures / Equipment by other Trade Subcontractors, Internal Bracings, Access Trestle, Temporary Bridges and other structures." BBII was instructed as what to anticipate as it pertains to the permanent structure reference the BSE A-series drawings.

Number	Subject	Status	Date Created	Date Required	Date Answered	Cost Impact	Proceed
P1-0013.1	Traffic Light Details for Wedge Barriers	Closed	07/25/2014	08/04/2014	08/20/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: Reference: A1-7402, A1-2306, A1-2307, A1-2310, 28 16 44, P1-0013  RFI response P1-0013: "No indicator lights are required at the wedge barriers in the Bus Plaza (sheets A1-2306 and A1-2307). Indicator lights for the wedge barriers at the Vehicle Ramp are now shown on A1-7402 and A1-7418 delivered with MEPTSc Addendum # 4 to be issued on 06/20/2014."  Original comment remains. 28 16 44, 3.5.I. indicates that wedge barriers provide an output to the traffic control system. Provide details and output requirements. A1-7402 shows one indicator light for two wedge barriers, while 28 16 44 2.3.H. states that each wedge barrier shall have their own light. Clarify what is required.			SUGGESTION:			ANSWER: Accept Suggestion: <input type="checkbox"/> 1. Wedge barrier controller to provide two (2) dry contact relay outputs to the traffic control system, one per barrier set.  2. Custom pylons shown on A1-7402 and A1-7418 should have indicator lights in front and rear sides of same pylon (one set of lights per barrier/traffic direction).	
P1-0014	Impact of Attenuator	Closed	06/09/2014	06/19/2014	08/05/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>
	<p>A1-2302, A1-2303, A1-7402, A1-7418 from ASI 118, A1-7418 (SKA-3526) issued in ASI 119</p> <p>RFI response P1-0032: "Equipment and detail to be provided by the Operable Barrier manufacturer/supplier. Locations for photoelectric beam pylons identified on updated sheets A1-2302, A1-2303, A1-7402 and A1-7418 included with MEPTSc Addendum # 4, to be issued 06/20/2014."</p> <p>- Locations of photoelectric beams are not called out on sheet A1-2302, A1-2303. Provide updated details. Also provide details for sheets A1-2304, A1-2306, A1-2307.</p> <p>- Confirm that photoelectric beam on A1-7402 is wide enough to cover the entire wedge barrier if someone is standing on it.</p>						
						on sheets A1-2302, A1-2303 and A1-2304. However, location of indicator light pylons and/or knox box and key switch + indicator light is clearly shown, (see attached). Per section 28 16 44.2.7.C, Custom Pylons describe two configurations of the pylon matching the annotations on plans. Design of custom pylon, complete with photoelectric beams and other equipment shall be provided by the Bollard Manufacturer.	
						Additionally, photoelectric beams are not shown on sheets A1-2306 and A1-2307, which describe the wedge barriers at West and East ends of the MUNI Bus Plaza, because they are not required at those locations.	
						2. Photoelectric beam shown on sheet A1-7402 does not require full width coverage of the entire wedge because of the limited accessibility by the general public and saturated video area coverage.	
						3. Sheets included with this response include [A1-2302, A1-2303, A1-2304 from ASI 0119], [A1-3100, A1-3105 from ASI 0123], [A1-7402 and A1-7418 from ASI 0121].

REQUEST: Reference: 12 93 30, 05 50 00  Bollards in spec 12 93 30 and 05 50 00 do not match in regards to their parameters, ratings and requirements. Clarify why there are two incongruous lists of bollards that use three of the same numbers. Correct and revise accordingly.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> Bollard specifications from Sections 12 93 30 and 05 50 00 have been consolidated into updated Section 28 16 44. Refer to 06/18/2014 Secondary Mitigation VE Round 2 package.		
P1-0048	Bollard Detail type	Closed	06/09/2014	06/19/2014	06/30/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: Reference: L1-7360  Landscape drawings do not detail each bollard type. Clarify which bollard type is on this sheet. Coordinate with Architectural and Structural drawings. Clarify if bus deck level BOL-1 and BOL-2, and loading dock BOL-3 are to be used for all areas? Provide details for all bollard types required.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> 1. Bollard manufacturer/fabricator shall design/build bollards of various types to suit identified conditions. Locations of individual types and conditions are clearly identified on drawings along with proximity to ramps, OCS poles, etc.  2. Bollards identified on Landscape drawings do not engage TTC Structure.  3. Bus Deck BOL-1, BOL-2, and Loading Dock BOL-3 are to be used only where identified on Architectural drawings.  4. Details to be provided by the bollard manufacturer/fabricator.

REQUEST:			SUGGESTION:		ANSWER:		
Reference: A1-8720 and A1-8721					Accept Suggestion: <input type="checkbox"/>		
Provide detail for Retractable Bollard Drain, piping route and termination. Does the effluent need to be collected and treated as hazardous waste? Coordinate with Plumbing Drawings.					1. Retractable bollard drains connect to plumbed drainage lines located under the structural slab. Refer to Plumbing drawings delivered with MEPTSc Addendum # 4, issued 06/20/2014.		
					2. There is no special consideration required for the collected effluent.		
P1-0051.1	Stationary Bollards	Closed	07/25/2014	08/04/2014	09/03/2014	Potentially	<input type="checkbox"/>

REQUEST:			SUGGESTION:		ANSWER:		
Reference: A1-8720, A1-8721 P1-2252, and P1-2202					Accept Suggestion: <input type="checkbox"/>		
RFI P1-0051 response: "1. Retractable bollard drains connect to plumbed drainage lines located under the structural slab. Refer to Plumbing drawings delivered with MEPTSc Addendum # 4, issued 06/20/2014.					Arup believes the RFI incorrectly states Minna Street when the question was intended for the retractable bollards at Natoma Street.		
2. There is no special consideration required for the collected effluent."					The retractable bollards that are located near grid line 1, and the retractable bollards that are located near grid line 10 which are outside the footprint of the trainbox, shall drain to a dry well as shown on the attached two sketches (SK-C-0001 and SK-C-0002).		
- Original question remains for retractable bollard locations at Minna Street on GL 1 and 10 where no drain lines are shown.							
- Confirm that both retractable bollard drain and pit drain connect to the single plumbing line as stated on P1-2202 "2" SAN/AD - UP (TYP 9) TO RETRACTABLE BOLLARDS CASING AND PIT".							
- P1-2252 states "2" UP TO RETRACTABLE BOLLARD DRAINS (TYP 6)". Please clarify if this drain line is meant to be for the retractable bollard drains and the pit drains.

P1-0070	Steel Flashing at Column	Closed	06/09/2014	06/09/2014	06/09/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Scott Shope			To: Turner Construction Company PHIL MILITELLO				
Co-Author:			Answered By: Adamson Associates, Inc. George Metzger				
REQUEST: Reference: 3/A1-3190  Detail calls out for a 12 ga. steel flashing closure plate within the web of interior cruciform columns, but does not provide details for attachment, or where material is to flow from the flashing (there is a checker plate cap at the top of the column to deflect material from entering the enclosure). Is the 12 ga steel flashing required? If so, please provide details on attachment and draining. If not, please revise detail.			SUGGESTION:			ANSWER:            Accept Suggestion: <input type="checkbox"/>  The 12ga steel flashing is supported using metal Z-Grits. Please refer to detail 5/A1-3190 for a cross section through the flashing. Any water the gets past the flashing cap will drain down the flashing closure to the drainage layer beneath the floor finish topping. Refer to the attached SKA-3703.

P1-0080	Gantry Crane Support at Transformer Vaults	Closed	06/11/2014	06/21/2014	07/16/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Scott Shope      To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
Reference: 2/L1-7317					Accept Suggestion: <input type="checkbox"/>		
Detail indicates that the architect and structural engineer are to confirm the detail. A1-8717 refers back to Landscape, and structural does not appear to address the issue. Please coordinate landscape, architectural and structural.					TT Response:		
					The gantry equipment is to be supported by concrete blocks over the concrete MFB beams. See attached sketch SKS-0360 for concrete block details at the gantry supports. These details will be added to the structural drawings in a future ASI.		
					PWP Response:		
					1. The concrete block (by structural) which is exposed to the sidewalk should be specified as integral color to match landscape cast in place concrete. Refer to attached SKLA-304.		
					2. TT's sketch SKS-0360 reflects a notch in the concrete block at manhole covers. It should be clarified that in order to avoid cracking and failure of the paving at the notch, that the notch in concrete to occur adjacent to metal lined frame of lift out lids. Metal frame and tray by others. Refer to attached SKLA-304.		
					AAI Response:		
					Gantry support concrete blocks are not a part of TG07.2 except for cast-in dowels as identified by structure. Refer to attached sketches SKA-3694, SKA-3700, SKA-3701 and SKA-3702.		
P1-0080.1	Concrete Block Placement for Gantry Crane Support at Transformer Vaults	Closed	07/18/2014	07/28/2014	08/05/2014	Potentially	<input type="checkbox"/>

P1-0083	PVC Roofing Substrate Requirement	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	<input type="checkbox"/>	
From: Webcor Construction LP                      Scott Shope                      To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger					
Co-Author:								
REQUEST:			SUGGESTION:		ANSWER:			Accept Suggestion: <input type="checkbox"/>
Reference: Specification Section 07 54 19 3.2A					The Contract Documents refer to the Contractor defined as the General Contractor/Construction Manager (CMGC) in the TJPA/CMGC Agreement for responsibility to complete the Work and for coordination of the Work, not to individual subcontractors that are contracted to the CMGC. The specification is correct.			
07 54 19 3.2A requires "the general contractor shall examine substrates, areas, and conditions" with the installer for compliance with the contract documents. Please remove the requirement for the general contractor to verify existing conditions with subcontractor. Subcontractor is solely responsible to verify and accept existing conditions prior to commencing work.								
<hr/>								
P1-0083.1	Additional Review of PVC Substrate Requirement	Closed	07/01/2014	07/11/2014	09/01/2014	Potentially	<input type="checkbox"/>	
From: Webcor Construction LP                      Tram Nguyen                      To: Turner Construction Company PHIL MILITELLO			Answered By: Transbay PMPC                      Ray Quesada					
Co-Author:								
REQUEST:			SUGGESTION:		ANSWER:			Accept Suggestion: <input type="checkbox"/>
REFERENCE: RFI Response P1-0083, Specification Section 07 54 19 3.2A					The TJPA does not agree that what is required in this specification section is an added service. The CM/GC is ultimately responsible for the quality of the entire project. If the CM/GC wishes to assign or delegate any responsibility to a subcontractor related to quality control, that is your prerogative.			
As stated in RFI Response P1-0083, "The Contract Documents refer to the Contractor defined as the General Contractor/Construction Manager (CMGC) in the TJPA/CMGC Agreement for responsibility to complete the Work and for coordination of the Work, not to individual subcontractors that are contracted to the CMGC. The specification is correct."								
Per the contract, the CMGC verifies compliance of the work with the contract documents via the QA/QC process at the time of installation. Additional review of the work to reverify conformance with the contract documents as set forth in Specification Section 07 54 19 3.2A is an added service. Please confirm TJPA intends to have this added service to CM/GC's contract incorporated into the work.

Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:            Accept Suggestion: <input type="checkbox"/>			
REFERENCE: RFI Response P1-0099.1, GA-214-10				Gypsum Board Finish & In the elevator shafts, provide Level 3 finish.			
RFI Response P1-0099.1 confirms a Level 1 finish is to be furnished, installed and painted on the interior of the elevator shafts, however does not provide the requested paint finish requirements.				Paint Finish requirements shall be as specified in section 09 91 00 (Painting) item 3.2.I.			
Per industry standard (see attached GA-214-10), Level 1 finish includes embedment of tape in joint compound, but tape and fastener heads need not be covered with joint compound. Per 09 91 00 3.2 I, joints and screw heads are to be covered with joint compound and sanded smooth and flush with adjacent surfaces (i.e. a higher finish level than Level 1).				Paint shall be per products specified in Paint Finish Schedule for exterior surfaces (for Portland Cement Plaster, . . . ) 100 percent Acrylic Flat - Refer to section 09 91 00, item 3.7.A.			
Please provide the requested paint finish requirements referenced in RFI P1-0099.1.				Color to be selected in the future.

REQUEST:		SUGGESTION:		ANSWER:            Accept Suggestion: <input type="checkbox"/>			
REFERENCE: Detail 1/S1-2252 (Attached), Detail 10/S1-9001, Details 2 & 3/A1-9229, Sheet A1-8662 Fire Protection Matrix & Schedule (All from IFC Drawings for Main Package dated 3/31/14)				TT Response:			
Per Detail 1/S1-2252 (Attached), Composite Deck Type S1 extends through the face of the northerly CMU wall, and is supported by this wall (see attached). This condition is shown on Detail 10/S1-9001 (direction to this detail is given on 4/S1-5032).				For the exit passageway composite deck structural steel framing, refer to response to RFI P1-0103. Updated detail 10 of S1-9001 was issued with ASI-0121.			
Details 2 & 3/A1-9229 show this condition as being supported by structural steel framing which does not show on structural drawings and fireproofed which would not be required per Sheet A1-8662 Fire Protection Matrix and Schedule. Please coordinate architectural and structural drawings to match.				AAI Response:			
				Fireproofing is required for the exit passageway composite deck structural steel framing, beams, and hangers. Refer to attached SKA-3905. Refer also to A1-9229 and A1-9230 issued with ASI-0121.			
<hr/>

From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: reference: 07 54 19 2.2A  07 54 19 2.2A specifies only Sika Sarafil Waterproofing systems, or substitute products of another manufacturer for RF-1. Webcor intends to require all manufactures be approved via QBD prior to bid. If this is not acceptable, please provide specific manufacturers and products which are acceptable to use.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>  The Request for Substitution process established by TJPA and WOJV as outlined in the General Conditions specification section 00 04 40 is the process to be utilized for Bidder proposed substitutions to the Basis of Design. In the Substitution Request, the bidder shall provide the information that outlines how the product is equivalent for the JPA representative's review. The QBD process is not the correct process, because it will leave the burden for researching how the product is equivalent on the TJPA team rather than the bidder and manufacture who are the experts on their proposed products.		
P1-0108.1	Product/Manufacturer Substitution for PVC Roofing	Closed	07/31/2014	08/10/2014	08/05/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Tram Nguyen To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: REFERENCE: RFI Response P1-0108, Specification Section 00 04 40  RFI Response P1-0108 states, "The Request for Substitution process established by TJPA and WOJV as outlined in the General Conditions specification section 00 04 40 is the process to be utilized for Bidder proposed substitutions to the Basis of Design."  Specification Section 00 04 40 states, "Contractor will be provided a period of 10 days after the date of each Trade Package award for submission of data substantiating a request for a substitution with an "or equal" item."  The specification section referenced in RFI Response P1-0108 indicates that substitutions are addressed post-bid.  Per the meeting between TJPA, PCPA, Turner, and Webcor-Obayashi on 7/17/14, the response to RFI P1-0108 is to be revised to state that the QBD process is to be used for suggested alternate materials/manufacturers pre-bid.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>  Your understanding is not correct. TJPA will alter Specification section 00 40 40 to adjust the current process.

reference: 07 11 16 2.3							
07 11 16 2.3 specifies Degussa Building Systems (BASF Company), or equal for dampproofing. In an attempt to prevent single sourcing, and assure bidders only bid approved materials, Webcor intends to require any alternate manufactures be approved via QBD prior to bid. If this is not acceptable, please provide alternate manufacturers/products which are acceptable to use.		The Request for Substitution process established by TJPA and WOJV as outlined in the General Conditions specification section 00 04 40 is the process to be utilized for Bidder proposed substitutions to the Basis of Design. In the Substitution Request, the bidder shall provide the information that outlines how the product is equivalent for the JPA representative's review. The QBD process is not the correct process, because it will leave the burden for researching how the product is equivalent on the TJPA team rather than the bidder and manufacture who are the experts on their proposed products.

REQUEST:		SUGGESTION:		ANSWER:            Accept Suggestion: <input type="checkbox"/>			
REFERENCE: RFI Response P1-0109, Specification Section 00 04 40				Your understanding is not correct. TJPA will alter Specification section 00 40 40 to adjust the current process.			
RFI Response P1-0109 states, "The Request for Substitution process established by TJPA and WOJV as outlined in the General Conditions specification section 00 04 40 is the process to be utilized for Bidder proposed substitutions to the Basis of Design."							
Specification Section 00 04 40 states, "Contractor will be provided a period of 10 days after the date of each Trade Package award for submission of data substantiating a request for a substitution with an "or equal" item."							
The specification section referenced in RFI Response P1-0109 indicates that substitutions are addressed post-bid.							
Per the meeting between TJPA, PCPA, Turner, and Webcor-Obayashi on 7/17/14, the response to RFI P1-0109 is to be revised to state that the QBD process is to be used for suggested alternate materials/manufacturers pre-bid.							
RFI Response P1-0109 has not been revised.							
Please confirm the QBD process is to be used to suggestion of alternate materials/manufacturers.

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: RFI Response P1-0110, SG1 Drawings, Division 10 Specifications					Accept Suggestion: <input type="checkbox"/>		
Please refer to SG1-6202, "General Sheet Notes, Item 'D' - "SIGN SUB-CONTRACTOR TO PROVIDE SIGN MOUNTING LOCATIONS/SURFACE CONDITION REQUIREMENTS AND METHOD OF ATTACHMENTS TO TJPA REPRESENTATIVE". Sub-Contractor's proposed anchoring details (proposed 'methods of attachment') are to be included as a component of the required signage submittal/shop drawing package."					Please reject and void this RFI as it is too vague and not possible to address.		
SG1 Drawings and Division 10 Specifications do not appear to provide mounting design requirements (i.e. allowable point loads, mounting into concrete over geosynthetic fill, mounting into waterproofing, etc.). Please provide design requirements for mounting all signage.					The previous response to P1-0110 makes it clear that mounting of the sign is the contractor's responsibility for this performance based item. In addition, the Contract Documents show signage mounting for many signs in various locations. If the contractor has a question about a particular location, the RFI should refer to a specific location and detail.

**Co-Author:**

**REQUEST:**

Reference: 07 13 55 2.1

07 13 55 2.1 does not provide a specific manufacturer for thermoplastic water tank liners. Webcor intends to require all manufactures be approved via QBD prior to bid. If this is not acceptable, please provide specific manufacturers and products which are acceptable to use.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Manufactures that meet the Performance requirements specified in the referenced specification section are acceptable. The successful bidder shall submit the product the meets the specification requirements as a shop drawing submission.

The QBD process is not the correct process for determining quality of products. If WOJV wants to vet products during the bid process, than utilize the Request for Substitution process established by TJPB and WOJV as outlined in the General Conditions specification section 00 04 40.

P1-0131	Fire Blankets Shown at Ceiling Locations	Closed	06/11/2014	06/21/2014	06/30/2014	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Scott Shope <b>To:</b> Turner Construction Company PHIL MILITELLO			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>Co-Author:</b>							
<b>REQUEST:</b> Reference: A1-8890, 07 09 13  The contract documents show fire blankets within the ceiling space at several locations. Are these part of the rated seismic joint assemblies? The seismic joint assemblies note that the assembly must have a "fire barrier", but does not identify the barrier as a "fire blanket." If the "fire blanket" is the "fire barrier" identified in 07 09 13, please remove/revise the language on the drawings to match the specification. If this is an added material to be furnished and installed separately, please provide a spec., extent, and details for the fire blanket.  This affects TG16.1 Framing/Drywall and/or TG07.8 Expansion Joints. Please provide the requested information so as not to impact the bidding schedule.			<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The Fire Blanket is part of the seismic joint assembly. The annotation has been revised to match the Specification. Refer To SKA-3692.

	<p>Section 09 80 00</p> <p>As stated in RFI Response P1-0132, "This is a means and methods requirement that the CM/GC shall manage as stated in Division 01. Specification 09 80 00 sets forth the industry standard requirements for installation of the insulation materials an systems. Specification language does not change."</p> <p>RFI Response 0132 requires that insulation not be installed unless no further installation of materials requiring wetness, moisture or dampness is contemplated. Drywall mud, thin set for tile, terrazzo, paint and other finish materials create wetness, moisture, and damp condition within the building. Please revise the language to mandate material specified within Specification Section 09 80 00 shall be installed per the manufactuer's written installation instructions.</p>						be revised as recommended in this RFI. This revision will be included in ASI 127.
P1-0133	Relative Humidity Requirement	Closed	06/11/2014	06/21/2014	07/02/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Scott Shope		To: Turner Construction Company PHIL MILITELLO		Answered By:Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
Reference: 09 80 00							
1.9 B requires that relative humidity in the area of work does not exceed 55% humidity for the duration of the project. The average relative humidity for San Francisco is above 55% for +80% of the year (and those days below 55% are intermixed between days above 55%). By this standard, we would need to scaffold, shrink wrap, rent air conditioners/dehumidifiers and run them for several years until substantial completion. Please rewrite this requirement to follow the manufacturer's written recommendations.				Specification Section 09 80 00 1.9 B shall be revised to state: "Ensure manufacturer's written installation requirements for ambient conditions are met."

PROJECT MANAGEMENT - REQUEST AND ANSWERS LOG

30100 - Transbay Transit Center Project

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>
	<p>Per the contract documents, WPM-3 is to be used at the roof park level below grade. Per 07 13 54, WPM-3 is Sika Sarnafil Waterproofing System PVC G476-20. Per the product data for Sarnafil PVC G476 (see attached), WPM-3 can be exposed for a maximum of 3 months. Based upon this limitation Webcor will be requiring the waterproofing subcontractor to protect the waterproofing until permanent overburden (foam fill, soil, rock, etc.) can be installed. This may lead to substantial added cost to the project. Please confirm that this is acceptable, or revise the contract documents to a product which can be exposed for an extended duration.</p>			<p>See Application specification section 07 13 54 / 3.3 that states "The waterproofing sequence in general shall be as follows: install the first ply of the membrane to serve as temporary waterproofing until the building is ready to receive the overburden at Park level. Following installation of ..... Additional protection in areas where construction will occur above the membrane will be installed and removed by other contractors."</p> <p>The Contractor is responsible for means and methods of construction and scheduling the interaction of trades to complete the work. The contractor shall determine the most cost effective means of water management during construction to reduce project costs. The suggested construction phase water management process outlined in specification section 07 13 54 can be altered as desired by the Contractor to reduce costs and coordinate with the Contractor's means and methods. The completed waterproofing system, testing, etc. shall comply with 07 13 54 and the drawings in the Contract Documents (e.g. waterproofing detail 7/A1-8851).</p>			
P1-0136	Roofing Spec	Closed	06/11/2014	06/21/2014	07/02/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore		To: Turner Construction Company PHIL MILITELLO		Answered By: Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
reference: 07 13 54 1.8 A 2				The referenced specification section 07 13 54 / 1.8.A2 states "Be prepared to cover unfinished work with temporary covers in the event of an unexpected rainfall." The statement does not state that the entire area of the roof shall be covered every night. This is required to prevent damage to the incomplete ongoing waterproofing work, which might result from issues such as water entrapment within the system.			
Per 07 13 54 1.8 A 2, the roofing subcontractor must be prepared to cover unfinished work with temporary covers in the event of an unexpected rainfall. Per 07 13 54 1.8 B, the roofing subcontractor must leave the building in a completely watertight condition at the end of each day, and make unfinished work watertight. Based upon these requirements, Webcor will be requiring the roofing subcontractor to protect the entire area of the roof until it is completely watertight. This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.				Specification section 07 13 54 / 1.8 B will be revised in a future ASI to delete the requirement that "At the end of each day, leave the building in a completely watertight condition." WOJV has bid manual

instructions that appropriately describe the CM/GC requirements on this issue.							
P1-0137	Waterproofing Membrane Curing time	Closed	06/11/2014	06/21/2014	07/02/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore		To: Turner Construction Company PHIL MILITELLO		Answered By:Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
REFERENCE: 07 13 00 3.5 A		The language has been revised. Refer to attached SKLA-306.					
Spec Section 07 13 00 3.5 A 1 requires the waterproofing membrane to cure a minimum of 7 days at 70 degrees Fahrenheit. In San Francisco, the average daily high temperature does not get up to 70 degrees for 8 months out of the year, and the average low temperature is below 70 degrees year round. As such, acclimatization (scaffold, tenting, and heaters) will be required to maintain the 70 degrees the entire duration of the W/P activity. This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.							

P1-0138	Unfinished work watertight spec	Closed	06/11/2014	06/21/2014	07/02/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore		To: Turner Construction Company PHIL MILITELLO		Answered By:Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
07 14 13 1.8 B		Spec Section 07 14 13 / 1.8 B shall be deleted.					
Spec Section 07 14 13 1.8 B requires "at the end of each day, leave the building in a completely watertight condition. Make unfinished work watertight." This requirement will require the tenting of the entire building in order to make the building and unfinished work "watertight." This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.

reference: 07 54 19 1.9 A 5					Accept Suggestion: <input type="checkbox"/>		
Spec Section 07 54 19 1.9 A 5 requires "at the end of each day, leave the building in a completely watertight condition. Make unfinished work watertight." This requirement will require the tenting of the entire building in order to make the building and unfinished work "watertight." This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.					The following sentence; "...at the end of each day, leave the building in a completely watertight condition. Make unfinished work watertight." Will be deleted from Spec Section 07 54 19 1.9 A 5. You are correct, construction phase weather protection is a means and methods issue.		
					WOJV shall review this changed specification in relation to the Bid Manual and adjust the Bid Manual as required. The Bid Manual previously stated: "It shall be the responsibility of the Trade Subcontractor to take all measures to protect Work from inclement weather, including that determined by WOJV, until completion of the work and acceptance by the Owner." and "In the event that the building requires weather protection and rain water control, Trade Subcontractor shall furnish and install all weather protection as required for Work to continue unabated and will be liable for damage to other Work or costs for weather protection installation due to Trade Subcontractor's failure to timely or properly install weather protection." We also don't believe your text is intended to require each individual trade subcontractor to fully tent the building each day or even on a rainy day.

Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:            Accept Suggestion: <input type="checkbox"/>			
Reference: 4/A1-0022				Not all CMU walls have concrete curbs. The CMU walls that have a concrete curb have annotation <i>CC</i> specified on their wall tag. These walls, with their wall tags, have been illustrated on the architectural zone plans.			
4/A1-0022 indicates that a "CC" accompanies the CMU wall symbol if a concrete curb is to be erected below the wall. 1/A-0025 indicates that typical CMU walls do not have curbs. 2/A-0025 indicates that if a CMU wall is on a sloped slab, a curb is typically required below the CMU wall. Enlarged floor plans in architectural plans do not typically show a concrete curb below CMU walls (i.e. no "CC" adj. to the symbol). Typical structural details (1 & 2/S1-9001) show concrete curbs at all CMU walls. Are all CMU walls supposed to receive concrete curbs or only the ones identified on architectural plans?				S1-9001 illustrates curbs for CMU walls, where they exist.			
P1-0148	CMU Rated Walls	Closed	06/13/2014	06/23/2014	06/24/2014	Potentially	<input type="checkbox"/>

REQUEST: REFERENCE: RFI Response P1-0148, Specification Section 04 20 00 2.2 F  RFI Response P1-0148 states, "For fire rated CMU walls, use mineral wool, backer rod and fire / smoke stop, as has been illustrated on detail 3/ A1-0024. Specification section 04 20 00 2.2 F shall be revised to conform and shall be issued with a future ASI.  RFI Response P1-0148 refers to a future ASI to revise Specification Section 04 20 00. No revised specification has been received. Please provide the revision for Specification Section 04 20 00.		SUGGESTION:	ANSWER:	Accept Suggestion: <input type="checkbox"/>			
P1-0149	Train Box Construction Joints	Closed	06/13/2014	06/23/2014	06/24/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Scott Shope		To: Turner Construction Company PHIL MILITELLO		Answered By:Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST: Reference: 3 & 4/A-0024  Per 3 & 4/A-0024 within the train box there are 2 different wall joint details depending if the wall is running north and south, or east and west. The details go on to reference structural for wall control joint information in each direction. Per S1-9000 - S1-9003 (Typical CMU Details) there is one standard detail for all construction joints. Please confirm there is only one construction joint detail desired for walls running in any direction, and coordinate arch. drawings to match.		SUGGESTION:	ANSWER:	Accept Suggestion: <input type="checkbox"/>  This question is vague and cannot be answered. Joint widths vary along the E/W length of the building as well as vertically by level. Contractor to provide information on the joints in question by both gridlines (N/S & E/W) as well as building level (Platform, Lower Concourse etc.).			

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>
P1-0149.1	Widths for Below Grade/Train Box CMU Control Joints	Closed	07/03/2014	07/13/2014	08/05/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Tram Nguyen      To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: RFI Response P1-0149, Details 3 & 4/A-0024, Details 7 & 10/S1-9000					Accept Suggestion: <input type="checkbox"/>		
As stated in RFI Response P1-0149, "This question is vague and cannot be answered. Joint widths vary along the E/W length of the building as well as vertically by level. Contractor to provide information on the joints in question by both gridlines (N/S & E/W) as well as building level (Platform, Lower Concourse etc.)"					Joints laid out in the architectural drawings reduce continuous wall lengths for the purpose of crack control and/or permit the seismic displacement of elements braced to the floor above relative to those elements that are permitted to slip relative the floor above.		
<ul style="list-style-type: none"><li>- Per Detail 3/A-0024 the train box CMU control joints running in an east to west direction appears to be the width of a standard grout joint.</li><li>- Per Detail 4/A-0024 the train box CMU control joints running in a north to south direction are larger than the width of a standard grout joint.</li><li>- Details 3 &amp; 4/A-0024 indicate that structural drawings are to be referenced for control joint information.</li><li>- Per Details 7 &amp; 10/S1-9000 standard below grade CMU wall control joints are 3/8" regardless of orientation.</li></ul>					For joints oriented in the north-south direction, control and seismic functions are satisfied at a joint width of 3/8". This is due to the small magnitude of below grade seismic building drift in the east-west direction.		
Please confirm that all below grade/train box CMU wall control joints are to be 3/8" wide as required by structural, rather than differing widths based upon orientation as indicated on the architectural drawings.					Joints oriented in the east-west direction for the purpose of providing seismic separation under north-south building drift shall be sized per General Note CD-6 of S-0005, requiring Operational Performance under GSL-2 Earthquake. The GSL-2 story drifts that control the joint widths are tabulated on S-0006. For partition walls at the Train Platform Level, the Lower Concourse drift demands apply. For partition walls at the Lower Concourse, the Ground Level drift demands apply. Drift demands are converted to displacements (joint sizes) by multiplying the percentage drift by the story height.		
P1-0149.2	CMU Wall Layout Requirements	Closed	08/14/2014	08/24/2014	09/05/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Tram Nguyen      To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: RFI Response P1-0149.1					Accept Suggestion: <input type="checkbox"/>		
RFI Response P1-0149.1 does not provide specific sizes and layout requirements for CMU walls.					Dimensioned setting out for all concrete and CMU partition walls is referenced from the Architectural Zone Plans, located on related details and identified as CJs e.g. A1-3007 GL 7, E.6.		
Please provide specific sizes and layout requirements for CMU walls as Trade Package TG07.4 CMU is not design-build.					On the Architectural Zone Plans and details, the CMU wall tags refer to the Masonry Partition Schedule on Architectural drawing A-0022, which stipulates the CMU wall thicknesses and performance criteria.

<b>REQUEST:</b>		<b>SUGGESTION:</b>		<b>ANSWER:</b>		<b>Accept Suggestion:</b> <input type="checkbox"/>	
REFERENCE: RFI Response P1-0155							
As stated in RFI Response P1-0155, "A1-9703 is the Ground Level Door Schedule yet the door referenced uses Concourse Level door nomenclature. We believe the door in question is actually 01401B, if this is the case the gate does not need a hardware set. In a future ASI the following will be documented:							
door number will be deleted from the zone plan (drawing A1-2304)							
door 01401B will be deleted from the door schedule (drawing A1-9703)							
Refer to sheet A1-7523 for gate detailing and requirements."							
The RFI Response P1-0155 references future documentation. The documentation referenced has not been received. Please provide the documentation referenced in the response to RFI P1-0155.

