<p>Per the response to SK RFI 812 (T-1673), the EOR made recommendations that allowed for certain reductions in NDT. The final decision rested with TJPA/Turner and at that time they decided to not permit the reduction of any NDT testing.</p> <p>However, as per the meeting held at XKT Engineering on 11/14/14, it was discussed that TJPA/Turner would revisit the NDT reduction request from XKT Engineering. XKT has continued to demonstrate the quality of their welders, keeping repair percentages at 2%, well below the required limit of 5% as per AISC. At this time, XKT has completed 16 moment frame columns with another 20 columns currently in fabrication (see attached status report). This experience has allowed them to substantiate their repair percentages and the overall quality of their work.</p> <p>Please confirm that the EOR's recommendation to SK RFI 812 (T-1673) is acceptable and the NDT reduction may occur at the XKT Engineering facility.</p>		<p>Per the response to SK RFI 812 (T-1673), the EOR made recommendations that allowed for certain reductions in NDT. T-1701	SSS - Insufficient Cope for Erection Clearance From: Webcor Construction LP Gregory Kemerer REQUEST: Please refer to beams highlighted in S1-2503 (SK1) and work with this RFI. The 1' 11 1/2" cope is not sufficient for erection clearance as shown on A4644, A4645 (SK2, SK3). The Type 4 (V) drag connection on the other end of the beam limits the position in which the beam can be erected (See SK4, SK5). The beam needs to be erected from below and positioned through the shear plate on the moment frame column. As you slowly lift the back side that is currently coped, a 1/4" clash transpires between the top flange of W40x327 and the shear plates on the bus deck casting. Please advise. T-1702.1	SSS - Weld Terminations on Moment Frame Column Shafts	Closed	CR	10/01/2014	10/11/2014	10/17/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST: As a follow-up to SK RFI 821 (T-1702.1), please note the following: It is unclear on how to exactly fix the weld terminations that currently do not conform with Section 5.17.1- Figure 5.2 from the AWS D1.1 Structural Welding Code. Skanska proposes two options that would allow the transitions to be permissible as per AWS code. Option 1: Remove material from the web/CJP that would allow for a proper transition down to the flange. See SK1. Option 2: Add additional weld metal to the CJP that would allow for a proper transition down to the flange. See SK2. Please confirm that both options are acceptable & it is at the fabricators discretion to choose which method.

T-1711	SCS - Roof Shear Key and Pylon Rebar Epoxy Connection	Closed	CR	09/19/2014	09/29/2014	09/29/2014
From: Webcor Construction LP Stephanie Azzolino						
REQUEST:						ANSWER:
<p>Per S1-3282 detail 9 "SHEAR KEY AT ROOF" calls for vertical #4 rebar dowels to be cast with the structural deck. Per S1-3281 detail 7 "SIGNAGE PYLON FOOTING DETAIL" calls for vertical #5 rebar dowels to be cast with structural deck. For constructability reasons it is essential that Shimmick's operations maintain open access for roof top small cranes and man lifts for all trades. Per specification section 03 20 02 Part 2.3 F. 3. Adhesive for dowels in existing concrete b. HIT-RE 500_SD injectable adhesive by HIL TI, Inc., is an approved method. The minimum embedment depth requirement for #4 rebar is 2.75 inches and the concrete thickness requirement is 4 inches at the shear keys. The minimum embedment depth requirement for #5 rebar is 3.125 inches and the concrete thickness requirement is 4.375 inches for the signage pylon. The roof deck is 7" with 3" tall flutes leaving a clear space of 4 inches. Shimmick's solution for the 4.375 inch concrete thickness requirement is to pour an additional .5 inches of concrete at the concrete deck where the pylons will be installed. See drawing attachment "A" and product data attachment "B" on page 4 for rebar drill and epoxy requirements.</p> <p>Shimmick requests approval for the shear keys and the pylons be drill and epoxy rebar doweled connections after the roof top deck has been poured and larger operations have been completed.</p>						<p>Per S1-3282 detail 9 "SHEAR KEY AT ROOF" calls for vertical #4 rebar dowels to be cast with the structural deck. Please see attached SKA-4052 (per RFI #T-1661), SKS-0398 & SKS-0400 (confirmed in RFI #T-1661and 1658), and Markup A1-2960A (per email from TT on 8/8). SKS-0400 visually shows the grade beams sloping but does not provide the exact percent of slope. Cross referencing the available sheets provides conflicting slopes for each beam.		Please see attached SKA-4052 (per RFI #T-1661), SKS-0398 & SKS-0400 (confirmed in RFI #T-1661and 1658), and Markup A1-2960A (per email from TT on 8/8). SKS-0400 visually shows the grade beams sloping but does not provide the exact percent of slope. Cross referencing the available sheets provides conflicting slopes for each beam.				
The grade beams GB1 and GB2 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Constant Slope: Projection of Ground Level Slab". SKA-4052 calls out a single west-east slab slope of 1.2%. However, SKS-0398 provides two unique end of beam top elevations for GB1 and GB2, suggesting that the beams have two different slopes. The grade beams GB3 and GB4 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Slope to Foundation Wall", where the grade break occurs at the west face of the foundation wall at EL + 15' 7". 3/SKS-0400 visually indicates the grade break at the east face of the foundation wall. No elevation on the east end of GB3 or GB4 is provided. The top of slab is provided, but 1/S1-5023 does not show a difference between top of slab and top of beam.		The grade beams GB1 and GB2 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Constant Slope: Projection of Ground Level Slab". SKA-4052 calls out a single west-east slab slope of 1.2%. However, SKS-0398 provides two unique end of beam top elevations for GB1 and GB2, suggesting that the beams have two different slopes. The grade beams GB3 and GB4 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Slope to Foundation Wall", where the grade break occurs at the west face of the foundation wall at EL + 15' 7". 3/SKS-0400 visually indicates the grade break at the east face of the foundation wall. No elevation on the east end of GB3 or GB4 is provided. The top of slab is provided, but 1/S1-5023 does not show a difference between top of slab and top of beam.				
1) What are the slopes for GB1, GB2, GB3, and GB4? 2) What creates a difference in top elevation between GB 1 and GB2? 3) Where does the grade break for GB3 and GB4 occur? 4) What is the top elevation of GB3 and GB4 at the east face of the foundation wall? 5) What is the top elevation of GB3 and GB4 at GL 1.4, per 1/S 1-5023?		1) What are the slopes for GB1, GB2, GB3, and GB4? 2) What creates a difference in top elevation between GB 1 and GB2? 3) Where does the grade break for GB3 and GB4 occur? 4) What is the top elevation of GB3 and GB4 at the east face of the foundation wall? 5) What is the top elevation of GB3 and GB4 at GL 1.4, per 1/S 1-5023?

T-1751	SSS - Upper Basket Column Pipes at Gridline 1	Closed	CR	09/26/2014	10/06/2014	10/08/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST: Upper basket column pipes located at gridline 1/G and 1/C are shown to be concrete filled to top of pipe in S1-4018 Rev 4. Details shown in B/S1-4018 require a 2" diameter vent hole in the roof level cast nodes. Roof level cast nodes at these locations are 72-36 and 72-37 and according to machining drawing CN-0127 Rev 4 (issued 12/19/13), neither of these cast nodes have vent or grout holes. Currently, pipes are detailed with (2) - 5/8" vent holes approx. 7" from the top of the pipe so the pipes could be filled to this point. Please confirm currently detailed pipe vent holes can remain as is or provide new vent hole details for the pipe and/or cast nodes. Please note cast nodes 72-36 and 72-37 have already been released to Oregon Iron Works by Bradken. T-1767	SSS - Weld Clearance Hole Size at Moment Frame Column Cruciform From: Webcor Construction LP Gregory Kemerer	Closed	CR	10/01/2014	10/11/2014	10/13/2014
REQUEST: Several Moment Frame Columns have cruciform sections that weld over column web splice joints. The splice joint provides a transition from thick web to thin web. In a majority of these cases, the cruciform web as detailed has a 1" radius cutout to clear the column web splice joint. The 1" radius cutout is insufficient to adequately clear the tapered double bevel splice joint and provide space for runoff tabs necessary for the CJP weld. Please confirm it is acceptable to provide a weld clearance hole in the cruciform section wide enough to clear the bevels of the column web splice joint plus 1" on each side of the bevel for weld runoff tabs. See attached sketch. If confirmed, this information needs to be shown on detail drawings.		ANSWER: Several Moment Frame Columns have cruciform sections that weld over column web splice joints. REQUEST:			ANSWER:			
<p>This is a confirming RFI following our October 9, 2014 structural coordination meeting. The following items / actions were discussed:</p> <ol style="list-style-type: none">For anchor bolts that do not clash with the column base plates but are out of AISC tolerance thus limiting the ability to adjust for structural steel fabrication and erection tolerances, the EOR takes no exception to modifying the base plate holes in the shop or field to suit the as-built anchor bolt position.The EOR takes no exception to reducing the size of the plate washers above and below the horizontal stiffener/anchor plate in the column. This will be done to clear the fillet weld for the vertical stiffener below the horizontal anchor plate and to allow for consistent plate washer sizes. The plate washers will be larger than the major diameter of the anchor nuts. The attached spreadsheet details the sizes we will use at each location.The EOR takes no exception to adding a spacer plate below the horizontal anchor plate and above the nut at the 2-1/2" anchor rod locations where necessary. This is necessary to accommodate out of tolerance anchor bolts so that the nut can clear the fillet weld between the horizontal anchor plate and the vertical stiffener below. <p>Please confirm the above items.</p>			<p>This is a confirming RFI following our October 9, 2014 structural coordination meeting. Otherwise, please provide a detail for bracing the top of an interior concrete pier to the concrete deck.		ANSWER: Please see the attached clouded drawings, S1-9050, S1-9002, and S1-9001. Note 5 on detail 9/S1-9050 refers to detail 1/S1-9002 for the typical top of pier bracing details. Detail 3/S1-9001 depicts the bracing of an interior CMU/Concrete Pier below a metal deck. There are no other details shown on the contract drawings that depict bracing of interior CMU/Concrete pier below concrete concourse deck. Please confirm it is acceptable to omit the 3/8" thick plate on Detail 3/S 1-9001 for bracing below concrete concourse deck. Otherwise, please provide a detail for bracing the top of an interior concrete pier to the concrete deck.

T-1785	BGP - Area 2 South Splice Bar Correction	Closed	01	10/06/2014	10/16/2014	10/13/2014
From: Webcor Construction LP Claude Titché						
REQUEST:			ANSWER:			
The southern #9A42 splice bars that are being corrected in the field should have been placed during the previous pour (D205). During the correction for Decks C203 and D204, it was discovered that there was not enough room to insert these bars from the East side of GL-X due to the proximity of the pour joint. Per the attached drawings, please confirm the constructible reconfiguration of the splice bars acceptable. T-1796	SCS - Sky Light Embed Layout Dimensions	Closed	01	10/07/2014	10/17/2014	10/07/2014
From: Shimmick Construction Company, Inc. Henry Chiang						
REQUEST:			ANSWER:			
After searching through sky light drawings AI-8401 through AI-8479 and SI-8000 through SI-8020 Shimmick was not able find information providing the sky light attachment to top of wall embed sizes, anchor bolt length, and spacing of embeds. For the central sky light from grid line 19.1 to 22 on page A 1-8451 which shows the structural truss frames for the sky light, which determines the embed layout, the truss frames are called out as equally spaced between each grid line. This does not give you the complete perimeter and requires too many assumptions. Also on AI-8401Note2. Dimensional control sub part A. "Dimensional control shall be derived from the three dimensional (3D) computer model and the two dimensional (2d) drawings." Sub part B. "See sheet AI-0009 for an index of 3D models". The 3D models referenced on AI-0009 are models that Shimmick TG07 Superstructure currently does not have access to. Shimmick would prefer to have the embed information on a drawing sheet equivalent to what is provided for the roof park railing details on sheets AI-8680 to AI-8685. T-1807	SCS - Roof Perimeter Wall Construction Joint Relocation	Closed	01	10/13/2014	10/23/2014	10/15/2014
From: Webcor Construction LP Claude Titché						
REQUEST:						ANSWER:
RFI #T-1710 Shimmick requested approval to relocate the construction joint from the wall to the deck and pour the chamfer with the scallop wall.						RFI #T-1710 Shimmick requested approval to relocate the construction joint from the wall to the deck and pour the chamfer with the scallop wall.
Shimmick requests confirmation that this is acceptable for the entire perimeter and not just the scallop locations. Refer to perimeter wall detail 2 on S1-3282.						Shimmick requests confirmation that this is acceptable for the entire perimeter and not just the scallop locations. Refer to perimeter wall detail 2 on S1-3282.
T-1808	SCS - Bottom Bars Per 4/S1-5022	Closed	01	10/13/2014	10/23/2014	10/14/2014
From: Webcor Construction LP Claude Titché						
REQUEST:						ANSWER:
Refer to 4/S1-5022 for welded bars at the bottom flange of steel beam. Detail 'A' requires the "rebars to match the number and size of beam top bars". Detail 'B' requires the "rebars to match the number and size of beam bottom bars". Per S1-3600, moment frame beams can have two sets of bottom reinforcement, B 1 and B2. 4/S1-5022 does not reference whether B1, B2, or both sets of bars are required.						Refer to 4/S1-5022 for welded bars at the bottom flange of steel beam. Detail 'A' requires the "rebars to match the number and size of beam top bars". Detail 'B' requires the "rebars to match the number and size of beam bottom bars". Per S1-3600, moment frame beams can have two sets of bottom reinforcement, B 1 and B2. 4/S1-5022 does not reference whether B1, B2, or both sets of bars are required.
Per conference call with Thornton Tomasetti on 10/9/14, for both details, bars on the top to match the top bar and bars on the beam's bottom flange are to match the quantity of BI bottom bars only. No B2 bars need be welded to the flange.						Per conference call with Thornton Tomasetti on 10/9/14, for both details, bars on the top to match the top bar and bars on the beam's bottom flange are to match the quantity of BI bottom bars only. No B2 bars need be welded to the flange.
Please confirm.						Please confirm.
T-1809	SCS - Top Bar Clearance Per 4A/S1-5022	Closed	01	10/13/2014	10/23/2014	10/14/2014
From: Webcor Construction LP Claude Titché						
REQUEST:						ANSWER:
Please refer to 4/SI-5022 and Detail 5/SI-3600 for top rebar cover on ground level moment frame beams. Detail 'A' calls for 2" clear for the top bars but detail 5/S1-3600 calls for 2.75" clear to the stirrup.						Please refer to 4/SI-5022 and Detail 5/SI-3600 for top rebar cover on ground level moment frame beams. Detail 'A' calls for 2" clear for the top bars but detail 5/S1-3600 calls for 2.75" clear to the stirrup.

<hr/>						
From: Webcor Construction LP	Gregory Kemerer					
REQUEST:			ANSWER:			
Skanska and their construction engineer, Hassett have evaluated several options for setting and securing the train box columns in position until the grouting operation has been complete. Based on Hassett's calculations the only feasible option to adequately stabilize the column is to utilize shim packs at each corner of the base plate.			Skanska and their construction engineer, Hassett have evaluated several options for setting and securing the train box columns in position until the grouting operation has been complete. Based on Hassett's calculations the only feasible option to adequately stabilize the column is to utilize shim packs at each corner of the base plate.			
Due to the congestion of rebar at the base plate block-out, there is currently insufficient room to set shim packs on a flat surface, therefore Skanska propose to pour 10"x10" grout pads at each corner to achieve the required uniformed surface for shim packs, see attached SK-5.0 for clarification.			Due to the congestion of rebar at the base plate block-out, there is currently insufficient room to set shim packs on a flat surface, therefore Skanska propose to pour 10"x10" grout pads at each corner to achieve the required uniformed surface for shim packs, see attached SK-5.0 for clarification.			
Skanska propose to use TG07.2's Dayton Superior grout, previously approved in submittal TG0702-500.			Skanska propose to use TG07.2's Dayton Superior grout, previously approved in submittal TG0702-500.			
Please confirm this is acceptable.			Please confirm this is acceptable.

T-1838	SCS - 4th Lift Foundation Wall - Moment Frame Beam Alignment	Closed	01	10/22/2014	11/01/2014	10/31/2014
From: Webcor Construction LP Claude Titché						
REQUEST:						
See attached sketch. This RFI is related to RFI T-1467.						
Ground level moment frame beams tie into the foundation wall. Due to level shoring towers, the moment frame beams will be step in elevation. The level moment frame beams will be interfacing with the sloped 4th lift foundation wall causing issues in alignment and constructability in the remaining foundation wall. SCCI proposes to have the top of 4th lift be 3'-11" below top of slab. This method will clear the alignment issues, provide a starter wall edge and will result in a 1" ± 1/4" encroachment of 4th lift wall into the moment frame beam.						
Please confirm it is acceptable for the 4th lift encroach into the moment frame beam by 1" ± 1/4"

T-1844	SST - Checkered Plate Stair Tread Clearance	Closed	CR	10/28/2014	10/28/2014	10/30/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST: Q1: Architectural design for the setup of checkered plate treads shows the vertical bent lip fitting up tight with the bottom of tread's riser. As illustrated in the attached sketch, the vertical bend of the lip creates a natural radius that will clash with the riser if you were to create this tight fit. Please advise if it's acceptable to back-off the riser portion of the tread by 3/8" to create a gap that clears the lip radius.						ANSWER: Q1: Architectural design for the setup of checkered plate treads shows the vertical bent lip fitting up tight with the bottom of tread's riser. As illustrated in the attached sketch, the vertical bend of the lip creates a natural radius that will clash with the riser if you were to create this tight fit. Please advise if it's acceptable to back-off the riser portion of the tread by 3/8" to create a gap that clears the lip radius.
T-1845	SST - Floating Stair Connection Issue at Stair 401	Closed	CR	10/28/2014	11/07/2014	11/06/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST: Q1: Per the stair layout dimensions provided on 2/A1-7012, stair 401 nosing location at landing elevation 39'-9 will go 7" past the supporting column and beam per 3/S1-7009. As a result, the designed conneciton called out 10/S1-7601 will not work. The cantilevered beam has no purpose in this scenario. Please see included sketch and advise.						ANSWER: Q1: Per the stair layout dimensions provided on 2/A1-7012, stair 401 nosing location at landing elevation 39'-9 will go 7" past the supporting column and beam per 3/S1-7009. As a result, the designed conneciton called out 10/S1-7601 will not work. The cantilevered beam has no purpose in this scenario. Please see included sketch and advise.