P1-0156	Openings around Ground Level Columns	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: reference: A1-2104  Per the architectural slab plans (see below for example) there are openings around the ground level columns with galvanized steel plate supporting the slab above. Structural drawings (see below for example) does not show these openings. Are these openings required? Please revise the documents to conform with each other.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>  The openings around the ground level columns, are block outs for the base plate. For locations and dimensions of these openings, refer to the architectural slab edge plans. Structural drawing A1-5052 illustrates the base plate detail and dimensions.		
P1-0157	Base Plate Detail at Ground Level	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	<input type="checkbox"/>

<b>From:</b> Webcor Construction LP      Zachary Moore <b>To:</b> Turner Construction Company PHIL MILITELLO <b>Answered By:</b> Adamson Associates, Inc. George Metzger <b>Co-Author:</b>							
<b>REQUEST:</b> reference: S-2063, S1-2502, A1-2502  Per the Bus Ramp Drawing S-2063, the elevation at T.O. AC is 56.10 (56' - 1-3/16") where the bridge connects to the transit center. Per S1-2502 T.O. Steel at H line (1' - 7" away from the bus bridge connection) is 56' - 4" (2'-13/16" higher than the bus ramp AC). Per A1-2502, drive aisle high point along GL-H is 57' - 11-1/4" (1' - 10-1/16" higher than the T.O. Bus Bridge AC). Please review the grades at this location to confirm the bus bridge aligns with the top of bus deck.		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Per S1-2502, 56'-4" top of steel elevation at GL-H is correct. Per A1-2502, 57'-11 1/4" drive aisle high point along GL-H is correct.			
<b>From:</b> Webcor Construction LP      Tram Nguyen <b>To:</b> Turner Construction Company PHIL MILITELLO <b>Answered By:</b> Adamson Associates, Inc. George Metzger <b>Co-Author:</b>							
<b>REQUEST:</b> REFERENCE: RFI Response P1-0159, RFI Response B-0008, Detail 2/A1-8378  As stated in RFI Response P1-0159, "Per S1-2502, 56'-4" top of steel elevation at GL-H is correct. Per A1-2502, 57'-11 1/4" drive aisle high point along GL-H is correct."  Per RFI Response P1-0159, the Bus Deck Drive Aisle high point at the bus bridge is 57'-11 1/4". Per RFI Response B-0008, the top of bus bridge paving is 57'-11 3/4". Per Detail 2/A1-8378, the transition from the Bus Bridge to the Bus Deck Drive Aisle is at 57'-11 1/4". Please revise Detail 2/A1-8378 to reflect the elevations confirmed in RFI Responses P1-0159 and B-0008.		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The response to RFI P1-0159 is correct. Arup will be revising their response to RFI B-0008 to conform to the information contained in RFI P1-0159.

P1-0160	Structural Slab Detail	Closed	06/11/2014	06/21/2014	07/11/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: reference: S1-2502, A1-2892, A1-9532  Per S1-2502 and A1-2892, the structural slab extends 1'-7" south past GL H to meet the bus bridge. Per A1-9532 the bus deck topping slab stops 3'-4" north of GL H. This will leave a 4'-11" area with no topping slab between the bus deck and bus bridge. Please revise the drawing to show the desired condition.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> Topping extents revised per attached SKA-3723 based on sheet A1-9532. Refer also to details 2 & 3/A1-8378 previously issued, for extent of slab and bus bridge interface.		
P1-0161	Topping slab at bus deck	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: reference: A1-6102  There does not appear to be a detail depicting the edge of topping slab and associated waterproofing where the bus deck meets the bus bridge. Per A1-6102 the connection between bus bridge is under study. Please provide the details for the connection between the bus bridge and bus deck. This will affect bid documents for TG07.6 Topping Slabs and TG13.2 Waterproofing.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> For topping slab at Bus Deck to Bus Ramp, see detail 2 & 3 on A1-8378.		
P1-0162	Expansion Material	Closed	06/11/2014	06/21/2014	06/24/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: attached: S-6113  Per the bus bridge plans S-6113, a 24" wide piece of expansion material is to be inserted between the bus bridge and bus deck. This does not appear to be a waterproof assembly, and may leak onto the building/people below. Please confirm this is acceptable.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> See detail 3 on A1-8378 for the waterproof joint assembly at the Bus Deck to Bus Ramp transition. Waterproofing details will typically be found in the architectural drawings and not on structural drawings.

P1-0169	Coating for Metal Surfaces	Closed	06/09/2014	06/19/2014	06/24/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Andrew Kitchen		To: Turner Construction Company PHIL MILITELLO		Answered By:Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Reference: 05 15 21							
Per 05 15 21 Steel Castings (see attached), steel castings (most notably the cast nodes) are to be furnished as bare metal. This was confirmed in the construction issues meeting held on 04/17/14 (see attached), with the indication that coating of the bare metal is to be included in TG16.5 Painting. 09 97 16 High Performance Coatings ç Superstructure Package (see attached) identifies a coating system for exterior exposed factory-primed metal surfaces, and a coating system for galvanized steel, but not a coating system for exterior exposed unprimed/non-galvanized metal surfaces. Please provide the coating system for all unprimed/non-galvanized metal surfaces.				Per specification section 09 97 16, part 1, 1.1, A.1; all AESS are to receive high performance coatings. Per specification section 05 10 00 part 2, 2.2, A and 2.2, C indicate all structural steel is to be either primed of galvanized; there is no exception for the cast steel items. Shop Primer is required as specified.			
Revised: IFC Set 09 97 15 2.5 B calls out for "Shop Primer" in the "Coating System for Exposed Unprimed and Non-Galvanized Steel Surfaces." Based on this information the painter (who in not under contract yet) would need to go to the steel erector's shop to prime the steel (which is currently in production) with the materials called out in 05 10 00 and 05 12 13. Based on the current schedule, the unprimed/non-galvanized steel will be erected before the painter is under contract. In addition, adding priming of these surfaces to the steel scope of work would negatively impact the delivery and erection schedule of steel. Please revise the spec to provide priming of unprimed and non-galvanized metal in the field,				The specifications are intended to be read as a whole and as such, specification section 05 15 21 only speaks to the fabrication of steel castings, a sub-set of structural steel which is governed by section 05 10 00.

From: Webcor Construction LP Jonathan Flaming To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: Reference 3/S1-6020  How does the Stainless Steel sliding plate attach to the structural steel sliding plate? Please clarify.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>  The sliding bearing is a design-build item. It can be welded, bolted, glued or any other form of attachment method. It will be up to the contractor to select a bearing and with that define a way to attached it to the supporting steel framing.		
P1-0187	TG08.7 W-13 Glass Floor Detail Reference	Closed	06/11/2014	06/21/2014	07/11/2014	Potentially	<input type="checkbox"/>

Co-Author:							
REQUEST: Reference: IFC Set 07 81 23 2.4 C  Per IFC Set 07 81 23 2.4 C, the decorative top coat for intumescent paint is as specified in 09 97 15, and the custom color is to be selected by TJPA. There does not appear to be a system for top coating intumescent paint specified in 09 97 15, nor a color shown for the finish. Please specify the top coat material, and color.			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>  Specification 07 81 23 2.4 C is correct. The topcoat or finish coat of steel members fireproofed per 07 81 23 shall adhere to the paint systems specified on 09 97 15.  The specified epoxy intumescent coating system is compatible with a wide variety of paint system top coats. Additionally, the contractor shall comply with 09 97 15 1.3 B and 2.3 A and 2.3 B.  The colors will be indicated in the drawings in upcoming ASI.

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: (IFC Drawings for Main Package dated 3/31/14) Specification Section 07 81 23 2.4 C Specification Section 09 97 15  Specification Section 07 81 23 2.4 C indicates that the top coat is to be an aliphatic urethane as specified in Specification Section 09 97 15.  Specification Section 09 97 15 does not have a coating system for steel coated in intumescent fireproofing.  Please provide the requested top coat and color.					Accept Suggestion: <input type="checkbox"/> Specification section 07 81 23 1.1 C.2 states that the finish coat is to comply with division 09 for the decorative top coat. Specification section 09 97 16 2.3, 2.4 and 2.5 provides the top/finish coat; this is the same coating system for steel elements coated in intumescent fireproofing.  Please refer the enclosed sketches for colors.		
P1-0189	Paint Finish Schedule	Closed	06/18/2014	06/28/2014	07/11/2014	Potentially	<input type="checkbox"/>

Co-Author:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
REQUEST: Reference: 5/A1-8883  Per 5/A1-8883 2 ea. 2" dia. PVC pipes penetrate the train box wall for draining FJC2 at ground level. Per 5/A1-8883, concrete is to be poured tight to the PVC pipe, and no sealant/link seal/waterproofing is shown around the pipes within the wall. This may lead to the PVC pipe breaking at the wall if the concrete shifts, and a point for water intrusion at the train box wall. Please confirm this is the desired detail at this location.				The PVC pipes are provided with flexible couplers that are attached to flexible membrane and SS secondary gutters to allow both the gutter and PVC drains to move if the concrete shifts. Refer to annotations on details 4 and 5 of A1-8883 issued with the Main Package IFC dated March 31, 2014.  These PVC drain pipes receive 2 plies WPM-1A spiral wrap on the outside face of the foundation and SJ concrete end wall to prevent water intrusion. Refer to annotations on details 4 and 5 of A1-8883 issued with the Main Package IFC dated March 31, 2014.  WOJV shall review the details that interface with the Trainbox waterproofing with the WOJV waterproofing system subcontractor/designer (Best/Grace) and submit shop drawings for each waterproofing condition.

P1-0204	Future Loading of W-5 Cladding	Closed	06/19/2014	06/29/2014	07/02/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
Reference: Detail 1 / A1-7844. Detail 1 shows a future W5 Wall Cladding (as part of Phase 2) which will be attached to a train platform partition (partition type 31 as part of Phase 1). Specification 09 22 19 requires that the metal framing of the partition be designed by the Trade Contractor. Is the trade contractor to include the loading of the future W-5 cladding in his design calculations for the metal framing? If so please provide the loading of the future W-5 cladding to be used in the design calculations.					Accept Suggestion: <input type="checkbox"/>		
					1. The trade contractor is responsible to include the loading of the future W-5 cladding in his design for the metal framing.		
					2. For loading requirements of the future W-5 cladding system to be used in the design calculations for metal framing, refer to specification section 08 44 39 under 2.3 Design Criteria.		
P1-0205	FJC3A spec and Drawing information	Closed	06/19/2014	06/29/2014	07/28/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Zachary Moore To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
Per 1/A1-8894 FJC3A is to be installed at the bus deck level guardrail, and to refer to specification. 07 09 15 indicates that FJC3A is specified in 07 09 13. 07 09 13 does not indicate the manufacturer, type, gutter, or integration into FJC3. There does not appear to be details showing extent of FJC3A, or tie-in to adjacent expansion joints. Please provide omitted specification and drawing information.					Accept Suggestion: <input type="checkbox"/>		
					See specification section 07 09 13 / 3.4 C & D: "Moisture Barrier: Manufacturer's standard modified as shown on drawings."		
P1-0206	Galv. Metal Plate at Fireproofed Beam	Closed	06/20/2014	06/30/2014	07/22/2014	Potentially	<input type="checkbox"/>

REQUEST:			SUGGESTION:		ANSWER:		
Reference: 3/A1-8894 and 3/A1-8897					Accept Suggestion: <input type="checkbox"/>		
Per 3/A1-8894 dated 03/31/14 and 3/A1-8897 dated 03/31/14, galv. metal plate is covering a fireproofed beam is to be furnished and installed at the edge of the bus deck and roof park levels. Structural does not appear to show these plates. Please provide size, location, attachment requirements, and fireproofing details for these plates.					Refer to attached sketch SKA-3860. Detail 4 has been added to clarify FJC3A seismic joint assembly and components.		
					Note: there is no galv. metal plate noted nor required for the seismic joint assembly at Roof Park Level (3/A1-8897).

Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:			
REFERENCE: Drawing A1-8880, Specification 07 09 13 (IFC Drawings for Main Package dated 3/31/14)				Accept Suggestion: <input type="checkbox"/>			
Per drawing A1-8880, there are 2 ea. FJC2 expansion joints. One of the FJC2 joints is located at the W-12 exterior glass system (GL 20), and one on the Ground Level adjacent to Beale Street (GL 35). FJC2 as specified in 07 09 13 appears to be for the W-12 system, and 07 09 15 does not appear to specify a seismic joint for FJC2.				The enclosed SKA-3735, SKA-3736 Drawings and Specification pages with 07 09 13 markup clarify seismic joint assemblies FJC1 and FJC2 accordingly.			
Please provide a specification for the FJC2 joint located at the Ground Level.				Revised construction documents will be submitted in forthcoming ASI.			
P1-0215	Panel Noise and Vibration	Closed	07/01/2014	07/11/2014	07/11/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Zachary Moore		To: Turner Construction Company PHIL MILITELLO	Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:			
Reference 2014/06/16 W-1 Re-issued for Bid 08 44 27 2.2N				Accept Suggestion: <input type="checkbox"/>			
Noise and/or vibration due to wind are listed as an unacceptable conditions. There is the possibility that wind will create noise and/or vibration in properly installed panels because of factors such as (but not limited to) perforations and gaps between panels. If provisions remains in the specifications, they may result in additional cost in the bids and/or limit the bidding pool. Confirm that noise and/or vibration caused by wind within properly installed panels will be acceptable.				JV, TJPA, PMPC, and the design team discussed this extensively. The specification as written is the agreed upon Contract Document. Noise and/or vibration caused by wind are not acceptable and are assumed, until determined otherwise, to be an indication that the panels are not installed properly.

P1-0215.1	Exterior Awning Noise Due to Wind	Void	08/13/2014	08/23/2014		Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Andrew Kitchen		To: Turner Construction Company PHIL MILITELLO		Answered By:			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
Reference Specification Section 08 44 27 Section 2.2N (TG08.2 Issued for Rebid Documents)							
Please confirm that noise due to wind moving through the patterns cut out in the Aluminum Panels of the Exterior Awning and through the gaps between the panels Exterior Awing and noise due to wind moving above and below the entire system is not to be considered an unacceptable condition. The contractor is providing the pattern per the contract documents and they will have no control over any noise due to wind moving through the predetermined pattern, gaps between each panel and wind moving above and below the entire system. The contractor should only be responsible for noise due to vibration caused by poor workmanship and should not be responsible for any noise due to the inherent design of the W-1 Exterior Awning.							
P1-0216	Touch up Specification	Closed	07/01/2014	07/11/2014	07/11/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Zachary Moore		To: Turner Construction Company PHIL MILITELLO		Answered By:Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
Reference 08 44 27 3.10 F.1.b Specification Section 08 44 27 calls for touchup so that repair is invisible from a distance of 2 ft. According to PDCA P1-04 TOUCH-UP PAINTING AND DAMAGE REPAIR (see attached), Section 2.3 states: "...In order to determine whether a surface has been "properly painted" it shall be examined without magnification at a distance of thirty-nine (39) inches or one (1) meter, or more, under finished lighting conditions and from a normal viewing position."							
Based on PDCA recommendations, anything less than 39" may result an unnecessary increase in cost to the bids. Additionally, the nearest normal viewing position of the final constructed awning will be several meters. Please confirm that the 2 ft. requirement is to remain.

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: Specification Section 07 09 13 2.2 A 1 (IFC Drawings for Main Package dated 3/31/14)					Accept Suggestion: <input type="checkbox"/>		
Per Specification Section 07 09 13 2.2 A 1, Construction Specialties, Inc. is the basis of design for the seismic joint assemblies. As such, the details associated with the seismic joints which were bid out to Shimmick and Skanska were based upon Construction Specialties, Inc. Specification 07 09 13 2.2 A goes on to list another 3 manufacturers which can be used. Since each manufacturer may require different block-outs, embeds, attachment to structure, etc., there could be some added unforeseen costs if a bidder uses a product which is not the basis of design.					Let the bidders know that Construction Specialties is the basis of design and that the bidder will need to cover any costs associated with using one of the other listed manufacturers.		
Would TJPB like us to direct the bidders to cover any costs associated with any changes required due to the use of a product which is not the basis of design, or would TJPB like to carry the risk/costs associated with this?							
P1-0218	Inconsistent Specification and Drawing References for Joint Sizes and Movement Closed		07/02/2014	07/12/2014	07/11/2014	Potentially	<input type="checkbox"/>

REFERENCE: Sheet A1-8880, Sheet A1-4303, Sheet A1-4403 (IFC Drawings for Main Package dated 3/31/14)					Accept Suggestion: <input type="checkbox"/>		
Per Sheet A1-8880, Joint Type CJC4 is within GWB ceilings at GL 10 on the Ground Level and the Second Level. Sheet A1-4303 at GL 10 on the Ground Level shows W-16A, but does not call out a seismic joint or details. Sheet A1-4403 at GL 10 on the Second Level does not call out a seismic joint or details. Please revise the drawings and schedule to match.					Please refer to following Sketches: SKA-3736.3, SKA-3820, SKA-3821 & SKA-3822 that clarify seismic joint cover CJC4 to be issued a subsequent ASI.		
P1-0226	Materials for Seismic Joint Assemblies per Specification Section 07 09 13	Closed	07/02/2014	07/12/2014	07/11/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Tram Nguyen      To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: Specification Section 07 09 13 2.5 Specification Section 07 09 13 2.6 Specification Section 07 09 13 2.7 Specification Section 07 09 15					Accept Suggestion: <input type="checkbox"/>		
Spec Section 07 09 13 2.5 indicates the materials and coatings to be used. Spec Section 07 09 13 2.6 indicates that the joint assembly design to be based upon the design shown. Spec Section 07 09 13 2.7, indicates that an engineer is to design the materials for use in the seismic joints. Are the subcontractors to follow Spec Section 07 09 13 2.5 as per Spec Section 07 09 13 2.6, or redesign the materials per Spec Section 07 09 13 2.7? This is similar to Spec Section 07 09 15.					Specification Section 07 09 13 / 2.5 and 07 09 13 / 2.6 are correct as stated. At the request of the CM/GC in different review meetings, the TJPA directed the Design Team to delete the requirement for a Corrosion Engineer in all the Glazing and Cladding specifications.		
					Specification Section 07 09 13 /2.7 is not incorrect as currently issued. However, to further reduce costs on the Project, Specification Section 07 09 13 / 2.7. will also be revised to deleted the requirement of a Corrosion Engineer and will state the following:		
					"Conduct a component-by-component analysis of potential corrosion resulting from galvanic action between materials, for components of the work of this section and provide report."		
					This revision will also be applied to specification Section 07 09 15. These two Specifications will be re-issued in subsequent ASI.

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: RFI Response P1-0230					Accept Suggestion: <input type="checkbox"/>		
Per RFI Response P1-0230, topping slab concrete is to be as specified in Specification Section 03 30 02. Per Specification Section 03 30 02, all concrete mixes, excluding the concrete fill at basket columns, have a 3/4" aggregate.					For typical detail for concrete at the small ramps, refer to Structural detail 5/S1-5003.		
In several locations (Train Platform Level GL 2 - 4 and GL A - F for example) show the topping slabs sloping to zero thickness. This condition will not allow the use of aggregate or reinforcing as noted on the revised sheets in the response to RFI Response P1-0230.							
Please provide details and specifications for sloping of concrete to zero thickness.

<b>P1-0230.2</b>	<b>Concrete Ramp Details for Structural Slabs Poured per Slab Plans</b>	<b>Closed</b>	<b>07/22/2014</b>	<b>08/01/2014</b>	<b>08/05/2014</b>	<b>Potentially</b>	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Tram Nguyen <b>To:</b> Turner Construction Company PHIL MILITELLO			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>Co-Author:</b>							
<b>REQUEST:</b>			<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>		
REFERENCE: RFI Response P1-0230.1, Detail 5/S1-5003 (IFC Drawings for Main Package dated 3/31/14)					The referenced structural detail calls for saw cut and roughening of the slab to ¼" amplitude. The architectural slab edge drawings are not intended to show areas of slab roughening.		
RFI Response P1-0230.1 references Detail 5/S1-5003 for the installation of small ramps. Per Detail 5/S1-5003, there is a minimum slab thickness of 2" at the ramp, to saw cut the concrete at the nose of the ramp, and to roughen the surface of the structural slab to receive the ramp.					The small ramps have been shown on the architectural zone plans and on the structural details since well before the Below Grade Package TG07 Issue for Construction. Execution of this a contractors means and methods item and the drawings do not need to be revised as requested in this RFI.		
Architectural slab edge plans do not show depressions within the structural slabs where these ramps exist (topping slab ramps or housekeeping pad/mechanical pad ramps). As such, a 2"x40" swath of concrete would need to be removed where concrete has been poured per the slab plans (note - mat slab rebar is 1.5" clr. from the t.o. slab, 1 way slab and composite deck rebar is 3/4" clr. from the t.o. slab).							
Please provide revised concrete ramp details where structural slabs have been poured per the slab plans.							
<b>P1-0230.3</b>	<b>Rebar Depressions and Fixes at 2" Depressions</b>	<b>Closed</b>	<b>08/14/2014</b>	<b>08/24/2014</b>	<b>08/27/2014</b>	<b>Potentially</b>	<input type="checkbox"/>

<b>Co-Author:</b>							
<b>REQUEST:</b>			<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>		
REFERENCE: Detail 5/S1-5003 (IFC Drawings for Main Package dated 3/31/14)					It is not necessary to provide depressions in the slab for the small concrete ramps. As suggested in the RFI, a different material can be provide the taper of the small ramps.		
Detail 5/S1-5003 requires a minimum 2" thickness of concrete for the ramp. In order to maintain a minimum 2" thickness, a depression in the slab will need to be provided at the ramps. Depressions are shown on the slab edge plans.					Specification section 09 30 00 to be revised as follows:		
Train platform, lower concourse decks, and associated reinforcement are part of TG06, not TG07.2.					09 30 00 2.7.H Leveling Topping: One of the following or equal.		
Please revise the plans to show depressions and fixes for rebar at the 2" depressions, or provide a different material					1. Mapei "Planicrete 50" (basis of design)		
					2. Mapei "Mapecem"

**Co-Author:**

**REQUEST:**

Reference: L-0006 and L-0007

While sizing the maximum load for the rooftop cranes it was communicated by PWP and TT that the maximum tree size will be no greater than 25,000 lbs and that the roof is designed for a maximum of 26,000 lbs. Confirm that the structure will be able to accommodate the additional tree weight which will incur over the years as the trees grow.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

TT Response:

The roof structure was designed for the tree weights given to us by PWP during the course of the design. It was noted that the tree weights are the "average" weight of the mature tree. For seismic design, the "average" tree weight was used, because the floor slab diaphragm will distribute the weight of all trees to the seismic force-resisting system. For gravity design of steel beams carrying the tree, a factor of safety of 2 is applied to the "average" weight to account for the situation when a specific tree outgrows the "average" weight. The tree weight for the seismic design and gravity design is tabulated in the contract document Detail 2/S-1013.

PWP Response:

The "average" size of tree materials was determined by species and available soil volume (growing medium).

<b>P1-0236</b>	<b>Details for Expansion Joint Covers in Concrete Barrier</b>	<b>Void</b>	<b>07/11/2014</b>	<b>07/21/2014</b>	<b>08/05/2014</b>	<b>Potentially</b>	<input type="checkbox"/>

Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
Reference: ASI 119 and 28 16 44				The last sentence in Specification Section 28 16 44, paragraph 2.8.B.4 the reads: "Any features not available through the API or SDK interface shall be described as an exception by the Contractor as part of the Contractor's bid." shall be deleted.			
2.8.D.2 states "Any features not able to operate in a virtualized server environment shall be described as an exception by the Contractor as a part of the Contractor's bid." Since exceptions are not allowed in any bids for this project and would render the bid invalid, the statement needs to be removed.				A revised specification section will be issued in ASI 127.

REQUEST:			SUGGESTION:		ANSWER:		
Reference: 28 16 44/APA ASI 119					Accept Suggestion: <input type="checkbox"/>		
Provide sequence of operation for Bus Plaza Anti-Ram Barriers and their integration with the traffic control system, including but not limited to, types of output required (when does the traffic light change color, which traffic light changes color for each barrier, what stage of barrier operation aligns with each output) and extent of interaction with traffic lights. For example, do lights at Howard and Mission street change color depending on status of lights at the Bus Plaza Anti-Ram Barriers?					1. Control system to provide an output to the traffic control system in Section 34 41 13 to indicate barrier deployment.		
					2. The barrier control system will trigger a relay associated with the specific lane/barrier that the operator is controlling for an outbound bus.		
					3. The traffic lights controlling the flow of traffic on the public street is to begin their sequence to stop traffic (e.g. turn red).		
					4. After the traffic light has indicated vehicles on the public street are to stop, the light associated with the lane of the exiting bus shall change state to indicate to the bus operator that they can proceed.		
					5. After the bus clears the barrier, the barrier operator will trigger the system via the control to change the bus exit light to red.		
					6. Once the exit light is red, the barrier is to rise to the secure position and the traffic light associated with the vehicles traveling on the public roadway is to reset to indicate that vehicles can proceed.		
					7. Final sequence operations to be coordinated with the Owner's security concept of operations and with the traffic light control system contractor.		
P1-0277	Vehicle Barrier Timing	Closed	07/15/2014	07/25/2014	08/20/2014	Potentially	<input type="checkbox"/>

REQUEST:			SUGGESTION:			ANSWER: Accept Suggestion: <input type="checkbox"/>		
REFERENCE: Detail 6/A1-9306 (ASI 119 dated 6/18/14)			Provide 1/2" diameter drain hole in embed; drill 3/8" diameter hole through mortar to allow for drainage down to substrate.					
Per Detail 6/A1-9306, the HD galvanized rail embed shows a drain hole in the bottom of the embed. The detail goes on to show the bottom of the embed seated in grout which will prevent water from draining out of the drain hole.								
Please confirm plugging the rail embed drain hole as shown in 6/A1-9306 is acceptable.								

P1-0293	Bus Bridge Crash Rail Material Confirmation	Closed	07/18/2014	07/28/2014	08/20/2014	Potentially	<input type="checkbox"/>

Co-Author:							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
REFERENCE: Detail 2/A1-8378 (ASI 119 dated 6/18/14)				Confirmed. The Bus Bridge crash rail is metal per the Bus Bridge contract documents. Per VE item # 32, the Transit Center Building crash rail at the Bus Deck level is concrete. Locations of the respective crash rails at the Bridge/Building joint have been coordinated in the attached sketch, SKA-3661-R2.			
Per the current Bus Bridge Contract Documents, the Bus Bridge Crash Rail is metal as it approaches the Bus Deck.							
Per Detail 2/A1-8378 of ASI 119, the Bus Bridge Crash

P1-0294	Method of Construction for Concrete Column Steel Jacket Base	Closed	07/18/2014	07/28/2014	08/20/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Tram Nguyen		To: Turner Construction Company PHIL MILITELLO	Answered By:Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:		SUGGESTION:	ANSWER:      Accept Suggestion: <input type="checkbox"/>				
REFERENCE: Detail 1/A1-9208 (ASI 118 dated 6/20/14), Detail 6/S1-3503 (IFC Drawings for Main Package dated 3/31/14)			Arup response:				
Per Detail 1/A1-9208 of ASI 118, the concrete column steel jacket base are welded studs/post installed expansion anchors, and to refer to structural for sizing.			Confirmed that post-installed expansion anchors at mat-slab(train platform level) and lower concourse level can be furnished and the jacket base plate can be placed on top of slab where the slab has been poured prior to column steel jacket installation.				
Per Detail 6/S1-3503, welded studs are to be used at the lower concourse, post-installed anchors are to be used at the mat slab (train box), and jacket base plate is poured integrally to the slab whether welded studs or post-installed anchors are used.			TT response:				
Based upon the current construction and bid schedules, steel jackets will not be procured prior to pouring mat slab and lower concourse deck.			Drilling of the holes for the post-installed expansion anchors shall not damage the slab reinforcement rebars. Fabrication of the base plate shall be done based on the field locations of the anchors				
Please confirm post applied anchors can be furnished and installed at all locations column steel jacketing is required, and that the jacket base plate can be placed on top of the slab/deck where the slab/deck has been poured prior to column steel jacket installation.

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: (IFC Drawings for Main Package dated 3/31/14) Sheet A1-8690 Sheets A1-8692 through A1-8695					Accept Suggestion: <input type="checkbox"/>		
Sheet A1-8690 and Sheets A1-8692 through A1-8695 call out for AESS closure elements to be welded per structural, and finished per the AESS specification.					The plate thickness is 3/8" thick, per drawings: 8/S1-4351, S1-4350, S1-4352 and S1-4353.		
However, the details for the AESS closure elements do not call out the thickness of the material.					Also, RFI T-1517 acknowledged 3/8" thick plate.		
Please provide the thickness of the AESS closure element material.							
P1-0296	Utilization of Sheet A1-8378 for Joint Type FJC7	Closed	07/23/2014	08/02/2014	08/20/2014	Potentially	<input type="checkbox"/>

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: RFI Response P1-0224, Sheet A1-8378 (IFC Drawings for Main Package dated 3/31/14)					Accept Suggestion: <input type="checkbox"/>		
Per RFI Response P1-0224, details for FJC7 are located on Sheet A1-8378 2 Formed Aluminum Panel System (W-9) Sheet Typical Details. The answer to RFI P1-224 was then voided.					The work of seismic joint cover FJC7 is documented in Sheet A1-8378 and Specification Section 07 09 13 Seismic Joint Assemblies.		
The plans do not provide a path to direct expansion joint bidders to this sheet (no detail references are given on the plan sheets, and FJC7 is not part of the W-9 system).					Note that several other RFI's that have been responded to, covered this subject also.		
Please confirm details on Sheet A1-8378 are to be used in relation to bidding, furnishing, and installing FJC7.

<b>Co-Author:</b>							
<b>REQUEST:</b> REFERENCE: ASI 122 dated 7/23/14, Detail 4/S1-3281A (IFC Drawings for Main Package dated 3/31/14)  Per ASI 122 sheet notes, all pylons are deferred.  If pylon footings are to be deferred, the anchor bolts will also be deferred. This will prevent footings from being installed as currently designed in Detail 4/S1-3281A.  Note that pylon footing is currently included in the Trade Package TG07.2 contract.  Please provide revised footing details, or designate the anchorbolts to be used.		<b>SUGGESTION:</b>	<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The pylon footings are not deferred, per ASI 122 A1-2602 (SKA-3704) as well as other roof park zone plans, and are to be constructed as per detail 4/S1-3281A.

P1-0350	Traffic Coating at Bus Deck Level	Closed	08/04/2014	08/14/2014	08/26/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Tram Nguyen		To: Turner Construction Company PHIL MILITELLO	Answered By:Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: REFERENCE: Sheets A1-9532 through A1-9534 (IFC Drawings for Main Package dated 3/31/14)  Per Sheets A1-9532 through A1-9534, the topping slab is to receive a scratch coat. The scratch coat may have too high of an amplitude to receive traffic coating. In addition, the contract documents do not require a traffic coating at the drive aisle.  Per the email from Mark O'Dell sent on 7/29/14, traffic coating will be added to the Bus Deck Level. Details and specifications have not been provided for the traffic coating at the Bus Deck Level.  Please confirm that the topping slab is to receive a scratch coat and provide the traffic coating details and specifications per prior discussions.		SUGGESTION:	ANSWER: Accept Suggestion: <input type="checkbox"/> Correction, the topping slab referenced is required to receive a scratch finish, not a scratch coat; this is confirmed.  Specification section 07 18 14 07 Floor Coatings (FC-1, FC-2) is currently being updated to document the traffic coating to be added to the Bus Deck Level traffic/topping slab. This will be issued in an upcoming ASI.

REQUEST:		SUGGESTION:		ANSWER:            Accept Suggestion: <input type="checkbox"/>			
REFERENCE: Detail 2/A1-8237D (ASI 120 dated 7/11/14)							
Detail 2/A1-8237D of ASI 120 calls for fireproofing at the steel ring beam.		Sheets A1-8662 and A1-8663 indicate the scope and application of steel fireproofing requirements for the project. Details graphically show the fireproofing in the vicinity of the specific condition drawn, if the steel element is being cut, the fireproofing is shown in section, if the element is not cut (it is in the background) typically the fireproofing is not shown-- this is standard graphic convention. For the extent of all fireproofing of ALL structural steel, please refer to Fire Protection Matrix and Schedule in sheets A1-8662 and A1-8663.					
No fireproofing is shown at the column supporting the steel ring beam.							
Please confirm that fireproofing is not required at the column shown in Detail 2/A1-8237D. If fireproofing is required at the column supporting the steel ring beam, please provide the details and type for the required fireproofing.