T-1858	SCS - Opening blockouts through Ground Level	Closed	01	10/30/2014	11/09/2014	11/12/2014
From: Webcor Construction LP Claude Titcher						
REQUEST:			ANSWER:			
Due to the North to South shoring along the Lower Concourse Level, the concrete partition walls cannot be built until the Ground Level is poured and struts have been removed. Since the Ground Level will be completed before the partition walls are built, SCCI proposes installing blockouts in the Ground Level above the walls in order to complete the concrete pours and vibrate for the partition walls in GL 10 to GL 13. The blockouts will be 8" diameter circle, the rebar detail will be the one shown at 9/S1-5003. The blockouts will not be farther than 5' O.C. or closer than 2' 6" O.C. See the attached drawing for blockouts layout. Please confirm this is acceptable. T-1859	SCS - Vertical Trim Bar Termination	Closed	01	10/30/2014	11/09/2014	11/05/2014
From: Webcor Construction LP Claude Titcher						
REQUEST:			ANSWER:			
Please reference drawing 4/S1-3207, RFI T-1666, RFI T-1698 and see attached spreadsheet listing out the length of trim bar to be embedded into poured spans of 3rd lift for relevant openings. The foundation wall penetration detail 4/S1-3207 requires vertical trim bar of LTS + W above and below the opening. RFI T-1666 and RFI T-1695 responses have noted that a hook or head may be used to terminate trim bars where bar length exceeds height of wall. However the third lift will require embedded trim bars for all foundation wall openings where this detail is applied. seer proposes to terminate trim bars with hooks at the bottom of the 4th lift, similar to RFI T- 1666's response for the top of wall. Please confirm if terminating trim bars with hooks at the bottom of the 4th lift is acceptable or provide parameters for cases where this would be acceptable. 2. Verify 1'-7" dimension from center of column to center of grout hole. Typical at 3 places.			2. Verify 1'-7" dimension from center of column to center of grout hole. Typical at 3 places.			
T-1867	SSS - Flange Cut Flush Requirement	Closed	CR	10/31/2014	11/09/2014	11/06/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST:			ANSWER:			
Shop drawings have been detailed with a note to "cut flange flush with web." Where there are web doubler plates (web stiffener plates) installed, the thickness of the web plus doubler plates controls erection clearances. Please confirm that there is no need for the flange to be ground flush with the web in these locations, and that flange metal can sit proud of the web but not thicker than the thickness of the web plus doubler plates. T-1871	SCS - Rebar Detail for Upturned Beams at GL 18, 26, 34, and 35	Closed	01	11/03/2014	11/13/2014	11/13/2014
<div><div>From: Webcor Construction LP REQUEST: Please reference S1-3660 through 3663, and TG03 Balfour Beatty Bridge submittal TG0300-201. Shimmick is proposing a rebar detail change at the ground level roadway upturned beams to facilitate rebar placement. Per BBII's detail 6/SH-5101 , the upturned beam's vertical clearance is 7"-12" to the W18 steel, and the horizontal beam clearance to the cap beam is 19 .5". Details S1-3660 to 3663 show the ground level upturned beam rebar detail with closed stirrups at every beam. In lieu of the closed stirrup, Shimmick proposes to use an open stirrup and a cap (similar to Detail 2/S1-3600), with the opening and cap placed on the side of the beam. Please confirm that the proposed open stirrup and cap in lieu of the closed stirrup is acceptable.</div><div>ANSWER: Please reference S1-3660 through 3663, and TG03 Balfour Beatty Bridge submittal TG0300-201. T-1875.1	SSS - ST401 Slab Opening Dimension Clarifications	Closed	01	01/22/2015	02/01/2015	01/30/2015
From: Webcor Construction LP Andrew Kitchen						
REQUEST: Contract Doc Ref: T-1875, S1-2304 (ASI 128) Location: GL 15-16 Add'l Doc Ref: CD RFI 672.1 SK1 The noted W33 beams were located 9" from the edge of slab opening. ASI-127 revised the dimensions from the edge of opening to the W33's as shown. RFI T-1875 confirmed that the beams may remain where they were prior to ASI-127 but the edge plates are to be moved to suit ASI-127. That will result in the slab opening dimensions changing to what is shown in blue. Confirm that is the intent. T-1902	SST - Terrazzo Tread Clarification From: Webcor Construction LP REQUEST: One of the specified terrazzo tread suppliers, Wausau, has indicated that using only marble chips in the aggregate mix for the terrazzo stair treads is "unusual" as per Spec Section 09 66 14, section 2.4.C. Olson Steel priced the terrazzo stair treads from Wausau per this spec. Please confirm the design intent does not include any glass/mirror into the aggregate mix. Under Spec section 09 66 23 Epoxy Terrazzo Flooring, section 2.3.B.5 the terrazzo stair landings are specified to use an aggregate mix of 50% recycled glass/mirror and 50% natural marble/stone. The aggregate mix for the landings differs from the tread; please confirm this was the design intent.	Closed	CR	11/08/2014	11/18/2014	12/11/2014

T-1910	BGP - As-Built Condition of Rebar Dowels for Shear Walls W390B and W390D	Closed	01	11/14/2014	11/24/2014	11/17/2014
<p>From: Webcor Construction LP Claude Titche</p>						
<p>REQUEST:</p> <p>SCCI recently performed an as-built survey of the western-most Shear Wall rebar dowels for the 3rd Lift that were cast into the 2nd Lift Shear Walls and Lower Concourse. These dowels dictate the western face of the 3rd Lift Shear Walls as well as a couple of columns on the West Throat Slab and a B130/B131 Beam alignment. Out of the walls that were surveyed, two of the walls had rebar dowels that were several inches to the west of where they should have been. Based on the results shown in the attached drawings, please confirm that the resulting as-built conditions are acceptable for construction:</p> <ol style="list-style-type: none"> 1. Encroachment of the western faces of W390B and W390D into the adjacent corridor. 2. New location of C19 Column above W390B (roughly 8" to the southwest in alignment with the western face of W390B below). 3. New alignment of B130/B131 Beam below the Vehicle Ramp as a result of the new C19 Column location above W390B 			<p>ANSWER:</p> <p>SCCI recently performed an as-built survey of the western-most Shear Wall rebar dowels for the 3rd Lift that were cast into the 2nd Lift Shear Walls and Lower Concourse. T-1912	SST - Stair 403 Clarifications	Closed	CR	11/14/2014	11/24/2014	11/24/2014
<div><div>From: Webcor Construction LP</div><div>Gregory Kemerer</div></div>						
REQUEST:			ANSWER:			
<p>This question impacts stair 403 between concourse and ground level.</p> <p>1. Per the attached comments onSK-RFI-12A, the stair is currently setup to agree with 5/A1A7011and the structural steel locations noted by ASI-027. The new dimensions noted in ASI-127 will revise the edge of slab, thus revising the width of the stair well and the widths of the stairs inside it. Please furnish a revised detail.</p> <p>2. Per the attached comments on SK-RFI 12B,new stair width dimensions have been determined to be5'-4 and 5'-6 ½". Please verify these dimensions are correct. These new dimensions create uneven ascending and descending stair widths. Does the stair need to be re-centered to 5'-5 ¼" equal widths on each side or is it allowed to be uneven?</p> <p>3. Per the attached comments on SK-RFI-12C. the stair support columns would need to shift with the stairs and this creates a problem near the grid D.8 adjustment. The 2" shift south puts it too far off the edge of the concrete beam below and 11/S1-7600 will no longer work. Please advise on a revised detail.</p> <p>*Please furnish revised details 2, 4, 5/A1-7011 to reflect changes on ASI-127 and furnish revised column edge detail to replace 11/S1-7600</p>			<p>This question impacts stair 403 between concourse and ground level.</p> <p>1. T-1913	SST - Checker Plate Mid Landings at Detail 10S1-7601	Closed	CR	11/14/2014	11/24/2014	12/10/2014
<div><div>From: Webcor Construction LP</div><div>Gregory Kemerer</div></div>						
REQUEST:			ANSWER:			
<p>This question impacts all checkered plate mid-landings at detail 10/S1-7601</p> <p>Q1: At detail 10/S1-7601 there will be a checkred kicker plate butting up against the end of the stringer at the soudside stringer connections. The long slot and bolted connection that allows the stringer to float will not be able to float in the direction of the kicker plate that stops it. This is typical at midlandings. Please see included sketches and advise.</p>			<p>This question impacts all checkered plate mid-landings at detail 10/S1-7601</p> <p>Q1: At detail 10/S1-7601 there will be a checkred kicker plate butting up against the end of the stringer at the soudside stringer connections. T-1930.1	SSS - Stud Spacing Detail	Closed	CR	12/18/2014	12/28/2014	12/29/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST: Contract Doc Ref: 1/S1-5000 Location: Bus Deck Grid Line: Throughout Add'l Doc Ref's: The response to RFI T-1930 item 2(C) indicated that if studs are required where there is no rib over the beam due to flange plates, studs should be welded to the flange plates and centered on the beam. On the gusset plate on the SLRS framing at the bus level, the 12" studs indicated will project through the topping slab. The decker can provide 10" studs at no additional cost but these will only project 1-3/4" into the topping slab and not meet the 2" min requirement. If a custom stud length is required the decker will have additional material and labor costs as the stud welding equipment will need to be modified to shoot the custom length stud. Please confirm it is acceptable to use 10" studs at the flange plates. T-1936	BGP - Steel Jacket GL 1.4/D.4 - Ring Base Plate	Closed	01	11/21/2014	12/01/2014	12/25/2014
From: Webcor Construction LP Claude Titcher						
REQUEST:			ANSWER:			
The column at Gridlines 1.4/D.4 requires a post installed steel jacket. Please reference the attached clouded detail 6/SI-3503. Due to the added reinforcement around the column and field experience with drill and epoxy rebar dowels in this area, the possibility of post installing the ring base plate with postinstalled expansion anchors at shop drilled holes location is highly unlikely. Please confirm it is acceptable to exclude the ring base plate or please provide an additional detail that is more constructible for post-installed column jacket base plate attachment. REQUEST: See attached CD RFI # 707 SK1 for items 1 to 3: 1) A 1/16" gap remains between the beam flanges when they are centered under the curbs. Confirm this is the design intent or supply revised beam locations. 2) The double angle connections per 1/S1-5010 will not fit at the noted locations. Confirm it is acceptable to supply shear plate connections per 1/S1-5011 except they will be welded to the web stiffeners and the underside of the beam flange. If not, supply a new connection detail. 3) Confirm a shear plate per 1/S1-5011 may be used at the noted locations as 1/S1-5010 will not work opposite the connection per 9/S1-5032. If not, supply a new connection detail.						ANSWER: See attached CD RFI # 707 SK1 for items 1 to 3: 1) A 1/16" gap remains between the beam flanges when they are centered under the curbs. Confirm this is the design intent or supply revised beam locations. 2) The double angle connections per 1/S1-5010 will not fit at the noted locations. Confirm it is acceptable to supply shear plate connections per 1/S1-5011 except they will be welded to the web stiffeners and the underside of the beam flange. T-1972	PLG - 8" Storm Water sleeve size conflict	Closed	CR	12/04/2014	12/14/2014	12/08/2014
From: Webcor Construction LP Aseem Goyal						
REQUEST:		ANSWER:				
Reference : P1-0051 dated 02/21/2014, Table of Foundation Wall Penetrations (TG07.2 IFC Documents) & Submittal Package No TG0702-022		Reference : P1-0051 dated 02/21/2014, Table of Foundation Wall Penetrations (TG07.2 IFC Documents) & Submittal Package No TG0702-022				
Submittal Package No TG0702-022 was returned with markups calling out for 12" sleeves through the foundation wall for 8" Storm Water line. The Table of Foundation Wall Penetrations also specifies 12" sleeve for the same (See attached) . However a 10" sleeve is called out for 8" Storm Water pipe in the Pipe Sleeve Schedule P1-005. Please confirm 12" sleeve is required, if so provide an updated Pipe Sleeve Schedule. ANSWER: Contract Doc Ref: S1-2406 Location: Zone 4, Second Level Grid Line: D.4 & 31 Add'l Doc Ref's: CD RFI # 728 SK1 S1-2406 shows a double angle connection near grid lines D.4 and 31. The double angle connection per 1/S1-5010 fouls the web stiffener per 3/S1-5019 by 1 3/16" as shown in SK1. Advise whether to reduce the length of the web stiffener by 2" or replace the double angle connection with a shear plate connection per 1/S1-5011.

requirements for the Moment Frame Columns.

2) Please clarify the Table 2-1 remark under welds not described below, "MT 25% of joints, full length". It is our understanding that 1 out of every 4 joints will receive full length MT inspection and the next 3 joints will not receive MT. Please confirm.

If this is not accurate, please supply the NDT requirements for the Moment Frame Columns.

2) Please clarify the Table 2-1 remark under welds not described below, "MT 25% of joints, full length". It is our understanding that 1 out of every 4 joints will receive full length MT inspection and the next 3 joints will not receive MT. Please confirm.

ANSWER:

Contract Doc Ref: N/A
Location: West Foundation Wall. W379. W380
Grid Line: N/A
Add' Doc Ref: Field Report SS10-073, attached sketches.

Please see attached sketches and field report #SS8510-073, sections 073.3.2 and 073.3.3, authored by Sean McNeill.

Due to a variance in concrete cover at foundation walls W379 and W380 SCCI proposes the following solutions.

073.3.2: Where the 4 instances occur, SCCI proposes to excavate behind the vertical dowel approximately 6" down to allow for field bending of the dowel in order to achieve specified cover. Vertical will be identified, concrete will be excavated and dowel will be field bent away from face of wall. (Please reference attached sketch referencing issue #073.3.2)
Please confirm this is acceptable.

073.3.3: Where condition occurs at wall W80, a 12"x 12" grid of #4 temperature steel will be added. This grid of temperature steel will be bled off of existing contract bars in order to achieve specified cover. The approximate height of the grid will be 3' to 6' and approximately 15' to 20' in length. At the top of the wall clear cover will be set to specified amount. (Please reference attached sketch referencing issue #073.3.3)
Please confirm this is acceptable.

ANSWER:

Contract Doc Ref: 2/A1-3001 - 3003, A1-2862, A1-2865

Location: Zone 1 to 3, Ground Level

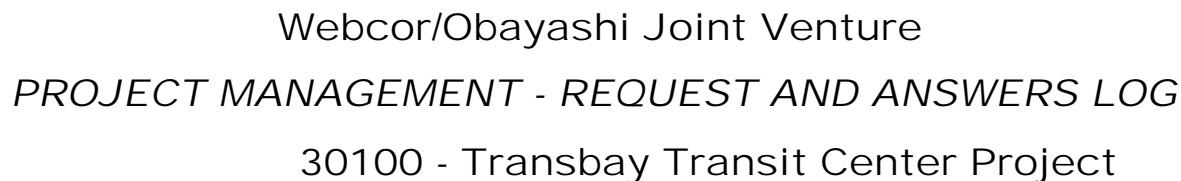

Gridline: B/1.4-5, B/9.8-12, H/20.1-22

Add'l Doc Ref's: N/A

Please reference Detail 2 of Drawings A1-3001 - A1-3003 and See attached slab edge plan drawings with markups of slab opening curbs.

On Drawings A1-2862, A1-2862 and A1-2865, Curbs are called out at the Transformer Vault room openings, however the top of curb elevations are not provided or called out as "Height to Be Coordinated". Detail 2 of Drawings A1-3001 - A1-3003 call out Transformer Vault curb elevations as Top of Cover. SCCI requires confirmation on curb elevations in order to appropriately plan for construction of openings on the ground level.

Please confirm if A1-3001 - A1-3003 Detail 2, Top of Cover elevations are top of curb elevations for Transformer Vault room opening curbs, if not please provide elevations.

1) The CIP Bus Deck Crash Rail detail is currently shown as poured monolithic with the structural topping slab of the Bus Level composite deck. For forming reasons it isn't practical to place this wall with the same pour as the deck it sits on. Please confirm if the horizontal keyed joint for the crash rail can be relocated to the top of the structural deck as shown in the attached markups or advise how else the detail may be modified to separate vertical and horizontal elements.						1) The CIP Bus Deck Crash Rail detail is currently shown as poured monolithic with the structural topping slab of the Bus Level composite deck. Contract Doc Ref: S1-5022 Location: Ground Level Grid Line: C and G Add'l Doc Ref's: Attached			Contract Doc Ref: S1-5022 Location: Ground Level Grid Line: C and G Add'l Doc Ref's: Attached			
Please reference Sheet S 1-5022 showing the typical steel to concrete connection at the ground level. Note the 1:1 slope from bottom of beam to bottom of flange in Detail 1B and 4A. Insufficient rebar details are available in this 1:1 slope in SI-5022. The details direct to the SI-37XX series for further rebar details. Sections are taken at various GLs at N/S Transfer Girders, but not between GLs at the E/W perimeter steel. The bottom bar embedment varies: 90 degree, 45 degree, and terminator ends are all used.			Please reference Sheet S 1-5022 showing the typical steel to concrete connection at the ground level. Note the 1:1 slope from bottom of beam to bottom of flange in Detail 1B and 4A. Insufficient rebar details are available in this 1:1 slope in SI-5022. The details direct to the SI-37XX series for further rebar details. Sections are taken at various GLs at N/S Transfer Girders, but not between GLs at the E/W perimeter steel. The bottom bar embedment varies: 90 degree, 45 degree, and terminator ends are all used.			
Shimmick requires further rebar details in the 1:1 sloped region of the MFBs between GLs at the E/W perimeter steel along GL C and G to produce shop drawings. This RFI affects Submittal TG0702-076 for Ground Level 13-19 Rebar and has potential changes for Submittal TG0702-075 for Ground Level 10-13.			Shimmick requires further rebar details in the 1:1 sloped region of the MFBs between GLs at the E/W perimeter steel along GL C and G to produce shop drawings. This RFI affects Submittal TG0702-076 for Ground Level 13-19 Rebar and has potential changes for Submittal TG0702-075 for Ground Level 10-13.			
1. Please provide a new rebar detail applicable to all MFB between grid lines, one each for GL C and GL G. Please include bent bottom bar requirements and stirrup requirements as applicable.			1. Please provide a new rebar detail applicable to all MFB between grid lines, one each for GL C and GL G. Please include bent bottom bar requirements and stirrup requirements as applicable.			
2. Are bent bars, similar to those shown in the SI-37XX markups, required in the 1:1 sloped region of the MFBs between TRs along GL C and G?			2. Are bent bars, similar to those shown in the SI-37XX markups, required in the 1:1 sloped region of the MFBs between TRs along GL C and G?			
3. If bent bars are required per #2, please provide criteria on when to apply each of the following bottom bar end conditions: 90 degree, 45 degree, and terminator ends. Shimmick would propose the criteria as the size of the 1:1 slope region.			3. If bent bars are required per #2, please provide criteria on when to apply each of the following bottom bar end conditions: 90 degree, 45 degree, and terminator ends. Shimmick would propose the criteria as the size of the 1:1 slope region.			
4. If bent bars are required per #2, Shimmick proposes that the bottom bent bars are added with a splice to facilitate placing the bar. Propose (a) splice length per splice schedule on S1-3001, to extend from start of 1:1 toward foundation wall, (b) to reduce bent bar size from matching MFB to a #5, (c) splice length per larger bar size.			4. If bent bars are required per #2, Shimmick proposes that the bottom bent bars are added with a splice to facilitate placing the bar. Propose (a) splice length per splice schedule on S1-3001, to extend from start of 1:1 toward foundation wall, (b) to reduce bent bar size from matching MFB to a #5, (c) splice length per larger bar size.			
5. Please provide a distance from the GL G and C at

In detail 1/S1-4354, 2 of the bottom bars sit on the outside of the 2" stiffener plates. All bottom bars are welded to bottom of flange. In cross referencing the Structural Steel Shop Drawings, the bottom flange extends no further than the edge of the 2" stiffener plate. There is no bottom flange on which to weld the 2 outermost bottom bars as shown in detail 1/S-4354. Propose either (a-preferred) fit all 26 bottom bars within both 2" stiffener plates by reducing spacing from 5" OC to 3" OC minimum, with bars field adjusted to avoid plates, or (b) weld the north bar to the north face of the 2" stiffener plate. Please confirm which proposal is acceptable. Rebar shops will reflect detailing change if acceptable.			In detail 1/S1-4354, 2 of the bottom bars sit on the outside of the 2" stiffener plates. Contract Doc Ref: S1-2304 Location: Ground Level Grid Line: 14-15 Add'l Doc Ref's: Attached.		Contract Doc Ref: S1-2304 Location: Ground Level Grid Line: 14-15 Add'l Doc Ref's: Attached.				
Reference S1-2304 for the ground level bollard pit (South of GL G, between GL 14 and 15). Per approved submittal TG0702-027, the beam soffits are typically level in the east-west direction. The slab soffit slopes in the east-west direction. In the ground level bollard pit area, maintaining both the level beam bottoms and the sloping soffit will result in a reveal in the bottom of the concrete beams. See the attached sketch noting the expected 3/8" beam reveal.		Reference S1-2304 for the ground level bollard pit (South of GL G, between GL 14 and 15). T-2104	SCS - Rebar Detail for MFB14 at G16.9 - Roadway Slab Area	Closed	01	01/16/2015	01/26/2015	01/27/2015
From: Webcor Construction LP Claude Titcher						
REQUEST:						ANSWER:
Contract Doc Ref: 1/S1-3703, S1-2304 Location: Ground Level Grid Line: 16.9/19.1 Add'l Doc Ref's: Attached.						Contract Doc Ref: 1/S1-3703, S1-2304 Location: Ground Level Grid Line: 16.9/19.1 Add'l Doc Ref's: Attached.
Please reference Detail 1/SI-3703, showing the rebar detail for the MFBs bordering the roadway slab at GL 16.9/19.1. The detail shows the bottom of the concrete beam below the bottom of steel. At MFB14 at G/16.9, the bottom of the concrete beam is above the bottom of steel. Please see attached SI-2304 mark up cross referencing contract elevations. The above elevation conflict removes the need for the 4' 90 degree embedment and the welded couplers/bars at the bottom flange shown in SI-3703. No detail is currently available for the above situation.						Please reference Detail 1/SI-3703, showing the rebar detail for the MFBs bordering the roadway slab at GL 16.9/19.1. The detail shows the bottom of the concrete beam below the bottom of steel. At MFB14 at G/16.9, the bottom of the concrete beam is above the bottom of steel. Please see attached SI-2304 mark up cross referencing contract elevations. The above elevation conflict removes the need for the 4' 90 degree embedment and the welded couplers/bars at the bottom flange shown in SI-3703. No detail is currently available for the above situation.
Please provide a new rebar detail applicable when the bottom of beam is above top of steel for MFB 14 at G/16.9. Please include an alternative for the 4' vertical embedment and the welded couplers/bars on bottom flange, both of which are not applicable in this case. Note that the new bottom bar end condition must correlate with the stiffener plates on the bottom of flange.						Please provide a new rebar detail applicable when the bottom of beam is above top of steel for MFB 14 at G/16.9. Please include an alternative for the 4' vertical embedment and the welded couplers/bars on bottom flange, both of which are not applicable in this case. Note that the new bottom bar end condition must correlate with the stiffener plates on the bottom of flange.

ANSWER:

Contract Doc Ref: S1-3705
Location: Ground Level
Grid Line: N/A
Add'l Doc Ref's: Attached.

Please reference SI-3705, Sheet 631AC from SSS TG0701-074, and Sheet GN02F from SCS TG0702-075. All sheets are in reference to the concrete MFB framing into TR 12 at GL C as an example.

SI-3705 shows 2" holes penetrating TR 12 at top and bottom of web for placement of stirrups. The steel shop drawing for TR 12 shows the hole layout. However, when detailing the MFB/TR connection at C/12, the stirrup holes fall outside the concrete beam bottom due to the 1:1 sloped region of the concrete beam (shown in SI-3705). The conflict is reflected in the rebar shop drawing. This results in exposed stirrups.

Shimmick proposes that stirrups be eliminated when transfer girder stirrup holes fall outside the concrete limits. Please confirm this is acceptable. If this is not acceptable, Shimmick proposes to provide hanger bars through only the top holes in the web, with size to match original stirrups and fit concrete limits.

Contract Doc Ref: 5/S1-3501 Location: Vehicle Bike Ramp Grid Line: N/A Add'l Doc Ref's: Attached Detail 5 on plan sheet S1-3501 calls for structural polystyrene for area where formwork cannot be removed. RFI T-1706 confirms that foam shoring could be utilized for the entire B301 Bicycle Ramp due to the perpendicular wall blocking access under this portion. Please confirm the attached product data for EPS Foam is an acceptable lost formwork foam. ANSWER:

Contract Doc Ref: (ASI 128 dated 12/16/14)
Detail 1/A1-9585
Sheets A1-9520 through A1-9537

Location: N/A

Closest Column Line Intersection: N/A

Add'l Doc Ref's:
RFI Response P1-0457

Detail 1/A1-9585 calls out for the Grand Hall topping slab thickness to be 3-5/8", with radiant floor heating tubes and #4 rebar.

Notes on Sheets A1-9520 through A1-9537 confirm that reinforcement within topping slabs is to be #4 rebar at 16" o.c. each way.

Based upon the minimum clearances and material thicknesses (1.5" clr. for tubing, 3/4" nominal O.D. for tubing, 1" for rebar mat, 3/4" minimum clr. for rebar), the topping slab minimum thickness would be required to be 4" (NOTE: 4" does not include any room for allowable tolerances), which exceeds the thickness called out on Detail 1/A1-9585.

Please provide direction as to the desired topping slab thickness at the Grand Hall (NOTE: RFI P1-0457 previously changed the reinforcement to 6x6x4.5x4.5 within the Grand Hall).

T-2168	SSS - Light Column Pipe to Cast Node Joints	Void	01	02/03/2015	02/13/2015	
From: Webcor Construction LP Andrew Kitchen						
REQUEST:		ANSWER:				
Contract Doc Ref: S1-6005, S1-6006 Location: GL 23 Add'l Doc Ref: AWS D1.1		Contract Doc Ref: S1-6005, S1-6006 Location: GL 23 Add'l Doc Ref: AWS D1.1				
<p>Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. Pipe has been ordered and delivered in conformance with this specification. Detail 6/S1-6006 shows the intended fit between the vertical pipe legs and the cast nodes. The castings have a machined feature on each nozzle end that is intended to slide into the pipe ends and act as a backing ring. The corresponding weld between these two components is called out as a complete joint penetration weld in the same detail. In accordance with AWS D1.1 Section 5.22.1.1, the separation between faying surfaces of butt joints landing on a backing shall not exceed 1/16". The allowable tolerances for API 5L Grade X52 pipe do not require concentricity (between internal and external bores) or even a constant wall thickness that would be required by AWS D1.1 to provide a complete joint penetration weld. Further, there is no requirement in the contract documents for additional machining to the internal bores of the pipe ends as would be required by AISC Code of Standard Practice.</p> <p>As a result our fabricator has encountered the following conditions;</p> <ol style="list-style-type: none">1. Pipe does not fit over the machined backing ring at the cast node nozzle end as intended without additional grinding and/or machining2. Pipe fits over cast node backing ring; however, pipe ID is not circular or concentric, resulting in excessive gaps that exceed fit tolerance requirements for a complete joint penetration weld. Further, the lack of concentricity may result in misalignment of the pipe and cast nodes in the vertical legs.3. Ring pipe segments will be made from different pipe sections. Pipe ends from such sections will have varying and unmatched IDs again inhibiting the installation of a tight fitting backing ring required to complete a CJP. <p>For demonstration please refer to attached SK RFI 1015 SK 1 and SK 2 which shows actual dimensions for the first pipe section cut by our fabricator (p16056) and corresponding measurements from cast nodes 702-01 and 702-02 machined backing ring (see attached sketches).</p>		<p>Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. Contract Doc Ref: P1-5040, 21 13 19-3 Location: Train Platform Level Closest Column Line Intersection: Between B,C.3 & 4,5 Add'l Doc Ref's: N/A		Contract Doc Ref: P1-5040, 21 13 19-3 Location: Train Platform Level Closest Column Line Intersection: Between B,C.3 & 4,5 Add'l Doc Ref's: N/A				
P1-5040 calls out the Fire Water Storage Tank as a 45,000 Gallon Tank. The Tank should be sized for the worst case hazard classification of the building. Per Specification 211319-3, the Bus Deck Level is Classified as Extra Hazard Group 1 with a design density of .24 over 4,000 sq. ft. If sizing the tank for this density it should hold 131,400 gallons.		P1-5040 calls out the Fire Water Storage Tank as a 45,000 Gallon Tank. The Tank should be sized for the worst case hazard classification of the building. Per Specification 211319-3, the Bus Deck Level is Classified as Extra Hazard Group 1 with a design density of .24 over 4,000 sq. ft. If sizing the tank for this density it should hold 131,400 gallons.				
4,000 x .24 = 960 gallons 960 gallons + 500 gallons hose allowance = 1,460 gallons 1,460 gal. x 90 minutes duration = 131,400 gallons		4,000 x .24 = 960 gallons 960 gallons + 500 gallons hose allowance = 1,460 gallons 1,460 gal. x 90 minutes duration = 131,400 gallons				
Please confirm water storage tank sizing?		Please confirm water storage tank sizing?

T-2181	SSS - Deletion of Lower Nuts on Anchor Bolts	Closed	CR	02/04/2015	02/14/2015	02/06/2015
From: Webcor Construction LP Stephanie Azzolino						
REQUEST: Contract Doc: 3,5,8/S1-5051 Location: Zone1-4, Lower Concourse Gridline: All Add'l Doc Ref's: N/A Skanska requests permission to eliminate the lower nuts on the threadbar anchor bolts securing the columns at the lower concourse level. Based upon discussions with the owner design team, it was determined that the anchor bolts are only intended to resist uplift. Skanska employs shims under the baseplate of the columns for support and leveling, therefore the lower nuts are unnecessary and of no need to us. Please confirm this is acceptable.		ANSWER: Contract Doc: 3,5,8/S1-5051 Location: Zone1-4, Lower Concourse Gridline: All Add'l Doc Ref's: N/A Skanska requests permission to eliminate the lower nuts on the threadbar anchor bolts securing the columns at the lower concourse level. T-980.1	SSS - Perimeter Girders at Ground Level	Closed	CR	12/30/2013	01/09/2014	01/13/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST: As a revision to parts 1 & 2 of SK RFI 238 (T-0980), please refer to the following and CD RFI 162.1 SK1 & SK2 attached which are modifications to the BU girder connection details on 3 &7/S1-4350: 1.) Confirm it is acceptable to provide the beam web, flange, and plate assembly as indicated. The CJP indicates the plate to flange weld above the beam per 5/S1-4350 while the PJP indicates the proposed web to flange weld. The web to flange fillet welds per RFI # T-0704.1 will be applied beyond the shown CJP and PJP welds. 2.) Per the response to SK RFI 238 (T-0980), it is acceptable to stop the bottom flange plate short as shown, extend the web plate of the BU WT to the web plate of the BU beam. Please verify the proposed weld is acceptable. The web to flange fillet welds per RFI # T-0704.1 will be applied beyond the shown CJP welds.						
						ANSWER: As a revision to parts 1 & 2 of SK RFI 238 (T-0980), please refer to the following and CD RFI 162.1 SK1 & SK2 attached which are modifications to the BU girder connection details on 3 &7/S1-4350: 1.) Confirm it is acceptable to provide the beam web, flange, and plate assembly as indicated. The CJP indicates the plate to flange weld above the beam per 5/S1-4350 while the PJP indicates the proposed web to flange weld. The web to flange fillet welds per RFI # T-0704.1 will be applied beyond the shown CJP and PJP welds. 2.) Per the response to SK RFI 238 (T-0980), it is acceptable to stop the bottom flange plate short as shown, extend the web plate of the BU WT to the web plate of the BU beam. Please verify the proposed weld is acceptable. The web to flange fillet welds per RFI # T-0704.1 will be applied beyond the shown CJP welds.
T0860.1	BGP - Rebar barlocks for interior Walls in Area 3	Closed	CR	11/13/2013	11/23/2013	11/19/2013
From: Webcor Construction LP Michael Spillane						
REQUEST: Further to the response to RFI-860, Please find attached information (see exhibit A) on the proposed class 2 barlocks which are intended to be used at the noted partition walls in Area 3 as outlined in original RFI T-0860 see exhibit B. Due to the overall diameter of these Type-2 bar locks, please confirm that it is acceptable to have reduced concrete clear cover to the barlocks which will be approximately ¾". This reduced clear cover will only be applicable for the length of the barlocks itself, which at worst case is approximately 12". Please confirm that this is acceptable

From: Webcor/Obayashi Joint Venture Manuel Saldana						
REQUEST: Reference Exhibit A, Section VI Part 2A indicates the Trade Subcontractor must utilize surveyors who can provide \$25,000,000 of insurance. This will effectively eliminate many survey engineers from being able to bid on this work. The resultant effect will be higher bid costs. Please consider this and confirm what the insurance requirements are for land surveyors. Submitted by Kelly Turner Granite / CJA / NCC Joint Venture 08/06/2010			ANSWER: Reference Exhibit A, Section VI Part 2A indicates the Trade Subcontractor must utilize surveyors who can provide \$25,000,000 of insurance. This will effectively eliminate many survey engineers from being able to bid on this work. The resultant effect will be higher bid costs. Please consider this and confirm what the insurance requirements are for land surveyors. Submitted by Kelly Turner Granite / CJA / NCC Joint Venture 08/06/2010			
TG03.00-0027	TG03 Question 0027 - Temporary Street Closures / Detours	Closed	06	08/10/2010	08/17/2010	08/13/2010
From: Webcor Construction LP Manuel Saldana						
REQUEST: Reference Exhibit A, Section VI Will temporary closures and/or temporary detours of First St, Fremont St, and Beale St be allowed so the contractor can perform activities such as 1) installation of CDSM elements, 2) demolition, 3) installation of temporary street elements? If not, how is the Owner proposing these work elements be performed? Submitted by Kelly Turner Granite / CJA / NCC Joint Venture 08/09/2010			ANSWER: Reference Exhibit A, Section VI Will temporary closures and/or temporary detours of First St, Fremont St, and Beale St be allowed so the contractor can perform activities such as 1) installation of CDSM elements, 2) demolition, 3) installation of temporary street elements? TG03.00-0032	TG03 Question 0032 - Extend Bid Date	Closed	06	08/10/2010	08/17/2010	08/13/2010
From: Webcor/Obayashi Joint Venture Manuel Saldana						
REQUEST:			ANSWER:			
<p>Exhibit A, II, "Key Dates for Bidding Process" of the Project Bidding Manual establishes the Bid Due Date as Sept. 14, 2010, 6 weeks from the date of bid package issuance.</p> <p>Six weeks is an insufficient amount of time to adequately prepare a \$200M estimate and bid. We therefore request that the Bid Due Date be extended an additional 8 weeks for the following reasons</p> <p>Design-Build The SBE package includes major design-build elements. The extent of the design work related to shoring, bracing, trestle, cross-street bridging and dewatering that the BSE Trade Subcontractor will be responsible for performing became fully apparent to the prequalified contractors only when the bid package was issued. Developing these required Trade Contractor designs far enough to allow accurate pricing to begin will take time.</p> <p>Considering the magnitude and location of the construction work, the risk accompanying the design is also extremely high. A memorandum of understanding that adequately addresses this risk must be negotiated with the Trade Subcontractor's Professional Engineer before design can even begin. This will take time.</p> <p>Similarly, the Trade Subcontractor will likely enlist the services of an independent Professional Engineer to act as a peer reviewer to check the work of the Trade Subcontractor's principal engineer. Reconciliation of any differences identified during this review will take time.</p> <p>Liquidated Damages Liquidated damages associated with not meeting the CM/GC's schedule for Substantial Completion are extraordinarily high. It appears to us that the BSE Trade Subcontractor's time for substantial completion, i.e. 1,825 days following Notice to Proceed with pre-construction services, is highly interconnected with the work of other trade subcontractors and also contingent on their performance. If this is the case, it becomes very difficult to accurately assess risk of exposure to liquidated damages. The Joint Venture will need time to clarify with the CM/GC the relationship between the other trade subcontractors' work and the BSE Trade Subcontractor's</p>			<p>Exhibit A, II, "Key Dates for Bidding Process" of the Project Bidding Manual establishes the Bid Due Date as Sept. 14, 2010, 6 weeks from the date of bid package issuance.</p> <p>Six weeks is an insufficient amount of time to adequately prepare a \$200M estimate and bid. Q - Reference is made to Part III. Instruction to Bidders, Section V., Webcor/Obayashi Bidding Forms, Paragraph A., Bidding Checklist (BCL), Item 3. which states "Each Bidder shall submit with its Bid the following forms, properly completed and executed." Following this statement there are various forms listed including "Escrow Agreement for Security Deposits in Lieu of Retention (Section 00 06 30)." Since this "Escrow Agreement for Security Deposits in Lieu of Retention" form states that - "pursuant to the construction contract entered into between the TJPA and Contractor for Transbay Transit Center. . . in the amount of _____ dated _____", we request that this form be among those forms submitted by the successful Trade Subcontractor after the Notice of Intent to Award and not with the bid form. Please advise.			Q - Reference is made to Part III. REQUEST:			ANSWER:			
Reference Transbay Terminal Center Bid Package TG03 Shoring, Buttress and Excavation (Cont.)			Reference Transbay Terminal Center Bid Package TG03 Shoring, Buttress and Excavation (Cont.)			
Q - We have started into our second week of intensive review of bid documents and drawings in which to grasp what is prescriptive work and what requires additional contractor design and scheduling in our bid proposal preparation. Having been involved in not only pre-bid contractor designed support-of-excavations but final design and construction of numerous deep supported excavations in urban environments in numerous cities in California, we look forward to working on this unique and challenging project. This project brings additional elements to be considered during design of support-of-excavation and traffic supported trestles that would not normally be considered in below street level construction. One, the width of the supported excavation at approximately one hundred and eighty L.F., will require at least two intermediate vertical piles to support the horizontal bracing levels. Second, the need to incorporate both longitudinal and transverse traffic trestle decking whose vertical support locations will add to the constraints and interference with the location of the horizontal bracing levels. Third, the phasing of the shoring and excavation will require various locations of bracing levels of the CDSM cut-off walls. Fourth, the tie-down anchors will have to be designed to meet project specifications. Fifth, the volume of information including as-builts and the myriad of geotechnical information provided will consume considerable time which our designers can ill afford not to digest the pertinent information. And lastly, the tremendous coordination and evaluation of the various key subcontractors scopes and proposals will be itself a considerable effort since various proprietary information will be provided to them for pricing Tutor-Saliba's in-house designs. For these various reasons, we strongly urge a postponement of at least four weeks to the current scheduled bid date of September 14th in which we can properly develop the most complete and competitive design concepts and pricing proposal to Webcor/Obayashi. It is very important that you evaluate this request in a timely manner in which we can allocate the limited time available to our engineering and estimating forces. Your timely written response is appreciated. TG03.00-0056	TG03 Question 0056 - Access Trestle Permanent Structure	Closed	06	08/16/2010	08/22/2010	08/20/2010
From: Webcor/Obayashi Joint Venture Manuel Saldana						
REQUEST:			ANSWER:			
Reference Exhibit A, Attachment 3 A.			Reference Exhibit A, Attachment 3 A.			
Q - We note that the access trestle is to be coordinated with permanent construction, not conflict with the permanent structure except for penetrations, and is to be at the same level of the temporary bridges at the connections. This would appear to require that the trestle deck be below the bottom of the ground floor permanent structure section, with built-up ramps to match the street bridges. We also note that the permanent ground level structure is lower at the street crossings than elsewhere. This would push the trestle deck further down, conflicting with the limits of placement of the top level bracing strut. No guidance is given regarding how the future Trade Subcontractor will want to use the trestle to construct the ground floor or the superstructure. Please clarify where the top of trestle deck is intended to be located, and whether it is acceptable to locate the trestle deck at ground floor level, such that it could be used for sequential construction of the ground floor and superstructure. Is there an upturned longitudinal beam down the middle of the street crossings? . Schedule A on S1-3201 only indicates a 30" slab. TG03.00-0076	TG03 Question 0076 - Access Trestle	Closed	06	08/19/2010	08/25/2010	08/19/2010
From: Webcor/Obayashi Joint Venture Manuel Saldana						
REQUEST:						ANSWER:
Reference Exhibit A						Reference Exhibit A
Attachment 3, Access Trestle Criteria, states "The level of the access trestle shall be the same as the level of the Temporary Bridges at the connections." Attachment 3 also states "The layout for each member of the Access Trestle, shall not conflict with the permanent structure." Tying the trestle to the cross streets will cause the trestle structure (which is approx 7' deep) to conflict with the concrete roof of the follow on structure. It is our understanding that the CM/GC understands this and will coordinate the removal of the access trestle and the temp streets such that the concrete roof can be constructed after these conflicting structures are removed. Pls confirm.						Attachment 3, Access Trestle Criteria, states "The level of the access trestle shall be the same as the level of the Temporary Bridges at the connections." Section states "Contractor shall provide uniformed...police officers, as required by the TJPA representative..." It is our understanding that per the contract definitions, the Contractor is defined to be Webcor/Obayashi. Please confirm that Webcor/Obayashi will direct and pay the costs for the uniformed officers described herein. If it is the intent of the contract that the Trade Subcontractor direct and pay the costs for these officers, please provide specific guidelines on when these officers will be required. Simply stating "as required by TJPA" will result in exorbitant bid costs due to the lack of specific information provided. Suggest an allowance for this. TG03.00-0103	TG03 Question 0103 - Monitoring	Closed	06	08/24/2010	08/31/2010	09/04/2010
From: Webcor/Obayashi Joint Venture Manuel Saldana						
REQUEST: Reference specification 39 09 13 The plans show geotechnical instrumentation including inclinometers, MPBXs, piezometers and settlement points. Specification Section 39 09 13 states that "... Geotechnical instrumentation consists of inclinometers, settlement casings, settlement monitoring points, survey reference points, piezometers and multiple point borehole extensometers." The plans state that the geotechnical instruments for monitoring the TBT excavation and shoring work are to be drilled and installed by the TJPA representative. However, the specifications call for "...furnishing, installing, monitoring, reading, recording, maintaining, protecting geotechnical instrumentation." The specifications go on to state that "...where shown on the drawings, the Contractor will procure and install the specified instrumentation." We find no notes on the plans calling for the Contractor to procure and install the specified instrumentation nor notes as to who is responsible for monitoring the shoring performance. The plans appear to be inconsistent with local practice in that it is customary in Northern California for the Contractor to furnish, install and monitor appropriate geotechnical instrumentation when the Contractor is responsible for constructing works involving deep excavations and shoring. We recognize the Internal Bracing Specification requires a monitoring program for struts, but is silent on exterior monitoring. 1. What is the Owner's intent in this regard? 2. Will the TJPA be responsible for the exterior monitoring						ANSWER: Reference specification 39 09 13 The plans show geotechnical instrumentation including inclinometers, MPBXs, piezometers and settlement points. (TG0300-0058) requested: A. Please help to clarify the strut and waler system stiffness requirements. Our initial interpretation and the associated analyses indicate that strut and waler sizes increase very significantly over what would be required by strength considerations alone. Please provide a sample calculation or procedure for determining stiffness for comparison with the values given in kip per foot, per foot of wall. B. Pre-loading will take out a portion of the axial shortening of the struts. We assume that it is appropriate to subtract out that deflection from the stiffness calculation. Please confirm. TG03.00-0159	TG03 Question 0159 - Temporary Bridge	Closed	06	09/03/2010	09/10/2010	09/13/2010
From: Webcor/Obayashi Joint Venture Manuel Saldana						
REQUEST:			ANSWER:			
Schedule A on S1-3201 identifies top of structure elevations. When these elevations are cross referenced against the elevations of the cross streets the temporary bridges that tie into it will be several feet above grade, unless there is a provision for a concrete "leave out" Drawing A 5206 shows First Street Elevation at 14.94. The top of structure at this zone is from 12.79' to 13.47', this allows less than 2' for the temporary bridge installation. Depending on the final Temp. bridge design and clearance necessary to construct box structure below the bridge deck may be as much as 6' above the city street. Is it the owners intent to ramp up on the city street to the temp bridge elevation? If so what is the max grade allowed for the approach ramp?			Schedule A on S1-3201 identifies top of structure elevations. When these elevations are cross referenced against the elevations of the cross streets the temporary bridges that tie into it will be several feet above grade, unless there is a provision for a concrete "leave out" Drawing A 5206 shows First Street Elevation at 14.94. Is it the owners intent to ramp up on the city street to the temp bridge elevation? If so what is the max grade allowed for the approach ramp?			
Also, please comment on the intent for side sloping, access for business, support of fill, etc. This condition applies to Beale street as well.			Also, please comment on the intent for side sloping, access for business, support of fill, etc. This condition applies to Beale street as well.