REFERENCE:					Accept Suggestion: <input type="checkbox"/>		
Sheet L1-3606 (IFC Drawings for Main Package dated 3/31/14),					This RFI is incorrect. Drawings A1-8651 and A1-8652 (ASI 122 date 7/23/14) clearly show the top of step elevation above the Park Level elevation of 86'-9".		
Details 1 & 2/A1-8651 (ASI 122 dated 7/23/14)					See notes on 2/A1-8651 and 3/A1-8652, which refer to Landscape drawings for stair elevations. The Architectural and Landscape drawings are coordinated.		
Detail 3/A1-8652 (ASI 122 dated 7/23/14)							
Sheet L1-3606 shows a top of step elevation of 86.90 at Stair 601.							
Details 1 & 2/A1-8651 shows a top of step elevation of 86'-9" at Stair 601 then refers to Detail 3/A1-8652.							
Detail 3/A1-8652 also shows a top of step elevation of 86'-9".							
Please confirm the correct elevation and coordinate the plans and details to match.

P1-0367	Deferral of Expansion Joint Covers per ASI 122	Closed	08/14/2014	08/24/2014	08/27/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Tram Nguyen                      To: Turner Construction Company PHIL MILITELLO			Answered By:Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: ASI 122 - VE Round 3 dated 7/23/14					Accept Suggestion: <input type="checkbox"/>		
Per ASI 122 dated 7/23/14, the Roof Park expansion joints have not been deferred, but their covers have been deferred.					The decision to defer the grade level seismic joint covers, as noted on SKA-3706, SKA-3708 and SKA-3819 issued as part of ASI 122, is rescinded. Covers are to be provided as part of the complete seismic joint assembly. If the Roof Park is still being deferred at time of installation then an alternate pan infill material will be proposed at that time.		
Expansion joints and all associated components are sold as a unit. This will affect the warranty (depending if the park is built out) and result in added cost with little benefit.							
Please confirm TJPA wants W/O to contract out the entire roof top park expansion joint assembly at grid lines 10 and 20 except the cover.

<b>REQUEST:</b>			<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>		
REFERENCE: Detail 1/A1-9250, Detail 3/A1-9251, Detail 4/A1-9251 (ASI 118 dated 6/20/14)					For the updated WPM-5 waterproofing details at the Telecom Service Vaults, refer to SKA-4015.		
Detail 1/A1-9250 of ASI 118 shows WPM-5 crystalline waterproofing being applied to the bottom of metal deck and the bent plate at the edge of deck.							
Details 3 & 4/A1-9251 of ASI 118 shows WPM-5 crystalline waterproofing going over a metal sleeve.							
Crystalline waterproofing is not compatible with metal.							
Please revise waterproofing detail where WPM-5 crystalline waterproofing is shown over metal deck, bent plate, and metal sleeve.							
<b>P1-0381</b>	<b>W-2 Schedule of Unit Prices</b>	<b>Closed</b>	<b>08/20/2014</b>	<b>08/30/2014</b>	<b>09/22/2014</b>	<b>Potentially</b>	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Andrew Kitchen <b>To:</b> Turner Construction Company PHIL MILITELLO			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>Co-Author:</b>							
<b>REQUEST:</b>			<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>		
Reference 08 44 25 (ASI 120 and Div. 00/01 Specifications)					The unit price requirement for the temporary retail facade change to a glazed facade will be changed to an additive alternate, to be priced below the line. Please refer to attached marked up specification sections 01 10 30/APA and 08 44 25, and to attached sketches A1-8189 (SKA-3851-R2) and A1-8190 (SKA-3852-R2).		
Specification Section 08 44 25 subsection 1.3 calls for a unit price for Temporary Retail Façade and Glass Retail Façade for 2, 3 and 4 bay modules. There is not a Schedule of unit prices specification for the W-2 system in the Div. 00/01 dated August 11, 2014. If a unit price is required for the Temporary Retail Façade it needs to be included in the Div. 00/01. Currently the only unit price specifications listed are 01 10 20/APA for TG03, 10 10 20/APB for TG04.5.1, 01 10 20/APC for TG04.3, 01 10 20/APD for TG04.4, 01 10 20/APE for TG04.1, 01 10 20/APF for TG04.2, 01 10 20/APG for TG04.6, 01 10 20/API for TG06.0, and 01 10 20/APJ for TG18.1. If unit pricing for Temporary and Glass Retail Façade is desired, provide unit price specification, otherwise revise specification to not include unit pricing language.

Co-Author:							
REQUEST:		SUGGESTION:	ANSWER:            Accept Suggestion: <input type="checkbox"/>				
REFERENCE: Specification Section 09 21 16 1.6 E 3, Specification Section 09 21 16 1.6 E 5 (IFC Drawings for Main Package dated 3/31/14)			No portable lighting is required for the punchlist review prior to final acceptance by TJPA, unless the punchlist review is required prior to the time permanent building lighting is in place and operational.				
Specification Section 09 21 16 1.6 E 3 requires the trade subcontractor to provide portable lighting for the review of mock-ups under various light conditions for defects and improperly finished joints, trim, and screw heads.							
Specification Section 09 21 16 1.6 E 5 indicates that the mock-ups will be used as a standard for the gypsum board work with the same finish for the Project.							
No requirement is given elsewhere that portable lighting is required for providing various lighting conditions for inspection/punch prior to final acceptance by TJPA.							
Please confirm no lighting for inspection/punch prior to final acceptance is required beyond the ambient lighting found in the area under review.

P1-0409	Drill Holes for the Birdwire System	Closed	08/22/2014	09/01/2014	09/04/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Tram Nguyen		To: Turner Construction Company PHIL MILITELLO		Answered By:Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST: REFERENCE: Specification Section 10 81 13 3.2 C 2 (IFC Drawings for Main Package dated 3/31/14)  Specification Section 10 81 13 3.2 C 2 indicates that the installer of the Birdwire System is to drill ¼" holes in the substrate for mounting.  These holes may void the warranty of the substrate, and create a possible point of water intrusion.  Please confirm this is acceptable, or revise specification to allow for installation with adhesive only.		SUGGESTION:		ANSWER:            Accept Suggestion: <input type="checkbox"/> Install system using mechanical fastening methods only, without the use of adhesives. Use aluminum or stainless steel clamps, brackets, clips and fasteners for installation as shown in the Contract Document details. Use stainless steel hose clamp with attached post when attaching to pipe or round structural sections where diameter allows (e.g. light poles). The mechanical fastening method shall not penetrate the substrate in a manner that creates water intrusion or voids the warranty of the substrate.

P1-0415	Pricing Coordination with PG&E	Void	08/26/2014	09/05/2014		Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Andrew Kitchen <b>To:</b> Turner Construction Company PHIL MILITELLO <b>Co-Author:</b> <b>REQUEST:</b> Reference Note #8 C1-8001 - C1-8005 ASI 123  Note #8 on Civil drawing(s) 8001 - 8005 contains the following: "Contractor shall coordinate with PG&E via TJPA for service connection work prior to start of construction. Location of PG&E service point is undermined and subject to change."  Please provide clarity for the Trade Group bidders on how TJPA would like them to provide pricing, for this unknown element with an undetermined location and/or duration of time necessary for coordination. <b>SUGGESTION:</b> <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>							
P1-0416	Finish Details for Landscape Drawings	Closed	08/26/2014	08/26/2014	09/01/2014	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Andrew Kitchen <b>To:</b> Turner Construction Company PHIL MILITELLO <b>Co-Author:</b> <b>REQUEST:</b> Reference A1-2870, S1-2310 and S1-3201 (IFC Main set)  Architectural drawing A1-2870 directs the contractor to the Structural drawings for information regarding the concrete finish elevations; Structural drawings S1-2310 & S1-3201 provide elevation for top of concrete at the train box only; landscaping drawings do not provide any finish information ¿ (see highlighted section) as this is not included in the landscaping.  Please provide information regarding the highlighted section on the attached drawing L1-2330 and/or drawing number wherein concrete sectional details can be found, including topping slab to concrete on grade. Provide details for elevations, expansion joints, contraction joints, landscaping if any, civil site work if any. <b>SUGGESTION:</b> <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The area referred to and highlighted in this RFI is Parcel F. There is no Landscape or Civil Site Work scope in this area, as the finishing of this area is future work not within the current scope of the Transbay Transit Center project.  Note:  A1-2870 does not direct the contractor to the Structural drawings for concrete finish elevations.  S1-2310 has a few elevations, but that is a structural convention to illustrate a step in the slab. All elevations for the top of concrete Ground Floor level slab are derived from the Architectural slab edge drawings.  S1-3201 is a section, not a plan and there are no elevations shown on this drawing. <b>Answered By:</b> Adamson Associates, Inc. George Metzger

<b>Co-Author:</b>							
<b>REQUEST:</b> Reference all Landscaping drawings  Recently it was discussed that VE item number 4a (see attached); removal the banding at the topping slabs has been accepted by TJPA. Please provide new landscaping drawings and details with information to allow the bidders to incorporate this into their pricing.		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>		The information on this VE item (4A) is the same as Alternate No. 26 listed on Specification Section 01 10 30/APE. Also refer to Specification Section 03 33 12, par. 3.16.C.	
<b>P1-0418</b>	<b>Revision of Corrosion Engineer Requirement Anywhere Stated</b>	<b>Closed</b>	<b>08/28/2014</b>	<b>09/07/2014</b>	<b>09/08/2014</b>	<b>Potentially</b>	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP                      Tram Nguyen		<b>To:</b> Turner Construction Company PHIL MILITELLO		<b>Answered By:</b> Adamson Associates, Inc. George Metzger			
<b>Co-Author:</b>							
<b>REQUEST:</b> REFERENCE: Specification Sections requiring a Corrosion Engineer  Specifications currently require a corrosion engineer to conduct a component-by-component analysis of potential corrosion and and provide the engineer's report.  Per discussions with TJPA, PMPC, and WOJV, the use of a corrossion engineer is no longer required.  Please confirm that all specification sections currently requiring a corrosion engineer will be removed and the only requirement is to provide the report as approved by the TJPA Representative.		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>		The Contractor is to provide a component-by-component corrosion analysis report with their own forces, rather than providing an analysis by a corrosion engineer, when a corrosion analysis is called for in the specifications.  It is believed the requirement for the corrosion analysis to be performed by a corrosion engineer has been removed from all specification sections. Please provide a follow-up RFI for any current specification sections you find with the requirement for a corrosion engineer.

Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: Details 4-8/A1-9060 (IFC Drawings for Main Package dated 3/31/14)					Accept Suggestion: <input type="checkbox"/>		
Details 4 - 8/A1-9060 indicate that the exposed wall space area above tile within the SFPD Restrooms are to be painted cement board.					For the restrooms, cement board is used as a substrate for the tile finish. The wall area between the top of the tile and the ceiling is painted gypsum board. The annotation on the Lower Concourse Restroom elevations and the wall assembly annotation on the Partition Schedule have been updated accordingly. Please refer to the attached SKA-4070 to SKA-4074.		
Painting of exposed cement board is not a typical application.							
Please confirm painted cement plaster board is desired where indicated in the contract documents, and provide finish/appearance required for the painted cement board.

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: Specification Section 09 24 00 1.1 C 2 (ASI 124 dated 8/18/14)					Accept Suggestion: <input type="checkbox"/>		
Per Specification Section 09 24 00 1.1 C 2 of ASI 124, the raceways, wiring, and pathways needed for concealed electrical systems i.e., lighting fixtures, exit lighting, power, way finding, automatic door power, along with low voltage wires (concealed or exposed as indicated in drawings are to be furnished by others, but installed by the Portland Cement Plaster Trade Package.					Paragraph 1.1 C.2 of Specification Section 09 24 00 issued on ASI-0127 is deleted, work is defined under TG10.4.		
TG10.4 - Electrical, Communications, Security, and Integrated Networks, is to furnish and install all electrical work unless specifically referenced in other trade packages (for example, some low voltage is in the Doors and Hardware Trade Package).							
Please remove installation of electrical out of the specification for Specification Section 09 24 00.							
P1-0425	Test Methods per Specification Section 09 24 00 1.7 G 2	Closed	08/28/2014	09/07/2014	09/11/2014	Potentially	<input type="checkbox"/>

Co-Author:

REQUEST:

REFERENCE: Note PA-1/S-0008, Note PA-3/S-0008 (IFC Drawings for Main Package dated 3/31/14)

Note PA-1/S-0008 defines a powder actuated fastener as a post installed anchor.

Note PA-3/S-0008 states to use scanning equipment or other means to locate and avoid cutting or damaging reinforcing bars.

Based upon these requirements, scanning for rebar will be required prior to the installation of any powder actuated fasteners (metal framing top and bottom tracks, ceiling wires, etc.).

This could significantly increase the cost and duration of the work. Please confirm scanning or other methods for locating rebar is required prior to the installation of powder actuated fasteners.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

If powder actuated fasteners are long enough to cause damage to rebar, then scanning per PA-3 is required. If the powder actuated fasteners are short enough not being able to hit or damage rebar, then section PA-3 is not invoked hence scanning is not required.

Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: Specification Section 09 24 00					Accept Suggestion: <input type="checkbox"/>		
Specification Section 09 24 00 2.7 B indicates that the cement plaster color is to be Gray. No other integral colors are noted.					Specification Section 09 24 00 paragraph 2.7 B has been revised. Please refer to attached markup of this section for revised plaster system and materials.		
If the cement plaster requires paint, the plaster will need to cure for an extended duration before paint is applied. This will impact the duration the scaffold is in place.					Issues related to curing times per specification are determined by the plaster system manufacturer's recommendations.		
Please note that TG16.1 Drywall/Framing is currently scoped to leave the scaffold in place if the cement plaster requires painting.					Please refer to paragraph 2.5 in the attached revised plaster Section. The color is integral to the pre-mixed exterior finish coat, which is applied over the plaster mesh over the brown coat. The basis of design specified is Parex "Image Smooth Finish" with a custom color - The color is BM 1548 classic gray to match TJPA's Representative sample.		
Please confirm that the gray cement plaster is to remain exposed and does not require paint.					The duration of the scaffold in place is a Means and Methods decision to be determined by the Contractor.		
P1-0429	Doors 01901A and 01920A per Sheet A1-9703	Closed	09/03/2014	09/13/2014	09/05/2014	Potentially	<input type="checkbox"/>

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: Sheet A1-9703 (ASI 124 dated 8/18/14)					Accept Suggestion: <input type="checkbox"/>		
Sheet A1-9703 of ASI 124 calls out Doors 01901A and 01920A.					Both doors are located in at the Ground Floor Zone 10 SW area in the vicinity of the Vehicle and Bicycle Ramp. Door 01901A is the exterior exit door from Stair 901 and Door 01920A is the door for the Communication Vault to the south and west of the stair exit door.		
The plans do not show these doors.							
Please provide a plan showing Doors 01901A and 01920A.					Please see attached SKA-4077 for the location and SKA-4078 for the updated Door Schedule showing these two doors.

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: (IFC Drawings for Main Package dated 3/31/14)					Accept Suggestion: <input type="checkbox"/>		
Sheet A1-0023					Wall types 30 & 61 are specific to supporting the W-5 System and at locations where noted on the drawings.		
Detail 1/A1-7020					The W-5 System may also be supported by HSS posts, these locations are also appropriately referenced and detailed on the drawings.		
Sheet A1-0023 describe Wall Types 30 and 61 as supporting the Colored Glass Cladding System (W-5).							
Details (Detail 1/A1-7020, for instance) show the Colored Glass Cladding System (W-5) as being supported separately from Wall Types 30 and 61.							
Please confirm Wall Types 30 and 61 are only supporting the W-5 where the W-5 system is specifically shown to hang from Wall Types 30 and 61 on the drawings.

P1-0448	Bronze Floor Inserts	Closed	09/10/2014	09/20/2014	09/24/2014	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Andrew Kitchen <b>To:</b> Turner Construction Company PHIL MILITELLO			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>Co-Author:</b>							
<b>REQUEST:</b> Reference Specification Section 09 66 23 2.3.C IFC Main Set (03/31/2014)  09 66 23 2.3.C indicates that 56 bronze floor inserts are to be furnished and installed as part of the terrazzo work. Please see the following and provide responses accordingly:  1) No drawings or specifications (grade of bronze, required finish, patina, etc.) have been provided showing the bronze floor inserts. Please provide these drawings/specifications.  2) 09 66 23 2.3.C states that there are 6 different designs of bronze inserts, but the list below only shows 5. Please revise so these are no longer in conflict.  3) 09 66 23 2.3.C.5 shows "12 inch TBD". Please provide the missing information that is currently shown as "TBD".			<b>SUGGESTION:</b>				
			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> 1. Specification for the bronze inserts (grade of bronze, required finish, patina, etc.) shall be provided by the Artist.  2. 6 Designs is correct. Artist shall provide the design and description of the 6th element. For the remaining 5 elements refer to attached "20142703_JC Bronze Inset Sketch 1.pdf", and "20132212_JC Bronze Inset Sketch 2.pdf".  3. Refer to the attached " 20132212_JC Bronze Inset Sketch 2.pdf" for illustration of "12 inch TBD".

REQUEST:			SUGGESTION:		ANSWER:		
Reference Specification Section 09 66 23 1.9.A IFC Main Set (03/31/2014)					Accept Suggestion: <input type="checkbox"/>		
09 66 23 1.9.A states ¿ The minimum slab temperature shall be 60 degrees F before commencing installation, during installation, and for at least 72 hours after installation is complete. The substrate temperature must be at least 5 degrees F above the dew point during installation.¿ The Manufacturer's written installation instructions state "Throughout the application process, substrate temperature should be 60°F ¿ 90°F. Substrate temperature must be at least 5°F above the dew point. Applications on concrete substrate should occur while temperature is falling to lessen offgassing. The material should not be applied in direct sunlight, if possible. Protect material from freezing prior to installation.." The specifications do not match manufacturer¿s written installation instructions. Please confirm the environmental conditions required within 09 66 22 shall override the manufacturer¿s written installation instructions.					Environmental conditions for Terrazzo are to be as per Manufacturer's written instructions.

P1-0457	FI Requirements for Terrazzo	Open	09/12/2014	09/22/2014	10/29/2014	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Andrew Kitchen <b>To:</b> Turner Construction Company PHIL MILITELLO			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>Co-Author:</b>							
<b>REQUEST:</b> Reference Specification Section 03 30 02, 09 66 22, 09 66 23 IFC Main Set (03/31/2014)  03 30 02 3.6.A.2 states to comply with dimensional tolerance limitations given by ACI 117 for Concrete Finishes, and 03 30 02 3.6.A.4.c states "FI numbers shall not apply to unshored slabs or shored slabs with camber." ACI 117 4.4.1 states that slabs on structural steel or precast concrete have no deviation from elevation requirement. However, 09 66 22 3.2.B states that the Terrazzo Trade Subcontractor must level the floor to a specific FI, and 09 66 23 3.3.F refers to 09 66 22 3.2.B for FI requirements for Epoxy Terrazzo Flooring. As such, the concrete filled metal pan deck and topping slabs have a FI requirement which conflicts with the allowable FI referenced in 09 66 22 and 09 66 23. In addition, the concrete substrate may continue to move after installation of terrazzo. Please provide direction on installation of terrazzo epoxy crack suppression and epoxy terrazzo flooring where their FI requirements conflict with the FI requirements of the concrete substrate.			<b>SUGGESTION:</b>				
			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Specification Section 09 66 22, 3.2 B: Reference to tolerances is to be removed from this section.  Specification Section 09 66 22, 3.2 C to be revised as follows: After leveling and before installation of the moisture control system, engage a California licensed surveyor or civil engineer to make a survey of the floor to confirm the flatness SOF of 50 and levelness as indicated on drawings using a self propelled profilometer or a similar instrument that will give an accurate measurement downloadable to a computer in the form of a floor survey. Report any deviations from the floor flatness criteria or floor level to General Contractor for correction.  Specification section 03 30 02, 3.6 G: Revise section to add 3. Finish surface of topping slab to SOF of 50. Level of topping slab to be as shown on drawings.  To facilitate installation of reinforcing in topping slab at Grand Hall and to mitigate conflict with Hydronics Piping substitute #4 bar with WWR 6x6x4.5/4.5 on bolsters. WWR to be flat sheet.

REQUEST:		Refer to attached SKA-4139-R1 and SKA-4140-R1 for clarification.					
Reference: 2/A1-9001, 2/A1-9002, 2/A1-9004, 2/A1-9012, 2/A1-9015, 2/A1-9017, 2/A1-9021, 2/A1-9023, 2/A1-9024, 3/A1-9033, 3/A1-9034, 5/A1-9041, 10/A1-9042 (IFC Main Set 03/31/2014)							
Bathroom floor plans show sloping adjacent to the drain, but flat at the remainder of the field tile (see 2/A1-9001, 2/A1-9002, 2/A1-9004, 2/A1-9012, 2/A1-9015, 2/A1-9017, 2/A1-9021, 2/A1-9023, 2/A1-9024, 3/A1-9033, 3/A1-9034). 5/A1-9041 and 10/A1-9042 call out for a setting bed on topping slab at the restroom floors. Please confirm only the areas around the floor drains, as shown on the floor plans, are to be sloped, and that a setting bed is not required where tile is not sloped (i.e. the tile is thin set on the topping slab).

REQUEST:			SUGGESTION:		ANSWER:		
Reference Specification Section 32 15 10 3.12.B.2 IFC Main Set (03/31/2014)					Accept Suggestion: <input type="checkbox"/>		
Specification references Section 3.11.B.1. This is an incorrect reference. Please revise section 3.12.B.2 to reference the correct section.					See attached SKLA-328.		
P1-0482	Geotextile Fabric Source	Open	09/23/2014	10/03/2014	10/01/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Andrew Kitchen To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
Reference Specification Section 32 11 24 2.1.A, 2.2.A IFC Main Set (03/31/2014)					Accept Suggestion: <input type="checkbox"/>		
Specification says that 100% of materials are to be sourced regionally. The Geotextile Fabric manufacturer listed in this Specification is from Georgia, which would cause great difficulty in achieving this credit. Please revise the Specification so that the LEED credit is achievable with the given manufacturers.					The manufacturers global headquarters is in Georgia. Contact manufacturer to confirm local fabrication plant.		
P1-0483	Recycled Content Requirements	Open	09/23/2014	10/03/2014	10/21/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Andrew Kitchen To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
Reference Specification Section 32 11 24 2.1.A IFC Main Set (03/31/2014)					Accept Suggestion: <input type="checkbox"/>		
Recycled content submittal requirements are included in Part 1. Since there is no LEED MRc4 requirement listed in section 2.1, confirm that there are no recycled content requirements.					No minimum recycled content is required for the subject specification. Only a LEED data submittal is required.

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE: (ASI 127 dated 9/12/14) Sheet A1-2970 Sheet S1-2603  Sheet A1-2970 of ASI 127 calls for a 10" concrete knee wall, thicker concrete walls at the elevator core, refers to structural drawings, and do not show the walls as deferred at the Roof Park Level.  Sheet S1-2603 of ASI 127 does not identify the type of wall to be built, but references Sheet S1-2701. Sheet S1-2701 has not been issued.  Please provide Sheet S1-2701 and details on the concrete walls to be built at the Roof Park Level.					Accept Suggestion: <input type="checkbox"/> George Metzger: Sheet S1-2701 was issued as part of Roof Park Restaurant package, dated 05/30/2014. Contact TJPA regarding the status of this and the TJPA direction on the Restaurant.  Ray Quesada: Roof Park Restaurant IFC set, dated 5/30/2014, will be issued to W/O with the conformed IFC set to be issued in December, 2014.

<b>Co-Author:</b>							
<b>REQUEST:</b> Reference A1-8520 (ASI 124)  Details 1, 2, and 4/A1-8520 show the connection of the W-14 ceilings and the cast nodes. There is no detail or information provided for the reveal between the W-14 and the cast nodes. Please provide a cut that shows this reveal detail.			<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The aluminum ceiling portion of this project is treated as Design/Build; the design intent is shown and profiles are diagrammatic in nature, thus not all conditions are detailed; additionally, the ceiling reveals illustrated in details 1, 2 & 4 on A1-8520 occur at angled pipe columns, not at cast nodes.  As noted in the W-14 System Description on A1-8500, dimensional control for the joints between W-14 ceilings and adjacent systems shall be derived from the 3D model. Refer to the W-14 3D model listed on sheet A1-0009.

Reference Detail 2/A1-8531 ASI 124				Detail 2/A1-8531 is revised. The note calls out the ceiling suspension system. There is not a "Secondary Structure" and sheet A1-8504 has been deleted, as it is not required.			
Detail 2/A1-8531 calls out "Secondary Structure See A1-8504." A1-8504 was not issued in the IFC Main Set or any subsequent ASIs. Please provide sheet A1-8504.							
P1-0503	Rigid Insulation Above W-14	Closed	09/30/2014	10/10/2014	10/13/2014	Potentially	<input type="checkbox"/>
<div><div>From: Webcor Construction LPAndrew Kitchen</div><div>To: Turner Construction Company PHIL MILITELLO</div><div>Answered By: Adamson Associates, Inc. George Metzger</div></div>							
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Reference ASI 124 Drawings				a) Acoustical insulation is required at all corrugated ceiling panels to mee the criteria in Specification 09 51 23 2.4 Q. Acoustical insulation is required at horizontal, sloped or vertical soffits to meet said criteria.			
The following sheets show a new W-14 Metal Ceiling location, without deleting the old rigid insulation location: 2/A1-8501, 3/A1-8510, 1/A1-8511, 1/A1-8530, 4/A1-8530, 5/A1-8530, 9/A1-8530, 4/A1-8531, 3/A1-8532, 5/A1-8532, 7/A1-8532. Additionally, the following sheets do not show rigid insulation redrawn with the new redline markups: 2/A1-8501, 5/A1-8510, 1/A1-8511, 1/A1-8521. It seems that there was no intent to place rigid insulation above horizontal or diagonal soffit locations.				b) Per TJPA's direction, all of the Conformed IFC Documents with the revised construction documentation will be issued in the Conformed Set of December 2014.			
a) Please confirm there is no rigid insulation located above horizontal or diagonal soffits.							
b) Please revise these drawings so that the rigid insulation is properly located, and so that all old rigid insulation locations are deleted.							
P1-0504	W-14 Connection to Large Fan Sleeve	Closed	09/30/2014	10/10/2014	10/13/2014	Potentially	<input type="checkbox"/>

REQUEST:

REFERENCE: (ASI 127 dated 9/12/14)  
Specification Section 10 14 16

Specification Section 10 14 16 1.6 A 2 Cast and Etched Graphics indicates the warranty period is subject to final approval by TJPA representative.

This requirement may impact pricing of the bid.

Please provide a specific time period for the warranty.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

· Specification Section 10 14 16 1.6 A 2 Cast and Etched Graphics: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified. ¿ See attached.

· Specification Section 10 14 19 1.6 A 2 Dimensional Lettering: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified.¿ See attached.

· Specification Section 10 14 26 1.7 A 2 Pylon Signage: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified. ¿ See attached.

· Specification Section 10 14 33 1.6 A 2 Illuminated Panel Signage: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified. ¿ See attached.

· Specification Section 10 14 36 1.6 A 2 Non-Illuminated Panel Signage: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified. ¿ See attached.

REFERENCE: Detail 2/SG1-6023 (IFC Drawings for Main Package dated 3/31/14)				Accept Suggestion: <input type="checkbox"/>			
Key Note 9 on Detail 2/SG1-6023 indicates that the final artwork for Sign KM1 Static Map and Digital Display is to be supplied by owner.				The detailed configuration of the Transit Center is specific to all interior spaces and uses -- has not yet been finalized. Consequently, artwork for the final graphic for the static map is not yet available. Pricing can be based on the assumption that the final static map will be a large format digital print map of the Transit Facility, fabricated and installed as per the current drawings and specifications. There is no 3D Dimensional Lettering as a component of this sign type.			
Please provide the final artwork, information on amount of letters to be priced, or allowance amount to be used.

P1-0530	Pylon Signage Electrical Power Requirements per Specifications and Constructabi	Closed	10/10/2014	10/20/2014	10/21/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Tram Nguyen      To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE:					Accept Suggestion: <input type="checkbox"/>		
Specification Section 10 14 26 (ASI 127 dated 9/12/14) Details 6 & 7/SG1-6001 (IFC Drawings for Main Package dated 3/31/14)					As per the RFI and Constructability Comments 7909, 7910, and 7911, Specification Section 10 14 26 3.1 B, Pylon Signage, has been modified as follows: Delete the sentence ¿Verify that items, including anchor inserts, and electrical power are sized and located to accommodate signs.¿ in its entirety and replace with the sentences, ¿Verify that anchor and anchor inserts are sized and located properly to accommodate installation of Pylon signage. Sign Subcontractor to design signs to conform to electrical circuiting power allotments existing in the current design and if necessary, include additional electrical circuits in pricing if additional power is determined to be required.¿ See attached.		
Specification Section 10 14 26 3.1 Pylon Signage directs that the signage subcontractor is to verify that electrical power is sized and located to accommodate signs. In addition, Details 6 & 7/SG1-6001 indicate that the signage contractor is to provide power requirements to the TJPA representative.							
Per Constructability Comments 7909, 7910, and 7911, the signage specification are to be revised to require the signage contractor to design the signs within the electrical circuiting power allotments in the current design, and include additional electrical circuits in their signage bid if additional power is determined to be required.							
Please revise Specification 10 14 26 as indicated in the response to Constructability Comments 7909, 7910, and 7911.							
P1-0531	Warranty Period Requirement per Specification Section 10 14 26 Pylon Signage	Closed	10/10/2014	10/20/2014	10/20/2014	Potentially	<input type="checkbox"/>

Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE:					Accept Suggestion: <input type="checkbox"/>		
Specification Section 10 14 26 (ASI 127 dated 9/12/14)					WSP Response:		
The following Specification Sections for Pylon Signage call out for pylon sign lighting to be on a switchable lighting circuit:					All circuits serving sign types PS1, PS2, and PS4 shall be via normal power LRC located in same electrical room as power panel serving sign. Connect to existing available relay. Otherwise, provide matching relay, quantity as required.		
10 14 26 2.1 B 1 q 10 14 26 2.1 B 2 q 10 14 26 2.1 B 3 q 10 14 26 2.1 B 4 s 10 14 26 2.1 B 5 s 10 14 26 2.1 C 1 y 4 10 14 26 2.1 C 2 z 4					All circuits serving sign types PS5, PS6, PD1, and PD2 shall be via new emergency power LRC to be located in same electrical room as power panel serving sign. Provide separate cabinet and quantity of relays to match quantity of circuits served.		
The electrical plans do not show the pylons as being on a switchable lighting circuit. Please revise the Electrical Drawings/Pylon Signage Specifications to agree with each other.					The lighting circuits to these signs will be controlled through the LRC's (lighting relay cabinets). They are not controlled by the BMS. Electrical drawings will be revised in ASI-128 to reflect this.		
					WSP/ELW 10/23/14		
					WRNS Response:		
					Sign Types (Pylons) PS1, PS2, PS4, PS5, PS6, PD1, and PD2 as called out in the specifications will be on switchable lighting circuits.

<b>Co-Author:</b>							
<b>REQUEST:</b> Reference 13 34 24 (ASI 127)  The Contract Documents do not dimension the exterior window glazing for the Prefabricated Guard Booths. Please dimension the exterior window glazing before bid so that this package can be accurately priced.		<b>SUGGESTION:</b>	<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> refabricated booths are design-build elements. To realize the maximum design-build value, Design Team will rely on the booth manufacturer's standard fabrication modules.  Specification section 13 34 24, 2.3.H, shall be modified as follows:  2.3.H.  1. Maximize window size for all non-restroom spaces within manufacturer's standard module/panel size.  2. Window sill shall clear built-in work counter height, and be located between 2'-8" and 3'-0" above finished floor.  3. Window head height shall not exceed booth ceiling height.  4. Minimum window height shall not be less than 3'-6".