TG03.00-0163	TG03 Question 0163 - Temporary Bridge	Closed	06	09/03/2010	09/10/2010	09/08/2010
<p>From: Webcor/Obayashi Joint Venture Manuel Saldana</p>						
REQUEST:			ANSWER:			
<p>Attachment 3, Access Trestle Criteria, of Exhibit A includes a section titled, Minimum Radius of Corner, which states, "Additional spaces at all inner corners of the Access Trestle shall be added for helping Truck/trailer/Crane turn." Temporary Bridges, 01 53 13 1.3 A. 5 establishes the gate requirements with, "Gates providing twenty-four feet (24') of clear unobstructed access shall be provided through all barrier systems at the center of the bridge."</p> <p>Please confirm the intent confirm to add additional space for turning radius to the trestle at the bridges intersections, when the access is restricted by the clear opening of the gates.</p> <p>Submitted by Charles M. Gardner Kiewit Infrastructure West Co. 09/02/2010</p>			<p>Attachment 3, Access Trestle Criteria, of Exhibit A includes a section titled, Minimum Radius of Corner, which states, "Additional spaces at all inner corners of the Access Trestle shall be added for helping Truck/trailer/Crane turn." From: Webcor/Obayashi Joint Venture Manuel Saldana						
REQUEST:						
<p>The response to previous question TG0300-0054 states that the rebracing loads can be determined based on the information provided on GT-1110. Please identify the specific information on GT-1110 that is to be used to determine these loads. We note that the computation of these loads will depend upon the assumed degree of CDSM wall fixity at the base slab, the assumed distribution of seismic loads, as well as, other inherent assumptions. The CDSM wall analysis and design computations (which we assume must have included an analysis of the bracing removal/rebracing stages) have not been made available to the bidders so it is not possible to ascertain the basic loading and support conditions assumed by the CDSM wall designer for the bracing removal/rebracing conditions. We recommend that the static and seismic components of the rebracing design loads be provided so that all bidders are designing the rebracing for bracing demands that are consistent with the CDSM wall designer's computations.</p> <p>Submitted by Rich Zito Shimmick / Skanska / Traylor JV (SST) 09/07/2010</p>

TG03.00-0195	TG03 Question 0195 - Schedule	Closed	CR	09/13/2010	09/19/2010	09/15/2010
From: Webcor/Obayashi Joint Venture Manuel Saldana						
REQUEST: Exhibit A.V Construction Schedule and Milestones: 1) NTP #03, #04, and #05 are indicated to be issued , "no later than" 175, 235, and 265 calander days (respectively) for each of Zones 1,2, and 3. What is the "no earlier than" dates for these milestones? Theoretically TJPA could issue NTP #03-#05 immediately after NTP#02 which would stack the work. Request earliest start date to realistically plan our work. 2) What are the durations of Milestones NTP#06 through #7? 3) How are Milestones NTP #06 through #10 tied to the critical path?				ANSWER: Exhibit A.V Construction Schedule and Milestones: 1) NTP #03, #04, and #05 are indicated to be issued , "no later than" 175, 235, and 265 calander days (respectively) for each of Zones 1,2, and 3. What is the "no earlier than" dates for these milestones? Theoretically TJPA could issue NTP #03-#05 immediately after NTP#02 which would stack the work. Request earliest start date to realistically plan our work. 2) What are the durations of Milestones NTP#06 through #7? 3) How are Milestones NTP #06 through #10 tied to the critical path?

TG03.00-0199	TG03 Question 0199 - Retention	Closed	CR	09/13/2010	09/19/2010	09/14/2010
From: Webcor/Obayashi Joint Venture Manuel Saldana						
REQUEST:						ANSWER:
Reference Answers to Pre-Bid Meeting Questions.						Reference Answers to Pre-Bid Meeting Questions.
The answer to Question 13 says that retention is withheld for the duration of each subcontractor's scope of work rather than the entire project. Most of the SBE Subcontractor's scope of work will be complete with the placing of the rat slabs. However, the contract will continue until the SBE Subcontractor's responsibility for shoring/bracing removal and trestle/bridge removal is complete. The schedule for this work is contingent on other Trade Subcontractors and the completion date for the entire scope of the SBE Trade Subcontract Package is unknown. Will Webcor/Obayashi release retention attributable to all work completed up until the placing of the rat slabs when the placing of the rat slabs is complete?						The answer to Question 13 says that retention is withheld for the duration of each subcontractor's scope of work rather than the entire project. Most of the SBE Subcontractor's scope of work will be complete with the placing of the rat slabs. TG043-0007	Bid Form Clarification	Closed	CR	11/02/2010	11/16/2010	11/02/2010
From: Webcor Construction LP David Hungerford						
REQUEST: The bid form is far too complex. We can possibly understand the need for the data indicated by the bid form from the subcontractor awarded the project, but we can see no need for each and every bidder to fill out every space in a ten page bid form. In addition the bid form requires us to fill in the quantities. As every subcontractor will have different quantities, this seems somewhat odd. A typical SF PUC style bid form, with quantities provided, would result in bids that could be confidently compared with each other- ¿Apples to Apples¿, not¿ Oranges to Apples¿. We request that such a bid form be provided. If the bid form is not simplified greatly, we will not be able to bid this project, since it will take more time to complete the form than actually estimate the project. W/O to provide answer. TG043-0012	Demolition of Existing Electrical, Gas and Telecom	Closed	CR	11/02/2010	11/16/2010	11/02/2010
From: Webcor Construction LP David Hungerford						
REQUEST: Sheet U1110 and all the other demo sheets. On sheet U1110 note 5 does not specifically state that the gas is to be demolished by PG&E, note 7 does not say duct bank to be removed by AT&T (other notes are similar), but the notes also do not specifically state that ¿Trade contractor is to demolish¿ or something similar. Exhibit A.IV.D.2 (page 7), third bullet, states: ¿Unless noted otherwise on the drawings, Electrical, Gas & Telecommunication lines will be abandon and all feeders removed by the respective utility owners prior to demolition by this contract.¿ Thus there is an ambiguity. Are we, or are we not to include demolition of the Electrical, Gas & Telecommunication lines? In either case, who removes the boxes, vaults etc.? Please clarify. Exactly what is required at all locations on the plans? W/O to provide answer.						
						ANSWER: Sheet U1110 and all the other demo sheets. U-0017	JT Conflict with Basement @ Rickenbacker Rest. From: Webcor Construction LP Jeffrey Negley REQUEST: Reference sheet U-3407. PG&E has been potholing on the south east corner of Minna @ 2nd St. for a new gas line over the past number of days. We have observed in their potholes that a basement structure for the Rickenbacker Restaurant (123 2nd St.) extends out beyond the property line and under the sidewalk, along both Minna and 2nd Street. The basement appears to extend almost up to the roadway curb on 2nd Street and to face of curb or beyond on Minna. The joint trench at its current alignment (on Plan Sheet U-3407) along the south east corner of 2nd & Minna will be in conflict with this basement structure. Please review and advise.	Closed	03	11/09/2010	11/23/2010	01/12/2011

U-0035	Installlation Depth of Storm Drain New Catch Basins	Closed	03	12/09/2010	12/13/2010	12/13/2010
From: Webcor Construction LP David Hungerford						
REQUEST:		ANSWER:				
Reference: Sheet U-3023, U-3033 (Detail B), Attached detail from Department of Public Works Buearu of Engineering		Reference: Sheet U-3023, U-3033 (Detail B), Attached detail from Department of Public Works Buearu of Engineering				
Trinet is concerned that the installation depth for many of the new catch basin does not comply with SFDPW Sewer Departent guidelines, specifically regarding access to the traps for the maintenance department. The DPW sewer maintenance crews need to have ready access to the p-trap during flooding emergencies. DPW crews need to be able to reach the p-trap to, either remove the cleanout cap and release the flow to the culvert pipe (if the trap bottom is plugged), or rod the culvert line through the trap (if the culvert is plugged). To get some clarification of the installation guidelines, Trinet had informally talked to one of the design engineers at the SF Bureau of Engineerring, Hydraulics Department. He advised Trinet that new catch basins should be installed with center of trap and discharge piping grade located between 3 and 4 feet below the culvert runs to cross under existing utilities that are in conflict with a direct run to the discharge manhole. Bends should be 22 1/2 degrees where possible as required, and if 45 degree bends must be used we should limit the number to two (2). U-0050	Lower Sewer Laterals on Minna	Closed	03	12/15/2010	12/25/2010	01/11/2011
From: Webcor Construction LP Mario Saldana Sr.						
REQUEST:						
Reference: Sheets U-3007 & 3008, and Trinet RFI 41						
Two of the active sewer service laterals potholed on Minna St. are lower than the new sewer main and will not drain. The details of each issue are as follows: 1. Station 5+05 - Service for #2 Shaw Alley Top of pipe grade @ FOC for the 6" VCP sewer lateral is 11.37 . The invert elevation is approximately 10.8. The invert elevation of the new 24" sewer main @ Station 5+05 is approximately 11.4 2. Station 2+10 - Service for Anchor & Hope Restaurant Top of pipe grade @ FOC for the 6" VCP sewer lateral is 13.51. The invert elevation is approximately 12.94. The invert of the new 18" VCP sewer main @ Station 2+10 is approximately 13.4. Please review these issues and advise. An expedited response is requested by 12/16/10.						
ANSWER:						
Reference: Sheets U-3007 & 3008, and Trinet RFI 41						
Two of the active sewer service laterals potholed on Minna St. are lower than the new sewer main and will not drain. The details of each issue are as follows: 1. Station 5+05 - Service for #2 Shaw Alley Top of pipe grade @ FOC for the 6" VCP sewer lateral is 11.37 . The invert elevation is approximately 10.8. The invert elevation of the new 24" sewer main @ Station 5+05 is approximately 11.4 2. Station 2+10 - Service for Anchor & Hope Restaurant Top of pipe grade @ FOC for the 6" VCP sewer lateral is 13.51. The invert elevation is approximately 12.94. The invert of the new 18" VCP sewer main @ Station 2+10 is approximately 13.4. Please review these issues and advise. An expedited response is requested by 12/16/10.

Reference: Sheet U-3107 (dated 2010.09.29)			Reference: Sheet U-3107 (dated 2010.09.29)			
During excavation for the 8" water main along Minna Street, Trinet encountered a 1" Polyethylene service lateral at station 3+08, that extended into the vacant lot on the south side of the street. The service was broken during construction and Trinet has temporarily capped it. The utility was not shown on any utility plans. There is also no new service lateral, or reconnection of an existing, depicted on the new water main drawings at or adjacent to this location. Please advise on what should be done with the service. The repair is only temporary and a permanent reconnection will need to be performed by the SFWD if the service is to be maintained active. If the service is to be de-activated, then Trinet recommends that it be shut off at the connection to the old main. U-0066	Minna St Station 2+09 - 4" Water Service Lateral Encountered	Closed	03	12/23/2010	01/02/2011	12/28/2010
From: Webcor Construction LP David Hungerford						
REQUEST:						
Refer to Sheet U-3107						
During the water installation on Minna St we encountered an existing 4" water service lateral at Sta 2+09. The 4" service extends from the old 8" water main to 83 Minna St (Anchor & Hope Restaurant). This is in addition to a 1" service lateral to the same building which we encountered at station 2+09. The contract drawings only show the 1" water lateral service connecting to the new main.						
Please advise if the existing 4" service lateral is active and if it must be connected to the new water main. There was no material on site to install a tee in the line, and to avoid delaying the work, the new water main installation continued past the 4" service lateral. The recommendation is that if the 4" service line needs to be connected to the new main, work can be performed by SFWD as an additional tie-in.

Per a field walk with Eric Zagol on 12/23/10, the existing MH was confirmed abandoned. Please confirm/ advise the top of the MH will be demolished to allow the installation of the waterline, and the MH will be backfilled with CDF. The lower precast section of the MH will be 5' I.D., with a precast reducer section transitioning from 60" to 48" I.D. placed above. Attached is the revised drawing for MH 501 and shop drawings for the precast MH sections. The design was discussed with Cliff Wong from the SF Bureau of Engineering, Hydraulics Department, and he did not have a problem with a 5' I.D. manhole. Trinet requests an expedited response. </div> <div> ANSWER: Reference Sheet U-2021, RFI #U-0080, and attached drawings In response to the Engineer's concerns with the number and size of pipes in Trinet's original revised detail for MH 501 (RFI#U-0080), Trinet has changed their proposed installation drawing to include a 5' I.D. cast-in-place MH base. The lower precast section of the MH will be 5' I.D., with a precast reducer section transitioning from 60" to 48" I.D. placed above. Attached is the revised drawing for MH 501 and shop drawings for the precast MH sections. The design was discussed with Cliff Wong from the SF Bureau of Engineering, Hydraulics Department, and he did not have a problem with a 5' I.D. manhole. Trinet requests an expedited response. </div> </div>						
U-0081	Water Main Alignment - Howard St STA18+72 and STA19+98	Closed	03	01/19/2011	01/28/2011	01/24/2011
<div> <div> From: Webcor Construction LP Nhi Tran </div> <div> REQUEST: Reference Sheet U-3119 and attached drawing Please confirm that it is acceptable for M Squared to install the new 12in water line in a straight line as sketched on the attachment. Contract Drawings show the pipe offsetting between Sta 18+72 and Sta 19+98. Due to existing utilities discovered in potholes the 12in line will be installed 18ft from centerline. Also, please confirm the elevations of the water line can be raised dependant on the depths of the existing utilities Also, the referenced drawing has a discrepancy shown between the 12in water line bend station called out and the location shown in plan view. Please confirm that the first 45degree bend is located at 18+72, and not 18+27. </div> <div> ANSWER: Reference Sheet U-3119 and attached drawing Please confirm that it is acceptable for M Squared to install the new 12in water line in a straight line as sketched on the attachment. M Squared potholed at Sta 1+10 on Beale Street. We discovered that the 10in High pressure water line is 9ft-5in from the FOC. The existing 12in water line is 14ft-8in from the FOC. The 10in High Pressure line is closer to the FOC that shown on contract drawings. This now means that there is a larger window between the 10in high pressure water and the existing 12in water main. U-0088	Minna St 18in Sewer Conflict with PG&E MH#1355 at STA 1+77	Closed	03	01/28/2011	02/07/2011	03/24/2011
From: Webcor Construction LP Nhi Tran						
REQUEST:			ANSWER:			
Reference Sheet U-2007 and attached drawings			Reference Sheet U-2007 and attached drawings			
During layout for the installation of the new 18in Sewer Main on Minna St., Trinet observed that the alignment of the 18in Sewer Main is in conflict with existing PG&E MH #1355 at STA 1+77.50, which is to remain in place. The center line of the new sewer main is 0.10ft north of the outside edge of the manhole wall, as depicted in the attached drawing. The north side wall of the manhole is constructed on top of the existing 3ft x 5ft brick sewer. The brick sewer structure extends approximately 16in into the vault along its entire length. The brick sewer therefore cannot be demolished without undermining the north wall of the electric vault. Eric Z. of AECOM was notified of this issue via phone call on 01/21/2011. The original plan for connection of the 6in Fire Service Lateral @ 46 Minna St. was to leave the existing 6in gate valve (which is located at FOC) in place and connect the new 6in fire line to the downstream side of the old valve (See attached photo and sketch). This plan was proposed by SFWD inspectors, Tom Farhnam and Dan Helminiak, at a field meeting on 12/28/10. On Friday 1/28/11 the SFWD, plumbers when taking measurements for the tie-in, proposed a different plan. They want to extend the new 6in fire line beyond the curb and into the basement, and connect to the homeowners fire line inside the basement (under the sidewalk). Note: This will require coordination with building owner to put a hole through their foundation. Layout and a detail would need to be provided for the wall penetration, as well a detail to plug the hole where the existing water line is entering the basement. 	<p>Webcor/Obayashi has received Bid Addendum #1 for the TG04.2R bid. As part of this addendum, note number 8 under "General Notes" on sheet U-0008 is deleted. This note had previously placed a constraint on the AWSS construction schedule that the Mission Street work must be complete prior to cutting both the Beale Street and the 1st Street lines. It was acceptable to abandon one or the other prior to the Mission Street work but not both.</p> <p>Based on the deletion of this note, it is our understanding that there is no schedule constraint on any of the AWSS system modifications other than the cutting & capping procedures at 1st Street and Beale Street which are required for construction of the TTC Building. Please confirm.</p>

U-0102.1	Catch Basin #206 redesign	Closed	03	04/01/2011	04/11/2011	04/13/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST:						
Please clarify the following items relating to the re-design of CB#206:						
1) The only specification section addressing mortar coating is in 33 31 10 Paragraph 2.1.I, which specifies a "Wet Spray Mortar" application. This process would be cost prohibitive for coating only one catch basin. Trinet proposes the use of "SikaTop 123 Plus" mortar - product data sheets are attached. Please advise if this product is acceptable or specify an alternate material.						
2) The RFI response directs Trinet to use ductile iron pipe for culvert runs with less than 3' of cover. If 22.5% DI bends are required to construct the culverts Trinet would prefer to use Mechanical Joint Fittings. Please advise if these are acceptable.

U-0111	Minna St. Joint Trench Conflict with (E) 8" elbow and thrust block	Closed	CR	03/04/2011	03/14/2011	03/09/2011
From: Webcor Construction LP Nhi Tran						
REQUEST:						
Reference drawing sheet U-3409 and attached sketch.						
During our excavation for the joint trench on the east end of Minna St. (STA 9+29) Trinet encountered the (E) 8" water main in Trinet's trench line, approximately 1 foot from our termination point. The existing alignment is different from what is shown in the contract drawings. The drawings do not show the water line crossing the joint trench. The alignment and grade of the water main changed in Trinet's excavation to avoid the adjacent catch basin. A 22.5 degree elbow is located in the center of the joint trench excavation. The elbow is rolled up to accommodate the grade change and there is a thrust block under the footing. Trinet does not believe that it would be safe to excavate under the water main for Trinet's duct bank without having the line shutoff. Extending the PG&E ducts to FOC will also place the connection point for PG&E's extension of the duct bank directly under the water main fittings and elbows. There is adequate clearance to install the 4" gas line above the water main and extend it out to FOC per contract. The top of the water main is 49" below FG at the south side of the joint trench, at the location of the ags line.						
Trinet proposes to terminate the concrete encased duct bank approximately 5 ft. back from FOC. This would allow adequate room for Trinet to mandrel the ducts after the joint trench is installed without undermining the water main. PG&E could then extend their duct bank under the water main to connect to Trinet's water main. Please advise.						
ANSWER:

U-0114	PG&E Abandonment Schedule for Natoma St. at Second St.	Closed	03	03/09/2011	03/19/2011	05/07/2011
From: Webcor Construction LP Nhi Tran						
REQUEST:		ANSWER:				
Reference Sheet U-1110 and U-2010		Reference Sheet U-1110 and U-2010				
On 03/04/2011, M Squared met with a PG&E representative on site at Natoma and 2nd Street. The PG&E representative confirmed that none of their utilities had been abandoned in the area, and that the PG&E representative would be unable to provide a schedule for this abandonment.		On 03/04/2011, M Squared met with a PG&E representative on site at Natoma and 2nd Street. The PG&E representative confirmed that none of their utilities had been abandoned in the area, and that the PG&E representative would be unable to provide a schedule for this abandonment.				
Per note 2 on sheet U-1110, the services for 77 Natoma and 83 Natoma were to be terminated by Feb 2011. To date, this work does not appear to be completed. In PG&E's letter to the TJPA regarding their schedule, there is no reference to work on Natoma Street at 2nd St.		Per note 2 on sheet U-1110, the services for 77 Natoma and 83 Natoma were to be terminated by Feb 2011. To date, this work does not appear to be completed. In PG&E's letter to the TJPA regarding their schedule, there is no reference to work on Natoma Street at 2nd St.				
M Squared is unable to proceed with their sewer and water utility installation on Natoma St. west of shoring wall until PG&E has completed abandonment of their existing utilities.		M Squared is unable to proceed with their sewer and water utility installation on Natoma St. west of shoring wall until PG&E has completed abandonment of their existing utilities.				
Please provide M Squared with an updated schedule for all PG&E's termination/abandonment work at 2nd and Natoma St.		Please provide M Squared with an updated schedule for all PG&E's termination/abandonment work at 2nd and Natoma St.				
U-0115	AWSS Cap Work Sequence on First St	Closed	03	03/07/2011	03/17/2011	03/15/2011
From: Webcor Construction LP Nhi Tran						
REQUEST:		ANSWER:				
Refer to Sheets MA-5, MA-8		Refer to Sheets MA-5, MA-8				
There are two caps that are required to be installed in order to shutdown the AWSS service on First St between Mission to Howard St. Per the construction schedule, both caps were supposed to be worked on simultaneously. Please confirm per a conversation in the field on 03/07/2011 with inspectors Michael Smith (SFDPW) and Dan Helminak (DPW), only one AWSS cap can be installed at a time. U-0119	Minna St. JT_ AT&T Reconfiguration and impact on (E) trees	Closed	03	03/25/2011	04/04/2011	03/30/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST:						ANSWER:
The revised drawings for the Joint Trench alignment dated 3/16/2011 show the reconfigured AT&T ducts running through an existing tree well on the east side of the AT&T vault at Stn. 3+71. RFI U-0112 (Minna St, Joint Trench, AT&T Vault and Conduit Configuration) also shows the reconfigured AT&T ducts running through an existing tree well on the east side of the vault. This conduit layout in consistent with discussions with the AT&T inspector in the field was reflected in the shop drawings. The revised drawings do not address relocation and/or removal of the impacted trees and the related irrigation changes. Please review and advise. U-0120	MH601 Locatio	Closed	03	03/28/2011	04/07/2011	04/05/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST:						ANSWER:
Sheet U-3022 shows MH601 @ Sta 0+70 on Fremont Street. This location is also in the middle of the crosswalk on Fremont Street. USA markings show the existing traffic signal conduits crossing thru the center of the manhole. By moving the manhole approx 8' north the conflict with the traffic signal conduits would be avoided and it would also avoid having a manhole cover in a crosswalk. Please advise on how you would like to proceed.						Sheet U-3022 shows MH601 @ Sta 0+70 on Fremont Street. This location is also in the middle of the crosswalk on Fremont Street. U-0121	AWSS Caps at Beale Street	Closed	03	03/31/2011	04/10/2011	04/06/2011
From: Webcor Construction LP Colin Azevedo						

ANSWER:

Please confirm the following:

Per previous discussions it has been agreed between the TJPA, AECOM, Turner Webcor/Obayashi and M Squared that material submittals approved for use by M Squared in individual bid packages will be considered acceptable for all bid packages M Squared is working on (TG04.1, TG04.3, TG04.4, & TG04.6).

These submittal include:

- TG0434-002 - Excavation & Backfill Samples
- TG0434-003 - Excavation & Backfill Test Reports
- TG0434-004 - Excavation & Backfill Compaction & Warning Tape
- TG0434-005 - Shoring Plan
- TG0434-006 - Backfill Material
- TG0434-007 - Water Utilities Distribution Piping & Valves
- TG0434-010 - Asphalt Mix Design
- TG0434-013 - Noise Mitigation Plan
- TG0434-015 - CQC Plan
- TG0434-016 - Health and Safety Plan and MSDS
- TG0434-017 - SWPPP
- TG0434-018 - Debris Management Plan
- TG0434-025 - Cast in Place Concrete
- TG0434-030 - Labor Rates
- TG0404-001 - Sewer Package
- TG0404-002 - Filter Fabric
- TG0404-003 - Concrete Forming
- TG0404-004 - Precast Concrete
- TG0404-005 - Precast Concrete Catch Basin Base

U-0143.1	(E) PG&E Duct Bank from EMH #1320 to Demolished EMH #1355	Closed	03	06/14/2011	06/24/2011	06/14/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST: After further investigation of the existing PG&E duct bank between EMH #1320 and demolished EMH # 1355 (@ Anchor & Hope), Trinet found that there is only one unobstructed conduit between the two manholes. The unobstructed conduit is the one that already had a pull rope in place. Trinet had demolished a section of this conduit during excavation for sewer MH # 201 because it was in conflict with the shoring. Trinet replaced the damaged section (approx. 8 LF) on Saturday 6/1, and reconnected the pull rope in the conduit run. A sketch of the conduit run, depicting the section replaced, is attached. Please review and advise if one 4" conduit will be adequate from EMH #1320 to the west end of demolished EMH #1355. U-0147	Existing Top-Of-Curb Grades @ Minna Driveways for 575 Mission Building	Closed	03	05/27/2011	06/06/2011	06/01/2011
From: Webcor Construction LP Colin Azevedo						

REQUEST:

The existing driveways entering the 575 Mission St building, are depressed between 2 ½" to 3" below the adjacent top-of-curb and sidewalk grades - see attached drawing depicting the driveways. This condition seems to be a consequence of repeated overlaying of Minna street, which has resulted in a curb height in many areas far less than the City standard of 6 inches. The street grade along the north side of Minna along the 575 Mission building ranges from 3 ½ to 4 ½ inches below top-of-curb grade.

Trinet has been directed in the field by Jason Chin, and by the Engineer in RFI #U-0146, to construct the new roadway with finish grade at curb line 6" below top-of-curb grade. This is consistent with City standard plan # 87,169. The new roadway grades will result in 3" to 3 ½" of exposed curb height at the driveways to 575 Mission, which is considerably deeper than the 1" called for in the San Francisco standard plans for driveway construction (plan # 87,171). It will also not be possible to raise the street grade at the driveways without impeding road runoff drainage and causing ponding.

Please review and advise.

U-0148	Pavement Reconstruction Plan for West End of Minna Street - Stn 2+15 to 2nd St	Closed	03	05/27/2011	06/06/2011	06/07/2011
From: Webcor Construction LP Colin Azevedo						

REQUEST:

Please provide a pavement reconstruction drawing, or typical cross section detail, for the west end of Minna St from Stn 2+15 to 2nd St. Trinet had planned to reconstruct the street in this area from curb to curb. We find however, that there is a grade difference of approximately 6 inches between top-of-curb on the north side of the street and the south side, with the south side being at the higher grade. The construction detail approved in RFI #U-0146 (Trinet #094) cannot be utilized in this area, because the street already has a cross slope of approx. 2% from south to north.

U-0149	MH#701 Conflicts with existing utilities	Closed	03	05/27/2011	06/06/2011	06/09/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST:			ANSWER:			
The 14" AWSS line west of MH#701 was found to be constructed thru the roof of the existing 3x5 sewer. Several bends were used in the AWSS line construction and these bends included lugs and tie rods. As a result of the presence of these tie rods and fittings we can now not move MH#701 any further west. To install the new 24" VCP in a straight line (perpendicular to MH wall), and in order to get by the existing PGE MH we will have to pour the pipe wall and 2" of the internal diameter of the pipe into the west wall of MH 701. Please advise on how to proceed.			The 14" AWSS line west of MH#701 was found to be constructed thru the roof of the existing 3x5 sewer. From: Webcor Construction LP Colin Azevedo						
REQUEST:			ANSWER:			

<i>Number</i>	<i>Subject</i>	<i>Status</i>	<i>Choice Required</i>	<i>Date Created</i>	<i>Date Required</i>	<i>Date Answered</i>
U-0151.1	Additional Sewer Lateral Connection From: Webcor Construction LP Jonathan Flaming REQUEST: This is a follow-up to the request by the Engineer in his response to W/O RFI #U-0151 (Trinet RFI #097) for additional information relating to the 2nd sewer lateral connection for the 100 1st St building. Trinet also clarifies the issue of the existing 4" trap on the line, which was raised in the original RFI. The sewer lateral is located @ Stn. 7+09 and the invert elevation of the 4" cast iron sewer lateral pipe at face-of-curb is 14.6'. The elevation for the top of the new concrete encased ductbank @ Stn 7+09 is 13.85'. The sewer lateral was therefore not in conflict with the new joint trench utilities. With regards to the existing 4" trap on the line, Trinet checked with the SF Plumbing department which advised that a 4" cast iron trap was adequate for a 4" sewer lateral. The existing trap was therefore in compliance with the SF plumbing code. Trinet advised Jason Chin of this in the field and he agreed that the trap did not need to be replaced. The 4" cast iron vent pipe for the trap did not extend to street level but was capped-off approximately 18" below grade. Per field discussions with Jason Chin, Trinet	Closed	CR	06/29/2011	07/09/2011	07/05/2011

U-0164	Beale Investigative Trench Limits From: Webcor Construction LP Jonathan Flaming REQUEST: Sheet U-1008 shows the limits of the investigative trench on Beale Street (south of Mission St) to be 56' in total. 41.1' from center going west and 14.9' from center going east. By going 14.9' from center with the eastern portion of the investigative trench M Squared will not encompass the existing water line and the existing AWSS line as they are outside the limits of the 14.9'. Please direct M Squared how to proceed.	Closed	CR	08/09/2011	08/19/2011	08/10/2011
U-0165	Sewer Lateral to 92 Natoma From: Webcor Construction LP Jonathan Flaming REQUEST: While installing the new sewer on Natoma Street from 2nd to the shoring wall M Squared noticed that the sewer lateral to 92 Natoma is a new VCP lateral and has been installed in the last 12 months. The contract drawings show M Squared replacing all sewer laterals on Natoma from 2nd to the shoring wall, however this lateral appears like it does not require replacing. Jason Chin (BCM) has been made aware of this issue. Please confirm it is acceptable to leave this lateral in place and perform permanent connection to the new 24" VCP main. 	<p>REQUEST:</p> <p>Between Sta 6+05 and Sta 6+25 there is a PGE duct bank sitting on top of the AWSS pipe; as a result, M Squared is unable to install the new AWSS main at this location. See attached photo. The pipe cannot be lowered due to the AWSS penetrating PGE Vault #1302. In order for M Squared to be able to install the new AWSS main through PGE vault #1302, the PGE duct bank needs to be raised up.</p> <p>Please advise.</p>

U-0226.1	AWSS - TCG Duct Bank at 1st Street Intersection	Closed	CR	06/25/2013	07/05/2013	07/08/2013
From: Webcor Construction LP Jackson Tukuafu						
REQUEST: Please refer to response for RFI U-0226. As per response to RFI U-0226, M Squared is directed to "Remove the existing gate valve and connect to the existing pipe. Install an I-beam behind the 16" Tee...as an alternative restraint system" in order to avoid two PG&E duct banks in conflict with the AWSS. As a result of the I-Beam being installed at this location, a TCG duct bank would need to be moved 2-feet west. TCG has determined that the duct bank would take several months to re-locate their duct bank. Therefore, TCG has opted to avoid the conflict by pursuing the suggested 22deg bends as an offset from the 16" tee in RFI U-0226. Please confirm additional restraints are not required at the 22deg bends or provide all necessary restraints required to for the 10" line at this location. U-0236	RUP - AWSS Pipe Configuration at PG&E Vault #1722	Closed	CR	12/10/2013	12/20/2013	12/19/2013
From: Webcor Construction LP Jackson Tukuafu						
REQUEST: See attached sketches. Due to the proximity of PGE's Vault #1722 to the new AWSS line M Squared believes the following changes are needed to keep all pipe joints and fittings outside the limits of existing utility vaults. M Squared proposes installing the 14" x 12" reducer further east, until we are outside the limits of the vault. The pipe between the new cross piece and the new reducer will be 14-inch pipe, rather than the 12-inch shown on the plans. M Squared will be able to eliminate the need for the 12-inch sleeve here and tie 12-inch pipe into the existing main from the reducer. All joints will be restrained using stop collars. Please confirm that this configuration is preferred to in lieu having fittings and joints within the limits of the PGE Vault. Please advise.						ANSWER: See attached sketches. U-0239	AWSS - The Use of Sand Slurry Backfill at Mission and Main Street Phase	Closed	CR	01/16/2014	01/26/2014	02/04/2014
	<p>From: Webcor Construction LP Jackson Tukuafu</p> <p>REQUEST:</p> <p>Please refer to drawing MA-17.</p> <p>Due to the high number of utility duct banks on Main Street & Mission Street Intersection M Squared's crews effectively tunneled under sections of the street in order to install the new AWSS main. Where possible M Squared removed the street base and excavated as much as we could. The remainder of the trench was tunneled under duct banks and under the street, with the street base remaining in place.</p> <p>Now that all the AWSS main has been installed M Squared will shortly be faced with backfilling this intersection. There is currently only a small portion of trench that can be backfilled using conventional methods i.e ram compactor etc. The remainder of the trench will also not be suitable for backfilling using the jetting method as there will be no way to compact the area directly underneath the street base.</p> <p>M Squared is requesting permission to create several small holes (approx. 6" dia) in the street base, between some of the utilities and backfill the AWSS trench using a sand cement slurry backfill. See attached submittal</p>					<p>ANSWER:</p> <p>Please refer to drawing MA-17.</p> <p>Due to the high number of utility duct banks on Main Street & Mission Street Intersection M Squared's crews effectively tunneled under sections of the street in order to install the new AWSS main. Where possible M Squared removed the street base and excavated as much as we could. The remainder of the trench was tunneled under duct banks and under the street, with the street base remaining in place.</p> <p>Now that all the AWSS main has been installed M Squared will shortly be faced with backfilling this intersection. There is currently only a small portion of trench that can be backfilled using conventional methods i.e ram compactor etc. The remainder of the trench will also not be suitable for backfilling using the jetting method as there will be no way to compact the area directly underneath the street base.</p> <p>M Squared is requesting permission to create several small holes (approx. 6" dia) in the street base, between some of the utilities and backfill the AWSS trench</p>

U-0241	AWSS - Proposed Fire Hydrant Re-Location on Mission and Fremont Street	Closed	CR	01/21/2014	01/31/2014	02/13/2014
From: Webcor Construction LP Jackson Tukuafu						
REQUEST: As per AWSS Coordination Meeting on 01/17/2014, the location of this fire hydrant near the intersection of Fremont and Mission is potentially going to need to be moved to accommodate the new sidewalk expansion. The purpose of the RFI is for Michael Smith with SFWD to analyze, consider and direct the feasibility of relocating the fire hydrant further north. If the hydrant is to be located somewhere other than is shown on the drawing please provide a detail for this work as additional fittings may need to be ordered. U-0242	AWSS - Hydrant Lateral Connection Conflict at Sta. 17+20	Closed	CR	01/21/2014	01/31/2014	
From: Webcor Construction LP Jackson Tukuafu						
REQUEST: Sheet MA-16 shows that the hydrant tee is to be rolled down 45-degrees in order to tie in to the lateral piping. However, when M Squared excavated this section, they discovered that the hydrant lateral piping is shallow and the main is approx. 2-feet deeper. In order to install the piping, the hydrant tee will need to be rolled UP 45 degrees. In additon to this M Squared will need to order a customized 8-inch DIP flanged spool to join the tee to the flanged 45-degree elbow. Please confirm it is acceptable to proceed with the customized flange or provide direction. Please refer to attached drawing MA-16 and attached photos.			Please refer to attached drawing MA-16 and attached photos.			
After trenching to remove the AWSS, M Squared exposed the 12-inch VCP sewer culvert on the NW corner of Beale & Mission street spanning from the catch basin to the sewer main. The joint was open by 4-inches and was covered in cardboard and duct tape. There was also a reverse flow on the pipe by 15 degrees. U-0248	AWSS - Restraints at the Intersection of Mission and Fremont St.	Open	CR	06/04/2014	06/14/2014	
From: Webcor Construction LP Lynn Kowallis						
REQUEST:						
Please refer to drawing MA-16 and M Squared Sketch-TG04.2-072.1 and TG04.2-072.2.						
Question #1 - Does every joint between the new GV west of Fremont Street, and the new 16"x10" tee in Fremont Street intersection need to be restrained with bell & stop collars? This distance is approx. 50ft. Question #2 - Currently there does not appear to be enough space to install the new 16" pipe WITH bell & stop collars through the utilities in the Fremont St intersection. There does appear to be space to install 16" pipe without the stop/bell collars on.						
- Our suggestion would be to install the 16"x10" tee and restrain that tee on one joint heading east. Install piping across the Fremont St intersection without stop/bell collars, delete the 16" GV at that location (we believe we will not be able to fit one anyway), and tie off the last piece of pipe coming into the hydrant tee east of Fremont Street.						
Please clarify if this is acceptable.

Transbay Transit Center – San Francisco, CA

Noise and Vibration Mitigation Management Plan

Webcor/Obayashi

September 07, 2012

GENERAL:

The Webcor/Obayashi (W/O or CM/GC) Noise and Vibration Mitigation Management policy that will be implemented on the Transbay Transportation Center Project will be an overall project policy, with each Trade Subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to comply with Specification Section 00 08 13, 00 08 13/APB, the San Francisco Noise Control Ordinance, regulations and requirements and section 01 35 65, Specific Project mitigation measures and monitoring requirements as applicable to the various phases of work.

When required by the specifications, W/O will ensure its Trade Subcontractors comply with this plan as well as the San Francisco Noise Control Ordinance.

To expedite the project or minimize impacts, W/O will ensure that its Trade Subcontractors apply for written waivers of some of the noise requirements by application to the TJPA in accordance with Section 00 08 13 Specific Project Requirements when required by the specifications or contract. Written waivers shall be uploaded to Constructware by CM/GC. It is anticipated that some Work may require multiple shifts or for other reasons need to be performed outside of typical weekday daytime construction hours. Trade Subcontractors shall minimize construction activities during evening, nighttime, weekend, and holiday periods and shall obtain specific permits before performing construction in noise sensitive areas during these periods.

Night noise permits requests shall be submitted to the TJPA at least 7 days in advance of work. Noise permit request shall include:

1. Name of person in charge of work and phone number
2. Hours to be worked
3. Narrative of scope of work including necessity of doing work at night, maps, and truck routes
4. List of noise/vibration/light making equipment including make and model
5. Mitigation and monitoring methods being used

W/O will ensure that its Trade Subcontractors provide noise inspections and testing of equipment to ensure that all equipment onsite is in good condition and effectively muffled per manufacturer's recommendation. If inspection or testing documents are requested by the TJPA, or any of its representatives, W/O will require its Trade Subcontractors to provide requested documentation in a timely manner. Trade Subcontractors shall provide inspection and testing documents to CM/GC prior to start of work and as the equipment is replaced. CM/GC shall upload documents to a file location within Constructware.

W/O will ensure that its Trade Subcontractors minimize use of vehicle backup alarms and demonstrate how backup alarms will be minimized by using mitigation measures such as designing the construction site with a circular flow pattern that minimizes backing up of trucks and other heavy equipment. Trade Subcontractors shall submit quarterly reports of measures to reduce back up alarms. W/O shall upload these reports to a specific location within Constructware.

W/O will ensure that all its Trade Subcontractors' equipment onsite is equipped with broadband back-up alarms that will automatically adjust based on the ambient noise during nighttime hours (between 8 p.m. and 7 a.m.) when ambient noise is low. If safety considerations and applicable regulations will not allow use of broadband back-up alarms, Contractor shall request an exemption in writing to the TJPA

Representative including the applicable safety regulations (Cal/OSHA, OSHA). Trade Subcontractors shall comply with the TJPA's request for broadband back-up alarms for all work between 8 p.m. and 7 a.m. If requested by the TJPA or its representative, Trade Subcontractors shall provide W/O with equipment specifications showing broadband back-up alarms for submission via Constructware.

Through W/O's requirement of the submittals outlined in this noise and vibration plan, W/O will verify Trade Subcontractors' construction operations are performed in such a manner to minimize noise.

W/O will verify that its Trade Subcontractors perform noise monitoring to demonstrate compliance with noise limits and endeavor to minimize construction activities during off hours except for those required and deemed acceptable per the Contract Documents. Trade Subcontractors shall submit monthly monitoring reports to W/O for submission via Constructware.

W/O will verify Trade Subcontractors haul routes to ensure that they minimize noise intrusion into residential areas, and control noise during nighttime hours.

W/O will require all Trade Subcontractors to use procedures and equipment, when it would be effective, that produce lower noise levels than normal when required by the specifications or contract. W/O will require the Trade Subcontractor to submit manufacturer special noise control kit information. If none is available, then the Trade Subcontractor needs to submit a statement of this. Upon receipt and review of the information, W/O and the Trade Subcontractor will identify the events when the noise control measures should be used based on the specifications.

W/O will require all Trade Subcontractors plans to include use of temporary barriers near noisy activities as required by the specifications or contract. Such barriers shall be located close enough to the noise source to achieve noise attenuation. As necessary and when it is shown it would be effective, Trade Subcontractors shall construct shed-like structures or complete buildings to contain the noise from nighttime activities.

W/O shall require haul route map, plan and storage location to be part of Trade Subcontractor's plan and included within its submittal.

VIBRATION CONTROL

Vibration limits are based upon the Federal Transit Administration's Planning and Environment Transit Noise and Vibration Impact Assessment guidelines. W/O will require all Trade Subcontractors' to limit or prohibit use of construction techniques that create high vibration levels when it affects adjacent properties.