REQUEST:			SUGGESTION:		ANSWER:              Accept Suggestion: <input type="checkbox"/>		
REFERENCE:			Confirmed that electrical power is not required to supply sign Type BG1. Specification Section 10 14 73 3.1 B, Glass Signage, delete in its entirety the sentence, ¿Verify that items, including anchor inserts, and electrical power are sized and located to accommodate signs.¿ and replace with the sentence, ¿Verify that anchor and anchor inserts are sized and located properly to accommodate installation of Glass Signage.¿ See attached.				
Specification Section 10 14 73 (ASI 127 dated 9/12/14)							
Specification Section 10 14 73 1.3 E and Specification Section 10 14 73 3.1 B Glass Signage indicate that Sign Type BG1 Applied Message Band on Glass is powered. Specification Section 10 14 73 2.2 and Sheet SG1-6191 do not show electrical components associated with Sign Type BG1.							
In addition, the response to Constructability Comment 7927 states "The signage specifications will be revised to require the design-build signage contractor to design the signs within the electrical circuiting power allotments in the current design, and to include additional electrical circuits in their signage bid if additional power is determined to be required."							
Please confirm electrical power is not required to be supplied to Sign Type BG1 and delete the electrical references, or revise the contract documents to reflect the response to Constructability Comment 7927.

---------------	----------------	---------------	---------------------	----------------------	----------------------	--------------------	----------------

**Co-Author:****REQUEST:****REFERENCE:**

Specification Section 10 14 83 (ASI 127 dated 9/12/14)

Specification Section 10 14 83 2.4 G Interpretive Graphics states that signage development is independent of schedule, and to allow adequate time for development of product.

The signage subcontractor will be required to complete the work as required by the construction schedule.

Please remove the schedule language associated with 10 14 83 2.4 G.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

Specification Section 10 14 83 2.4 G, Interpretive Graphics, delete in its entirety the sentences  
¿ Signage development is independent of schedule.  
Allow adequate time for development of product.¿ See attached.

**P1-0570 Drawings for Interpretive Graphics****Closed****From:** Webcor Construction LP

Tram Nguyen

**To:** Turner Construction Company PHIL MILITELLO**10/16/2014****10/26/2014****10/22/2014****Potentially** ☐**Answered By:** Webcor Construction LP Andrew Kitchen**Co-Author:****REQUEST:****REFERENCE:**

Specification Section 10 14 83 (ASI 127 dated 9/12/14)

Specification Section 10 14 83 3.3 A Interpretive Graphics directs that the signage subcontractor is to locate signs and accessories where indicated.

No drawing has been provided locating the interpretive graphics. Please provide a document laying out the interpretive graphics.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

The Roof Park Garden layout ¿ where the Interpretive Graphics elements will be installed ¿ has not yet been finalized. Consequently, final locations for these elements cannot be identified at this time. Pricing should be based on the information contained in the Signage Drawings and associated specifications (e.g., nature of construction/fabrication, quantities, installation methodologies, etc.). Regarding Specification Section 10 14 83 3.3 A, Interpretive Graphics, delete in its entirety the sentence ¿ Locate signs and accessories where indicated, using mounting methods of types described and complying with manufacturer's written instructions.¿ and replace with the sentence ¿ Signs and accessories to be installed using mounting methods of types described and complying with manufacturer's written instructions.¿ See attached.

REQUEST:		SUGGESTION:		ANSWER:			
REFERENCE:				Accept Suggestion: <input type="checkbox"/>			
Specification Section 10 18 00 (ASI 127 dated 9/12/14)				Circuiting has been provided on the electrical drawings based on a preliminary estimate of power allocation for signage components. No electrical changes are proposed at this time. Per the signage drawings, signage contractor must confirm all power requirements on system submittals. In addition, the ticket machine power requirements need to be confirmed. When this info is provided, if additional power is required, wiring can be pulled in the existing conduits.			
The following Specification Sections indicate that the ticket and added value machines have separate power requirements from the associated kiosks:							
10 18 00 2.2 F 1 n 10 18 00 2.2 F 1 o 10 18 00 2.2 F 2 n 10 18 00 2.2 F 2 o							
Electrical drawings do not show separate power for the ticket and added value machines.							
Please confirm no additional circuits are required for the ticket and added value machines, or revise the electrical documents to reflect the desired power and data requirements.

REQUEST:

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)  
Color/Font/Material/Symbol/Icons Report  
Detail 4/SG1-6001

Per the Color/Font/Material/Symbol/Icons Report, Materials M8 and M13 require painting in some locations (Sign Types PS4 Rooftop Directional Pylon Sign with Exit Sign and RR4 Restroom Signage for example).

While colors are provided, no specification for painting of the signs has been provided (i.e. multiple manufacturers, mil thickness, prep requirements, etc.).

Please provide a specification (including light enhancing paint called out on Key Note 3C on Detail 4/SG1-6001) for signage to receive paint.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

Paint, where indicated on Signage Drawings, has been addressed in the following specification revisions:

- Specifications Section 10 14 19 2.1 C, Dimensional Lettering Signage, add "C", "Paints and Coatings: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposures indicated."
- Specifications Section 10 14 19 2.6 C, Dimensional Lettering Signage, add "C", "Baked Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils (0.04 mm). Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish."
- Specifications Section 10 14 19 2.7 A 7 b, Dimensional Lettering Signage, delete in its entirety, " : Spraylat Star-Brite White EF as manufactured by Spraylat Corporation (914-738-1600, http://www.spraylat.com) or equal."
- 1) Spraylat Star-Brite White EF as manufactured by Spraylat Corporation (914-738-1600, http://www.spraylat.com) or equal.
- 2) Matthews Paint 281 500SP High Reflective White 1.800.323.6593
- 3) Polar White as manufactured by Prismatic Powders 1.866.774.7628
- 4) Or equal . . . 1

and replace with the words, "manufacturer's standard white reflective paint."

- Specifications Section 10 14 19, Dimensional Lettering Signage, throughout the specifications section, remove the words "Construction Intent" and replace with the word, "Signage".

Co-Author:							
REQUEST:		SUGGESTION:	ANSWER:            Accept Suggestion: <input type="checkbox"/>				
REFERENCE:			The sides (elevations) and quantities of Clipper Tagging Devices to be installed at each Sign Type PS2 pylon varies based on that PS2's specific location (e.g., a PS2 that is backed up against the wall and away from traffic flow may not receive any Clipper Tagging Device, while a PS2 located in the middle of Grand Hall may receive multiple devices). The side (elevation) of a particular PS2 that will need to accommodate this device or devices is indicated on the Sign Message Schedule.				
Details 3 & 7/SG1-6001 (IFC Drawings for Main Package dated 3/31/14)							
Sign Message Schedule (ASI 127 dated 9/12/14)							
Details 3 & 7/SG1-6001 call out for a Clipper Tagging Device on one side of the Sign Type PS6 Interior Directional Pylon with Clipper Tagging.							
Per the Sign Message Schedule, some PS6 Pylons have 0 ea. (ex. PS6-G-03-020), 1 ea. (ex. PS6-G-05-022), or 2 ea. (ex. PS6-G-05-015).							
Please confirm the number of Clipper Tagging Devices to be furnished and installed with PS6 Pylons.			Note: As stated in the previous response to P1-0557, the "Clipper Tagging" device and is part of the vendor-supplied system to be bought-out separately by TJPA. The Sign Subcontractor would be responsible only for its installation and integration within the pylons and wall surfaces in which the devices are designated to be installed.

3/31/14)	Per Detail 1/SG1-6020 braille raster beads are to be installed on the perforated aluminum access panel for Sign Type KC1 Combined Touchscreen & Digital Display.						
	Please provide the message and exact dimensions for locating the braille raster beads.						
P1-0615	Footing Requirements per Specification Section 10 18 00 Informational Kiosks	Open	10/21/2014	10/31/2014	10/31/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Tram Nguyen		To: Turner Construction Company PHIL MILITELLO		Answered By: Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:            Accept Suggestion: <input type="checkbox"/>			
REFERENCE: Specification Section 10 18 00 (ASI 127 dated 9/12/14)							
Per Specification Section 10 18 00 1.2 Informational Kiosks, the signage subcontractor is to provide informational kiosks capable of withstanding the effects of wind loads based on criteria defined on the structural drawings, seismic performance criteria defined in Specification Section 01 80 50 Seismic Design Criteria for Nonstructural Components, and thermal movements defined in Specification Section 10 18 00 Informational Kiosks. There is no requirement to design the substrate upon which the informational kiosks are located.							
In several locations (Signs KT2-G-05-56 through KT2-G-05-61 and KM1-G-05-055 in the Grand Hall for example), informational kiosks sit on top of the topping slab with no footing down to structure.							
Please confirm that as long as the design requirements called out in Specification Section 10 18 00 1.2 are achieved, it is acceptable for the informational kiosks to be attached only to the topping slab with no footing through to structure.		The Informational Kiosks referenced in this RFI, along with all signage pylons and/or informational kiosks (non-structural components) located at Ground Floor, Second Floor, and/or Bus Level (PS1, PS2, PS5, PS6, PD1, PD2, KC1, KT1, KP1, KP3, KT2, KM1) are to be anchored directly to the structural slab or a housekeeping pad integrated into the structural slab as referenced in the Structural Drawings, Detail 1/S1-9102. Note that Section 1.2A of Specifications Section 10 18 00, Informational Kiosks, refers to Specifications Section 01 80 50 (Seismic design criteria for nonstructural components) for seismic provisions. Section 1.2B of that specifications section requires that the Contractor’s design engineer designs and details the anchorage of these non-structural components. In the case of these aforementioned sign types, this design and detailing would be coordinated with the Signage Subcontractor’s design and detailing of the referenced signs’ base components.

Detail 3/SG1-6021 (IFC Drawings for Main Package dated 3/31/14)					The rectangular space indicated on Detail 6/SG1-6201 and noted in Key Note 9 has not yet been finalized. Consequently, artwork for the final verbiage/graphic for the static graphic panel is not yet available from TJPA. Pricing can be based on the assumption that the final static graphic panel will be a large format digital print produced by Signage Subcontractor, fabricated and installed as per the current drawings and specifications.		
Key Note 9 on Detail 3/SG1-6021 indicate that the static graphic panels called out are to receive a surface applied digital print.							
No information has been provided on the surface applied digital print.							
Please confirm the referenced surface applied digital print is not included in the contract, or provide information on the surface applied digital print.

REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE:					Accept Suggestion: <input type="checkbox"/>		
Specification Section 09 97 15 (ASI 127 dated 9/12/14)					Please refer to enclosed markup of revised paragraph 1.3B of Specification Section 09 97 15.		
Specification Section 09 97 15 1.3 B High Performance Coatings makes the subcontractor responsible to ¿ approve the preparation of the substrates to be painted and application of the primer, which are both to be performed in the steel fabricator¿s plant."							
Based upon the current construction schedule, steel is being primed and shipped to the project prior to Trade Package TG016.5 Paint being bid.							
Please revise language to indicate the paint subcontractor shall review the surfaces to be painted and report deficient installation of material to general contractor prior to commencing with the work.							
P1-0645	Application Conditions for High Performance Coatings	Closed	10/24/2014	11/03/2014	10/27/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Tram Nguyen      To: Turner Construction Company PHIL MILITELLO			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
REFERENCE:					Accept Suggestion: <input type="checkbox"/>		
Specification Section 09 97 15 (ASI 127 dated 9/12/14)					Please see enclosed markup with revised paragraphs 1.10 A and 1.10 B of Specification Section 09 97 15.		
Specification Section 09 97 15 1.10 A High Performance Coatings requires that High Performance Coatings are applied only when temperature of surfaces to be coated and surrounding air temperatures are between 45 and 95 degrees F.							
Specification Section 09 97 15 1.10 B requires that High Performance Coatings are not applied when relative humidity exceeds 85%.							
These conditions do not match the manufacturer¿s written installation requirements for the specified products (ex. Carboguard 890 VOC, the minimum application surface and ambient temperature is 50 degrees F, and maximum							

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>
	allowable humidity is 80%).  Please revise the site condition requirements to meet the manufacturer's written installation instructions.						
<b>P1-0646</b>	<b>Paint Samples for High Performance Coatings</b>	<b>Open</b>	<b>10/24/2014</b>	<b>11/03/2014</b>	<b>10/27/2014</b>	<b>Potentially</b>	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Tram Nguyen		<b>To:</b> Turner Construction Company PHIL MILITELLO	<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>Co-Author:</b>							
<b>REQUEST:</b>		<b>SUGGESTION:</b>	<b>ANSWER:</b>				
REFERENCE: Specification Section 09 97 15 (ASI 127 dated 9/12/14)  Specification Section 09 97 15 2.4 A High Performance Coatings indicates that paint colors are to match the TJPA representative's control samples.  Please provide the referenced color samples.			<b>Accept Suggestion:</b> <input type="checkbox"/> The specified color is a manufacturer's standard color called in the bid documents with a color number. The physical samples will remain with the TJPA Representative and can be reviewed at the appropriate time at the PCPA/AAI offices. The contractor is to submit samples as specified in Division 01 to be reviewed by the TJPA Representative and returned to the contractor. The successful submitted samples will become the control samples.

RFI B-0047	BRP - Backfill Over Barrette Pile Concrete	Closed	09/05/2014	09/15/2014	09/11/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Claude Titcher		To: Turner Construction Company PHIL MILITELLO		Answered By: Arup		Kevin Clinch	
Co-Author: Shimmick Construction Company, Inc. Jeremiah Kent							
REQUEST: Part 3.4.D.9 of Section 31 63 32 - Barrette Piles - Bus Ramps states the following:  Place concrete in a continuous operation until barrette pile is completely concreted to at least two feet above final top-of-pile elevation. Above this, place controlled low strength material (CLSM) or lean mix concrete to within 3 feet of the guide wall top. The top two feet of concrete and the CLSM shall be demolished during exaction for the pile cap.  SCCI believes that using drain rock or sand, instead of CLSM, to backfill above the structural concrete will ensure that the rebar cage is clean upon the backfills removal. Using this lighter material will also work to ensure that bearing pressure limits are not exceeded while the second barrette pile is installed.  Is it acceptable to use drain rock or sand instead of CLSM for this backfill?		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
				This is acceptable.

RFI T-1096	BGP - Area 4 Exterior Wall Verts in Contact With Waterproofing	Closed	01/09/2014	01/19/2014	01/14/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Michael Spillane		To: Turner Construction Company PHIL MILITELLO		Answered By: Adamson Associates, Inc. George Metzger			

Co-Author: Shimmick Construction Company, Inc. Sylvia Hartanto

**REQUEST:**

In Area 4, between soldier piles #41 and #42, there are approximately 13ea wall vertical bars that are in contact with the waterproofing due to CDSM Encroachment. Soldier Piles #41 and #42 were surveyed and shown to not encroach more than 1/2". However, at the elevation of wall lift 1, it appears that the CDSM encroaches vertically into the foundation wall. Due to the wall verticals having little or no clearance to the waterproofing, the first list wall vertical bars cannot be coupled onto the dowels protruding from the top of the haunch. Per discussion with TT field representative, Gerdau proposes the following:

Option 1: Remove the waterproofing, chip the CDSM wall between soldier piles 41 and 42 to allow for clearance between the vertical bars and waterproofing. Vertical bars adjacent to soldier piles 41 and 42, up to 6 total, will be abandoned.

Option 2: The dowels above the haunch will be slightly bent away from the CDSM wall to allow for threading of the first lift wall vertical bars. Prior to bending the bar, the haunch concrete will have to be chipped out a minimum of 1.5 ft wide by 1ft deep to allow for hickey bar access. Once the first lift vertical bar is threaded onto the dowel, then the vertical bar will be transitioned back into vertical alignment with a slight bend over approximately 6ft. Note that this transition will require the wall horizontals to be bent and cross-ties will need to be shortened to follow the profile of the wall verticals.

Please confirm if proposed options are acceptable.

**SUGGESTION:****ANSWER:****Accept Suggestion:** ☐

Option 2 is preferred with the following modifications and additions:

- 1.Depth of haunch concrete removal shall be 1'-3" minimum at the encroaching bars.
  - 2.Bars shall be bent such that the top of coupler is displaced 1" from the waterproofing.
  - 3.Displacement shall be made in a controlled fashion.
  - 4.Bars shall only be bent in one direction.
  - 5.Embedded horizontal wall reinforcing that might prevent the field bend from occurring at the bottom of the 1'-3" excavation shall be locally removed. Other reinforcing shall be protected in place.
  - 6.As proof of concept, work shall begin with the bars immediately in front of steel soldier piles. If displacement cannot be controlled for all bars at the soldier pile locations, Option 2 shall cease and Option 1 shall commence. No bars will be accepted that have displaced more than 2" without nondestructive testing; 1", however, is the target. Option 1 may continue to bars between steel soldier piles only after acceptance of work by the structural engineer.
  - 7.The integrity of the waterproofing behind the excavation shall be maintained. Acceptance of the waterproofing by the manufacturer's representative and waterproofing contractor at the completion of field bending is required prior to patching the haunch excavation.
- Option 1 is acceptable only if Option 2 does not produce acceptable results. Modification and additions to Option 1 are as follows:
- 1.The target cover for wall reinforcing bars is 2" minimum.
  - 2.The minimum acceptable concrete cover over a bar or coupler at the level of the haunch is 3/4". This may require that CDSM grout be removed at the level of the haunch. To facilitate a smooth grout transition, this may require that grout be removed below the level of the haunch and perhaps excavation of the haunch itself. This has implications for waterproofing.
  - 3.At locations where 3/4" cover is not provided to the coupler at steel soldier pile locations, the coupler shall be removed with due regard to protecting the adjacent installed waterproofing.
  - 4.Any bars abandoned shall be replaced with bars having proper clear cover. It is not required that these

<b>RFI T-1151</b>	<b>SSS - AESS Mockup Sequence Clarification</b>	<b>Closed</b>	<b>02/05/2014</b>	<b>02/15/2014</b>	<b>02/10/2014</b>	<b>Potentially</b>	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP                      Stephanie Azzolino		<b>To:</b> Turner Construction Company PHIL MILITELLO		<b>Answered By:</b> Adamson Associates, Inc. George Metzger			
<b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton							
<b>REQUEST:</b>  Please clarify the sequence the contractor is being asked to provide for the AESS mockup. Is the contractor required to provide a mockup (and have A/E review/approve) in the field at grid line 11 (South) per A1-8660 prior to fabricating all AESS elements as indicated in 05 12 14?		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>  Specification section 05 12 14/1.6H states: "Mockups: Prior to fabricating AESS, construct mockups to demonstrate aesthetic effects as well as qualities of materials and execution." The purpose of the mock-up is to establish a standard of quality that will be provided in the other work. Fabrication of work prior to mockups approvals that may not meet the established standard of quality, presents a risk to the contractor. Submit a proposal to the TJPA Representative for when and how the contractor proposes to submit the mock-up and meet these goals within the Project Schedule.

Please reference Detail 6/A1-8711 and S1-3201 of the Contract Drawings and the attached drawing.							
SCCI is requesting to re-route all 2" dewatering well llines as proposed in the attached drawings. The re-route is to eliminatne any potential conflicts with future work (bracing removal, wall waterproofing, rebar, and for/pour/strip). Upon completion of the use of the dewatering system, the line will be cut below the sleeve, capped and grouted in with the trestle block-out pour back. The line will be poured in place with the future mat and concourse slabs and all 3 wall lifts. The line will also be capped at the top of the final wall lift.							
Is this acceptable?

SHIMM000-0004	BGP - Modified Bitumen Waterproofing	Closed	01/11/2013	01/21/2013	01/11/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Chris Williams		To: Webcor Construction LP	Answered By: Webcor Construction LP Robert Kjome				
Co-Author:							
REQUEST: Reference Specification: 07 12 10  A two-ply self-adhered modified bitumen waterproofing system has been specified for this blind side application (Section 1.1 of Specifications). It is unusual for any modified bitumen system to be used in a blind side application (i.e., where the waterproofing is installed before the structure is constructed). Section 2.2 of the Specifications lists only one potential manufacturer, Laurencio Waterproofing Systems. The Laurencio system is a bitumen modified with chloroprene rubber and applied with a cold adhesive. The required waterproofing membrane properties listed in Section 2.4.B are identical to those published by Laurencio. We cannot find any other other modified bitumen manufactured with chloroprene on the market. Are you aware of any other systems?		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> If Shimmick cannot find an equal system, proceed per the specified manufacturer.			

SHIMM000-0005	BGP - Waterproofing Wall System Layers	Closed	01/11/2013	01/21/2013	01/11/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Chris Williams		To: Webcor Construction LP	Answered By: Webcor Construction LP Robert Kjome				
Co-Author:							
REQUEST: Reference Specification: 07 12 10, 3.2-3.3  1. Section 3.2, D. requires the protection board horizontal construction joints to be shingled lapping the upper sheet over the lower sheet by 4 inches. What is the purpose of this shingle? Since the waterproofing membrane will not be adhered directly to the protection board and layers will be present between them (e.g. drainage composite w/filter fabric, insulation, felt), the shingle does not seem necessary. Please confirm.  2. Section 3.2, F. reads "seal top edge of filter fabric to membrane". There is a layer of 1/2" thick insulation between drainage composite and waterproofing membrane. Please clarify.  3. In addition to these items, there is also a concern about the number of layers used on this wall including the stability and durability prior to concrete placement. There is a large potential for problems such as creep of the		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> 1. Adhere to the manufacturers' specified details.  2. Please provide the manufacturer's shop drawings depicting the 1/2" thick insulation between drainage composite and waterproofing membrane.  3. We concur that asphalt saturated felt layers, drainage composite, filter fabric, and EPS insulation are required by the specifications as layers in the waterproofing. Please submit specific RFI's requesting clarification for discrepancies between the specifications and what is shown in the drawings. Furthermore, please address specific locations shown on the contract drawings that are in concern with the manufacturer's details.

penetration sleeve. Please advise.							
SHIMM000-0009	BGP - Geothermal Loop Soil Compaction	Closed	03/04/2013	03/14/2013	03/04/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Chris Williams		To: Webcor Construction LP	Robert Kjome	Answered By:Webcor Construction LP Robert Kjome			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
After observing existing subgrade compactions varying from 88%-95%, it appears that the existing conditions of the soil could be below the 95% compaction requirement. In the case of a geothermal loop being installed in areas with existing soils below 95%, can the geothermal loop be compacted to the localized compaction level in accordance with ASTM DI557? For example, if the first field has an existing condition of88% compaction, can the geothermal loop trenches be compacted to 88%? 95% compaction may not be possible with the existing soils and existing compaction in some areas.				See Response to RFI T-0387 and RFI T-0405.			
Please advise.							
SHIMM000-0010	BGP - Schedule Dates for GLS/GLR Manifold Construction	Closed	03/05/2013	03/15/2013	03/05/2013	Potentially	<input type="checkbox"/>

SHIMM000-0014	sleeve prior to the mat slab pour for access purposes. However, in the submittal comments to SUB-TG0600-036, the Engineer clearly states that the "contract documents specify a field weld of the steel ring such that the pile can be cut and removed without the ring installed." Without access to weld the collar after the mat slab has been poured, it isn't possible to weld the assembly in the field. Additionally, if the collar is to be welded prior to the pile being cut, damage will most likely occur to the ring plate or sleeve during the cutting process as stated in the submittal comments. With the comments to submittal TG0600-036 and the response to RFI T -0411 clearly contradictory, please provide the necessary construction sequencing to avoid damage to the assembly in the field and enable a constructible design.						
	BGP - Geothermal Risers in Leaking CDSM Wall	Closed	03/18/2013	03/28/2013	03/18/2013	Potentially	<input type="checkbox"/>
	From: Shimmick Construction Company, Inc. Chris Williams	To: Webcor Construction LP	Robert Kjome	Answered By:Webcor Construction LP Robert Kjome			
	Co-Author:						
	REQUEST:	SUGGESTION:		ANSWER:	Accept Suggestion:	<input type="checkbox"/>	
With water leakage throughout the CDSM wall at many different locations, the likelihood of a geothermal loop riser being laid out in the location of a CDSM wall leak is high. In the event that the Geothermal Riser is located at the same location as a CDSM wall leak, what should S3H do? Should the riser be relocated to a portion of wall that isn't leaking? If the riser is to be embedded in the wall at the location of a leak, grouting the riser back into the wall will not be possible. Please advise.			Discussed in Geothermal RFI Meeting 3/06/2013. Refer to follow up RFI SCI-087.

SHIMM000-0020	BGP - Waterproofing and CJ Layout Conflict	Closed	04/10/2013	04/20/2013	04/10/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Kirk Nielsen				
Co-Author:		Answered By:Webcor Construction LP Kirk Nielsen					
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
<p>Please reference AI-2203 and SI-3201 of the Contract Plans and the attached drawings. The current elevation at the bottom of the 2nd level bracing lookouts is at approximately -5.13, WEST of Grid 9 (see concourse slab drawing). The proposed top of concourse slab elevation is to be -5.42, WEST of Grid 9. Per the WPM-1 waterproofing system, the minimum overall tie-in dimension needed for the succeeding lift is approximately 1'-11" (see attached waterproofing drawing). The current elevation at the bottom of the 2nd level bracing lookouts is at approximately -6.15, EAST of Grid 9 (see concourse slab drawing). The proposed top of concourse slab elevation CJ is to be -7.67, EAST of Grid 9. Per the WPM-1 waterproofing system, the minimum overall tie-in dimension needed for the succeeding lift is approximately 1'-11" (see attached waterproofing drawing). In both locations, the minimum required dimension (1'-11") to tie-in to the next lift of waterproofing can not be reached with the current location of the 2nd level bracing lookouts and the proposed concourse slab elevations. SCCI is restricted in location for the CJ due to the absolute concourse slab location and elevation.</p> <p>Furthermore, a similar conflict exists in the 1st foundation wall lift and the 3rd level of bracing lookouts (see 1st wall lift drawing). With SCCI's current location of the CJ, there is virtually no room to allow for the waterproofing overlap to occur. SCCI fully understands its freedom to manipulate the location of the CJ's by lowering it approximately 2'. This will potentially change BBII's rebracing plans.</p> <p>Please advise.</p>				Consistent with RFI response #SHIMM000-0002 dated 11/27/12, revise the proposed locations of the CJ's to accommodate / coordinate with all of SCCI's work consistent with the sheet note on 1/S1-3201.			

SHIMM000-0021	BGP - Differential Movement in Waterproofing Layers	Closed	04/26/2013	05/06/2013	04/26/2013	Potentially	<input type="checkbox"/>

REQUEST:		SUGGESTION:		ANSWER:			
Reference Specification: 071210 - 3.5.B				Accept Suggestion: <input type="checkbox"/>			
The Specifications call for testing of"seams" independently by Applicator and Manufacturer. In the waterproofing pre-installation meeting on 3/27113, the Manufacturer (Laurenco) and the Architect stated that testing of seams is not required as this is not a single-ply system. Please define "seam" and advise if testing of seams is required or not, and if it is, then to what extent?				Specification 07 12 10 3.5.B remains unchanged. A seam is where any specified waterproofing component joins by overlapping.

SHIMM000-0023	BGP - Carlisle Miradrain 9900 Drainage Composite	Closed	04/26/2013	05/06/2013	04/26/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Robert Kjome				
Co-Author:		Answered By:Webcor Construction LP Robert Kjome					
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Reference Specification: 07 12 10 2.5.C				Fully bonded Miradrain 9900 is available upon request of Carlisle. If Bestdoes not want to use Miradrain submit a request for substitution pursuant to specification section 011630 and 000440.			
This section calls for "Drainage Composite: Three dimensional plastic rolls bonded to a geotextile on one or both faces: Mirafi Miradrain 9900, or equal with a minimum compressive strength of30,000 psi." The waterproofing membrane manufacturer (Laurenco) states that the specified product "Miradrain 9900" no longer meets the performance requirements of the specifications since the woven filter fabric is no longer bonded at every dimple of the molded polystyrene core. Best Contracting has contacted the drainage composite manufacturer and they have confirmed that the woven filter fabric is bonded at every fourth dimple. Best Contracting has also performed a shop "mock up" using the aforementioned composite which resulted in complete separation and failure upon the installation of the waterproofing membrane. Please provide direction.

SHIMM000-0024	BGP - Additional Fasteners for Protection Board Installation	Closed	05/02/2013	05/12/2013	05/02/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Kirk Nielsen				
Co-Author:		Answered By:Webcor Construction LP Kirk Nielsen					
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Please reference Spec Section 07 12 10 - 3.2.D. Spec Section 07 12 10 - 3.2.D states the following: "Secure 1/4" protection board to flanges of soldier piles with powder driven fasteners and washers spaced 12 inches o.c. Butt vertical joints . Maximum joint width : 1/4"..."				The pile plane always had a tolerance as was the CDSM surface was never continuously supported.			
The manufacturer of membrane waterproofing system (Laurenco) has indicated that due to "out of plane" piles, and relaxation of CDSM substrate requirement, they are requiring intermediate fasteners to hold the 1/4" protection board tight to the CDSM wall. Please review and advise.				Consistent with John Laurence (Laurenco's) comments during the 4/30/13 waterproofing meeting the concern over the protection board deflecting can be mitigated by two methods:			
				1. Intermediate fasteners 2. Ensuring when placing concrete SCCI does not cause the protection board to excessively deflect.			
				This is a means and methods issue at the discretion and cost of the Trade Subcontractor.

	<p>mud slab elevation. Per the geothermal trenching and backfill specification 31 23 34, 1.1.A.1, the only slot excavation in CDSM/concrete is to be in the wall panels. The specification does not require slot excavation/demolition for the horizontal field loops. Per Plan sheet GT-5201, the buttress shafts are to be demolished to a maximum of 4' below subgrade elevation (bottom of mud slab). The geothermal pipe is to be installed at 15" below the bottom of mud slab elevation, well within the 4' below mud slab demolition elevation. Please confirm that the geothermal loops in zone 4 will be trenched in soil like the rest of the project and as detail in the geothermal trenching and backfill specification (31 23 34).</p>				<p>elevation 41'-5" or bottom of the mud slab. SCCI's interpretation on plan sheet GT-5201 as it relates to demolition is incorrect. The note "...shafts shall be maximum 4 feet below, maximum 2 feet above subgrade elevation" is in reference to the parameters set for the concrete (high strength) being placed in relation to the CLSM mix. These parameters are not set as demolition or excavation bench marks.</p> <p>SCCI to proceed with geothermal loops in Zone 4 as shown in the approved shop drawing TG0601-065 and conform to specification section 31 23 34. SCCI to remit request for backfill and excavation requirements per specification 31 23 34 at buttress locations.</p> <p>SCCI to consider the following when re-submitting: Does SCCI plan to demo the buttress shafts down to the required 15",re-fill the area and meeting compaction requirements? or Does SCCI intend to seek a design variance by slot excavating through the buttress' and seek back-fill requirements within the buttress from the design team?</p>

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>	
	<p>The latest Webcor's weekly update schedule received by SCCI (Data date 06.17.2013 ), shows that:</p> <p>- Bracing Removal- Level D" (BGSOX-1120) is the driving predecessor to "Wall Waterproofing) st lift" (BGSOX-4000)- in each area.</p> <p>- Bracing Removal- Level C" (BGSOX-4100) is the predecessor to "Wall Waterproofing- 2nd lift" (BGSOX-4110)- in each area</p> <p>- Bracing Removal- Level B" (BGSOX-6000) is the predecessor to "Wall Waterproofing- 3rd lift" (BGSOX-6010) in each area</p> <p>Based on the current schedule logic, the bracing will need to be modified to allow the removal of walers and struts in each area, separately and independently from each other. E.g: Any walers spanning two areas will need to be cut during removal of bracing so SCCI can proceed with the waterproofing install in that area, without having to wait for the adjacent area. This is applicable to Bracing Removal level B, C and D. As requested in RFI#233 response, please find attached bracings that SCCI assumes are going to be removed/ cut prior to SCCI's specific wall pour.</p> <p>Please confirm.</p>

SHIMM000-0264	<b>REQUEST:</b> Reference: Spec Section 05 50 10  While attaching the 3/4" diameter by 8" Nelson Studs to the 8" X 4" X 1/2" angle it was determined the studs were not fusing to the base metal (angle). To maintain the procurement schedule of this fabrication needed for the Zone 1 - Area 03 Mat Slab placement, our fabricator (Gerlinger Steel) used the fillet weld method performed under the attached Welding Procedure Specifications (WPS) to attach studs to the angle(s). The welding was witnessed by the dispatched (IR #001459) ISI Shop CWI. Attached for the readers informationm and use are the shop fabrication drawing, the employed WPS, and photographs of the finished fabrication.  Is the alternate means of attaching the Nelson Studs to the angle, using the fillet weld method in lieu of the fusing method, acceptable?	<b>SUGGESTION:</b>	Closed	07/24/2013	08/03/2013	08/07/2013	Potentially <input type="checkbox"/>
	<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The angled stud in the interior of the angle requires a different type of ferrule (heel) to address the angled condition. The alternate means used to attach Nelson studs for angles in this RFI is acceptable provided that at least 2 studs per angle have been verified by bend test per specification section 03 20 00 2.2.C.2, which references AWS D1.1-2010 (Paragraph 7.8 for testing requirements).						
SHIMM000-0264	<b>BGP - Shear Wall Dowel and Shoring Pipe Bracing Conflict</b>  <b>From:</b> Shimmick Construction Company, Inc. Ben Gordon  <b>Co-Author:</b>	<b>To:</b> Webcor Construction LP  Jackson Tukuafu	Closed	07/24/2013	08/03/2013	08/07/2013	Potentially <input type="checkbox"/>
	<b>REQUEST:</b> Reference: Drawing S1-3001, Spec Section 03 30 20  A few potential conflicts exist between the typical shear wall vertical dowels and the 36" OD shoring Pipe Struts in Area 1. See attachment for locations of conflict.  Based on Detail A shown in S1-3260, the typical shear wall verts will be lap spliced.  Per the schedule in Detail 1-S1-3001, the #9 vertical shear wall reinforcement requires a 63" lap splice, which places the top of dowel at elevation -30'-5".  The centerline of Level D diagonal bracing atop Area 1 is shown to be at EL -29'-0" and the bottom of the 36" OD pipe strut at level D is at EL -30'-6".  The pipe strut will potentially encroach on the shear wall	<b>SUGGESTION:</b>					
	<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The contractor proposed lap splice length is acceptable only at locations where the conflict exists.