If construction techniques that create high vibration levels are used, W/O will require all Trade Subcontractors' to comply with the following additional restrictions:

1. Provide advance notice to TJPA of any vibration intensive activities. Perform vibration intensive activities only during daytime hours between 7 a.m. and 8 p.m. unless otherwise allowed by special permit or variance, as required by the specifications or contract. Perform vibration monitoring during vibration intensive activities during daytime hours between 7 a.m. and 8 p.m. unless otherwise allowed by special permit or variance, as required by the specifications or contract. Recorded data should be part of the Trade Subcontractor Daily report. A summary shall be submitted monthly and uploaded to Constructware.

2. Investigate alternative construction methods and practices to reduce the impacts if present and implement alternative methods and practices as reasonable.
3. Provide a plan to measure vibration levels including but not limited to measurement locations, times and metrics. Plan shall also include contingency plan if operations exceed the limits. This plan shall be uploaded into Constructware by W/O.
4. Limit or prohibit use of construction techniques that create high vibration levels.

Trade Subcontractors shall be responsible for providing technical information, as required by the specifications, in their plan. Trade Subcontractor's plan shall be submitted via Constructware for Record Only.

Transbay Transit Center – San Francisco, CA

Air Quality Plan

Webcor/Obayashi

January 16, 2012

GENERAL PLAN:

The Webcor/Obayashi (W/O) Air Quality Plan that will be implemented on the Transbay Transit Center Project will be an overall policy with each subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to comply with the Bay Area Air Quality Management District regulations and requirements.

W/O will require its Trade Subcontractors to establish a plan that complies with all requirements set for in specification sections 00 08 13, and 01 35 65 prior to starting Work onsite. W/O shall check and verify trade subcontractor's compliance with air quality requirements on a daily basis. Any non-compliant trade subcontractors will receive both verbal and written notice through Safe Site One (W/O internal program). Additional, W/O will require trade subcontractors to demonstrate they are actively monitoring air quality by providing checklists or documentation on each Trade Subcontractors daily report. W/O shall verify its Trade Subcontractors Air Quality plan includes the following but not necessary limited to:

1. Specific measures to minimize impacts to sensitive receptors associated with exposure to respirable nuisance dust (PM10) and achieve a goal of No Visible Emissions.
2. W/O shall verify Trade Subcontractors comply with City Dust Control Order (DPW Order No. 171,378. Water active construction areas at least twice daily to control dust using non-potable water in accordance with San Francisco Ordinance 175-91
3. Identify specific measures to minimize dust generation; to reduce health risks to workers and the public.
4. Mist the immediate excavation area with a water spray to prevent airborne dust particles. Perform continuous water spraying during dust-generating activities. Mist or spray in such a way as to prevent puddling or generation of runoff, which could potentially reach storm drains or catch basins.
5. Minimize the amount of excavated material or demolished debris stored at the Site. Remove excavated material and demolished debris, with the exception of hazardous materials or suspected hazardous materials, from the Site no later than the end of each workday. If hazardous materials or suspected hazardous materials are stored on site, store such materials in accordance with all applicable California Environmental Protection Agency regulations, including providing storage in proper containers and protection from exposure to the elements. Remove such materials from the Site as soon as possible for disposal or recycling in accordance with applicable laws and regulations.
6. Wet all exposed soil surfaces at least 3 times daily during dry weather or more frequently if dust is blowing or if required by the TJPA. Immediately wet sweep serpentine residuals from the street.
7. Keep the Site and adjacent areas clean and perform wet sweeping at the end of each shift. Sweep daily (with water sweepers) all paved access roads, parking areas and staging areas at construction sites. Sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public streets.
8. Load haul trucks carrying excavated material so that the material does not extend above the walls or back of the truck bed. Wet before covering and tightly cover the surface of each load before the haul truck leaves the loading area. Cover trucks hauling soil, sand, and other loose materials or require trucks to maintain at least 2 feet of freeboard
9. Clean up spillage on City streets, whether directly or indirectly caused by Contractor's operations.

10. Minimize use of on-site diesel construction equipment, particularly unnecessary idling. Shut off construction equipment to reduce idling when not in direct use. Where feasible, replace diesel equipment with electrically powered machinery.
11. Retain receipts of ultra-low sulphur fuel (ULSF) purchase and equipment tuning and repair and make these available to the TJPA Representative or to the Federal Transit Administration (FTA) designee upon request.
12. Locate diesel engines, motors, or equipment as far away as possible from existing residential areas.
13. Properly tune and maintain diesel power equipment. To manufacturer's specification and frequency.
14. Suspend grading operations during first and second stage smog alerts, and during high winds (i.e., winds greater than 25 miles per hour).
15. Upon completion of the construction phase, buildings with visible signs of dirt and debris from the construction site shall be power-washed and/or painted (provided that permission is obtained from the property owner to access and wash the property with no fee charged by the owner). Trade Contractor shall request CMGC to contact Singer and Associates to notify property owners for access. If permission from property owners for access is not granted, Trade Contractor is not responsible for power-washing or painting.
16. Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites.
17. If applicable, replant vegetation in disturbed areas as quickly as possible.

W/O will verify Trade Subcontractors comply with the requirements of the Bay Area Air Quality Management District (BAAQMD) Regulation 6 (for particulate matter and visible emissions), Regulation 7 "Odorous Substances," Regulation 11 "Hazardous Pollutants," and the California Health and Safety Code Division 26 "Air Resource", Chapter 3 "Emission Limitations," Section 41700 "Prohibited Conduct," and related regulations. Trade Subcontractors shall notify the BAAQMD 10 working days prior to commencing demolition or hazardous materials abatement work.

1. Such notification shall include the names and addresses of operations and persons responsible; description and location of the structure to be demolished or altered including size, age and prior use, and the approximate amount of friable asbestos; scheduled starting and completion dates of demolition or abatement; nature of planned work and methods to be employed; procedures to be employed to meet BAAQMD requirements; and the name and location of the disposal site.
2. The BAAQMD randomly inspects removal operations and will respond to any complaints received. Contractor shall cooperate with and facilitate all BAAQMD authorized inspections.\
3. Notifications shall be documented and provided to CM/GC for submission to the TJPA via ConstructWare.

Trade Subcontractors shall be responsible for providing technical information, as required by the specifications, in their plan. All trade subcontractors plans shall be submitted for Record Only via ConstructWare.

Transbay Transit Center – San Francisco, CA

Waste Management and Construction Debris Plan Revision 6

Webcor/Obayashi
November 7, 2013

GENERAL PLAN:

Webcor/Obayashi Joint Venture (Webcor/Obayashi) understands that the building contractor plays a critical role in the management of jobsite produced construction waste. Webcor/Obayashi has adopted a waste reduction and recycling policy that will be implemented on the Transbay Transportation Center Project. This policy will be an overall policy with each subcontractor contributing their specific plan as they come on board to the project.

The primary goal of the plan is to divert as much construction generated debris & unused material from landfills as possible. At a minimum, Webcor/Obayashi and its trade subcontractors will divert 75% of the waste generated on the construction project from landfills. Trade subcontractors Construction Waste Management Plan shall be prepared and submitted in compliance with the Owner's LEED project requirements and the requirements of the City and County of San Francisco.

The Trade Subcontractors are required to comply with Specification Sections 00 08 15, 01 74

00, and 01 81 13 as well as any or all of the procedures listed below. If a conflict in percentages exists between this section and Section 01 81 13, General LEED Building Design and Construction Requirements, the most stringent section shall govern.

- Use of approved debris haulers with documented recycling levels.
- Source separated debris boxes will be provided onsite for mixed debris and recyclable items such as lumber and wood related products, dirt, concrete and asphalt, cardboard & metals.
- Trade Subcontractors are required to handle and dispose of any generated hazardous waste.
- Requesting Trade Subcontractors and vendors to utilize reusable packaging when possible.
- Trade Subcontractor shall provide a Construction Waste Management Plan.

All Trade Subcontractors shall develop their own Waste Management and Construction Debris Plan that complies with the Contract Documents and this plan. Trade Subcontractors shall submit this plan in accordance with the specifications and it shall become part of Webcor/Obayashi's overall project plan. All technical requirements defined in the contract documents shall be fulfilled by Trade Subcontractors and submitted to the Construction Management Oversight (CMO) For Record Only through ConstructWare

Webcor/Obayashi will ensure the Trade Subcontractors are effectively implementing the procedures and are in compliance with Specifications.

Webcor/Obayashi will verify that after Award of Contract and before commencement of the Work at the site, the Trade Subcontractor conducts a Reuse/Recycle Assessment as part of their Solid Waste Management Plan (SWMP): Trade Subcontractor's assessment shall

estimate the types and quantities of materials for the Project that are anticipated to be feasible for source separation for recycling or reuse, either onsite or offsite, and note the procedures intended for a recycling, reuse, and salvage program. Documentation of the trade subcontractor's plan shall consist of the following:

- Trade subcontractor and vendor waste management strategies.
- Trade subcontractor required to provide a monthly summary of the total waste material with backup documentation (weight tickets) if processed offsite.
- The amount recycled (in tons), material types, recycling procedures, and processing facility locations to which materials were diverted if processed offsite.

Trade Subcontractor's Construction Waste Management Plan shall also include estimated wastes, disposal, and handling with the following:

A. List of materials that comprise source separated materials include, but are not limited to:

- Concrete, Wood, Mud, Mixed Aggregates, Yard waste, Metals, and Cardboard.
- Yard waste is not included in our overall diversion rate calculation on the template or corresponding spreadsheet per the requirements from the LEED BD&C v3.0 Reference Guide.

B. List of materials that comprise Miscellaneous Construction Debris include, but are not limited to:

- Wood, Scrap Metal, Drywall, Plastics, Film Plastics, Wire, Cable, Glass.
- The total quantity estimated, inception to completion Disposal.
- Total Project Generation, Diversion + Disposal.
- Project Diversion Rate.

Webcor/Obayashi will verify that Construction and Demolition Waste; Non-hazardous solid resources resulting from Trade Subcontractor's construction, remodeling, repair, and demolition operations for the Project are properly transferred to a C&D Recycling Facility. The C&D Recycling Facility shall be a facility that receives only C&D (construction and demolition) material. Trade Subcontractors shall provide Webcor/Obayashi a summary sheet, including all receipts for transport materials each month with the progress billing if any materials are processed offsite.

Webcor/Obayashi will verify that of the inevitable waste generated, Trade Subcontractor's reuse, salvage, or recycle as many of the waste materials as economically feasible.

Webcor/Obayashi will participate/attend a meeting with Trade Subcontractor, the TJPA Representative and representatives of the City's Solid Waste Management and recycling programs prior to commencement of work. Webcor/Obayashi will

ensure all Trade Subcontractors are made aware of the LEED requirements for C&D diversion before being allowed to work on the site.

Webcor/Obayashi will verify that Trade Subcontractors submit a Monthly Disposal and Recycling Summary Report; quantifying the construction and demolition waste generated and recycled, reused or disposed of at Class 3 Landfill. Contractor shall also send a copy of this report to the TJPA Representative and the SWMP to the City Government Recycling Coordinator. The Comprehensive Disposal and Recycling Summary Report shall be submitted quantifying the construction and demolition waste generated and recycled, reused or disposed of at Class 3 Landfill, on a monthly basis. This report is a condition of progress payment and failure to submit this information shall render the Applications for Payment incomplete. The Trade Subcontractors/trades are also responsible for contracting with a regional facility to haul any hazardous materials from the site. The Trade Subcontractor shall calculate the C&D diversion rate for both LEED requirements (excluding yard waste) and the requirements set by the City (including yard waste) for all materials processed offsite. The W/O LEED representative will screen every C&D Submittal and review Trade Subcontractor and lower-tier subcontractors C&D Plans for clarity, completeness, and compliance with City/LEED requirements.

Webcor/Obayashi will verify that Trade Subcontractors develop and implement procedures for source separation to the greatest extent feasible.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for transporting commingled (mixed) construction and demolition waste that cannot be feasibly source-separated if the intent is to process it offsite instead of using debris boxes provided onsite.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for Salvage and Reuse.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement practices for this project that will reduce waste at the source.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for materials that are recycled and/or reused onsite

Webcor/Obayashi will verify that Trade Subcontractors participate in reuse programs by reviewing each Trade Subcontractors Monthly Disposal report for any material processed offsite. For such reuse programs, Trade Subcontractor shall refer to the City's construction and demolition recycling program.

Webcor/Obayashi shall review the environmental goals of this Project with all Trade Subcontractors during the preconstruction meeting. Webcor/Obayashi shall make a proactive effort to increase awareness of these goals among the job site workers. Webcor/Obayashi will make a proactive effort to increase awareness of these goals among the site workers by requiring that each Subcontractor take Click Safety training prior to stepping on the jobsite. As part of this Click Safety training, there is a module dedicated to teaching and reviewing the

Exhibit P

LEED requirements of the project during construction activity.

Webcor/Obayashi will verify that Trade Subcontractors are using registered transporters and registered facilities. Only registered transporters can remove mixed construction and demolition debris from the construction site, and they must take this material to a registered facility. NOTE: A Registered facility: is any facility that accepts mixed construction and demolition debris for processing and recycling must be registered with the City and County of San Francisco and must demonstrate an overall minimum recycling rate of 65% for mixed construction and demolition debris. A registered facility must have applied for and received a registration from the San Francisco Department of the Environment. Webcor/Obayashi will ensure that Waste Management Companies that service San Francisco and retained by the Trade Subcontractors are registered transporters and meet the City/LEED requirements. Trade Subcontractors shall refer to SFEnvironment.org for the City's most current list of registered transporters.

Webcor/Obayashi will verify that Trade Subcontractors are implementing the following:

1. Eliminate the procurement of unneeded supplies.
2. Reduce waste by printing and copying double-sided.
3. Submit all submittals, reports, and forms in electronic format (PDF) unless otherwise noted.
4. Fully participate in available and required recycling and composting programs.
5. Purchase products made with recycled content such as paper and recycled aggregate.

Webcor/Obayashi will verify that Trade Subcontractors shall submit:

1. Construction and Demolition Debris Management Plan.
2. Construction and Demolition Debris Recovery Monthly Summary Report and supporting documentation for any materials processed offsite.
3. Construction and Demolition Debris Recovery Final Report for all materials processed offsite.

Trade Subcontractor's plan shall comply with specification section 02 41 00. All Trade Subcontractors will remove and dispose of all waste materials from the site for off-site disposal in compliance with all applicable laws, ordinances, rules, and regulations. Webcor/Obayashi and all Trade Subcontractors will work with the TJPA representative so that the representative may characterize the waste materials as required by law to the extent required by Webcor/Obayashi's selected disposal facilities.

Trade Subcontractor's plan shall comply with specification section 01 15 00. Trade Subcontractor's shall perform work in a manner to minimize generation of dust, dirt, rubbish, and other debris, to prevent dust and debris from interfering with the progress of the work, and to keep dust and debris from accumulating at the work site or adjacent areas. Trade Subcontractor's shall remove debris and rubbish from the site on a daily basis.

Trade Subcontractor's plan shall comply with specification section 01 13 50, by preventing the mixing of hazardous and non-hazardous materials.

Trade Subcontractor's shall be required to provide technical information, as required by the specifications including compliance with the City and County of San Francisco Ordinance 27-Exhibit P

Construction Waste Management Plan

06, in their plan which will be submitted For Record Only to the CMO.

Mr. Rick Buellesbach
Senior Project Manager - Transbay Transit Center
Webcor/Obayashi Joint Venture
175 Beale Street
San Francisco, CA 94105

Re: Transbay Transit Center Quality Control Surveys
Subject: December 2011 Control Verification Survey Results

Dear Mr. Buellesbach:

The field work for subject surveys was conducted by Chaudhary & Associates December 5 - 8, 2011. The surveys included verification of Chaudhary & Associates control (as shown on the Survey Control Plan dated 11-10-2011), with the exception of control point 217 which was destroyed sometime between the November 2011 and December 2011 control verification surveys.

Horizontal control values for point numbers 54, 208, 209, 213, 101, 105, 215, and 227 were constrained in this control network horizontal adjustment. The elevation values remain unchanged from the November 2011 surveys. The table below shows both the 11-10-2011 and the 12-21-2011 values for the remaining control points. Because data values can be impacted by environmental factors (temperature and humidity), seismic activity, and the various combinations of back sight and foresight data available on any given day, only the values which differ by 0.01' or more are adjusted and shown on the following table (and updated on the 12/2011 control map to be sent to you tomorrow). Field note copies and Star Net Reports have been mailed to you.

Horizontal Values

Point #	November 10, 2011		December 2011		Description
	Northing	Easting	Northing	Easting

SURVEY PROCEDURES

- 1) CHAUDHARY AND ASSOCIATES FIELD CREW LOCATED AND TIED OUT CONTROL BETWEEN APRIL 22-MAY 13, 2011. DIGITAL LEVELS WERE UTILIZED FOR THE VERTICAL COMPONENT, AND A TRIANGLE SB WAS USED FOR THE HORIZONTAL COMPONENT. CONTROL WAS ADJUSTED UTILIZING STAB-NET SOFTWARE.
- 2) THE 4 MAIN CONTROL POINTS SHOWN ON SHEET C-0100 OF PLANS (BEING PINS 54, 101, 105, AND 106) WERE USED TO ADJUST THE CONTROL. THE ADJUSTMENT WAS PERFORMED FOR THE VERTICAL COMPONENT. THE STAB NET ADJUSTMENT A TOPCON DL-102 DIGITAL LEVEL WAS UTILIZED FOR THE VERTICAL COMPONENT.
- NOTE: CONTROL POINTS 220-226 WERE FIELD SURVEYED BETWEEN SEPTEMBER 9-14, 2011.
- 3) CENTERLINES AS SHOWN ON PLAN SHEET C-0100 TO BE FIELD VERIFIED.

GRID LINES TO BE SET BY PLACING A CUT X OR OTHER APPROPRIATE SURVEY MARKER ON THE EXTENSION OF SAID GRID LINES WHERE PRACTICAL, OR PER WEBCOR AUTHORIZATION

Traffic Control Plan

Webcor/Obayashi

WO-TCP0001

REVISION 2

8/22/2012

GENERAL

The Webcor/Obayashi Joint Venture (W/O) Traffic Control Plan that will be implemented on the Transbay Transportation Center Project is an overall project policy, with each trade subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to provide a framework to insure compliance with Specification Section 01 15 70. To assist in this effort, W/O has enlisted the services of a traffic control consultant (TCC) – Sandis Engineering. Award of this contract between Sandis Engineering and W/O was based on a competitive request for proposal (RFP) process referred to as TG05.4.

TCC is responsible for participating in all aspects of traffic control planning and implementation including, but not limited to:

- Traffic control design oversight;
- Coordination between trade subcontractor traffic control designs;
- Interface with City of San Francisco and other agencies as necessary;
- Participate in coordination efforts of the TJPA Representative;
- Oversight of implementation of approved traffic plans;
- Provide daily reports regarding status of traffic control measures;
- On call traffic control services as requested.

TRAFFIC PLAN REVIEW AND COORDINATION

TCC shall prepare a detailed “as built” traffic plan for approximately four blocks in all directions from the jobsite. This map will be based on SFMTA maps and will be augmented as appropriate per field review of existing conditions. This map will include all striping, signage, curb lines, curb cuts, curb painting, buildings and any other feature of the street layout and traffic control. Beyond the four block distance, the map will include street layout and striping configuration.

Once a trade subcontractor is under contract, W/O shall provide the trade subcontractor with the as-built plan in CADD format. The trade subcontractor will then be required to use this base map for preparation of all their traffic control plans. A summary of the below criteria can be found in the attached Traffic Control Plan Preparation Packet.

The trade subcontractor is required to prepare and submit a complete traffic plan consistent with requirements of the project specification and all requirements per the City of San Francisco. The submittal must be made in a timely fashion to allow for the review timeframe prescribed in the specifications plus an additional four weeks for review by the TCC.

Upon receipt of the submittal from trade subcontractor, W/O will forward it to the TCC for review. The plan will be reviewed for adherence to specifications and for compatibility with previously submitted plans. Comments will be returned to the trade subcontractor who will make modifications as is appropriate.

When the trade subcontractor’s traffic control plan is reviewed and coordinated with the TCC, it will be submitted to the TJPA Representative for approval. Submittal will be in compliance with Specification Section 01 15 70, paragraph 1.4B.

Upon approval by the TJPA Representative and SFMTA, the TCC will update the baseline traffic

control plan as appropriate. The baseline plan will be updated only when a change to the traffic pattern will be in place for three or more months. If the traffic control plan will be in place for less than three months, the plan will be superimposed over the base map for coordination but the baseline drawing will not be modified.

FIELD IMPLEMENTATION

It is intended that the TCC will maintain a regular, but not full time, presence on site. Similar to the traffic control design review, their scope of work is to review the trade subcontractor's adherence to city standards, project specifications and approved traffic control plans.

TCC review and assistance in field coordination includes but is not necessarily limited to:

- Perform site review of traffic control;
- Note traffic control deficiencies;
- Coordinate correction of site deficiencies with W/O and trade subcontractor;
- Provide daily report of traffic control observations and corrective measures;
- Attend site meetings as necessary to review short term Special Traffic Permit and coordinate between subcontractors and SFMTA;
- Miscellaneous coordination with SFMTA as necessary;
- Review of pedestrian protection as it relates to vehicle traffic;
- Provide traffic control devices and personnel as required to augment traffic control efforts;
- Confirm proper training of subcontractor flagging personnel;
- Provide continuous oversight of traffic control for major construction operations as determined by CM/GC.

TASKS NOT CURRENTLY ANTICIPATED BY TCC

Training of flaggers for the trade subcontractors although it is an option should it become apparent that subcontractor employees need additional training.

Coordination of the 10b police officers between subcontractors will be the responsibility of the CMO.

Pedestrian control unless it is specifically impacted by vehicle traffic.

TRANSBAY TRANSIT CENTER – TRAFFIC CONTROL PLAN PREPARATION PACKET

Overview

The purpose of this packet is to provide the contractor with the information necessary to prepare a Traffic Control Plan (TCP) for their work in accordance with the requirements of the Project Specifications and the City and County of San Francisco (CCSF). It includes procedures, timing, a base map, plan sheet template and examples for use when preparing and submitting Traffic Control Plans (TCPs) for review and approval. The documents included in the TCP Packet are described below.

Flow Diagram

The flow diagram included within the TCP packet identifies the specific components and required time intervals for TCP submittal, review and approval. Please note time requirements for Plan review and approval. No work will be allowed without an approved plan. It is the contractor's responsibility to anticipate and allow for required lead times.

Base Map File

The AutoCAD drawing of the Base Map file included in this packet represents the City of San Francisco street layout as of the date indicated on the Base Map file title block. ALL proposed TCPs shall be created using this Base Map file as a starting point. It is crucial that proposed TCPs be provided on the same coordinate system as the Base Map file so multiple approved TCPs can be overlain in a composite exhibit. TCPs prepared using a different base or plan template will be rejected.

TCP Standards

Design Standards

The Traffic Control Plans shall be prepared and submitted in accordance with the following documents:

1. Transbay Transit Center Project Specification Section 011570 – Traffic Routing Work, dated September 23, 2010. A copy of this specification is included in the TCP Packet.
2. City and County of San Francisco Regulations for Working in San Francisco Streets (Bluebook), 7th Edition dated October 2006. Refer to the following link for a copy of this document: <http://www.sfmta.com/bluebook>

CAD Standards

The sheet TCP-001 provides a template with title block, symbols, and specific details pertaining to the presentation and setup of drawings to be used when preparing a TCP. The CAD standards identified under the Vendor Submittal Instructions, including layering configuration, title block, and symbols, shall be referenced and followed when creating all TCP AutoCAD drawings. The contractor shall include additional signs in the form of blocks, notes, and details as needed.

TCP Samples

There are three sample Traffic Control Plans included in this packet. These samples provide an example of how the TCPs shall be set up and configured.

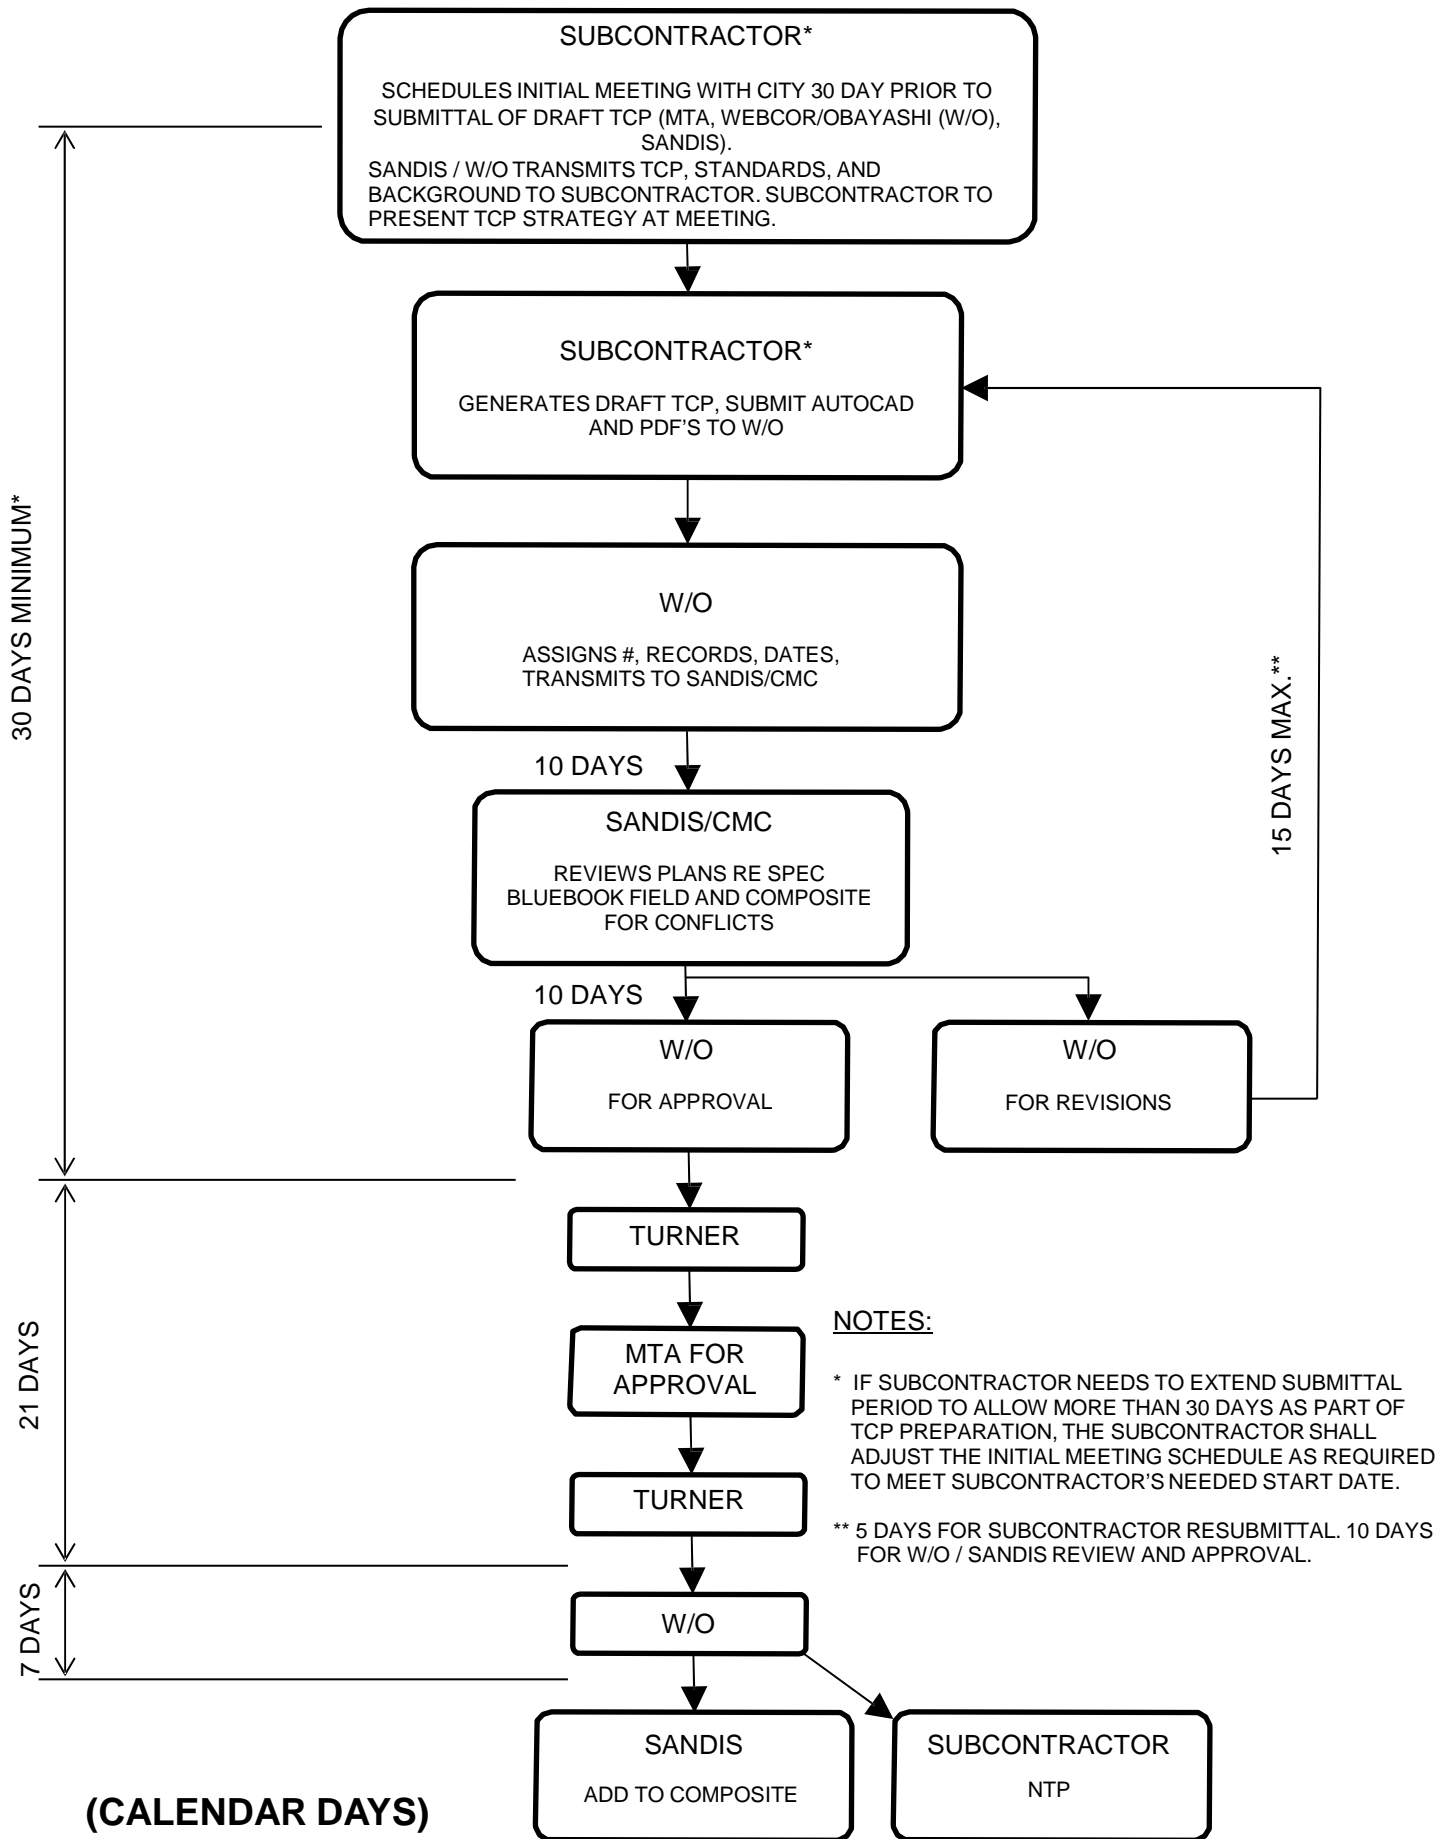

TCP Submittals

All proposed Traffic Control Plans shall be submitted at 1"=80' scale on 22"x34" sheet size in both pdf and AutoCAD 2007 formats. They are to be submitted electronically to Webcor-Obayashi's trade package project manager. An important item to be included on all TCP sheets is the submittal tracking number. The tracking number consists of four segments separated by a period. The first segment is the 4-digit contract identification number, the second segment the 3-digit TCP number (provided by Webcor), the third segment is the 2-digit revision number, and the fourth the 3-digit page number. Refer to the Submittal Tracking Number Diagram below for additional direction.

TCP-001

SHEET

VENDOR SUBMITTAL INSTRUCTIONS

TRAFFIC CONTROL PLANS SHALL BE SUBMITTED AS FOLLOWS:

- 1) FIVE (5) HARD COPIES

2) ELECTRONIC COPY IN PDF AND AUTOCAD 2007 FORMATS

3) 11"x17" SHEET SIZE

4) 1"=80' SCALE

5) SHEET NUMBERING "TCP-###"

6) ELECTRONIC FORMAT PER TEMPLATE PROVIDED: SINGLE CAD FILE CONTAINING MULTIPLE LAYOUT TABS WITH A SINGLE TCP PER TAB. THE TCP SHALL BE DRAFTED IN MODEL SPACE ON TOP OF THE STREET BASE FILE WITH NOTES/LEGEND IN PAPER SPACE. MODEL SPACE SHALL BE DRAFTED AS FOLLOWS:

a) EACH TCP PAGE SHALL CONSIST OF FIVE LAYERS WITH A PREFIX FOR THAT PAGE NUMBER. FOR EXAMPLE, PAGE 001 WOULD CONTAIN THE FOLLOWING LAYERS:

001-TCP-DIM

001-TCP-NOTES

001-TCP-SIGN

001-TCP-SIGNTEXT

001-TCP-STRIPELINE

001-TCP-WORKAREA

b) ALL SYMBOLS, BLOCKS AND DIMENSIONS SHALL MATCH THOSE ON THIS SHEET IN SIZE, COLOR, AND LAYER. CREATE NEW BLOCKS USING SIMILAR COLOR AND SIZE FOR SIGNS/DEVICES NOT SHOWN HERE.

c) INSERT STANDARD TITLE BLOCK PER SHEET. USE ATTRIBUTE EDITOR TO FILL IN TITLE BLOCK WITH APPLICABLE INFORMATION.

d) TABLES, NOTES, AND LEGENDS SHALL BE IN PAPER SPACE PER SHEET ON LAYER XXX-TCP-GENERAL, WHERE XXX IS THE PAGE NUMBER

e) STANDARD TEXT STYLES, SIZES, DIM STYLES PER TEMPLATE

f) STANDARD LAYER COLORS AND NAMES; AND CTB/PEN SETTINGS PER TEMPLATE

g) FREEZE LAYERS IN VIEWPORTS AS NECESSARY TO ONLY SHOW THOSE NEEDED FOR THAT INDIVIDUAL SHEET.

7) REFER TO PROVIDED SAMPLE TCP PLAN FOR AN EXAMPLE OF THE FORMAT BEING IMPLEMENTED.

SHEET

Exhibit U Submittal Schedule

Trade Subcontractor's Schedule submission shall include a full submittal schedule per Specification Section 01 13 00 1.4 – Submittal Schedule.

1. All submittals are to be submitted to Webcor/Obayashi Joint Venture within 60 days of Award.
2. The Submittal Schedule shall contain additional data fields to indicate: 1) the duration in work days for procurement of the item starting from the date that the submittal is approved until the item is available for construction, and 2) the Activity ID of the earliest construction activity for which the item will be required (the submittal/procurement item's successor).
3. The Trade Subcontractor should use the attached data format, Submittal Schedule Excel Template, for the submission of Submittal Schedule as Microsoft Excel File. Contact Webcor/Obayashi Joint Venture to obtain the blank excel file of the Submittal Schedule.
4. The Trade Subcontractor shall show critical submittals in the Exhibit I Construction Schedule in addition to providing the comprehensive submittal schedule required herein. Critical submittals are those submittals considered vital to the timely progression of the project schedule. These items may include, but are not limited to, engineering submissions; long lead items; items required within the first 25% of Subcontractor's performance period; and items that are required for construction or installation of a task with less than 20 working days of total float in the overall project schedule. The last group of items may not be determined until after acceptance of the Trade Subcontractor Construction Schedule submission and its full incorporation into the project schedule. Therefore, the Subcontractor may be required to add items to its Primavera schedule file subsequent to approval of its Construction Schedule submission.

QUALITY COMMISSIONING PROCEDURES AND GUIDELINES

Exterior Skin and Waterproofing Systems

- ✓ Roofs
- ✓ Decks
- ✓ Windows
- ✓ Curtain Walls
- ✓ Exterior Wall Systems (Precast, Stucco, EIFS, GFRC)
- ✓ Water Shedding Systems
- ✓ Flashings
- ✓ Expansion Joints
- ✓ Caulking, Sealants
- ✓ Primary and Secondary Water Barrier Systems
- ✓ Above & Below Grade Waterproofing
- ✓ General Waterproofing Systems

1.0 Purpose

The purpose of this procedure and guideline is to set forth a commissioning process, which will ensure that the building's exterior envelop and waterproofing systems perform and function in conformity with design intent and to provide a means of verifying the implementation of these systems based on the project specifications, design and applicable industry standards.

2.0 Definition of Commissioning

The term "Commission" refers to a Quality Assurance process by which the building's exterior envelop and waterproofing systems (i.e., below and above-grade waterproofing, decks, roofs, caulking, plaster, precast concrete and GFRC, curtain-wall, flashing, expansion joints, etc.) are provided, installed and tested in order to verify the systems perform in accordance with the contract documents and the design intent.

Commissioning entails the development of a clear and complete process that verifies the systems design and operational intent. It also is to verify that the exterior envelop and waterproofing systems and its components are installed according to the contract documents, manufacturer's recommendations and published industry standards and that the system receives adequate installation and performance inspections by the installing contractor.

The process must include verifying and documenting the installation steps, phases, and system performance with respect to the design intent and the contract documents. Commissioning is a team effort that requires cooperation by all parties to succeed.

3.0 Description of the Commissioning Process

Commissioning is a “**systematic**” process for achieving, validating and documenting the performance of building systems as so that it meets the design intent and requirements.

The process extends through all phases from design to occupancy, and extending through the warranty period. Numerous checks and inspections shall be performed at each stage of the process to ensure that established procedures are followed. The process also includes training of facility operational personnel to ensure continued efficient use of the exterior envelop and waterproofing systems as originally designed and installed.

This guideline provides a uniform, integrated and consistent approach for the commissioning of all waterproofing systems as well as assisting in insuring product and design compatibility. Since many building waterproofing systems are integrated, a deficiency in one system or component may result in sub-optimal performance and failure among others.

4.0 Commissioning Plan

Commissioning is a “**Quality Process**” for validating the system and component design performance.

The reports from the commissioning process are not just test reports, but reports that document design, installation, inspections, and particular tests and or evaluation procedures. The commissioning plan is continually updated to reflect changes in program and design of the waterproofing system(s). Commissioning reports shall document and record the results of the commissioning process.

Each Trade Subcontractor’s specific commissioning plan must be neatly organized in a consistent manner that reflects the nature of the building systems and their performance. The commissioning plan shall include schedules, requirements and procedures.

Trade Subcontractor(s) shall be responsible for the timely and efficient completion of all commissioning in accordance with the Subcontract Agreement.

At no time shall any work be permitted to commence without a WEBCOR/OBAYASHI’ approved Trade Subcontractor Waterproofing Commissioning Program.

Failure to do so may require Trade Subcontractor to assume all related costs and expenses in accordance with the Subcontract Agreement.

In addition, Trade Subcontractor may also be required to assume all related cost should WEBCOR/OBAYASHI find it necessary to develop, manage and or perform any Trade Subcontractor commissioning work.

5.0 Objectives

The fundamental objectives of the commissioning process are:

- 5.1 Create a procedure to verify and provide documentation that the waterproofing performance of the facility meet the design requirements.

- 5.2 Enhance communication by documenting data and decisions throughout all phases of the project.
- 5.3 Validate and report that the performance of waterproofing systems meets design intent.
- 5.4 Provide a means of Quality Control and Quality Assurance (QA/QC) throughout all phases of the waterproofing system(s) installation, inspection, and testing process.

6.0 Contractors Normally Participating in the Commissioning Process

- ✓ Waterproofing Consultant
- ✓ Architect
- ✓ Structural Engineer
- ✓ Mechanical
- ✓ Plumbing
- ✓ Electrical
- ✓ Fire Sprinkler
- ✓ Glass Systems
- ✓ Caulking
- ✓ Brick, Tile, Precast, GFRC, and Stone
- ✓ Fountains and Ponds
- ✓ Swimming Pools & Spas
- ✓ Roofing
- ✓ Insulation
- ✓ Flashing & Sheetmetal
- ✓ Waterproofing Contractors
- ✓ Concrete (If waterproofing admixtures are included by design)
- ✓ Stucco, EIFS, DEFS systems
- ✓ Elastomeric Painting
- ✓ Rough Carpentry (Wood cladding)
- ✓ Architectural Metal Cladding
- ✓ Expansion Joint Systems
- ✓ Water Tanks
- ✓ Special Systems or Components

7.0 Commissioning Team

The commissioning team members may consist of the following:

- ✓ WEBCOR/OBAYASHI - Project Team as required

- ✓ Owner - Designated representative of the owner, building operator/engineer, and/or the owner's construction management firm
- ✓ Engineers - Architect and Designers
- ✓ Waterproofing Contractor
- ✓ Waterproofing Consultant
- ✓ Flashing / Sheet Metal Contractor
- ✓ Exterior Skin Contractor
- ✓ Roof Contractor
- ✓ Glass and Curtain Contractor
- ✓ Caulking and Sealants Contractor
- ✓ Commissioning Agent (CA)
- ✓ Mechanical Contractor
- ✓ Plumbing Contractor
- ✓ Fire Sprinkler Contractor
- ✓ Electrical Contractor
- ✓ Testing Contractor
- ✓ Other as necessary

8.0 Meetings

Regularly scheduled commissioning meetings of **the entire team** shall be conducted for site coordination, communicating issues of concern, resolving conflicts, reporting on system process and status, identifying urgent work and all deficiencies.