SHIMM000-0266	BGP - Temporary Perimeter Lighting	Open	07/24/2013	08/03/2013	07/30/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Jackson Tukuafu				
Co-Author:		Answered By:Webcor Construction LP Jackson Tukuafu					
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Per the TG06.0 pre bid Q&A TG06.0-0036 response dated 6/11/12 (attached), the temporary perimeter lighting drawings are to be issued to the trade subcontractor prior to the start of the work. When is this work scheduled to begin? Are the drawings and specifications for the perimeter lighting available?				SCCI to produce and provide all information including, but not limited to, product data and layout drawings necessary for installing and maintaining temporary lighting along the perimeter of the site at 50'-0" O.C. and installed in such a manner that it does not interfere with the structure and at all walkways utilized by the workers and the public, as required to provide code-minimum lighting at egress paths, as well as sufficient foot candle lighting levels to safely perform the work at all times.			
Please provide the required documents or clarify when they will be provided.				SCCI is responsible for maintaining the temporary lighting and related facilities until completion of the work.			
SHIMM000-0267	BGP - Mat Slab Conduits	Closed	07/24/2013	08/03/2013	08/13/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Chris Williams		To: Webcor Construction LP	Jackson Tukuafu				
Co-Author:		Answered By:Adamson Associates, Inc. George Metzger					
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Reference: A1-9204, E1-6001				The embedded junction box details on A1-9204 applies only to the flat surfaces (north and south sides) of the columns along GL D.8 of Platform 2 (refer to note on details 1 & 2 on A1-9204) and shall have embedded boxes and conduits. Locate the conduit and boxes such that the device faceplates will be finished flush to the finished column cladding.			
The electrical conduit details on sheet A1-9204/Detail 1 and Detail 5 on E1-6001 regarding the electrical conduits on the columns are in conflict. Detail 1 on A1 -9204 indicates an embedded junction box in the long portions of the columns at Line D.8 above the Train Platform Level. Detail 5 on E1- 6001 indicates all conduits are to be stubbed up 12" at the face of the column. This Detail 5 shows all conduits (shown dashed) above the 12" stub up in the Mat Slab are to be installed in future phases outside of the TG06.0 contract. The columns are part of the TG06.0 scope.				The east and west sides of the columns indicated on the note shall have surface mounted junction boxes and conduits (refer to detail 1 on A1-9204).			
1. Please clarify if these junction boxes and conduit are to be embedded in the columns or stubbed up through the slab at the face of each column at all four (4) locations..				For all other columns in the BGP, the junction boxes and conduits are typically surface mounted (refer to detail 5 of E1-6001).			
2. If the conduits and boxes are to be embedded in the columns please provide a revised embedded conduit detail indicating conduits as part of TG06 Below Grade Scope.

SHIMM000-0268	BGP - Column and Reshoring Struts Conflict	Closed	07/26/2013	08/05/2013	09/20/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Jackson Tukuafu				
Co-Author:							
REQUEST: Reference: Attached Drawings  The highlighted areas on the attached re-shoring drawings show re-shoring struts against some of the oval shaped columns. In order to construct the concrete columns SCCI will need at least 30" of clearance between the column face and the struts.  Please confirm that the reshoring struts will be moved enough to provide needed clearance.		SUGGESTION:	ANSWER: Accept Suggestion: <input type="checkbox"/> Further review and coordination of specific struts that are in conflict or in close proximity to formwork is required. Please submit as-built of all locations that are in concern.				
SHIMM000-0269	BGP - 1st Street 48" Bridge Pile Asbuilts	Open	07/25/2013	08/04/2013	07/31/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Jackson Tukuafu				
Co-Author:							
REQUEST: Reference: Drawing S1-3003  48" temporary bridge piles (00 1 through 010 in the drawing attached) under the 1st Street temporary bridge exceed the 48" diameter required per Detail 6 on Plan Sheet S 1-3003. The varying diameter of each temporary bridge pile is the result of the pile being a 48" CIDH concrete pile instead of a steel pile like the rest of the slab penetrations. As typical of a CIDH pile, the surface profile varies much greater than the 1 /2" gap tolerance required per Detail 6 on S 1-3003. Attached is an as built of the 48" piles with their varying diameters. In consequence the penetration sleeves will not fit the current conditions of the 48" piles.  Please advise how to proceed.		SUGGESTION:	ANSWER: Accept Suggestion: <input type="checkbox"/> BBI's temporary bridge detail drawing SH-5101, depicts the CIDH pile diameter at 48". Our review of the the Caltrans specification on CIDH piles indicate no reference to tolerances; therefore, we cannot ascertain any diameter larger than 48". SCCI to proceed as shown on the BBI and contract drawings with the CIDH pile at 48" in diameter. Please note, SCCI has ten (10) sleeves fabricated and onsite. The remaining sleeves are in fabrication at this time.

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>
	<p>Due to quality and constructability concerns of placing a 4" thick slab on the 45-degree plane of the pits, installed on waterproofing membrane, SCCI is proposing the option to pour the sloped plane of the pits with the mat slab. In order to provide protection from pit reinforcing steel, SCCI will place the protection slab in the bottom of the pit, 12" up the sloped plane on all sides, and the horizontal placement will stop at the top edge of the pit.</p> <p>Per the Grace waterproofing requi rement that tbe membrane not be left exposed for more than 56 days all'er installation, SCCI will ensure that the membrane never exceeds the 56-day exposure limit.</p> <p>Please confirm this option is acceptable?</p>						
				workers may damage the waterproofing. Furthermore, once the rebar is installed it is very difficult to go inside these cages and perform an inspection on the waterproofing.			
				Other means and method options for SCCI to consider, include but not limited to:			
				1. Installing #3 rebars at 18" o.c. each way similar to what was done in the mud slab. 2. Use smaller aggregate 1/2" instead 1". 3. Install top and bottom protection slab first and then pour this sloped surface after. 4. Try to pour concrete similar fashion it was poured at the steep pit mud slab. You may need to add more dobe's horizontally to allow the concrete to adhere to 1 1/2" space between bars and waterproofing. Rebar is more stronger than wire mesh for someone to climb up onto the surface.			
SHIMM000-0282	Temporary Power from Skids #3 and #4	Open	08/14/2013	08/24/2013	08/14/2013	Potentially	<input type="checkbox"/>

Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
SCCI and Bass had planned to used Temporary Power "skids #3 & #4 for temporary power needs. Currently Skids #3 & #4 are not available and have been removed and are unavailable. Will these skids be up and running in time fto use for temporary power? If not, where should SCCI and BAss route temporary power from? Serving the projects temporary power needs from Skids #1 and #2 is not feasible.				Please refer to Drawing SL-001 of Exhibit A.			
				Temporary power skids 3 & 4 are not represented in any of trade group package TG06 contract documents. As indicated in trade group package TG06 Exhibit A, SCCI is required to tie into the "nearest" power source; furthermore, the Site Logistics Plan drawing SL-001 show the location of three (3) skids (Skid 1, 2 and 5) to tie into. Servicing the projects temporary power needs is a means and methods by SCCI. Overcoming distance and circuitry limitations, include but not limited to, increasing the load capacity to each zone and/or using available Skid 5.

Co-Author:							
REQUEST: See attached Gerdau's RFI #066  Withing all of the Moment Frame Beam Sections found in the structural drawings, the T9 ties are depicted alternating. Gerdau is proposing to install the T9 ties within the Moment Frame Beams with all the 90 degree hoods at the bottom rather than alternating.  During the installation of the mock up, it was evident that the process of hooking the 135 degree hook around the bars at the bottom of the beam was problem due to the limited clearance (1.5") and the depth of the 135 hook (4.5"). By eliminating the alternating ends and only installing the 90 degree hook end down, it would resolve this situation.  Please confirm that this configuration is acceptable withing the Moment Frame Beams.		SUGGESTION:		ANSWER:	Accept Suggestion: <input type="checkbox"/>	Per meeting between TT, WOJV and SCCI on 08/08/2013, TT rejected the non-alternating configuration per code.

REQUEST:		SUGGESTION:	ANSWER:	Accept Suggestion: <input type="checkbox"/>			
1. Please confirm the contract documetns (TG06.0) do not specify a FF value for the Mat Slab.							
2. Also, please reference ACI 302.1R and contract specification 033020.3.6.B. ACI 302.1R does not provide any recommendations on F-numbers for broomed surfaces. Furthermore, table 8.15.3.b of ACI 302.1R (page 46) demonstrates to achieve FF value of 20 for a slab on grade, it must be a smooth, floated surface.							
Please clarify if the designer intends to have a rough broom/rake finish, or intends to have the concourse slab finished to a value of 20.							
3. Please confirm the concrete finish within the train box							
SHIMM000-0292.1	Cast-In-Place Concrete - FF & FL Values for Concourse Slab	Closed	10/02/2013	10/12/2013	02/13/2014	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor/Obayashi Joint Ventu Spencer Sayles	Answered By:Webcor Construction LP Ted Williams				
Co-Author:							
REQUEST:		SUGGESTION:	ANSWER:	Accept Suggestion: <input type="checkbox"/>			
This RFI is being submitted in resposne to RFI response T-0691. Please refernce TG0600 contract specificaiton section 033020.3.6.B. Section 3.6.B specifies a FF value of 20 for the surface of the lower concourse slab.		Refer to T-0777					
Table 8.15.3b of ACI 302.1R (page 46) statres that to achieve a surface with an FF value of 20, it must be a smooth floated surface. ACI 302.1R does not provide any recommendations of "F" numbers for broomed surfaces.							
Please clarifiy if th edesigner intends to have a rough broom/rake finish, or intends to have the concourse slab finished to a FF value of 20.

Note B on the SKE-01-3201, SKE-01-3202, & SKE-02-320I(from RFI T-0633 response) indicate that all electrical equipment shown in halftone is to be included in the later phase 2 construction (outside of TG06.0 scope). With that, there is extensive electrical equipment (switch gear, panels, etc) that are shown in full tone on the drawings. Please clarify whether or not this electrical equipment is to be furnished and installed under the TG06.0 scope of work. Additionally, if it is required, please provide the specifications pertinent to the required equipment.				All termination points, conduits and boxes shall be clearly identified and labeled for future connections to be performed by other trade subcontractors for the electrical equipment shown. All Electrical equipment shown in the attached sketches are excluded from trade package group TG06.0 and will be included in the phase 2 construction as noted..			
SHIMM000-0294	BGP - Rebar Configuration at Moment Beam with Incorporation of S-3 vs T-9 Ties	Accepted	08/23/2013	09/03/2013		Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Answered By: Jackson Tukuafu				
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Please find attached Gerdau's RFI#70.							
At the contractor's option, Gerdau would like to propose utilizing S-3 stirrups with only one T-9 tie (see attached sketch) for the vertical ties in the moment frame beam. This will be installed in lieu of installation all T-9 ties. This is done to avoid the constructability issues associated with alternating the hooks under the 1.5" of clear cover beneath the bottom beam bars.							
Please confirm that the proposed reinforcing configuration is acceptable.

<p>Some of the drainage lines and fixtures are designed to be constructed in close proximity of the concrete columns, similarly S1-3005 depicts typical mat shear reinforcement schedule and details. Some of these shear reinforcement bars will be interfering with the drainage lines and fixtures. SCCI suggest to displace these shear reinforcement bars where conflicts occur. Displacement would occur laterally, in 8" increments, governed by the grid of the mat slab main reinforcement bars.</p> <p>Please advise.</p>							
SHIMM000-0305	BGP - Haunch Reinforcement at Double Waler Condition	Closed	08/29/2013	09/08/2013	09/02/2013	Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. John Berggren		To: Webcor Construction LP	Jackson Tukuafu	Answered By:Adamson Associates, Inc. George Metzger			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
Gerdau RFI No. 075 dated August 29th, 2013						The revised haunch reinforcement clear cover as described in the RFI per field coordination is confirmed.	
This RFI is to confirm the resolution as proposed in the field. At the double shoring waler condition, where the waler web is lower than that of a single waler, the tail of the #10@8" (10C262 on BM-3t) haunch reinforcement interferes with the web of the shoring waler. The condition was observed at Grid 2/ A and will likely repeat at other double waler locations. The resolution to the condition shall be to adjust the position, where required, so that the interfering tail clears the double waler web. As a result the 1-1/2" clear cover will deviate up to 4-112" of clear cover. The plan location of the tail shall remain as close as possible per the placement drawings. See the attached sketch for further details. The 1-1/2" clear spacing shall remain at locations unaffected by the reduced clearance of the double-waler. For pieces not yet fabricated and delivered, Gerdau has submitted in [Gerdau] RFI #074 {SCCI #303} a proposed solution to conform to the 1-1/2" clear cover.							
Is this confirming RFI accurate and acceptable?

	<p>odd number of bars interrupted (typical bars and add bars) the number of bars added on either side of the opening can be (number of interrupted bars +1)/2.</p> <p>2. Detail 1 on Sheet S1-3501, which applies to sinks, can be relaxed in terms of additional bars. For an even number of bars interrupted (typical bars and add bars) the number of bars added on either side of the opening can be (number of interrupted bars)/2. For an odd number of bars interrupted (typical bars and add bars) the number of bars added on either side of the opening can be (number of interrupted bars +1)/2. The minimum requirement of 2 bars on either side of the opening need not apply.</p> <p>3. The number of bars and maintenance of clear spacing will take precedence over 8" or 4" module spacing as to minimize the number of potential bar interruptions (and minimize resulting add bars). Any bar may be displaced to avoid conflict. The maximum center-to-center spacing of any two adjacent bars may be as large as 16". Clear spacing of 1 bar diameter shall be maintained between bars where bar relocation necessarily reduces spacing in the vicinity of relocation. Where bar relocation affects a lap splice, noncontact lap splices will be allowed up to 6" for #10 and #11 bars. This remedy shall apply in particular when seeking to avoid interruptions at small penetrations such as risers, vents, sinks and conduits.</p> <p>4. Clear spacing of 1db minimum shall be maintained in all mat reinforcing except for contact lap splices.</p> <p>5. Measures to reduce congestion at other locations such as catch basins, sump pits, elevator pits, shoring bracing and bridge piers will be considered on a case-by-case basis during field coordination with Thornton Tomasetti's field representative.</p>						
SHIMM000-0318	BGP - Mat Slab CJ Layout Areas 2/4, 6	Accepted	09/10/2013	09/20/2013	09/10/2013	Potentially	<input type="checkbox"/>

REQUEST:		SUGGESTION:	ANSWER:	Accept Suggestion:	<input type="checkbox"/>		
Per Detail 7 on plan sheet E1-6001, sump pump conduits for the below grade package are to be terminated 12" above the mat slab directly adjacent to the future train platform wall. With the train platform wall beginning at grid line 12 and moving east, where are the conduit terminations for the sumps to be installed west of grid line 12 where there is not a train platform? Is there a set dimension the conduit should be set away from the sump when the train platform is not present? Please advise. Please note that for the two sumps that have been poured							
in Area 3, the conduits were placed roughly 9' to the north of each sump opening to avoid the future train tracks. There are 8 total sumps west of grid line 12 with 6 of them left to be placed.

SHIMM000-0328	BGP - Structural Slurry Primer in Mat Slab	Open	09/24/2013	10/04/2013		Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Jackson Tukuafu	Answered By:			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:	Accept Suggestion: <input type="checkbox"/>		
Please refer to the attached letter, authored by Rober Foley (CEMEX QC), dated September 17, 2013.							
With limited site access, many Mat Slab pours will require a larger than normal amount of slick-line. To ensure that no slick-line gets plugged, SCCI is proposing to prime the slick-line with a structural slurry that will reach and exceed the specified design strength for the Mat Slab. A miniscule percentage of this primer will be deposited into the mat slab. This percentage would amount to .01 to .02 percent by volume.							
Please confirm the proposed SCCI method of slick-line priming is acceptable.							
SHIMM000-0329	BGP - Internal Bracing Level D Removal	Open	09/24/2013	10/10/2013	09/30/2013	Potentially	<input type="checkbox"/>

SHIMM000-0340	Areas 5 and 6 EW Top Mat Reinforcing at South Wall Radius	Open	10/04/2013	10/14/2013		Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Filip Filipic		To: Webcor Construction LP	Spencer Sayles	Answered By:			
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
Refer to the attached sketch 131003_S105-S106 South Radius.							
In Areas S105 and S106, EW top mat reinforcing makes an increasingly acute angle with the south wall. This eventually prevents the reinforcing from penetrating the haunch and wall reinforcing curtains to reach the edge of the mat.							
Per field coordination, it is acceptable to terminate EW top mat reinforcing in a hook prior to reaching the edge of the mat slab. The provisions are as follows:							
¿ All terminating EW top mat reinforcing shall be hooked							
¿ Where the angle becomes such that the mat reinforcing cannot penetrate the inner wall reinforcing. The reinforcing may terminate immediately in front of the wall reinforcing inside the haunch. This is labeled Zone 1 in the sketch.							
¿ In Zone 1, single haunch bars that interfere with penetration of mat reinforcing into the haunch shall be relocated to allow penetration. Relocation will be to the nearest adjacent placement opportunity without regard to the 8" spacing module. Clear spacing, however, between haunch bars shall be maintained.							
¿ The total number of haunch bars will remain unchanged.							
¿ In Zone 1, provide a curved band of reinforcing at the typical size and spacing of the mat within the wall.							
¿ Where the angle becomes such that the mat reinforcing cannot penetrate the haunch without relocating more than one haunch bar, reinforcing may terminate at the toe of the haunch. This is labeled Zone 2 in the sketch.							
¿ In Zone 2, provide a curved band of reinforcing at the typical size and spacing of the mat within the haunch.							
¿ Zone 1 and Zone 2 bands will overlap typical reinforcing by the distance LTS.

Please reference detail 7/A1-8881 and 4/S1-3010 of the contract drawings.		1. The current contract drawing details differ from those provided and referenced in the RFI. Refer to architectural drawing A1-8881 dated 07/17/13 and structural drawing S1-3010 dated 11/12/27.					
1. Detail 7/A1-881 shows several elements that are not shown on the structural drawing (highlighted in red). Please confirm these are required in the assembly and provide details for tabs, bolts and welds.		2. See response to Item #1 above.					
2. The same detail depicts a "y" shaped object protruding from the seismic embed. What are these objects and what is their function?		3. See response to Item #1 above.					
3. Detail 4/S1-3010 depicts a 3/4" diameter stud that is not shown on the Architectural drawings. Please clarify.

REQUEST: Please reference Detail 7/A1-8881 and 4/S1-3010 of the Contract Documents.  1. Detail 7/A1-8881 (and other details on A1-8881) call for a 5/8"x6' galvanized steel plate secured to mud slab and soldier piles. This plate does not appear on the structural details for the seismic joint. What is the function of this plate?  2. How is the plate secured to the mud slab? How is it secured to the soldier beams? There does not appear to be access to weld directly to soldier beam.		SUGGESTION:		ANSWER:	Accept Suggestion: <input type="checkbox"/>

Attached is a rebar congestion model of the concourse slab and column C2 at C24.9. As is apparent, the structural steel shear lug portion of the plate embed is in conflict with the reinforcing steel and will not fit with required rebar spacing. The rebar conflicts with he shear lug and blockout that are present, include but are not limited to:							
- Typical MFB Beam at C24.9 (blue colored bars in model)							
- B-68 Beam (yellow colored bars in model)							
- Main concourse slab (pink colored bars in model)							
- Column C-2 vertical T-Heads (purple colored bars in model)							
Please provide a solution that will provide a constructible blockout and embedment of the structural steel plate.

SHIMM000-0358	Sump Pit Rebar Tail and Trestle Pile @ GL 18.5/E - Area 9	Open	10/17/2013	10/27/2013		Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Spencer Sayles	Answered By:			
Co-Author:							
REQUEST:		SUGGESTION:	ANSWER:	Accept Suggestion: <input type="checkbox"/>			
Reference: RFI T-0644							
Three of the sump pit lower mat #11 tails near grid line 18.5/E are in conflict wit the nearby trestle pile. The bars have been trimmed to clear the trestle pile and provide an LTE of 34" instead of 60" as required per plans.							
Typically, a bent bar would be spliced to the interrupted bar as required in SKS-0281 in the response to RFI T-066; however, the trimmed bars have a 70" length which would not beet the 78" LTS requirement. Gerdau propose to leave the 3 ea trimmed bars as-is and not incoporate an additional spliced bent bar. Please confirm if this is acceptable.

SHIMM000-0362	Area 11 to 16 Mat Slab Layer 3 Lap Splice Relocation	Open	10/21/2013	10/31/2013		Potentially	<input type="checkbox"/>
From: Shimmick Construction Company, Inc. Ben Gordon		To: Webcor Construction LP	Spencer Sayles	Answered By:			
Co-Author:							
REQUEST:		SUGGESTION:	ANSWER:	Accept Suggestion: <input type="checkbox"/>			
Due to limited access between the waterproofing and access trestle, Gerdau proposes to shorten the mat slab typical layer three (North-South) 67'-0" bars at Areas 11 through 16. This requires the lap splice location to be moved from the center of column line, as specified on Note 1 of the Mat Top Bar Notes in S1-2052, to the location shown in the attached sketch.							
Please confirm if this is acceptable.							
SHIMM000-0363	Lower Concourse Construction Live Load Variance	Open	10/23/2013	11/02/2013		Potentially	<input type="checkbox"/>

Co-Author:							
REQUEST:		SUGGESTION:	ANSWER:	Accept Suggestion: <input type="checkbox"/>			
Please reference Specification Section 03 10 00 - 3.2.A.2 and the attached project spreadsheet. This spec section calls for a minimum construction live load of 50 psf without referencing or indicating before or after concrete is placed. According to D.H. Charles (shoring designer), falsework projects of this application typically approach the falsework design for 50 psf before concrete is placed and 20 psf afterwards, while always maintaining a minimum design load (dead + live) of at least 100 psf. See attached D.H.

REQUEST:			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>		
SCCI is in receipt of response to RFI SHIM000-0376 in which WOJV requests SCCI to submit a cost proposal for revisions: 1 Concrete curbs (CC) and 2. Reinforced Concrete Walls (RCW) as released in ASI 107. Please clarify the following:							
1. SCCI to to price the construction of the concrete partitions (shown as 'ghost lines' in Architectural drawings) to the full height up to the ground level. This means that the construction of the concrete wall at concourse level cannot take place until level A bracing and Rebracing RA is taken out (after TG07.2 contractor build the ground level).							
2. Since the RCW I concrete wall is now to be installed by TG06 contractor, dowels are to be installed (similar to platform rebar dowels in Area 3), instead offormsavers. Please confirm that this will not create inefficiency with TG06 or TG07 contractor.							
3. 3.ASI 107 new notes on A1 -2222-A1-2231 state: "CC- Cone Curb- Ref to A-0022 for concrete curb schedule- refer to struct dwgs for coupler details." Please provide the most recent copy of A-0022. SCCI has

Co-Author: Skanska USA Civil West California DisRyan Clayton							
REQUEST:		SUGGESTION:	ANSWER: Accept Suggestion: <input type="checkbox"/>				
1. Please confirm the embedded steel in the following details which is not connected to any TG07.1R steel is not in TG07.1R scope and will be supplied and installed by others: 4 & 5/S1-3002; 4 & 6/S1-3203; 2, 3, 6 & 7/S1-3205; 2/S1-3207; 3, 5 & 7/S1-3210; 4/S1-3281; 1/S1-3282; 1 & 10/S1-3411; 3 & 6/S1-3412; 6/S1-3502; 6/S1-3503; 2A/S1-3706; 4 & 7/S1-7604; 3 & 8/S1-7631; 5 & 9/S1-7660 and 6, 7 & 9/S1-9052.			1) Confirmed that embedded steel not connected to TG07.1R steel is not in TG07.1R scope. However, several details listed by Skanska appear to be connected to TG07.1R steel (3 & 6/S1-3412, 3 & 8/S1-7631, 8/S1-7602, 1/S1-3705, 9 & 11/S1-7600) and are included in Skanska's scope. Detail 2A/S1-3706 is an edge of metal deck support, and is included in Skanska's scope.				
2. Please confirm the embedded steel in 8/S1-7602 which is clearly indicated below the scope delineation line is not in TG07.1R scope and will be supplied and installed by others. Skanska will field weld the 3/8" plate to the embed steel as indicated on see SK1.			2) See response to item #1				
3. Please confirm the embedded plate and angle in detail 1/S1-3705 will be supplied and installed by TG06 and Skanska will field weld the double angle connection to the embedded plate as indicated on SK2.			3) See response to item #1				
4. Details 9 & 11/S1-7600 indicate the top and bottom connections for stair 202 & 403 between the Train Platform Level and the bottom of the Lower Concourse slab. As the scope delineation line clearly shows the embedded plates will be supplied and installed by TG06. Once these embeds are poured in place the HSS post cannot be installed as detailed. Please confirm these HSS post will be supplied and installed by TG06 after the platform slab has been poured and before the Lower Concourse slab. See SK3 for clarification.			4) See response to item #1				
SKAN000-385.1	SSS - Embedded Plate - Scope Clarification	Closed	03/25/2014	04/04/2014	03/25/2014	Potentially	<input type="checkbox"/>

Co-Author: Skanska USA Civil West California DisRyan Clayton							
REQUEST:		SUGGESTION:	ANSWER: Accept Suggestion: <input type="checkbox"/>				
As per SK RFI 385 response, Skanska has the following comments on the details WO indicated are included in TG07.1R scope:			1) OK				
1) 3 & 6/S1-3412: As no clear scope delineation line is indicated on these two details and the embeds are attached to TG07.1R steel, Skanska will provide the embedded plates for others to install as detailed on 3 & 6/S1-3412 SK1.			2) Drawing S1-7102 has not been issued for construction by the design team. It is currently listed as issued for bid. The attached S1-7102 is provided for your reference only.				
			3) Skanska to field weld 3/8" plate to embedded angle. Embedded angle to be provided and installed by others.				
			4) OK

REQUEST: It is understood through review of the TG07.1R package that no applications of standard paint systems on structural steel are required at this time. However, in preparation for potential future changes, Skanska is collecting product information for standard paint systems for potential use on the project.  Specification section 05 10 00-2.2.A.1 lists general requirements for structural steel standard primer, but does not list the basis of design manufacturer(s) for this system. This section refers to the Division 9 specification; however, Skanska has only been issued the high performance coating specification within Division 9. Please provide the basis of design manufacturer(s) approved for structural steel standard paint coating systems on this project.		SUGGESTION:	ANSWER: Accept Suggestion: <input type="checkbox"/> Please reference the specifications issued along with TRANSBAY FIELD ORDER 00027 - 100% Main Package Drawings, "Issued for Construction" dated 3/31/14.

SKAN000-478	SSS - Lift Eyes on Ground Cast Nodes	Closed	03/21/2014	03/31/2014	03/21/2014	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Gregory Kemerer To: Webcor Construction LP Jeff Galoyan Answered By: Webcor Construction LP Gregory Kemerer							
Co-Author: Skanska USA Civil West California DisRyan Clayton							
REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
The contract drawings indicate that lift eyes will be provided for shop handling. The lift eyes that were cast into the back side of the ground level cast nodes have now been machined off by Bradken, leaving only the lift eyes inside the nozzles. In order to safely handle these castings, new lift features need to be added to the back side to replace those that were machined off.				Note 6 on the Cast Connex drawings indicates "PICKING EYE(S) TO BE LOCATED WITHIN THE INTERIOR OF THE CASTING'S NOZZLE(S)."			
It is requested that drilled and tapped holes be added to the back side of the ground cast nodes by Bradken to facilitate safe and efficient shop handling as indicated by the contract drawings.				Removal of additional lift eyes not within the cast node nozzles is in line with this note. Please note that the picking eyes provided are intended for use in lifting the weight of the cast nodes only, and are not intended to support the weight of any additional material attached subsequently.

T- 0851	BGP - Lower Concourse Shoring/Reshoring Calculation for Construction Live Load	Closed	10/23/2013	11/02/2013	11/05/2013	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Jackson Tukuafu To: Turner Construction Company Gary Krutsch			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author: Shimmick Construction Company, Inc. Scott Bunnell							
REQUEST:			SUGGESTION:				
Please refer to attached excerpt of Specification Section 03 10 00 - Concrete Formwork - Below Grade Package.			ANSWER: Accept Suggestion: <input type="checkbox"/>				
Per Article 3.2, Section A.2 of Spec Section 031000, the minimum construction live load design criteria for shoring and reshoring is 50 psf. The specification section is unclear whether the live load of 50psf is prior to or post concrete placement.			George Metzger 11/4/2013 RESPONSE: Specification 03 10 00: Design of formwork is the responsibility of the contractor. See Section 1.3C for formwork design requirements that include conformance with SEI/ASCE-37 and ACI 347. See Section 3.2 for Shores and Reshores including conformance with ACI 347.2R.				
According to D.H. Charles (SCCI shoring designer), falsework projects of this application typically approach the falsework design for 50 psf before concrete is placed and 20 psf afterwards, while always maintaining a minimum design load (dead + live) of at least 100 psf. The attached list of D.H. Charles project used the this same design approach. Falsework calculations are to follow.			ACI 347.2R typically assumes that the Live Load is associated with the placement of fresh concrete and that the Live Load is removed upon the completion of placement. Depending on the contractors planned use of "working surfaces" and the particular shoring/reshoring scheme, the Live Load may be more or may be less than the 50psf minimum after placement operations.				
Is the D.H. Charles design criteria acceptable?			Unless measures are taken restrict construction access to specific areas, it is assumed that the entire Lower Concourse will be a working surface and that the contractor will assign an Operational Class per SEI/ASCE-37 Section 4.8.1. Justification for the assumed uniform load will form part of the required submittal.

T-0018	BSE - Waler to CDSM Wall spacing	Closed	01/14/2011	01/24/2011	01/24/2011	Potentially	<input type="checkbox"/>
	From: Webcor/Obayashi Joint Venture Masashi Kojima	To: Turner Construction Company Daphne Faulkner				Answered By: Adamson Associates, Inc. George Metzger	
	Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal						
	REQUEST:	SUGGESTION:			ANSWER:	Accept Suggestion:	<input type="checkbox"/>
	There may be a potential conflict with the walers and the train box reinforcement. Spec 31-55-00 allows 6" minimum spacing from CDSM Wall to face of waler, but based upon Balfour Beatty past experience with a very similar situation, it is felt that the 6" space is not sufficient because of the following:				Thornton Tomasetti Response: It is permissible to use mechanical couplers for the vertical reinforcement interrupted by the whaler for the condition where whaler is 6" min away from CDSM wall. The proposed increase in whaler to CDSM wall spacing concept is acceptable by TT regarding the Trainbox wall, pending Arup's evaluation/comments. Submit details of revised scheme for review. ARUP Response: The design team cannot comment on the impact of the Contractor's proposal, without seeing more details of the shoring wall internal bracing system and associated proposed details. Adamson Associates Response: The proposal cannot be evaluated based on the limited documents submitted. However, it appears that the bracing and attachments shown in the drawing attached to this RFI will need to be modified to allow for the waterproofing system to be appropriately installed as the Wale system is removed.		
	1. There does not appear to be enough room between the bottom of the waler and the CJ for a lap splice of the vertical reinforcing as depicted on sheet S -3201. Reference the attached drawing.						
	2. The 6" gap is difficult to snake reinforcement through without damaging the waterproofing attached to the wall.						
	BBi recommends making the space between the face of the CDSM wall and the waler equal to the wall thickness. This would eliminate conflicts with the rebar and walers, reduce reinforcement splicing and reinforcing congestion.						
	Additionally attached is an example where the space behind the waler was equal to the wall thickness.						
	Please advise whether to continue the design with the current 6" minimum space or advise if the space increases.

T-0021	<b>REQUEST:</b> Reference Drawing Set D and Specification Section 02 41 01  Based upon Balfour Beatty observations of the site, there appears to be a concrete wall approximately 18in wide that is outside of the existing terminal basement walls adjacent to the 301 Mission Property line and the east side of Fremont St. that is not shown on BSE contract drawings or the existing Terminal drawings.  Does this wall continue around the entire perimeter of the Zone 4 basement?  Will this wall be removed by the demo contract prior to BSE NTP #02?  Please provide as-builts of the wall location if it is to remain.	<b>SUGGESTION:</b>			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Full extent of unforeseen concrete foundation wall not confirmed.  Existing Terminal and Ramps Demolition Project contractor (EBI) has been directed to remove extents of unforeseen foundation wall that are within limits of removal as shown in contract documents to a depth consistent with removal of adjacent structures (pile caps/footings).  Portion of unforeseen concrete foundation wall within Fremont Street to remain in place. Portions of unforeseen concrete foundation wall that are exposed but that are to remain in place are to be documented via as-builts. As-builts will be provided as completed.  Existence of similar walls in Zone 2 and 3 not

T-0024	Re-bracing for Revised SW Corner Alignment	Closed	02/02/2011	02/11/2011	02/11/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Nhi Tran      To: Turner Construction Company Daphne Faulkner			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author: Balfour Beatty Infrastructure, Inc.      Ural Yal							
REQUEST:			ANSWER:				
Reference Sheet GT-1112 and Specification Section 31 55 00			Accept Suggestion: <input type="checkbox"/>				
The response to RFI T-0017 showed a revised CDSM wall alignment at the SW corner of zone 1 and the addition of the structural shear walls on wall X1-1. The RFI response implied that BBII's cross-lot bracing needed to be re-designed so there are no conflicts with the concrete columns and shear walls. In order to minimize the cost and impacts as a result of this change, BBII suggests using rakers for the re-bracing in this corner.			ARUP Response:				
The cross lot bracing would be installed as specified for the initial excavation (ref stage 10 on GT-1112) similar to the layout shown on the attached sketch #1.			The use of rakers as rebracing is acceptable provided the design criteria specified in the construction documents is satisfied. This includes, but is not limited to, the bracing stiffness requirements. The effective stiffness of the rakers will be affected by the stiffness of the permanent train box wall and mat slab and tiedowns.				
Then for the re-bracing stage 12 and stage 15 rakers could be used in locations shown in attachment sketch #2.			The response to this RFI must include input from Thornton Tomasetti regarding the impact on the permanent structural elements.				
Would a design based on this concept be acceptable?			As discussed at the Feb 9, 2011 TG03 BSE Subcontractor - Design Team Coordination Meeting, it may be possible to reduce the requirement for rebracing if the permanent trainbox shear walls can be built sequentially and their construction coordinated with the removal of struts. Arup suggests a meeting with Arup, the Contractor, and Thornton Tomasetti as this requires an understanding of the proposed construction sequence and an evaluation of the permanent structural elements.				
If not, BBII is available and willing to brainstorm additional ideas.			Thornton Tomasetti (TT) Response: We have review the response by Arup, and found this is consistent with our prior discussion with Arup. No further comment from TT is needed.

T-0029	301 Mission Screen Wall - Sub Surface Structure Conflict with New Wall Location	Closed	02/09/2011	02/19/2011	02/18/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      David Hungerford                      To: Turner Construction Company Kevin Chiu			Answered By: URS Corporation                      David Fyfe				
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:                      Accept Suggestion: <input type="checkbox"/>			
Reference: Photograph attachments 1-8				To accommodate unforeseen location of existing structures, new concrete wall to be shifted south so that the south face of new concrete wall is flush with the exterior face of the existing 301 Mission street basement perimeter wall.			
In laying out the location of the new concrete wall, Transworld has determined that the new concrete wall will extend over existing sub-surface structures, which is not per the contract documents. Please reference attached photos.				Interfering regions of existing sub-surface structures (manhole rings and vault sides) at the base of new concrete wall shall be incorporated into new concrete wall. All surfaces of interfering concrete regions to be incorporated into new concrete wall shall be prepared as bonded construction joints. Verify functioning of manhole and vault lids/openings are not obstructed by new concrete.			
First, there are two manhole covers that are incorporated in concrete rings. These rings conflict with the location of the new wall and are included in photographed attachments. Due to the size of these concrete rings, a portion of the ring will be buried by the new wall. Second, the steel frame of the existing electrical vault doors is of similar condition as the manhole covers; this condition can also be seen in the photographed attachments.				Contractor to provide chalk line at updated south and north faces of new concrete wall for verification of updated location in field by TJPA representative prior to construction of new concrete wall.			
Please confirm that Transworld is to proceed with the plan location of the new concrete wall which will cover and bury a portin of these existing sub-surface structures.				See attached RFI coordination sketch.

T-0030	301 Mission Screen Wall - Detail required for concrete sleeve installation	Closed	02/09/2011	02/19/2011	02/18/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      David Hungerford      To: Turner Construction Company Kevin Chiu			Answered By: URS Corporation      David Fyfe				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
Reference: Attached 1/C-5001 and photo					Accept Suggestion: <input type="checkbox"/>		
The existing condition of the manhole covers are not consistent with the contract documents. Detail 1/C - 5001 indicates that the existing manhole sits above an existing concrete slab, to which is to be drilled into with 1 inch embedment. However, please refer to the attached photograph in attachment 1 which shows the manhole cover is actually a part of a subsurface concrete ring assembly, and wrapped with waterproofing. Please provide a new detail and instructions for the installation of the required concrete sleeve and a detail for penetrating the existing waterproofing.					Per contract documents;		
					Remove manhole lid;		
					Retain existing concrete and steel collar/frame;		
					Dowel into existing concrete collar/frame (1" max) with #3 hoops @ 10" O.C.;		
					Prepare existing concrete surfaces to be incorporated into new sleeve as bonded construction joints;		
					Cast in place 6" thick concrete sleeve directly over manhole (concrete and steel collar/frame);		
					Provide Kadee SS 1/8" circular grate satin finish.		
T-0030.1	301 Mission Screen Wall - Concrete sleeve installation	Closed	02/24/2011	03/06/2011	03/03/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      David Hungerford      To: Turner Construction Company Daphne Faulkner			Answered By: URS Corporation      David Fyfe				
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
Reference: RFI T-0030					Accept Suggestion: <input type="checkbox"/>		
The final measurement from the edge of the steel collar/frame at the existing manholes to the face of new wall is (+/-) 4-3/4", this dimension less form material (+/-) 3/4" to 1", results in the new cast in place concrete sleeve to be 4" thick at the point closest to the wall . Response to RFI T-0030 notes that the sleeve is to be 6" thick. Please clarify if the 4" thickness is acceptable.					4" minimum thickness acceptable only where new CIP concrete sleeve is in conflict with new interim screen wall. Remaining portions of new CIP concrete sleeve not in conflict with new interim screen wall shall be 6" thick per contract documents.		
					Contractor shall provide 3/8" expansion joint material between face of new interim screen wall and outside face of new CIP concrete sleeve.		
					See attached coordination sketch.		
T-0031	301 Mission Screen Wall - In-ground lighting	Closed	02/09/2011	02/19/2011	02/21/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      David Hungerford      To: Turner Construction Company Kevin Chiu			Answered By: URS Corporation      David Fyfe

**REQUEST:**

Reference: Note 10 on C-2000

The new in-ground lighting as anticipated in plans and note 10 on page C - 2000 must be substituted because the contract design cannot be accommodated in the new construction. The contract design requires:

1) that the new lighting match the existing with the same model and size.

The issue here is that the existing light fixtures are larger than can be accommodated within the thickness of the new construction.

2) that the existing electrical lines servicing the existing lights be disconnected so that it is reconnected to the new lights.

The issue here is that the electrical lines for the existing light fixtures are embedded in the concrete curb that is to be removed. Upon removal of the existing concrete curb, there will be no existing electrical lines to reconnect for the new lighting power.

Please provide a new detail and instructions for the in-ground lighting.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:** ☐

Additional information is required to understand/interpret existing conditions and facilitate a response to this RFI.

Please provide all available information on existing conditions that pertain to this RFI, including but not limited to the following;

1. type, model, size and manufacturer of existing light fixtures;
2. type and size of existing electrical conduit/conductor;
3. sketch illustrating alignment of existing electrical conduit/conductor, including junction boxes, termination points and power source; and,
4. sketch illustrating thickness of existing/new construction where new lights are to be set/placed.

T-0031.1	301 Mission Wall - In-ground lighting	Closed	03/31/2011	04/10/2011	04/06/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP		David Hungerford	To: Turner Construction Company Daphne Faulkner		Answered By: URS Corporation		David Fye
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:      Accept Suggestion: <input type="checkbox"/>			
Reference: Attached photos and sketch				We note that the Contractor has installed new electrical conduit and outlet boxes within the new concrete wall.			
Response to RFI T-0031 requested additional information.				To document the as-built conditions of all work and to verify conformance with all applicable codes and standards, Contractor shall submit drawing(s) illustrating full routing of all conduit(s), including alignment, conduit material type, couplings/fittings, outlet boxes, etc. Drawings shall detail the connection between existing electrical line and new electrical line and connection between new electrical line and new lights/fixtures.			
1. See the attached pictures for the information known about the lights that were removed.				Drawings shall be sufficiently detailed to document all electrical work is in conformance with all applicable codes and standards, and shall be sufficient for permitting and/or inspection of electrical work.			
2. The existing conduit is 3/4"				All conduit and/or boxes shall be set so as to provide minimum 1 1/2" clear from all rebar, anchor bolts or other embedded structural steel items. Outlet boxes located in new concrete wall shall be fully coordinated for direct connection with the new light(s)/fixture(s).			
3. Attached is a sketch and a photo showing the approximate location of the existing conduit.				It is our understanding that the existing 301 Mission driveway/roadway section (approximately 3 1/2" paver over 1 1/2" sand bed over 4 1/2" to 8 1/2" concrete topping slab) does not allow use of new lights/fixtures matching original lights/fixtures. It is recommended use of the Ligman Paragon square 186mm (50338-N-35) light/fixture, or approved equal, in lieu of the original light/fixture (Hydrel M9410). The new Ligman Paragon square light fixture (or equivalent fixture) shall be placed adjacent to new concrete wall and shall be mounted exposed above ground (not in ground) with the base of new light fixture located aligned to top of paver(s). See attached coordination sketch.			
There is one existing conduit on the south side of the wall protruding from the soil coming from the basement wall. The electrical conduit is approximately 6 feet east from the western transformer vault vent opening. Attached you can see the pictures of this conduit that is currently sticking out below the scaffolding planking.				Please confirm the use of Ligman Paragon square 186mm (50338-N-35) light(s)/fixture(s) can be fully coordinated with all work.			
4. Please advise the location and mounting details for the new lights.				See attached product data for Ligman Paragon square 186mm (50338-N-35) light/fixture.			

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>
			In addition, in response to item 2 of RFI No.T-0031, Contractor please coordinate with 301 Mission Building management to ensure that the new light shall be connected correctly to the existing power supply.

T-0031.2	301 Mission Wall - Light Fixtures	Closed	06/29/2011	07/09/2011	07/13/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      David Hungerford			To: Turner Construction Company Daphne Faulkner			Answered By:URS Corporation                      David Fyfe	
Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:                      Accept Suggestion: <input type="checkbox"/>		
Reference: Attached light specs							
Per field conversations with 301 Mission staff, the light fixture proposed in response to RFI T-0031.1 is not acceptable. Webcor-Obayashi has coordinated with 301 Mission management personnel and the lighting attachment to this RFI has been requested by 301 Mission. Confirm that the attached light specs are to be installed at the stucco slot locations.			URS provided four lighting options to Webcor-Obayashi on April 22, 2011 to coordinate with 301 Mission management personnel. It is noted that the lighting attachment to this RFI (Allscape BL-81) is similar to one of the four lighting options provided by URS (Allscape BL-80).				
			The Allscape BL-80 model (with 39 watt/240 volt, metal halide lamp and prismatic tempered glass lens) was selected by URS because it provides photometric qualities and operating electrical amperage comparable to the original lighting fixture (Hydrel M9410, 35 watts/277 volt, metal halide lamp).				
			It is noted that the lighting attachment to this RFI, Allscape BL-81 model (with 150 watt/277 volt, metal halide lamp and prismatic tempered glass lens) may provide photometric qualities and operating electrical amperage not similar to the original lighting fixture. It is also noted that the Allscape BL-81 model luminaire is 14.5" wide, which is greater than the 14" width stucco slot(s) specified in the contract documents.				
			Prior to order and/or installation of the lighting attachment to this RFI (Allscape BL-81, 150 watt/277 volt metal halide lamp) Contractor to confirm the following;				
			301 Mission building existing electrical circuit/feed that is to be used is sufficient to handle electrical load required by the Allscape BL-81, 150 watt/277 volt metal halide lamp(s); 14.5" width of the BL-81 luminaire(s) can fit within the stucco slot(s) constructed, note contract documents specify 14" wide stucco slot(s); and photometric qualities of 150 watt lamp (e.g. lighting intensity/brightness) is acceptable to/preferred by 301 Mission management personnel.

T-0033	301 Mission Screen Wall - Concrete Demo Scope of Work Clarification	Closed	<b>REQUEST:</b>		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>	
			Reference: attached text document				Response from David Fyfe on 2/23/11: Removal of element is in scope per contract documents, see detail B on sheet C-5000.	
			Please see attached text document explaining Transworld's request.				----- ----- -----	
			Transworld Construction requests that TJPA, Turner Construction, and Webcor-Obayashi make a final determination as to work scope based on the documents and discussions provided herein. It is Transworld's contention and belief that the 301 Mission wall relocation work scope does not require Transworld to remove the (e) concrete structure below the dark gray colored curb. For clarity see Exhibit D, page 1 and page 2.				Response from John Adams on 2/24/11: 1. Demolition scope Utility Vault "foundation" to be demolished by Evans Bros see attached sketch C-5000 Detail A. 2. Existing "Concrete Slab" in accord with attached sketch C-5000 Detail B - this element is in scope and is to be removed by Transworld per C-5000 Detail B including concrete as shown. 3. Demolition scope "unforeseen grade beam" to be severed by Evans Bros see attached sketch C-5000	
			Attached please see text explanation and Exhibits A, B, C, and D.

<b>REQUEST:</b> Reference Sheet S-3201 and Specification Section 31 55 00  BBII believes that they do not have enough detailed drawings of the Train Box to properly design a conflict-free bracing system. BBII states that the architectural sections A1-6000 through A1-6231 lack detail regarding dimensions of structural components (i.e. beams, walls, ramps and etc.). The only structural section BBII currently has is on S-3201 and there appears to be a beam running along C line, however that beam is not identified in the table.  BBII is requesting additional structural section and elevation drawings, specifically: - A dimensioned longitudinal elevation of the entire trainbox, showing the most current location and depths of beams. - Full cross section of typical trainbox as well as any other non typical section. Shown any cross slopes, high and low points of concrete. - Detailed sections of the SW corner showing dimensions and elevations of any ramps or locations where there are on ground floor slabs.  BBII would prefer CAD files if possible, however hardcopies will work.		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>  The design of the permanent structure inside the shoring wall is in progress and subject to change. At 50% Construction Documents on December 20, 2010 an in-progress 3D REVIT Program Computer Model was issued to TJPA and TJPA shared this model with W/O for informational purposes on the progress of the permanent structure design. We suggest that for reference only, W/O review the possible locations for shoring struts with the in-progress 3D REVIT Program Computer Model. This 3D REVIT Program Computer Model provides more information than you would receive in the limited number of sections requested above.

REQUEST: Reference Sheet GT-1110, Specification Section 31 55 00, and attached memo  Please see the attached memo from BBII's bracing design engineer, PB&A.  PB&A are finding more than a slight discrepancy between the bracing loads given in the tables of GT-1110 when compared to loads they calculated using the "design profile" earth pressured diagram as shown on the same sheet.  As required by note 6 on GT-1110, BBII is continuing their design with the forces given in the tables, however BBII feels it is prudent to note the variances.		SUGGESTION:		ANSWER:            Accept Suggestion: <input type="checkbox"/> See the attached reply. ----- Attached Response from ARUP - 02/18/2011 Kevin Clinch  The internal bracing system shall be designed to satisfy the criteria specified in the contract documents including the strut loads given in the tables on GT-1110.  Our review of the calculations included with the RFI was limited to that necessary to understand the Contractor's questions. The calculations have not been reviewed for conformance with the contract documents. A more complete review will be undertaken when the calculations are issued as a

T-0037	BSE - Request for Utility As-Builts	Closed	02/17/2011	02/28/2011	03/01/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP Nhi Tran Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal		To: Turner Construction Company Daphne Faulkner		Answered By: AECOM Technical Service Eric Zagol			
REQUEST: Reference Sheets U-2021 to U-2023, U-4005  BBII is requesting as-built data for the phase 1 electrical ductbanks at First St. and Fremont St. BBII is particularly interested in receiving the coordinates, elevations, width and depths of the ductbank where they intersect the CDSM wall as shown on utility drawings U-2021 through U-2023  Additionally, BBII would like to receive more info on the phase 2 utilities shown in section X&Y on U-4005: - What material are these ducts and are they encased? - Can the spacing shown on U-4005 be shifted to accommodate bridge girder spacing?		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/> Phase I electrical ducts as shown on the AECOM Relocation of Utilities Project (RUP) Plans sheets U-2020, U-2021, U-2022 and U-2023 on First and Fremont streets have been constructed or will be constructed by PG&E. AECOM has requested as-built information from PG&E on what has been constructed to date and will provide upon receipt.  Sections X and Y on RUP sheet U-4005 shows utilities in the proposed final locations following construction of the Transit Center substructure and permanent utility corridors on First and Fremont streets. Not all utilities shown need to be incorporated and supported by the interim bridge structures on First and Fremont streets.  Only PG&E and Verizon Phase II utilities need to be incorporated and supported from the interim bridge structure. The remaining utilities i.e. AT&T, TCG and PG&E "NIP" (PG&E New Bushiness) indicated in section, will be constructed following construction of the Transit Center substructure and permanent utility corridors.  PG&E has proposed steel conduit for the ducts to be supported by the interim bridge structures. Verizon has proposed PVC conduits.  Proposed modifications to utility alignments (horizontal and vertical) and conduit configuration may be acceptable upon review and acceptance by AECOM and the private utility. AECOM suggests a coordination meeting between BBII, AECOM and the

T-0038	BSE - Shear Walls for Rebracing	Closed	02/17/2011	02/27/2011	02/22/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>To:</b> Turner Construction Company Daphne Faulkner <b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>REQUEST:</b> Reference response to RFI #T-0024, Sheet GT-1112, and attached drawing  The response to RFI #T-0024 noted discussions that took place during the TG03 BSE Trade Subcontractor - Design Team Coordination Meeting, about utilizing the permanent shear wall as re-bracing during the train box build out.  Attached is a sketch showing a staged wall construction and strut removal sequence that BBII believes would eliminate the need for re-bracing along the SW Wall.  Is this sequence acceptable?			<b>SUGGESTION:</b>  <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Thornton Tomasetti Response:  The conditions depicted in Stage 12 & 13 of sketch GT-1112 for shearwalls to be used as re-brace elements will cause overstressing of the mat slab and excessive movement of the Trainbox wall, and therefore, is not acceptable. Note however, that once the Lower Concourse slab is constructed and develops the design strength, the upper portion of the shearwall above the Lower Concourse slab can be used as re-braces. See attached SKS-0101 that illustrates the load path of the shearwall.  ARUP Response:  The use of the permanent concrete shearwalls as bracing is acceptable provided the design criteria specified in the construction documents is satisfied. This includes, but is not limited to, the bracing stiffness requirements. The effective stiffness of the shear walls will be affected by the stiffness of the permanent train box wall and mat slab and tiedowns.  The response to this RFI must include input from Thornton Tomasetti regarding the impact on the permanent structural elements.				
T-0039	301 Mission Screen Wall - Base Plate Dimensions	Closed	02/17/2011	02/27/2011	02/23/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      David Hungerford <b>To:</b> Turner Construction Company Daphne Faulkner <b>Co-Author:</b>			<b>Answered By:</b> URS Corporation      David Fyfe				
<b>REQUEST:</b> Reference: 2/S-5000, D/S-5000, attached sketches  See the 301 Mission Screen Wall drawings, specifically details 2 and D/S-5000. Is it acceptable to use a base plate with dimensions 14" x 14", in lieu of the 14" x 18" per plan below the HSS 10" x 10"? See attached sketches of proposed anchor bolt mounting options A and B. If acceptable, please choose the detail you prefer.			<b>SUGGESTION:</b>  <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Neither options A nor B are acceptable for the anchor bolt mounting system. Provide a base plate as detailed on S-5000 that has the dimensions of 14" by 18".

T-0042	301 Mission Screen Wall - Elevation of concrete wall	Closed	02/24/2011	03/06/2011	03/10/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      David Hungerford      To: Turner Construction Company Daphne Faulkner			Answered By:URS Corporation      David Fyfe				
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:      Accept Suggestion: <input type="checkbox"/>			
Please clarify the following information regarding the field elevation of the new concrete wall. Detail A/S-4000 indicates that the concrete foundation wall height shall be +/- 2'- 2" to 2'- 8". Based on this reference the tallest part of the concrete wall will be the East point of the wall. The height of the wall will then decrease as the wall moves west towards Fremont St. (the west side). If we use a wall height of 2'- 8" at its tallest point (the east side), that would result in a wall height of 20.5 inches at Fremont Street (the west end). This is less than 2'-2" as indicated in the contract drawings; therefore please confirm that Transworld will be building a concrete wall height between 20.5 inches to 2'- 8". As a point of comparison, the original existing screen wall had this exact same dimension of 20.5 inches at the low and 2'- 8" at the high.				New concrete wall height of 20.5" above the existing embed plate on west end is not acceptable.			
				Contract documents show the new concrete wall height varies from 2'-2" +/- to 2'-8" +/- . This is based on the driveway elevations shown on the existing plans provided by Millennium Partners, developer for 301 Mission Street, and allowing for a code required minimum 18" high concrete wall from top of paver/driving surface for vehicle safety. As noted on A/S-4000, "Top of (E) Vault Wall Elevation may Vary, Contractor to VIF, Adjust Concrete Wall Accordingly", please adjust top of concrete wall to be minimum 18" above top of paver/driving surface (approximately 2'-4" +/- to 3'-4" +/- in wall height).			
				See attached coordination sketch.

T-0043	301 Mission Screen Wall - Temporary Vault Plug at Utility Vault Opening	Closed	02/25/2011	03/07/2011	03/23/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      David Hungerford                      To: Turner Construction Company Daphne Faulkner			Answered By: URS Corporation		David Fye		
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:              Accept Suggestion: <input type="checkbox"/>			
Regarding the transformer vault plug as shown on page C-5000; Transworld has been asked to submit some proposals as to how a plug should be installed. The original existing ventilation for the vault was open to the air at the original planters. This original ventilation was completely open and secured only by a metal grate to prevent access, but not water or air. As located on page C-5000, Transworld construction proposes to install 2 x 4 backing studs attached to the left and right vertical walls of the existing opening. These 2 x 4 backing studs will be adhered with powder actuated nails. Spanning across the backing studs Transworld construction proposes to install two 2 x 4 crossmembers which will be nailed to the 2 x 4 backing studs. This assembly can be seen in the attached pictures pages 1 and 2.				Contractor shall provide the transformer vault plug based on the Option 4 solution with the following amendments;			
The assembly noted above is option 1. Option 2- Added additionall 2x4 crossmembers which would further restrict air flow to the (e) vault. Option 3- Nail on a plywood sheet that would enclose the entire vault vent opening. Option 4 - Nail on a plywood sheet and waterproof the plywood to prevent water intrusion as well.				1. Provide 2x4 cross members at max. 12" o.c. spacing; 2. Face of all 2x4 members shall be flush with outside face of existing vault wall to facilitate extension of plywood sheet beyond ventilation opening (see number 5 below); 3. Plywood sheet shall be two layers of 5/8" for a total of 1.25" thick, laminate plywood layers with waterproof adhesives; 4. Secure plywood to 2x4 members with galvanized nails or screws at min. 6" spacing; 5. Extend plywood sheet min. 6" beyond edge of ventilation opening (all four sides); and, 6. Seal perimeter of plywood sheet and existing concrete vault wall with appropriate sealant to ensure weather tightness (all four sides).			
Note: Transworld Construction is concerned about restricting airflow into a vault that originally was designed to have this open vent. We are not familiar with any impact sealing this vent will have on the existing equipment.				In addition, Contractor is required to ensure sufficient air flow is provided to existing underground vault/electrical equipment at all times. Existing ventilation openings (one per vault) shall not be plugged until new ventilated manhole covers per C-5000/C-5001 are installed. The new ventilated manhole covers must be protected from damage and/or soiling from concreting activities of the adjacent stem wall. The existing ventilation openings must be plugged prior to start of BSE activities to restrict entry of water and/or construction debris into the existing underground vault/transformer spaces.

Reference: Attached pictures								
The new 301 Mission screen wall location is to be laid out over an existing embed plate. At that plate #8 rebars are to be epoxied per RFI T-0027. Currently in the field the embed has been cut where the dowels are to be installed and holes are being drilled to the required 30" depth. It has been discovered that there are voids below the existing embed plate of up to 1.5". See attached pictures for some locations where this condition occurs. Please advise if this void is to be filled.

T-0050	BSE - Revised Plans for CR T-005B	Closed	03/07/2011	03/17/2011	03/14/2011	Potentially	<input type="checkbox"/>
	From: Webcor Construction LP Nhi Tran Co-Author: Balfour Beatty Infrastructure, Inc. Ural Yal	To: Turner Construction Company Daphne Faulkner			Answered By: Turner Construction Company Daphne Faulkner		
	REQUEST: Reference CR T-005B  As BBII has explained at the TG03 Trade Subcontractor - Design Team Coordination Meeting No. 3, held on February 23, 2011, in order for BBII to provide meaningful pricing and make preparations to order materials that will be required for the changed work, BBII is respectfully requesting revised contract documents for all work that is impacted by this change, specifically including, but not limited to, geotechnical and demolition drawings.  These drawings will allow BBII to accurately identify the changes and provide pricing that complies with Section 6 of the General Conditions.  In addition, due to increasing steel prices and long lead times, BBII proposes a revision to CR T-005B to allow for the ordering of additional shoring wall beams prior to the rest of the Change Order being negotiated. BBII believes this will reduce the overall cost of this change. Upon receipt of the revised drawings that include the new shoring wall beam table (GT-5101), BBII will be able to receive quotes for this work and finalize an order.	SUGGESTION:			ANSWER: Accept Suggestion: <input type="checkbox"/> URS will issue a revised D-2200 drawing this week.  ----- ----- 03/10/2011 - George Metzger  Some parts of the question need to be answered by URS/PMPC/TJPA/Turner.  ARUP Response:  Arup's response regarding the request for geotechnical drawings and the soldier pile schedule is as follows: the "CDSM Shoring Wall Schedule" on GT-5101 does not change. The wall segments shown on the plan were simply extended to include the increased wall length. It is possible that the top of wall elevation may change +/- 1 ft once the finish grade is established following demolition of the buildings. The length of the soldier pile and the depth of the drilled hole from the ground surface will not change from that shown on the schedule.  In addition to GT-2101 which was issued as SKGT-0001-R1 in response to RFI-017, the change order will include the following drawings: GT-0000 (the drawing index will be clouded to show the affected drawings); GT-0100, GT-1110, GT-2000 (the shoring wall layout

REQUEST:		SUGGESTION:		ANSWER:		Accept Suggestion: <input type="checkbox"/>	
Reference Sheet GT-1110, RFI #T-0018, and attached photos and drawings				REVISED RESPONSE TO RFI #T-0053			
Previous RFI #T-0018 - BSE - Waler to CDSM Wall spacing addressed BBI's concern with only having 6" clear between the face of the CDSM Wall and the Waler. Conversations in the weekly TG03 BSE Design Team Coordination meetings have re-raised the issue and BBI believes it requires additional consideration. The response in RFI #T-0018 said that rebar couplers in the wall verticals (in the next contract) would be used to eliminate the conflict. BBI believes that this seems to be impractical and not cost effective for over 3000 lf feet of wall and 4 levels of walers. Providing a standoff equal to the wall thickness would be an additional cost to the BSE contract, but BBI believes it would be minor compared to dealing with the cost to deal with the conflict later.				TJPA revises response to as follows:			
BBI is requesting to please re-evaluate and provide direction.				The W/O and BBI proposal to increase the spacing between the waler and CDSM wall is acceptable to TJPA since it meets the requirements in 31 55 00 1.5 DESIGN subsections I, J, K, L, and M. This design is for Contractor use. This proposal from the Contractor creates multiple benefits for W/O and BBI including The waler is out of the way of the rebar and this will help W/O with their coordination with the Train Box concrete work subcontractor. W/O benefits since more rebar can be installed with this increased spacing which saves time to the schedule and costs associated with the waterproofing and rebar installations. BB benefits because it appears that there is a decrease to the number of times that struts and walers must be moved. BB benefits in that strut length remains essentially the same when restrutting after Train Box wall sections are completed.			
Attached is a suggested detail as well as examples where it has been used before, for your consideration.				TJPA and the Program Management Team suggest that W/O and BB proceed with a 3' - 6" spacing or whatever dimension is necessary to insure that the walers are not within the Train Box Wall profile. If the walers position requires rework, the Contractor and SubContractor take full responsibility to meet design requirements with no change to contract cost. TJPA agrees to this suggestion from the Contractor to offset the waler from the CDSM wall to allow for the construction of the Train Box wall. TJPA requests that the Contractor proceed on this issue as a no-cost resolution to these RFIs. If W/O finds that this Internal Bracing for Shoring Wall design does have an additional cost to TJPA, the funds will come from the CM/GC Contingency Fund.

<b>REQUEST:</b> Reference CR T-006  The Change Request documents do not indicate who will have the maintenance responsibility for the AC walkway.  BBII has the following questions: 1. Should BBII include pricing for maintenance? If this walkway is going to get placed on top of the 3" minus rubble, a fair amount of maintenance would be required. 2. When is this walkway scheduled to be constructed? And if maintenance is needed, when would it start? 3. Are the typical fence and K-rail shown in the section the same ones that are protecting the perimeter, or an additional row that creates a walkway that has both sides fenced, protecting the public from construction and vehicle traffic?  BBII needs to have this information in order to provide accurate pricing for this Change Request T-006. Please advise.		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>  This is not an RFI. W/O has control of the site and is to coordinate maintenance duration with their subcontractor for pricing.

T-0057	BSE - Verticality and Sonic Testing on Drilled Piers and Shafts	Closed	03/10/2011	03/20/2011	03/11/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP <b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.		<b>To:</b> Turner Construction Company Daphne Faulkner		<b>Answered By:</b> Adamson Associates, Inc. George Metzger			
<b>REQUEST:</b> Reference Sheet GT-5202 and Specification Section 31 63 29  Specification Section 31 63 29, 3.8.1.3 states "The contractor shall perform a test to determine verticality of the steel tubes, or drilled holes, that are going to be used for the sonic tests."  BBII has been advised by a number of testing firms that verticality tests cannot be performed on steel tubes or PVC tubes tied to steel cages. Detail 12 on Drawing GT-5202 shows 4 equally spaced PVC or steel tubes tied to reinforcing steel cage. BBII has also been informed that, as of now, there is not a specification in existence that mentions vertical tolerances of CSL tubes.  BBII is proposing to do the following in lieu of formally testing the CSL tubes for verticality: 1. BBII will make sure that the tubes are parallel and symmetrically placed. The cages and tubes will be properly inspected for positioning, spacing, parallelism prior to placing the cages into the hole. This is the most important inspection to ensure accurate CSL results. 2. Since the tubes are tied directly to a vertical cage, and the cages and casings are tested for verticality anyway, BBII will do a visual inspection to ensure that the tubes are sufficiently "vertical" for CSL testing purposes prior to placement of tremie concrete. 3. BBII will make sure that the cages are carefully lifted in a manner that limits the deflections of the cage to ensure		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> ARUP Response:  The verticality of the holes / tubes must be checked to properly interpret the CSL test results. If verticality tests cannot be performed on steel tubes, consider using PVC tubes. The integrity of the PVC tubes can be maintained by filling them with water and inserting alignment bars into them prior to concrete pouring.

T-0061	BSE - Concerns About Pile To Mat Slab Connection	Closed	03/15/2011	03/25/2011	03/23/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>To:</b> Turner Construction Company Daphne Faulkner			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal							
<b>REQUEST:</b> Reference Sheet S-3003 and attached detail  BBII has concerns that the trestle pile to mat slab slip connection as shown in detail 2 on S-3003 will not work as intended. Based on BBII's understanding that this joint is intended to allow the mat slab to deflect upward and our limited knowledge of the permanent structure design, BBII has listed some concerns with this connection below: 1. BBII does not think the sleeve will be able to slide with the bolts and slotted holes completely encased in concrete. (see attached) 2. If the slab does deflect upwards and the lower section of pile is no longer in contact with the bearing plate, then the mat slab is carrying the entire load on the pile. 3. Any upward movements of the slab will affect the trestle supper structure framing. Differential upward deflections could cause damage depending on severity.  BBII does wish to bear the risk of re-designing this joint due to the interaction with the permanent structure, however BBII has attached a suggestion that they feel would eliminate some of their concerns listed above.  Please provide a revised detail or rebut BBII concerns if you still believe the detailed connection is the best suited for this application.			<b>SUGGESTION:</b>  <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Thornton Tomasetti response:  Comments in response to BBII concerns:  1. Bolts/slotted holes could be isolated from the concrete via styrofoam blocks.  2. Anticipated slab movement upward is due to rise of groundwater pressure after the dewatering pumps are turned off - which is after structure is completed and trestle work is completed.  Comments regarding proposed alternate detail:  1. Proposed detail does not address waterproofing at bottom of mat and allows water infiltration into the mat as currently presented.  AAI Response: Alternate detail will not satisfy waterproofing requirements.

	<b>REQUEST:</b> Reference photos (attached)  It appears that the demolition contractor is leaving large unprocessed rubble along the backside of some of the basement walls (See attached photos). Per the demolition drawings included in BBII's contract, all of the material in this area should be crushed/processed concrete at 3" minus. Handling material that does not meet these requirements will be considered a changed condition. Please advise.	<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The site Parcel E is in progress. The basement will be filled in accord with the contract drawings with crushed/processed concrete at 3" minus upon completion of work by the demolition contractor - contract completion date 4/7/11.  Please do not use RFI to ask a question of an area not yet completed by the Demolition contractor. Webcor-Obayashi the CM/GC or Turner Construction CMO can easily answer these questions over the telephone or via e-mail.			
<b>T-0065</b>	<b>301 Mission Wall - Length of dowels in concrete wall</b>	<b>Closed</b>	<b>03/17/2011</b>	<b>03/27/2011</b>	<b>03/24/2011</b>	<b>Potentially</b>	<input type="checkbox"/>

	<b>Co-Author:</b>						
	<b>REQUEST:</b> Reference: Sheet S-5000, RFI T-0042  The response to RFI T-0042 specifies for the new concrete wall height to be exposed above the existing pavers a minimum 18". To achieve this requirement, the overall concrete wall height must be increased 8", therefore also increasing the length of the dowels that are to be installed. The #8 embedment bars have already been purchased and fabricated. To achieve the higher wall height per response to RFI #T-0042, 90% of these fabricated #8 bars will have to be scrapped and new bars with the longer length must be made. As an alternative, would it be acceptable to still use the fabricated #8 embedment bars dowelled 30" into the wall per RFI T-0027, with the lenton terminator which would be set 32" above the (E) steel plate?	<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Use of fabricated #8 bars with lenton terminator acceptable. #8 embedment bars shall be dowelled 30" into existing concrete vault wall per RFI T-0027.  Resulting distance from top of #8 embedment bars with lenton terminator to top of new concrete wall will vary between approximately 3" - 9", verify in field. If resulting distance from top of #8 embedment bars with lenton terminator to top of new concrete wall is greater than 6", contractor shall install #4 U-bars at 12" on center. #4 U-bars shall be centered between the #4 ties on both sides of the #8 bar(s). #4 U-bar legs shall be 22" long.  See attached coordination sketch.  TJPA Representative to field verify all rebar placement prior to Contractor placing concrete.

	REQUEST:	SUGGESTION:		ANSWER:	Accept Suggestion: <input type="checkbox"/>		
Reference Specification Section 01 14 10 and attached sheet				For pre-trenching work, Contractor is expected to acquire excavation permit from DPW. Permit fee is reimbursable by TJPA.			
BBII would like to confirm the following: - BBII is responsible for applying for Excavation Permits from the San Francisco Department of Public Works for all of the pre-trench excavations in the public right-of-way. - Per Specification Section 01 14 10 Appendix (attached), TJPA will compensate BBII for the excavation permit costs.				In addition to the excavation permit, please note the the pre-trenching activity may need to obtain street space permit from DPW for work in Minna, Natoma, Fremont, Beale, and 1st (fee also reimbursed by TJPA), and Special Traffic Permit (as required) from DPT (or Sustainable Streets Division, SFMTA).

<b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.		Ural Yal					
<b>REQUEST:</b>		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>			
Reference Response to RFI#T-0073				ARUP Response:			
During a meeting with the San Francisco DBI & DPW, it was expressed that BBII must use response spectra generated by ARUP in the design of the temporary bridges. It was also noted that if the bridges are going to be in place for over 5 years, the design must be for a permanent structure and the specified ground motion may not be suitable. Therefore, BBII requests response spectra for a ground motion with a 10% probability of exceedence in 50 years as specified, as well as for a ground motion with a 7.5% probability of exceedence in 75 years.				Attached are:			
				1. Arup Amec (2010) report Tables 3-3(bedrock), 3-7a ( base of structure West end of box), 3-7b (base of structure East end of box), 3-9 (ratio vertical to horizontal spectral acceleration ratios) and Table 3-4 giving scale factors for near-fault effects. Note that these spectra exclude structural interaction effects and do not include the progressive softening effects that will occur progressively in the Old Bay Clay.			
				2. Output from LS Dyna dynamic analyses of the temporary (1 in 100 year return period) condition at 301 Mission, adjacent Fremont Street abutment, using the Kobe bedrock and far-field motions to generate the horizontal acceleration spectrum at the top of the shoring wall. This produces increased spectral accelerations at the fundamental period ( understood to be 0.8s) of the Contractor's bridge structure.			
				Arup recommends that a meeting be held to review and discuss these after the Contractor's engineer has examined them.

T-0074	301 Mission Wall - Nelson Stud and Stirrup Locations	Closed	04/01/2011	04/11/2011	04/01/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      David Hungerford      To: Turner Construction Company Daphne Faulkner			Answered By: URS Corporation		David Fyfe		
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:      Accept Suggestion: <input type="checkbox"/>			
Reference: RFI T-0027				Industry standard practice is to use miscellaneous added tie rebar (e.g. #3 or #4 bar) to provide for requirements to tie reinforcement bars as required. This RFI is a request to change spacing of nelson stud bars from 12" o.c. to 9" o.c. (where #8 dowels are spaced at 9" o.c.) in lieu of use of added tie bars.			
Per field conversation, please confirm that it is acceptable to install/weld nelson studs at 9" on center at locations in front of the vault intrusions into the concrete stem wall, where the #8 size dowels are also spaced at 9" on center, per RFI T-0027. The Nelson Stud spacing will match dowel embeddment locations. This spacing also facilitates the installation of rebar stirrups and provides two tie points, one being the dowel, and the other the nelson stud.				We note this request is for convenience of the Contractor and on this basis take no exception to reducing the spacing of the nelson stud bars from 12" o.c. to 9" o.c. (where #8 dowels are spaced at 9" o.c.). Accordingly, no change in contract and/or extension in schedule will be provided to accommodate this Contractor request. All impacts including cost and schedule associated with reducing spacing of nelson stud bars shall be borne solely by the Contractor.			
This work is currently ongoing and immediate confirmation is requested. Please confirm this layout is acceptable.				David Fyfe, 04/01/2011 ----- No CR will be issued for work associated with the change in nelson stud spacing from 12" o.c. to 9" o.c. (where #8 dowels are spaced at 9" o.c.).  Kevin Chiu, 04/01/2011			
<hr/>							
T-0075	BSE - Specification Section 32 12 17 and 32 12 18	Closed	04/04/2011	04/14/2011	04/05/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Nhi Tran      To: Turner Construction Company Daphne Faulkner			Answered By: Transbay PMPC		Alfred Lau		
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:      Accept Suggestion: <input type="checkbox"/>			
We noticed that the Specification 32 12 17 at the bid has been revised to 32 12 18 in the IFC Document. 1. Please confirm that the content of the specification "STREET EXCAVATION AND RESTORATION" was unchanged between pre-bid and post-bid. 2. Please confirm that the Trade Subcontractor shall continue to use the Specification Number 32 12 18 and TJP A shall revise the Table of Contents and other specification sections referring to "32 12 17."				1. Confirmed. Street Excavation and Restoration specification was issued as 32 12 17 in the IFB set, and issued as 32 12 18 to avoid duplication with the Pavement Restoration specification for the Utilities trade packages.  2. Confirmed. As stated above, 32 12 17 is for Pavement Restoration section for the Utilities trade packages, and is not applicable for TG03 Work.

Co-Author: Balfour Beatty Infrastructure, Inc.      Ural Yal							
REQUEST:      SUGGESTION:      ANSWER:      Accept Suggestion: <input type="checkbox"/>							
Reference RFI#T-0084, Drawing Sheet D-2230, and Specification Section 02 41 01			As stated in response to RFI T-0084 there are two Storm Drain outlets on Parcel N and their status' are unknown because they are outside the scope of the demolition contractor. Unforeseen Catch Basin at Beale Street Bar & Grill is identified under Demolition Contractor RFI -00058.				
RFI response T-0084 has not provided clear direction for decommissioning these SD lines. The drawings indicate that the SD drain flows towards Beale Street and will conflict with the CDSM wall. Please advise on status for decommissioning the above SD lines.			This is outside the scope of the Demolition and the BSE contract. Webcor-Obayashi RUP relocation of Utilities Project Manager will be contacted for reroute or decommissioning these Parcel N parking lot storm drain lines.				
T-0085	BSE - Existing Site Conditions Lot N	Closed	04/05/2011	04/15/2011	04/11/2011	Potentially	<input type="checkbox"/>

REQUEST:		SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>			
Reference Demo Contract Drawings		Demolition Contractor second 16 foot gate eliminated due to Fremont Shoring wall. Demolition contractor used alternate means and methods for truck traffic to-from parcel D Zone 4.					
Per note 5 on drawing D-1006 of the demolition contract, each discreet fenced area shall have a minimum of two 16ft gates at the conclusion of demolition work. Currently, zone 4 only has one gate in place. BBII requests an additional gate be provided on the Fremont St. side of zone 4. BBII is available to meet and coordinate an ideal location.		That said, Demolition contractor has offered gate credit which could be used to install a 16 wide gate either at SW corner near 181 Fremont St. or on the Beale St. fence line. However- Demolition contractor would not be responsible for curb cut, removal of parking meters or other ancillary scope if Beale St. gate is chosen - that would be the responsibility of BSE Contractor. BBII can use/modify and relocate barrier fence and gates as needed per your contract. A field coordination meeting after the Monday 4/11/11 Street Coordination meeting is recommended.

Reference Sheet GT-2201 and Specification Section 31 63 29			This issue was discussed at yesterday's (4/6/11) BSE meeting. The information which will be included in the Contractor's drilled shaft work plan is needed by Arup to evaluate the feasibility of the proposed shift and to consider other options.				
The temporary shoring wall installed under the demolition contract was moved East away from Fremont St. to avoid an unknown existing concrete wall. The as-built alignment of the wall now falls along the edge of the third column (C) of buttress shafts. In an effort to avoid conflicts with column C shafts generated by the revised temporary shoring wall alignment, BBII suggests that the buttress formation be moved 12" East.

	Reference Sheets GT-2103, GT-5101 and Specification Section 31 56 13		ARUP Response:				
	In drawing GT-5101, the spacing of all shoring wall beams is specified as 4'-0". This is reflected in the drawings for all sections of the CDSM shoring wall except the east wall (Wall Segment 35-1). The beam spacing of this Segment (measured in AutoCad) is 3.94728'. This creates a dimension bust of approximately 2.4' over the length of the wall and significant problems based on the auger spacing. Please verify the spacing of beams in Wall Segment 35-1.		The spacing of the soldier piles shall be the stated dimension in the documents (4'-0", unless otherwise noted). The Contractor is reminded to not scale the drawings. Additionally, the AutoCad dwg files are not part of the contract documents and the Contractor is not to obtain dimensions off the electronic files.

<b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal							

**REQUEST:**

Reference response to RFI T-0096 and Specification  
Section 02 41 01

BBII interprets the Response to RFI T-0096 (BBI 0067) as TJPA's approval for the removal of this unforeseen structure. Please confirm.

BBII proposes to follow the method outlined below for the removal of this unforeseen structure. Please confirm in writing that the removal of this unforeseen structure is approved and that provided that it is performed with the method outlined below, no damage to adjacent buildings will occur.

## Pre Trench Obstruction Removal Method

Location:

Parallel along the 301 Mission St. Low Rise (Grid line A, approximately between lines 29 & 34).

Obstructions:

The footing consists of bricks and concrete. It also has a perpendicular footing that comes out from the footing that is parallel to the 301 Mission building wall.

**Method:**

BBII will first expose the obstructions and use an excavator mounted and hand held jackhammer to demolish the large masses into smaller more manageable sizes. An excavator with a bucket will then clear the debris, until the debris is removed from the area of the CDSM Wall location. BBII will chase the obstruction as deep as it goes in order to remove all debris necessary for a clean location to construct the CDSM Wall. Due to the unknown depth of the obstruction, at BBII discretion Sheet Piles or trench boxes may be used to support trench walls. All OSHA approved, safe practices will be used by BBII employees during the Demolition.

Additional Details:

As noted in the RFI response, the Archeologist has already examined the site. BBII (W/O) will notify the TJPA if additional structures or items are encountered.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion: ☐

Construction means and methods are the contractor's responsibility exclusively. RFI response are not authorization of any change in contract sum or contract time.

We take no exception to above method for the removal of structure. This work will be tracked in accord with CR T-0010.

<b>REQUEST:</b> Reference attached photos  BBII has encountered a drainage material along the 301 Mission wall while pretrenching. During pretrenching, this drainage material has been removed because it was not affixed to the structure. The wall does not have any exterior waterproofing system.  Upon installation of the CDSM shoring system, the cementitious material will be against this wall. The existing wall is a 5' deep cantilevered beam on the backside of the existing garage shaft for 301 Mission. Does TJPA plan to install any waterproofing along this wall that can tolerate the installation of a CDSM shoring system?  Please advise BBII of the TJPA's plan for waterproofing of this building.			<b>SUGGESTION:</b>          <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Drainage material encountered is to be removed from the 301 Mission Wall as it was a temporary measure installed at the time of 301 Mission building construction. No waterproofing is required at this location. See attached email response from R. Rothenburger at PMPC.  ----- 04/19/2011 - George Metzger  TJPA to provide direction to GC.

REQUEST:		SUGGESTION:		ANSWER:              Accept Suggestion: <input type="checkbox"/>			
Reference Specification Section 02 41 19 and attached response for TG0300-310 Production Extraction Plan				ARUP Response: This is not acceptable. The proposed procedure does not allow the volume of placed CLSM to be measured after the stroking of the casing.			
BBII proposes to eliminate the "stroking" of the steel casing right before the CLSM is placed. Upon removal of the steel casing, BBII proposes to "stroke" the steel casing after the CLSM is placed. BBII believes the same effect of filling the void will be achieved, and this procedure will help to expedite the Project schedule. Please kindly review our proposal. Your prompt response is appreciated.

<b>From:</b> Webcor Construction LP      Masashi Kojima <b>To:</b> Turner Construction Company Daphne Faulkner			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal							
<b>REQUEST:</b> Reference Drawings U-0100 and GT-0100  BBII's surveyor, KCA Engineers, has noticed some slight variations in bearings between the Utility drawings and the BSE drawings. Please see the following of KCA's observations and confirm coordinates provided on drawing GT-0100.  Drawings U-0100 has coordinates along the center lines of various streets. The result of those coordinates put a bearing on the center line of Mission Street and Minna Street at North 46° 18 ' 19.6" East and the center line of First Street at North 43° 41 ' 39.0" West. This results in those streets not being at right angles to each other.  Drawings GT-0100 has coordinates on Column Line E. The result of those coordinates puts a bearing of North 46° 18' 09.7" East on the terminal Tills is 00° 00' 10" off from being parallel with Mission and Minna Streets. Is this correct or should Column Line E be parallel with Mission and Minna Streets?  The numerical column lines are shown at right angles to Column Line E, which gives them a bearing of North 43° 41 ' 50.3" West. It was observed that Column Line 18 appeared to be in almost the same location as the center line of First Street, but First Street has a bearing of North 43° 41 ' 39.0" West which is 00° 00' 11" different than Column Line 18. Is it just a coincidence that the center line and column line are almost exactly in the same location or should something be adjusted to make the two lines identical?  Please advise if the bearings of the terminal should remain or be changed.			<b>SUGGESTION:</b>			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> ARUP Response: The Building Grid and bearing has been established to best-fit the numerous constraints on the project. It is coincidental that the street control lines (note, these are not necessarily in the center of the Right-of-Way and should not be construed as Center Lines) are very close, but at slightly different bearings. The building elements are constructed based on the building grid, whereas the utilities and subsequent street level improvements will be constructed based on the street control lines. The Numerical Bearings of the North South Grid lines appear to be correct. A follow-up survey control meeting should take place to ensure the shoring wall layout is performed as intended.

T-0105	BSE - Train Box Beam Sizes	Closed	04/20/2011	05/02/2011	04/22/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP		Nhi Tran		To: Turner Construction Company Daphne Faulkner		Answered By: Adamson Associates, Inc. George Metzger	
Co-Author: Balfour Beatty Infrastructure, Inc.		Ural Yal					
REQUEST:		SUGGESTION:		ANSWER:      Accept Suggestion: <input type="checkbox"/>			
Reference attached sketches and Sheet S1-3201				Thornton Tomasetti Reply:			
Drawing S1-3201 provides information on beam sizing in the permanent concrete structure. BBII was recently provided additional structure sections in response to T-0035.1, and a number of the beams appear to have changed in size. Beams at gridlines 18, 26, 34, & 35 should be 5' wide according to schedule A on drawing S1-3201. However, from the section provided at gridline A, these all appear to be sized at 7' wide. The sizes of these beams are critical in determining the final geometry and location of our temporary bridges. BBII acknowledges that the structural drawings are not to be scaled, so please advise if these beams are to be 60" wide as indicated in schedule A, or if they have increased in size to 84" wide.				The concrete beams at gridlines 18, 26, 34, & 35 at Ground Level have increased to 84" wide. The design is "in-progress".

Co-Author:							
REQUEST:		SUGGESTION:	ANSWER:            Accept Suggestion: <input type="checkbox"/>				
Reference: E & C/S-5000			The proposed Hilti X-U fasteners are for interior use only and are not acceptable for use on the 301 Mission exterior screen wall. Welding will damage the structural steel paint and light gauge steel galvanized coating and is not an acceptable means of connection.				
Please see E & C/S-5000. Transworld has attempted in their shop to set #10 SMS through the structural tube steel, as per plan. The attempt was unsuccessful, therefore Transworld tried the use of a Hilti X-U fastener into the structural steel. Attached are Hilti spec sheets for the X-U Universal Knurled Shank Fastener as well as a photo showing the X-U fastener through the structural steel. Welding is another option for connection to the tube steel. Please advise how Transworld is to fasten the metal stud to the structural tube steel.			To fasten metal stud to structural tube steel contractor may: 1) Use shot pins rated for exterior use (i.e. Hilti X-CR fastener - ESR 1663); or 2) Pre-drill holes and tap stainless steel machine screws.				
T-0107	BSE - Visual Test in Lieu of Formally Testing for Verticality in CSL Tubes	Closed	04/20/2011	04/30/2011	04/22/2011	Potentially	<input type="checkbox"/>

Reference RFI#T-0057, Sheet GT-5202, Specification Section 31 63 29, and attached documents CPM Activity Impacted - Buttress Wall			ARUP Response:				
Below are three cases (A, B, and C) in which formally testing for verticality on CSL tubes, BBII argues would prove to be highly unusual and counter-productive:			This is acceptable.				
A. Specification Section 31.63.29.1.3 states "The contractor shall perform a test to determine verticality of the steel tubes, or drilled holes, that are going to be used for the sonic tests." Balfour Beatty has been advised by a number of testing firms that verticality tests cannot be performed on steel access tubes as well as piles reinforced with steel. Magnetic interference from steel reinforcement and steel tubes will cause the instrument to not function properly. BBII has also been advised by Terracon (please see attached email from Dextra), a reputable CSL testing firm that there are currently no known cases in the US where verticality of CSL tubes in steel reinforced piles have been formally tested.							
B. Attached is a case study that details the investigation of

	<p>debonding that occurs when using PVC as CSL access tubes. The results of this study clearly show the use of steel tubes (BBII is proposing to use Sonitec tubes) should be preferred over PVC.</p> <p>C. After doing some research, the closest we came to find any mention of verticality in CSL tubes was this excerpt from EPA's website which states, "If the CSL access tubes are not installed in a near-vertical position and/or the distance between them varies significantly along the length of the shaft, errors in velocity calculations may occur." Judging by this approach to verticality in CSL tubes in most specs, BBII concludes that parallelism and symmetry between tubes are more important factors in ensuring accurate CSL test readings.</p> <p>In summary, BBII in lieu of formally testing the CSL tubes for verticality will perform a visual test making sure that the tubes are symmetrical (equally spaced) in a circle and parallel. This is the most important inspection to ensure accurate pulse readings.</p> <p>Please confirm that this is acceptable.</p>

-----

RFI#T-0108 - BSE - Building Adjacent Zone 3 Clean From Dust and Debris Generated By Demolition Work

Question -  
Reference Specification Section 01 15 40  
Please confirm that the demolition contractor has satisfied the requirement to clean all dust and debris generated by demolition contract to the satisfaction of the adjacent building owners, and BBII will only be responsible for cleaning dust and debris generated by BBII during its own operations, after the turnover of these are completed.

Response -  
Confirmed. Demolition contractor has satisfied the requirement to clean all dust and debris generated by demolition contract to the satisfaction of the adjacent building owners to date. This was confirmed through conversation with both EBI and Singer Associates.

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

Demolition Contractor ceased dust generating activities and turned over Zone 3 for BBII use on 4-13-11.

BBII did occupy the site and did commence work activities, and is responsible for dust control in accord with Mitigation and Monitoring Specifications from 4-13-11 until completion of BBII work activities.

BBII is only responsible for cleaning dust and debris generated from Zone 3 during BBII operations from 4-13-11 going forward.

T-0108.2	BSE - Building Adjacent Zone 3 Clean From Dust and Debris Generated By Demoli Closed	05/04/2011	05/14/2011	05/27/2011	Potentially	<input type="checkbox"/>

REQUEST:

Reference response to RFI#T-0108, RFI#T-0108.1 and Specification Section 01 15 40

The response to RFI#T-0108.1 did not provide the requested information.

W/O requests information on the measures used to clean the adjacent structures

SUGGESTION:

ANSWER:

Accept Suggestion: ☐

There are no prescribed measures. The cleanliness of the adjacent buildings is subjective. Cleanliness is discussed with building owners requesting cleaning of their property upon completion of demolition work and initiated by the adjacent property owner/manager. Discussion with adjacent property owners is coordinated through TJPA Representative and Singer Associates.

REQUEST:		SUGGESTION:		ANSWER:                      Accept Suggestion: <input type="checkbox"/>			
Reference Sheet GT-0100 and Specification Section 01 10 50				Response provided by PMPC.			
Drawing GT-0100 shows four control points. BBII's surveyor, KCA Engineers, have surveyed their locations and found the following:				RFI T-0112 is a Survey and Control issue. Webcor/Obayashi is responsible for coordination with their subcontractors and this RFI lies within their domain of responsibility. Please ask W/O to coordinate their Survey Subcontractor (Contract T05.1 Chaudhary & Associates) provide a response to their BSE Subcontractor (Contract TG03 - Balfour Beatty).			
1) Survey Control Point #101: This point has been damaged - the brass disk is missing, though the rivet remains in the concrete sidewalk. There are score lines in the concrete BBII assumes would intersect on the brass disk.				1)        Regarding Control Point #101 by Martin M. Ron (Drawing GT-0100), TJPA is requesting a meeting with Martin M. Ron (DPW). In the meantime W/O surveyors should assume that the riven and cross marks constitute the mark on Drawing GT-0100 and to submit the results of their check survey against the other remaining points to see if the given coordinates match those given on Drawing GT-0100. W/O should consult with Chaudhary & Associates now under subcontract to W/O, as to how Chaudhary & Associates used this point and whether it was damaged then. TJPA will set up a meeting with Martin M. Ron, Chaudhary & Associates, W/O and TJPA representatives.			
2) Project Benchmark Point #54: KCA was able to locate this point. Please confirm that it is acceptable to use the coordinates of this point for horizontal control, even though it is listed as a benchmark.				2)        Regarding Project "Benchmark" Point #54, the coordinates of this point given on Drawing GT-0100 are given for use as line survey control as well as elevation.			
3) Survey Control Point #106: KCA was unable to locate this point.				3)        Regarding Control Point #106 (Drawing GT-0100), W/O is to consult with DPW and Chaudhary & Associates as to their knowledge of the last time this point was located. This can be done by W/O alone or in the meeting the TJPA representative will set up. With the 3 remaining Control Points #101, #054, #105 (Drawing GT-0100), W/O should use the given position of Control Point#106. If this has already been done TJPA will re-establish this Control Point.			
4) Survey Control Point #105: KCA was able to locate this point.				4)        No action requires.			
With the current condition of the provided control points, KCA is not able to do a hard check on their survey work.				TJPA requests that the BBI and W/O surveyor submit their notes on what they have completed and verified to date.			
Please confirm that all the control points above may be used for the TG03 BSE Trade Package. Please reset the damaged or missing points for KCA's use.

Reference RFI#T-0112, Transmittal No. 140-01593, Sheet GT-0100, Specification Section 01 10 50, and attached document				Adopting Chaudhary's survey grid control document is acceptable.			
Chaudhary's Transbay "Survey Grid Control Document" was transmitted to Ed Sum (TJPA) and Agnes Katanics (URS) on 5/18/11 (transmittal #140-01593, attached) following a meeting which took place on 5/17/11 with URS, F3, DPA and TJPA. In an effort to confirm the four survey control points shown on GT-0100, Chaudhary discovered that Point #101 and Point #106 were missing.							
Due to the missing points, W/O requests TJPA to either approve Chaudhary's Survey Grid Control Document included as part of transmittal #140-01593, or have the monuments missing from GT-0100 replaced.

Last month Webcor/Obayashi was requested to mark an alleged property line @ 199 Fremont between Beale and Fremont streets per the 12-10-2008 CAD file data provided by the Bruce Storrs of DPW. Chaudhary & Associates completed the task and the results were forwarded for TJPA review on June 20, 2011 via Transmittal # 140-01864. In that transmittal it was recommended that alleged Property Line (PL) data points as indicated within the attached (coordinates added) be presented to Bruce Storrs of DPW for verification of PL data accuracy. Has this been accomplished and, if so, what was the outcome?							
Be advised that as previously confirmed in RFI #T- 112.1 Webcor/Obayashi is ONLY using Grid Control for construction reference, layout and staking.

Co-Author:							
REQUEST:			SUGGESTION:		ANSWER:		
Reference: A-5000					Accept Suggestion: <input type="checkbox"/>		
Regarding the aluminum panels on the 301 Mission wall, bottom panel at each end of the wall will need to be trimmed. The standard panel is 2-11 1/2" tall, but the bottom panel measures out to be 2'-1"+/- on the west end and 2'-9"+/- on the east. Please confirm that this is acceptable. If not, please advise.					Per contract documents aluminum panels shall match original aluminum panels. Existing bottom aluminum panel(s), as shown in photos on sheet C-5010, have an approximate 1" gap between the bottom of panel and top of existing grade.  Contractor shall place bottom aluminum panel(s) to provide an approximate 1" gap between bottom of panel and top of finished/existing grade. It is acceptable to provide bottom panel(s) that are less than 2' - 11-1/2" tall to provide an approximate 1" gap between bottom of panel(s) and top of finished/existing grade.

T-0122	BSE - Hazardous Material Removed From Zone 3 (Potential Contaminated Material Closed		04/29/2011	05/09/2011	05/02/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Nhi Tran      To: Turner Construction Company Daphne Faulkner			Answered By: Turner Construction Company Jack Adams				
Co-Author: Balfour Beatty Infrastructure, Inc.      Ural Yal							
REQUEST:      SUGGESTION:      ANSWER:      Accept Suggestion: <input type="checkbox"/>			Hazardous material has been removed from site per the extent of demolition contract drawings for zones 3 - this does not include the "pedestals" in Zone 3. The building and above ground structures were demolished to the extent shown on Demolition contract drawings. Hazardous materials abatement scope was completed within the scope of demolition only. Refer to Demolition Drawings D-1050, D-1051 and D-1073 for representation of limits of structures (specifically the referenced pedestals) demolished and hazardous material abatement.				
Reference Specification Section 00 03 35, 1.2			BSE Contractor to handle remaining demolition and abatement in accord with BSE Spec 00-08-14 Health and Safety Criteria Para 1.2 and 1.3 Lead hazards, BSE Spec. 02-41-01 "Demolition" and BSE Spec. 01-13-50 "Hazardous Materials Procedures".				
During Investigation of Zone 3, BBII discovered potential lead based material existing on site. The specific area of concern is the pedestals on Fremont Street.							
Please confirm that all contaminated material (specifically the referenced pedestals) as specified in the specification section 00 03 35, Article 1.2 has been removed and abated by the Demolition Contractor.							
BBII is scheduled to remove these pedestals next week and cannot proceed with this critical work until it is confirmed that the site is cleared of lead based materials as required by the Specifications.							
The TJPA's attention is directed to the following Section of the Specifications:							
SECTION 00 03 35 2 EXISTING CONDITIONS: HAZARDOUS MATERIALS							
"1.2 HAZARDOUS MATERIALS REPORTS A. The TJPA's environmental consultants have surveyed the facility for the presence of various hazardous materials. Materials investigated may include asbestos, lead, PCB ballasts, mercury containing lamps, contaminated soils, underground storage tanks, and other hazardous materials. The demolition contractor for the Demolition project (Evans Brothers Inc.) is responsible for removing and abating products containing asbestos, lead, or PCB ballast, and mercury-containing lamps."

	<p>on Sheet S-0002, and A-6000 (see attached marked up sheets). Note 1 within the "WALL FINISH" section of the notes on page S-0002 says to use insulation separation tape between treated wood surfaces and steel framing. In note 2 on page S-0002, SASM is specfied as a different material, but on the details of page A-6000 SASM is shown to be used in the same areas as is described for the insulation tape. It is the interpretation of Transworld that the insulation tape is to be used at all locations referenced on sheet A-6000 as "SASM". Please clarify if these two different materials are to be applied in the same areas.</p>						<p>on the contract documents.</p> <p>These two materials (SASM and insulation tape) may overlap in certain locations where insulation tape is provided between treated wood and metal surfaces and where waterproofing is also required.</p>
T-0123.1	301 Mission Wall - SASM and Insulation Tape Materials	Closed	05/06/2011	05/16/2011	05/09/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP		David Hungerford	To: Turner Construction Company		Daphne Faulkner	Answered By:URS Corporation	David Fyfe
Co-Author:							
REQUEST:		SUGGESTION:		ANSWER:      Accept Suggestion: <input type="checkbox"/>			
Reference: RFI T-0123, A-6000, S-0002							
<p>The response provided to RFI T-0123 is in conflict with the contract documents. The response requires the contractor to create a waterproofing barrier for the entire length of the wall; however, the contract documents do not indicate a complete waterproofing barrier. References to SASM on page A-6000 instructs the application of SASM at all points where pressure-treated or moisture resistant wood comes in contact with metal. This application instruction, therefore, would not result in a waterproof barrier along the entire length of the wall. Please clarify if on the details "SASM" was intended to read "insulation tape", because the application locations of the SASM, as per A-6000, are called out and described to be at all locations of the insulation tape defined on S-0002.</p>							
<p>In the alternative, is it the intention of the design team to apply additional waterproofing not shown on the contract documents?</p>

REQUEST:		SUGGESTION:		ANSWER:                      Accept Suggestion: <input type="checkbox"/>			
Reference: RFI T- 0124, URS response to RFI T- 0124				Material substitution (two 1/8" thick aluminum panels glued together in lieu of a single 3/16" thick aluminum panel), "Proposed gap closure per RFI #T-0124-Option3" provided in attached Change Request No. 10C from Transworld Construction Inc. to Webcor/Obayashi dated 7/26/2011 is acceptable, provided aluminum panels are fastened to metal stud with rivets or sheet metal screws at 24" o.c.			
Per recent Change Order negotiations for the required 301 Mission Wall end panel per RFI # T-0124, the panel detail is now being revised to a two-piece, glued enclosure panel. Please confirm the method of two-piece panel attachment to the existing wall is the same as that indicated in RFI # T-0124.

Reference Sheets GT-2101-2103, GT-5101 and Specification Section 31 56 13				ARUP Response:			
In the Owner's preferred method of soil mixing, the triple auger method, a continuous wall is formed by drilling adjacent sets of columns with a 100% overlap of the outer columns (see 2/GT-5101). A CDSM wall's strength, permeability, and homogeneity is largely contingent upon this remixing action. This overlap also helps ensure the				Arup received from DND the two sketches attached to this response at the BSE meeting on May 4, 2011 as further clarification of the Contractor's proposal. The Contractor's proposal is acceptable.

	verticality and alignment, as the augers in the secondary panels tend to follow the path of the outer columns of the primary panels. Based upon the beam and column layout shown in GT-2101-2013, the corners formed by Wall Segment A/33.5-35 & 35-1 and R2-1 & X1-1 do not receive the complete remixing obtained by the typical 100% outer column overlap. These corner details are atypical compared to industry standards, and will lead to permeability issues. Is it acceptable to move a small number of beams slightly closer together (~0.1') near those corners, such that the panel layout is shifted enough to have a 100% column overlap at the corners?

	<b>REQUEST:</b>	<b>SUGGESTION:</b>	<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>				
	In order to drive sheet piles for the hammer head wall location along Fremont St and the North West Corner of Zone 4, BBII requests confirmation of the abandonment of all utilities east of the PG&E electrical duct bank. BBII also will need the As-Build drawing of the PG&E duct bank location.		Today, 5/11, BBI has sawcut AC and removed one lane-width and two laborers have exposed the utility lines in the street east of the PG&E duct bank. Verizon came and cut two of their 4" ducts. The remaining lines will be identified by the utility subcontractors in the next day or two. Please contact Jason Dunne (W/O) for the field conditions of abandoned utilities.				
	BBI needs this information to proceed on the extra unforeseen concrete wall in the hammer head area of the buttress wall.

<b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal							
<b>REQUEST:</b> Reference Sheets GT-2201, GT-5102 Sec. 10, and attached photos  In the northwest corner of Zone 4, BBII has exposed 2 openings below the screen wall in the 301 Mission structure. The first opening is located approximately 6 feet east of gridline 27 and the second opening is located approximately 8 feet east of gridline 29. These openings are approximately 18" x 36" in size. (See attached pictures).  These openings are not shown on construction documents. Please advise how to proceed. BBII requests an expedited response prior to the end of this week, as this matter is pertinent to backfill operation.			<b>SUGGESTION:</b>  <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Plugging of existing ventilation shafts/openings below screen wall is specified in the 301 Mission Interim Screen Wall contract documents. Webcor-Obayashi to coordinate all work amongst tradegroup packages/subcontractors.				
T-0128	BSE - Old Existing Concrete Floor Along 301 Mission in Zone 4	Closed	05/05/2011	05/15/2011	05/12/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>To:</b> Turner Construction Company Daphne Faulkner			<b>Answered By:</b> Transbay PMPC      Douglas Jacobson				
<b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal							
<b>REQUEST:</b> Reference Specification Section 02 41 01  During pre-trenching, BBII found an existing concrete floor along the 301 Mission St garage wall. It is located between the 301 Mission building wall and the buttress area between Grid Line 29 and 30. BBII has exposed a 20ft-30ft section of this floor (approximately on Grid Line A between Grid Lines 29 and 30), and have demolished the slab within the pre-trench area that has been exposed. It appears to BBI that this unforeseen obstruction continues further into the buttress area. If this unforeseen obstruction continues further into the buttress area, it would have to be removed so the buttress construction can continue.  Please advise on how to proceed.			<b>SUGGESTION:</b>  <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The obstruction was removed by BBI. Remove pre-trench obstructions per contract requirements and Force Account agreement with TJPB.

T-0134	BSE - 301 Mission Guide Wall	Closed	05/09/2011	05/19/2011	05/12/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal			<b>To:</b> Turner Construction Company Daphne Faulkner		<b>Answered By:</b> Transbay PMPC      Douglas Jacobson		
<b>REQUEST:</b> Reference Sheet GT-2103, Specification Section 31 56 13, and attached sketch  Typically in CDSM shoring, a guide frame constructed from steel beams is used, which straddles the CDSM wall. The guide frame is used to align the augers, align and place beams, and expand/collapse the drill rods. The existing 301 Mission building wall is approximately 5-6" away from the outside of the CDSM shoring wall. As such it will not permit placement of a standard steel beam guide frame. Is it acceptable to construct a temporary concrete/rebar guide wall on the outside of the CDSM wall and adjacent to the existing 301 Mission footing wall? See attached sketch details of the proposed guide wall.			<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> This guide wall proposal is for Contractor convenience.  Please submit more information for this proposal, e.g., spacing, depth, and diameter of anchors/studs, discuss means and methods, and describe condition that contractor will leave the CMU wall when finished.  Once the above information is returned, TJPA will meet with 301 Mission to negotiate authorization for this proposal.

<b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal							
<b>REQUEST:</b> Reference Specification Section 01 53 13  BBII proposes breaking up the bridge submittals to allow submittal fundamental structural drawings and calculations for the bridge, independent of accessories and specialized components necessary for a complete bridge package.  Specifically, the first set of submittals would include Structural drawings and calculations for the bridge structure from the pavement and decking down - piers, cap beams, girders, abutments, and associated connections. Additionally, it will include standard edge railing/barriers.  Follow on coordination submittals will include traffic coordination components, gates, hardware, locking mechanisms, fences, Muni OCS components, utility support details, surface grading and drainage.  BBII believes that it will take some time to finalize a complete bridge package that satisfies all interested parties. Isolating the core bridge structure into it's own submittals will ensure that detailing and fabrication of the main components of the bridge will not be held up while working out the details.  Please confirm this is acceptable			<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> The approval to split the temporary bridge submittal into two submissions is provided subject to the following conditions:  1. Items which are provided in the initial submission shall be designed for all loading to support all features which are deferred. This includes loading attributable to but not limited to the following: operable gates; vehicle barriers; required thickness of pavement for all purposes, added thickness of paving for pedestrian areas, curbs and provisions for slope inducement for handling of surface water; support for utilities; lighting poles/standards; OCS poles/wires; and any other items specifically required to meet city of SF requirements brought to the attention of the contractor team by review meetings with city staff.  2. Items deferred to the second submission shall be in full conformance with specifications requirements.  3. Any items for which a deviation from the specifications is sought shall be fully identified in the first submission.

REQUEST:			SUGGESTION:		ANSWER:		
Reference Specification Section 02 41 00					Accept Suggestion: <input type="checkbox"/>		
BBII followed the method approved to remove a section of the unforeseen structure in RFI #74 & 74.1, and found a separate concrete footing bellow that. It is believed to be a footing that extends below the 177/181 Fremont St. building. The top of this footing is approximately 8 feet below the original grade, and it is approximately 3 feet wide, and 3 feet deep. BBII is concerned with the removal of this footing and the extensive rubble that was exposed below it. When a bucket of dirt was removed along the footing, a large amount of water gushed out, from below the 177/181 Fremont St. building, and through the large amount of stone rubble that was exposed. At this point the bottom of the footing was found, and the soil was quickly replaced. This footing is within the CDSM wall extents, and will have to be removed. Due to the fragile nature, and the age of the 177/181 Fremont St. building; please clearly describe and advise. Please See Attached Pictures.					ARUP Response:  The RFI refers to RFIs 74 and 74.1. We understand these are BBI numbers; the corresponding RFI numbers in Constructware are 103 and 103.1.  If the CDSM shoring wall is to be installed in the location shown, then the material which is in the way, including any rubble which will interfere with the soil mixing for the CDSM wall, will need to be removed. Based on field observations made earlier today, and recent email correspondence, we understand the concrete (unreinforced) basement wall immediately adjacent to 181 Fremont has been removed. Arup requests TJPA to provide direction to the Contractor regarding any additional demolition and/or excavation should it be necessary. ----- ----- Adamson Associates, Inc. Comment:  CM (Turner) is to confirm that TJPA approves in writing the approach and work the Contractor proposes at this location as the Field Actives and Contractor actions may impact the adjacent property.

T-0146	BSE - Additional Timber Piles Adjacent 177/181 Fremont Building South Zone 4	Closed	05/19/2011	05/29/2011	05/20/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>To:</b> Turner Construction Company Daphne Faulkner			<b>Answered By:</b> Adamson Associates, Inc. George Metzger				
<b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal							
<b>REQUEST:</b> Reference RFI#T-0103 and attached photo  During BBII demolition of the unknown concrete structure along South side of Zone 4 adjacent 177/181 Fremont building (Refer to [RFI#T-0103] BBII RFI# 74), BBII discovered timber piles beneath the unknown concrete structure - see photos attached.  The location timber piles are in conflict with the alignment of the CDSM wall. Please advise on the method of removal of the obstruction.  Note: BBII has concerns regarding the stability of the adjacent 177/181 Fremont Building (old brick structure).			<b>SUGGESTION:</b>  <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> ARUP Response:  1. We suggest that the timber piles be exposed no more than 3 at a time, and that they are removed and the remnant void is infilled immediately with a material that can be drilled by the shoring wall equipment of DND. A suitable material was proposed for the similar situation adjacent to the parking garage/low rise portion of 301 Mission.  2. If more timber piles are revealed along this part of the pre-trenching, then the process in 2 above should continue along the northern flank of 181 Fremont and for a distance of 20 ft east of the northeast corner of the building.  3. 181 Fremont building is equipped with crack width gauges, and Arup staff will take readings of the gauges before and after removal of the timber piles along this length of pre-trenching provided the building owner grants us access.  4. Inclinometers to monitor the effects of the installation of the shoring wall and the subsequent train box excavation will be installed in due course.  5. The Contractor shall take appropriate measures to retain the material under 181 Fremont and keep it from sloughing into the excavation. ----- ----- Adamson Associates, Inc. Comment:  CM (Turner) is to confirm that TJPA approves in writing the approach and work the Contractor proposes at this location as the Field Activates and Contractor actions may impact the adjacent property.

Reference RFI#T-0148				Accept Suggestion: <input type="checkbox"/>			
The response RFI T-0148 did not answer for Item 8 and 9. Please respond for Item 8 and Item 9.				Confirmed-In regards to item #8 and 9 in the response to RFI T-0148; All of this work will be tracked on force account under CR T-010. If BBII takes every precaution to avoid damaging the adjacent wall, BBII will be compensated for repairs under CR T-010 as well.			
----- RFI#T-0148 Question: Reference RFI#T-0146.2				There is no Noise moratorium for 199 Fremont. This includes demolition, pile pulling, excavation, backfill, equipment set-up etc. is allowed at all times adjacent to 199.			
Based on the joint meeting between W/O, BBII and the TJPA on 5/23/2011, BBII would like to confirm the following:				Good neighbor notification policy is in effect - WO/BBII will notify Singer Assoc. whenever work will encroach on 199 Fremont property or when work activity will disrupt the tenants of 199 Fremont - both inside lot and on sidewalk/street.			
199 Fremont Street Pile Extraction:							
1. BBII will install additional survey control to establish the back of the shoring wall limit.							
2. BBII will contact DND Construction to confirm the allowable distance between an existing pile and the back of the shoring wall.

<b>REQUEST:</b> Reference attached sketch  Becho will be utilizing a 2200mm OD temporary casing for the Buttress Pile Installation. Becho requests that the spacing between tangent piles remain at 4" minimum and the secant piles overlap remain 1'-6". This will approximately increase the Buttress footprint by approximately 4'-4" to the east and 1'-9" to the south.  Please confirm this is acceptable.		<b>SUGGESTION:</b>	<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> ARUP Response:  This is acceptable provided no portion of the overall buttress shifts north-south. In particular, the Contractor shall verify that row R, once shifted east as proposed, can be installed in the same northsouth location, given the corner projection of the 301 Mission low-rise. Contractor to verify that the existing timber piles within the larger footprint have been removed and that the equipment pad is enlarged as necessary.

	REQUEST:	SUGGESTION:	ANSWER:				
	Reference Specification Section 31 63 29, 3.5.G.4.K		Accept Suggestion: <input type="checkbox"/>				
	SS31.63.29.3.5.G.4.k states "The tremie discharge end shall be immersed at least 25' in concrete at all times after starting the flow of concrete."		ARUP Response:				
	Becho requests concrete tremie embedment to be reduced to 10ft minimum for all piles and 5ft minimum tremie embedment at the secondary pile transition zones between structural and CLSM mix pushing the minimum contaminated structural/CLSM concrete zone at sub grade to +5 foot above sub grade elevation.		This is acceptable. Note that the procedure described pertains to both the primary and the secondary piles, not just the secondary piles as described in the RFI.				
	Please confirm this is acceptable.

T-0155	BSE - Primary Concrete Mix Tolerance	Closed	05/31/2011	06/10/2011	06/03/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal			<b>To:</b> Turner Construction Company Daphne Faulkner			<b>Answered By:</b> Adamson Associates, Inc. George Metzger	
<b>REQUEST:</b> Reference Specification Section 03 30 01, 1.5.F  BBII, Becho, Central Concrete, W/O, ARUP and Adamson Associates met on Tuesday 5/24/2011 to discuss the results of Buttress Primary Concrete Mix Trial Batches. During this meeting, Central Concrete expressed concern about variability in the Buttress Primary Concrete mix due to slight variations in material and batching. The Buttress Primary Concrete Mix is a very high performance mix and even small variations in the mix constituents can result in significant changes in strength. Please advise how much of a working tolerance is acceptable for the primary buttress concrete mix.			<b>SUGGESTION:</b>			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> ARUP Response:  The strength of concrete which has been placed in the primary shafts will be considered satisfactory if both of the following requirements are met:  1. Every arithmetic average of any three consecutive strength tests (each test consisting of at least two 6 by 12 in. cylinders or at least three 4 by 8 in. cylinders made from the same sample of concrete) equals or exceeds 2,000 psi.  2. No individual strength test (average of two 6 by 12 in. cylinders or at least three 4 by 8 in. cylinders) falls below 1,800 psi.	
T-0156	BSE - Primary Concrete Mix 90-Day Compressive Strength	Closed	05/31/2011	06/10/2011	06/03/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal			<b>To:</b> Turner Construction Company Daphne Faulkner			<b>Answered By:</b> Adamson Associates, Inc. George Metzger	
<b>REQUEST:</b> Reference Specification Section 03 30 01, 1.5.F  Per Specification Section 03 30 01 - 1.5F Trial Batches: "The mixes shall be proportioned to develop a compressive strength of 2,000 psi at 28 days." Per the response to Question TG0300-0262, "The rate of strength gain can be reduced so that the design strength is reached after 28 days but less than 91 days".  Please confirm that the Buttress Primary Shaft Concrete may take up to 90 days to achieve 2,000 psi.			<b>SUGGESTION:</b>			<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> ARUP Response:  The rate of strength gain can be reduced so that the design strength is reached after 28 days but less than 91 days, provided the Contractor submits test data demonstrating that the mix will reach 2,000 psi at or before 90 days. At a minimum, compressive strength tests of the mix shall be taken at 7, 14, 28, 56 and 90 days. Each test shall consist of a minimum three cast cylinders and a minimum three cores taken from trial batch cubes placed in accordance with submittal TG0300-385.  At shafts C/2, C/4 and C/6 (refer to GT-2201), the mixes shall be proportioned to develop a compressive strength of 2,000 psi at 28 days.  Contractor to submit proposed mixes and corresponding test results for approval prior to their use.

T-0156.1	BSE - 120 Day Acceptability of Buttress Primary Shaft Concrete	Closed	04/16/2012	04/26/2012	04/19/2012	Potentially	<input type="checkbox"/>
From: Balfour Beatty Infrastructure, Inc. Ural Yal To: Turner Construction Company Gary Krutsch			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: Reference: 4/12/12 Central Letter			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>		
BBII requests that in the event that the Buttress Primary Mix test specimens do not meet the 2,000 psi specified strength of 2,000 psi at 90 days (reference Response to previous RFIs #T-0157.2, and #T-0156), additional cylinders are to be taken and tested at 120 days. During this cooler climate, initial temperature may be impeding overall strength at the required time. Although only a few specimens are suspect of low strengths, Central Concrete is confident that at 120 days, the specimens in question will reach the required strength. If this criteria can be accepted for all test specimens at 120 days, this can mitigate any future concerns of suspect low strength.					ARUP Response: This is acceptable for shaft N-2. For future shafts, we will evaluate on a case by case basis. However, this will require the TJPA to take an additional cylinder at the sampling frequency required in the specifications so that, if the first cylinder tested at 90 days is less than 2,000 psi, there can be three samples tested at 120 days.		
					Christina Young : Per Turner, the additional cylinder sampling is to be performed by the Contractor's own testing agency.		
T-0157	BSE - Primary Concrete Mix 500 PSI At 7-Days	Closed	05/31/2011	06/10/2011	06/03/2011	Potentially	<input type="checkbox"/>

REQUEST: Reference Specification Section 03 30 01, 2.2.E			SUGGESTION:		ANSWER: Accept Suggestion: <input type="checkbox"/>		
BBII, Becho, Central Concrete, W/O, ARUP and Adamson Associates met on Tuesday 5/24/2011 to discuss the results of Buttress Primary Concrete Mix Trial Batches. One of the concerns for the Buttress Primary Concrete is to provide a mix that is able to consistently achieve both 500 psi at 7 days and 2,000 psi at 28 days. The Buttress Primary Concrete Mix is a very high performance mix and even small variations in the mix constituents can result in significant changes in strength. Please advise if it acceptable to allow a working tolerance for the 500 psi requirement at 7 days.					ARUP Response: The 7 day compressive strength of primary shaft concrete (Type "A" concrete in spec section 03 30 01) shall be 500 psi +/- 200 psi.

Reference Sheet D-2212, Specification Section 02 41 01, attached sketch and photo				06/06/2011 - Daphne Faulkner			
During Pre-trench, BBII found additional unforeseen timber piles within the pre-trench limits along gridline A, between gridlines 24 & 25. Per Contract Drawing D-2212 (attached), there should only be a single row of timber piles in conflict with the CDSM wall, although when the area was exposed there are three rows within the CDSM wall limits (see attached photo). These will have to be removed and will be considered extra work.				Response provided by S. Rule of Turner.  Please refer to note on Drawing D-2212 in the upper half between grids 23~26 which states,  "In areas where (N)CDSM wall conflicts with the existing pile caps and piles, remove (E) pile caps and/or piles prior to construction of (N) Transit Center Building CDSM perimeter shoring wall (see Note 3 and 6)."

Reference Specification Section 31 56 13, 3.13 and attached detail sketch				06/03/2011 - George Metzger			
Is it acceptable to cut a 1.5" diameter hole, 16" from the bottom tip, in the web of the soldier beam pile beams? The purpose of the hole is to aid in securing the tail of the beam to the "dolly" that DND will use to raise the beams into a vertical position.				ARUP Response:			
				This is acceptable.			
<hr/>							
T-0162	BSE - Buttress Concrete Test Cylinders	Closed	06/03/2011	06/13/2011	06/08/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP                      Nhi Tran		To: Turner Construction Company Daphne Faulkner		Answered By: Adamson Associates, Inc. George Metzger			
Co-Author: Balfour Beatty Infrastructure, Inc.                      Ural Yal							
REQUEST:		SUGGESTION:		ANSWER:                      Accept Suggestion: <input type="checkbox"/>			
Reference Specification Section 03 30 01 and attached summary of test results				ARUP Response:			
BBII, Becho, Central Concrete, W/O, ARUP and Adamson Associates met on Tuesday 5/24/2011 to discuss the results of Buttress Primary Concrete Mix Trial Batches (please refer to the attachment for a summary of the test results). The 28-day test results for the 4x8 test cylinders were on average 57% of the core 4" diameter core test results. The 28-day test results for the 6x12 test cylinders were on average 88% of the 4" diameter core test results. The test samples were extracted from the same concrete batches, at the same time and cured in the same manner. BBII believes the difference in compressive strength between the test results may be attributed to the sample size & the resultant heat of hydration which drives the concrete cure rate. BBII also believes that the concrete cores may be more indicative of the actual in-situ concrete strength than the concrete test cylinders.				Arup believes that there is insufficient information available at this time for the Contractor to draw the conclusions stated in the RFI.			
The Specification Section 03 30 01 - 1.5 F Trial Batches references "concrete cylinders", however it does not specify 4x8 or 6x12 test cylinders.				Regarding the question posed in the RFI: Arup's understanding is that there should be little difference between 4x8 and 6x12 cylinders cast, cured and tested under identical conditions and, therefore, it is not essential to limit the TJPA's Testing Agency to one particular cylinder size.			
During the course of the meeting, it was generally agreed upon that 6x12 test cylinders appeared to be a more representative and consistent measure of the Primary Buttress Concrete strength relative to the core samples.

	<p>BBII has confirmed through CTS that there should be no additional cost in sampling and testing a 4x8 cylinder relative to a 6x12 cylinder.</p> <p>Therefore, BBII proposes that the 6x12 test cylinders should be used as the basis of acceptance testing both for the Trial Batches and also for future Field Quality Control and Testing for the Primary Buttress Concrete; 4x8 test cylinders should only be used for informational purposes only. Please confirm.</p>						
T-0163	BSE - Hazardous Material Removed From Site Zone 2	Closed	06/03/2011	06/13/2011	06/06/2011	Potentially	<input type="checkbox"/>

	REQUEST:	SUGGESTION:	ANSWER:            Accept Suggestion: <input type="checkbox"/>				
	Reference Specification Section 00 03 35, 1.2		06/06/2011 - Kevin Chiu				
	During Investigation of Zone 2, BBII discovered potential lead based material existing on site. The specific area of concern is the pedestals on First Street.		Hazardous material has been removed from site per the extent of demolition contract drawings for zone 2 - this does not include the "pedestals" in Zone 2. The building and above ground structures were demolished to the extent shown on Demolition contract drawings. Hazardous materials abatement scope was completed within the scope of demolition only. Refer to Demolition Drawings D-1050, D-1051 and D-1073 for representation of limits of structures (specifically the referenced pedestals) demolished and hazardous material abatement.				
	Please confirm that all contaminated material (specifically the referenced pedestals) as specified in the specification section 00 03 35 Article 1.2 has been removed and abated by the Demolition Contractor.		BSE Contractor to handle remaining demolition and abatement in accord with BSE Spec 00-08-14 Health and Safety Criteria Para 1.2 and 1.3 Lead hazards, BSE Spec. 02-41-01 "Demolition" and BSE Spec. 01-13-50 "Hazardous Materials Procedures."				
	BBII is scheduled to remove these pedestals next week and cannot proceed with this critical work until it is confirmed that the site is cleared of lead based materials as required by the Specifications.						
	The TJPA's attention is directed to the following Section of the Specifications:						
	SECTION 00 03 35 - EXISTING CONDITIONS: HAZARDOUS MATERIALS						
	"1.2 HAZARDOUS MATERIALS REPORTS A. The TJPA's environmental consultants have surveyed the facility for the presence of various hazardous						

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>	<u>Cost Impact</u>	<u>Proceed</u>
	<p>materials. Materials investigated may include asbestos, lead, PCB ballasts, mercury containing lamps, contaminated soils, underground storage tanks, and other hazardous materials. The demolition contractor for the Demolition project (Evans Brothers Inc.) is responsible for removing and abating products containing asbestos, lead, or PCB ballast, and mercury-containing lamps."</p>						
<b>T-0164</b>	<b>BSE - Timber Piles Adjacent 177/181 Fremont Building South Zone 4</b>	<b>Closed</b>	<b>06/06/2011</b>	<b>06/16/2011</b>	<b>06/06/2011</b>	<b>Potentially</b>	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal		<b>To:</b> Turner Construction Company Daphne Faulkner		<b>Answered By:</b> Webcor Construction LP    Nhi Tran			
<b>REQUEST:</b> Reference RFI@T-0146.1 [BBI 0104] and attached photo  Per [RFI #T-0146.1] RFI 104 Response, BBII inserted a metal sheet behind the timber piles required to be removed, in the location between 199 and 181 Fremont. The sheet is to hold back the soil in the alley. Due to the close proximity of the timber piles, the sheet location is too close to the timber piles required to be removed from the CDSM Wall Location. The sheet is too close for the pile extractor to attach to the tops of the pile. See Attached Photo.  Please Advise in detail.		<b>SUGGESTION:</b>		<b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> 06/06/2011 - Roger Rothenburger  The practice of removing the sheet pile was approved by TJPB in the "181 Fremont test" done on Friday June 3rd. The Contractor can remove the metal sheet and expose the piles as necessary with as steeply a sloped excavation that allows the vibrator pile puller to be attached. The work should be done in as reasonably a short duration as possible. All equipment, manpower, materials should be at hand when the metal sheet is pulled and the piles are exposed for extraction.

T-0165	BSE - High pH Water Found In Zone 3 Pre-Trenching	Closed	06/07/2011	06/17/2011	06/10/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>To:</b> Turner Construction Company Daphne Faulkner <b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal			<b>Answered By:</b> Turner Construction Company Daphne Faulkner				
<b>REQUEST:</b> Reference Specification Section 00 08 13, 1.9.C  BBI found high pH water while digging an exploratory hole in the Fremont St. side of Zone 3. This was confirmed by Peter Cusack from Treadwell & Rollo. Specification Section 00.08.13.1.9.C states that "Should the existing wastewater be contaminated, or should it be uncontaminated but subsequently become contaminated as a result of conditions other than the Contractor's operations, a Change Order will be issued..".  Please consider this as a Notice of Existing Contaminated Wastewater as defined by SS00.08.13.1.9.C. Please advise on how to proceed.			<b>SUGGESTION:</b>  <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Pending approval by the TJPA, a CR will be issued for the chemicals to treat the water per specification section 00 08 13 (1.9.B).				
T-0166	BSE - Unknown Concrete Structure at 199 Fremont Zone 4 (Gridline 33-30)	Closed	06/07/2011	06/17/2011	06/22/2011	Potentially	<input type="checkbox"/>
<b>From:</b> Webcor Construction LP      Nhi Tran <b>To:</b> Turner Construction Company Daphne Faulkner <b>Co-Author:</b> Balfour Beatty Infrastructure, Inc.      Ural Yal			<b>Answered By:</b> Transbay PMPC      Roger Rothenburger				
<b>REQUEST:</b> Reference RFI#T-0144 (BBI RFI 0103), Specification Section 31 56 13, and attached Turner Field Condition Report 056 and photos  BBII demolished the Unforeseen Concrete Structure along 199 Fremont St., and associated curb per RFI #103 [RFI#T-0144] response. During the process, due to the previous contractor's construction means, the curb inadvertently damaged the metal flashing, and possibly the waterproofing beside it.  Along with the curb, the fence panel was built on top of the Unforeseen Concrete Structure, so when the structure was removed, the fence came down too.  See attached pictures and Turner Field Condition Report (5/24/11)  BBII requests immediate direction from the TJPA on this issue.			<b>SUGGESTION:</b>  <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> Instructions for this were orally transmitted in the field and complied with by the BSE Contractor. The fence between the buildings 199 Fremont and 181 Fremont has been reinstalled. Repair of the curb and flashing can wait until work in the area is complete or at a point that no further damage is possible. The Contract requires that the BSE Contractor repair damage to any building damaged during construction activity for the site and this Contract.

REQUEST: Reference RFI #T-0144, RFI #T-0166 and Specification 31 56 13  Per the response to RFI#T-0166 (BBI RFI 103.1), please provide an acceptable repair procedure for the 199 Fremont building. Also, please confirm that the repair work will be included in CR T-010.			SUGGESTION:  ANSWER:      Accept Suggestion: <input type="checkbox"/> No action is required by the contractor at this time.  The specific damage to 199 Fremont Street has not been listed in the RFI. TJPA is aware of minor damage to the metal flashing along the curb at the bottom of 199 Fremont St and the removal of the unreinforced "curb" that ran along the base of the cinder block wall. As stated previously repairs to 199 Fremont will be made at a much later date. The damage that occurred to the flashing and unreinforced concrete curb resulted from using breaker on the unreinforced foundation wall and pulling the sections out and repairs will not be done until the project is further along in progress where no more likely damage will occur.				
T-0167	Survey Grid Control Documents	Closed	06/08/2011	06/10/2011	06/20/2011	Potentially	<input type="checkbox"/>
From: Webcor Construction LP      Tim Maxwell      To: Transbay Joint Powers Authority Edmond Sum			Answered By: Adamson Associates, Inc. George Metzger				
Co-Author:							
REQUEST: Reference RFI T-0112.1 and drawing GT-0100  As requested by Ed Sum in today's (6/8/11) OAC meeting we submit the following question:  Please confirm that gridlines as established from the GT-0100 and as confirmed on Chaudhary & Associates Survey Grid Control Documents (Ref: RFI T-0112.1) can be used for all future construction elements (i.e., CDSM wall, etc). Please confirm by 6/10/11.			SUGGESTION:  ANSWER:      Accept Suggestion: <input type="checkbox"/> ARUP Response:  For the purpose of laying out the work shown in the BSE package, the layout drawing provided by Chaudry (included in RFI T-0112.1) is acceptable.

Please provide City Survey of property lines with a translation to grid for our use.			ARUP Response:				
			The City's property line survey has been provided to the Contractor and GT-0100 ties the building grid to the survey.