Commissioning meetings are critical to the **Quality** of the commissioning process as well as timely completion of the project.

9.0 Trade Subcontractor Performance Requirements

- 9.1 Designation of the primary person who will be responsible, accountable, and act as the main contact person for all commissioning communications. Provide organizational chart indicating personnel who will be involved in the project. The chart should indicate factory, office, and on-site field personnel.
- 9.2 Review of drawings and specifications for completeness, appropriateness of details, and acceptance by Trade Subcontractor thereof.
- 9.3 Review WEBCOR/OBAYASHI standard details.
- 9.4 Preparing and submitting documentation of Trade Subcontractor's respective materials and systems to be integrated into the overall Commissioning Plan.
- 9.5 Submitting information on the intended commissioning protocol used on materials, and the integration into the system as a whole.
- 9.6 Provide a presentation of the commissioning process to WEBCOR/OBAYASHI, the Owner and or the owner's representatives. Demonstration shall indicate compliance with the Trade Subcontractor Commissioning requirements as outlined in this document.
- 9.7 Submitting shop drawings detailing waterproofing system layout as outlined in the contract documents. Shop drawings shall reflect all conditions present in the building, including but not limited to the following:
 - a. Conditions where different materials meet (i.e. windows to plaster or stone to plaster).
 - b. Corner conditions.
 - c. Conditions where vertical planes meet horizontal planes (i.e. soffits and sills).
 - d. Expansion joints and control joints.
 - e. Flashing.
 - f. Penetrations (i.e. Z-ducts, electrical outlets, louvers).
 - g. Conditions typically utilized by Trade Subcontractor's common practices.

Shop drawings shall include installation drawings indicating the planned sequence of installation of all components.
- 9.8 Providing means and method for preliminary testing of the exterior envelop and waterproofing systems with manufacturer's representative present as required:
 - a. Caulking: Include complete coordination with the caulking manufacturer's representative to assure compatibility of the caulking system with the

surrounding substrate and finishes. Trade Subcontractor shall submit caulking samples including manufacturer's specifications for materials, color, cleaning procedure, required primers, proper backer rod, installation procedures, testing requirements and results. Testing of caulking samples between all combinations of materials shall be performed by qualified testing agencies in direct accordance with A.S.T.M. Standard Test Method C794 (75), including seven (7) day immersion. A letter from the Caulking Manufacturer shall be submitted approving all testing procedures, the installation procedure and the use of the specified materials for the intended application. Any materials installed without such approval that may be in conflict with the approved procedures or of unacceptable color and appearance will be removed and replaced at the Trade Subcontractor's expense.

- b. Windows and Sliding Glass Doors: Assemblies shall be field tested in accordance with American Architectural Manufacturers Association (AAMA) 502-02 Voluntary Specification for Field Testing of Windows and Sliding Glass Doors using Test Methods A and B, testing a minimum of 1% of the products for air leakage resistance and water penetration resistance as specified for various stages of the product installation.
- 9.9 Reviewing all required testing under the witnessing of WEBCOR/OBAYASHI, Building Owner, and or the Owners representatives.
 - 9.10 Correcting all system deficiencies at Trade Subcontractor expense.
 - 9.11 Obtaining all required permits, code required inspections and final certifications.
 - 9.12 Preparing complete as-built record drawings made from an original set that has been marked up throughout the duration of the project. Drawings must indicate all work as it was actually installed showing change order revisions, field changes required to meet the working conditions, and any other items that will affect or reflected in the operation and maintenance of the facility.
 - 9.13 Obtaining all manufacturer's warranties and guarantees.
 - 9.14 Organizing the O&M manuals, if any, from suppliers and manufacturers.
 - 9.15 Performing any specified training for the facility's operational staff.

10.0 Information Management

The management and continued organization of the commissioning information shall be the sole responsibility of the Trade Subcontractor.

WEBCOR/OBAYASHI and the Trade Subcontractor shall mutually agree on the location where all the commissioning information and documentation shall be stored.

The Trade Subcontractor shall make every effort to continually update and manage the information throughout the commissioning process. WEBCOR/OBAYASHI and the Building Owner may review the commissioning information provided by the Trade Subcontractor at any time for updates, accuracy and completeness.

WEBCOR/OBAYASHI may elect to withhold or make appropriate adjustments to the Trade Subcontractor's monthly progress billing in the event the commissioning information or performance requirements as described in the Waterproofing Quality Commissioning Procedures & Guidelines are not being performed, managed and updated by the Trade Subcontractor.

11.0 Trade Subcontractor Commissioning Submittal Requirement

Each Trade Subcontractor has a responsibility to WEBCOR/OBAYASHI and the Building Owner to comply with the terms of the contract and to verify that the design intent of the waterproofing systems for the project is achieved.

Each Trade Subcontractor is required to provide two completed commissioning manuals containing the information outlined in Section 19 - Commissioning Binder Tab Index of this guideline. Each proposed formatted "3-ring" binder containing all information, including blank forms shall be provided to WEBCOR/OBAYASHI and the Owner for "**review and comment**" before the commissioning process begins, or by an agreed upon date.

WEBCOR/OBAYASHI, the Owner and the owner representative shall review the information and return it to the Trade Subcontractor within **two-week** time with all comments.

Each Trade Subcontractor shall make all required changes as agreed, to the commissioning manuals and resubmit them to WEBCOR/OBAYASHI within **two-weeks**.

Each Trade Subcontractor shall schedule and provide a formal demonstration of their commissioning process to WEBCOR/OBAYASHI, the Owner and the Owners representative after all required changes to the manuals have been satisfactory completed. Demonstration shall indicate compliance with the Trade Subcontractor Waterproofing Commissioning requirements as outlined in this document.

Each Commissioning Manual **shall be neatly organized** using appropriate tabs, dividers, table of content, index, etc. as required for easy referencing. Refer to Section 19 Commissioning Binder Tab Index for a standard binder organization. All Commissioning Manual(s) **must be user friendly**.

12.0 Commissioning Binder Tab Index

- Tab 1. Project design criteria specifications** – Provide information that describes the overall design criteria and performance requirements for the waterproofing system(s).
- Tab 2. Manufacture products and components** – Provide complete submittal list of all components that shall be contractually provided and installed.
- Tab 3. Manufacture installation instructions** – Provide manufacture documentation insuring that the system and components installation complies with all Manufacture requirements to maintain performance and guarantee obligations.
- Tab 4. Manufacture details** – Provide manufacture details or published industry standards for penetrations and terminations interfacing with other installed systems.
- Tab 5. Design transition review** – Provide design review comments and concerns on transition interfaces to other s or other compatibility issues.
- Tab 6. Quality Assurance / Quality Control Program** – Provide QAQC program with complete field inspections and checklists.
- Tab 7. Documentation** – Trade Subcontractor shall maintain a separate field binder documenting the QAQC inspections and field-testing for all installed work.
- Tab 8. Field mock-up and testing** – Provide information on mock-up or field performance tests that shall be preformed for all installed system(s). Provide manufacture recommendations or published testing standards used. If no performance testing is preformed, Trade Subcontractor shall provide documentation on how each system is performing in accordance to the documented design intent and contract warranty requirements.
- Tab 9. Schedule** – Provide schedule for, shop drawing devolvement, submittals fabrication, delivery and installation.
- Tab 10. Agency and factory test reports** – Provide all factory, agency, and field performance-testing reports on installed systems.
- Tab 11. Factory and Trade Subcontractor guarantee information** – Provide warranty responsibilities and durations for all systems and components installed.
- Tab 12. Owner Training** – Provide (O&M) and training for all required service and maintenance requirements as it extends throughout each system to maintain warranty. Include owner sign-off sheets verifying training.

- Tab 13. Attic Stock** – Provide list of spare material that shall be supplied by Trade Subcontractor to owner – Paint, applied materials, gaskets, handles, glazing, or patching products.
- Tab 14. As-Built Drawings** – Provide completed set of drawing and details accurately reflecting all installed and completed work.
- Tab 15. Material Safety Data Sheets** – Provide all Material and Data Safety Sheets (MSDS).

13.0 Identifying the Defects

It is the intent of the commissioning process to avoid defects in waterproofing systems. A standard of care exhibited during the commissioning process should anticipate potential defects and determine appropriate solutions prior to the installation of these systems. In the event that defects do occur, proper defect identification will help determine the repair needed and assist in selecting the appropriate method and materials.

It is important to acknowledge which factors have caused deficiencies in the waterproofing system and its components, and how a deficiency in one system may influence or amplify another. Careful and thorough defect identification is critical to obtain long-lasting, quality repairs. It is critical and necessary to eliminate the cause of the defect and not solely treat the symptom.

Each Trade Subcontractor shall be responsible for determining the cause and origin of various problems as it pertains to their contractual scope of work. Failure to do so may require Trade Subcontractor to assume all related costs and expenses for damages, repairs performed by others, testing, special inspections, and consultant fees.

14.0 Applicable Industry Standards

Unless the Contract Documents include more stringent requirements, applicable published construction industry standards shall be utilized. Where compliance with two or more standards is specified for quality or quantity levels, comply with the most stringent requirement.

Where sections of the specifications require that a product, material, installation, or test complies with a specified industry standard, the Trade Subcontractor shall obtain copies directly from the publication(s) source and include the information in the submitted commissioning information.

Each Trade Subcontractor engaged in construction on the project must be familiar with published industry standards applicable to their construction activity.

15.0 Schedules

An initial schedule shall be developed by the Trade Subcontractor identifying dates, times, and durations for shop drawings, approval of submittals, material fabrication, product delivery, acceptance, installation, testing and completion.

The schedule shall also include any commissioning task that shall be performed on waterproofing systems that may involve or affect other related building systems.

Each Trade Subcontractor shall update schedules, daily, weekly, monthly, or as required to keep WEBCOR/OBAYASHI and the Owner informed of the activities performed. This schedule will indicate appropriate milestones during the installation to allow WEBCOR/OBAYASHI and or the Owner the ability to observe and witness system installations prior to being covered up by subsequent s. The schedule will indicate milestone dates for Trade Subcontractor inspection and testing.

16.0 Execution of Inspections and Checklists

Trade Subcontractor and or vendors shall schedule initial inspections and checklist review with the commissioning team. The inspections and reviews shall be directed, executed, and documented by the Trade Subcontractor or vendor.

To document the process, the Trade Subcontractor performing the task shall provide and complete all documentation forms and checklists. (See attached sample checklist)

17.0 Field Inspections

One of the most important commissioning activities for waterproofing systems is field inspections. The field inspection process shall serve as a method and means of documenting the installation process as well as indicate variations between contractual design and construction.

Each Trade Subcontractor shall identify in detail the scope of their field inspections, and the types of field procedures that will be required to obtain the necessary information to provide a complete waterproofing quality control evaluation at the completion of the job.

18.0 Field Witnessing of Trade Subcontractor's Quality Control

WEBCOR/OBAYASHI, the Owner, consultants and the Architect reserve the right to witness the waterproofing system installation at any time. Spot checks shall be conducted on a random basis. If inconsistencies are discovered in quality, performance, or if commissioning information differs from those submitted, the Trade Subcontractor may be required to completely remove and remedy all conditions where the inconsistencies occurred at no additional cost or impact to the schedule.

Witnessing shall include all or part of, but not limited to the following:

- 14.1 Mock ups
- 14.2 Waterproofing component and system installation
- 14.3 System inspection and checks
- 14.4 Performance tests

14.5 Special Inspections

19.0 Documentation

Trade Subcontractor shall maintain a separate field binder documenting quality control inspections and field-testing for all installed work. Documentation shall include dates, quality control field checklist, reports with inspected locations defined by grid lines and elevations. Provide a dated photo log, documenting inspected areas and general sequence of installed work for the duration of the project.

20.0 Testing and Methods

The objective of field-testing is to correlate paths of moisture infiltration and to observe the source of damages. Moisture entering a building during extreme weather may be obvious, but the most reliable method to discover the infiltrating path is to recreate the leakage condition in a controlled manner. Testing also allows verification of the theory for the cause of leakage.

As all system and component tests are unique to some degree, there may not be one standard or method for testing that can be applied to all. There are several methods, standards, governing requirements, and manufacture recommendations, etc., which should be applied.

There are three types of acceptable testing methods that can be used during the investigation. All of which must be approved by WEBCOR/OBAYASHI. These testing categories include:

- ✓ Non-Destructive Testing
- ✓ Destructive Testing
- ✓ Laboratory Testing

20.1 Non-Destructive Testing

Non-destructive testing uses a variety of non-invasive tools. This type of testing causes little or no damage or interference to the building envelope. The various methods of non-destructive testing include:

- a. *Rilem Tube* - This calibrated device is adhered to exterior masonry walls to determine the porosity and condition of brick masonry units, mortar joints, head joints, and embedment joints.
- b. *Water Spray Rack (ASTM E1105)* - This test simulates a wind-driven rain condition on a facility. It can assist in determining the specific cause and origin of moisture infiltration when it is used to test independent components of the envelope. Spraying water over a large area in an uncontrolled fashion will not reveal specific causes of water infiltration.
- c. *Hose Spray Test (AAMA 501.2)* - This test method also simulates wind-driven rain in small segmented areas using a standard garden hose in which a calibrated nozzle is attached with a pressure gauge. The spray is

directed at a specific joint, crack, or defect to reveal potential moisture intrusion.

- d. *Differential Pressure Test (ASTM E1105)* - A pressure chamber is constructed on the interior of the facility at a specific location to test moisture driven through an assembly or component. The assembly or component is subjected to a negative force while simultaneously a spray rack is directed at the assembly to draw the moisture into the facility to simulate a negative pressure under a wind-driven rain condition.
- e. *Infra-Red Thermography* - Infra-red Thermography photographs the building exterior to determine the locations of wet components. Components, such as insulation and sheathing, etc., will act as heat sinks if they contain high levels of moisture. During the day, moist and dry components absorb heat. At night, the moist areas release the heat much slower than the dry areas. By reading the heat signature, Infrared Thermography will help expose the problem areas. Small test cuts may be required to verify moisture areas.
- f. *Soundings (ASTM D4580)* - There are different ways to perform sounding tests including the hammer tap test. In this test, a 16 oz. hammer is tapped against concrete for sound. A hollow sound indicates areas where the concrete has separated from the reinforcing steel, typically due to exfoliation or corrosion of the steel. Another method of sounding is to chain drag a heavy 15 ft. link chain along a concrete surface to listen for hollow sounds, indicating defective concrete. This method can cover larger areas effectively and is commonly used on parking garages and loading docks.
- g. *Pachometer Survey* - This test uses a magnetic device used to locate embedded steel reinforcement and help determine the concrete cover over the reinforcement. Generally, the Pachometer is fairly accurate when measuring ¼ inch to 3-inch thick concrete cover and when reinforcing placement is not too congested.
- h. *Poly-sheet Tape-down* - This test determines the presence of moisture coming through a concrete surface, typically a slab-on-grade type of assembly where the typical problem is tile or membrane separation from the floor. A 2' x 2' section of polyethylene is sealed to the concrete with duct tape and removed 24 hours later. If there is moisture beneath the polyethylene, it is a good indication that there is a vapor drive through the concrete section.
- i. *Glass-Slide Epoxy or Crack-o-meter* - This device is sealed in place over a crack and periodically checked to determine if any movement has occurred. If movement has occurred, the glass will crack or the meter will record movement.
- j. *Optical Illuminated Boroscope* - A boroscope is inserted into a 5/8-in. diameter pilot hole through an exterior wall system and allows the cavity walls of brick veneer, stud wall backup of exterior insulated finish systems (EIFS), or other types of constructions to be observed without large-scale destructive testing.

- k. *Smoke/Dust Tracer* - The smoke/dust tracer helps to find air infiltration. It is moved across the interior face of a window to observe the smoke and dust particles coming through the assembly.
- l. *Moisture Meter* - A Delmhorst meter is a digital device that detects the presence of moisture in various building components. This test is typically accompanied by a gravimetric analysis (oven drying of samples), which is used to confirm the results of the Delmhorst meter.
- m. *Flashlight and mirror* - These simple tools can be very useful to detect problem areas. Placing the mirror into the plenum or behind difficult-to-access areas with the flashlight will allow observation of concealed conditions.

20.2 Destructive Testing

When the main objective is to determine the existing composition and configuration of concealed assembly conditions, destructive testing may be warranted. The most common methods of destructive testing are test cuts and borings.

Any type of destructive testing must be reviewed and approved by WEBCOR/OBAYASHI.

- a. *Roof Testing* - Test cuts in the roof assembly may be necessary to determine the condition of the underlying insulation and substrate. Cutting into the system may help verify whether roofing problems are causing corrosion of the steel deck, or a spalled and cracked concrete deck, etc. Test cuts may also expose the as-built configurations of the flashing components at roof-to-wall locations, curb locations, etc. This information is critical to the appropriate remedial design and/or repairs.
- b. *Exterior Wall/Skin Testing* - Test cuts on exterior walls may be required to identify the origin of moisture infiltration. For masonry walls, it is most effective to make test cuts at window heads and sills, and at any through-wall flashing locations that may be suspected of allowing moisture intrusion. Masonry test cuts may expose defective through-wall flashing that is allowing moisture intrusion. Test cuts may also help determine the underlying conditions of the steel components in wall systems, including wall ties, reinforcing steel, sub-steel columns, etc.

20.3 Laboratory Testing

Destructive testing is also used to obtain samples for lab analysis. Samples of sealants, coatings, painted finishes, roofing materials, etc. can be sent to a laboratory to determine the presence of lead or asbestos. Samples of masonry or concrete can also be tested to help identify causes of moisture/air infiltration (descriptions of these analyses follow).

Laboratory testing may help obtain a better understanding of existing material types, presence of contaminants, and the possibility of hazardous components.

This type of testing can also provide valuable information concerning proper surface preparation, material selection, and implementation of repairs. The following laboratory tests are some of the more useful when performing building envelope evaluations:

- a. *Gravimetric Analysis* - This test will determine moisture content. After weighing and recording the in-situ existing sample, completely dry the sample in an oven and re-weigh it. The weight difference indicates moisture content and is particularly useful for insulating materials. Testing moisture contents of samples is critical to verify results from non-destructive moisture scans.
- b. *Petrography* - Petrography determines the “make-up” of concrete. This test will indicate the size and type of aggregate, air/void ratio, type of cement, and general mix design data of the concrete. Most materials testing lab can perform this test.
- c. *Air Entrainment* - Provides an indication of the existing concrete’s durability and freeze-thaw resistance. Air entrainment is generally indicated by petrography.
- d. *Presence of Carbonization* - Accomplished by spraying a solution of phenothelene on the concrete substrate and recording the depth of the solution’s color change. This will indicate to what depth carbon dioxide has progressed into the concrete. Carbon dioxide will degrade the cement matrix of the concrete and lower the pH level of it. The layer surrounding the reinforcement is then destroyed, allowing corrosion of the reinforcing steel. Corrosion by carbonization usually occurs over a broad area.
- e. *Chloride Ion Content* - Chlorides from marine atmospheres or mists from road salts entering the concrete substrate, and salts originally introduced to the concrete via admixtures or aggregates can promote accelerated corrosion of reinforcing steel, usually at concentrated or specific locations. The chlorides are not consumed in the corrosion process but rather act as catalysts in the process. The corrosion will progress along the reinforcing bars causing concrete de-bonding, cracking, and spalling.
- f. *Reinforcement Placement, Depth, Quantity, and Type* - This information may be established with the use of a Pachometer or similar electronic metal detector. It is useful in determining required steel replacement and structural capacities during engineering analysis phases.

21.0 Engineering Analysis

Using information obtained from the field, laboratory results, and collected data, a comprehensive engineering analysis may be required. The engineering analysis should include an assessment of field and laboratory data, structural analysis as well as the following:

- ✓ Thermal Analysis
- ✓ Drainage Analysis

- ✓ Vapor Drive Analysis
- ✓ Fire Rating Requirements
- ✓ Cost Estimations

22.0 Deficiencies and Non-Conformance

The Trade Subcontractor shall identify and list any outstanding deficiencies or procedures that were not completed successfully during any final testing. Documented deficiencies shall be submitted to WEBCOR/OBAYASHI within 48 hours of each test completion.

The Trade Subcontractor shall also provide in writing, the corrective action for each deficiency as required within 48 hours. The installing Trade Subcontractor and or vendor shall correct all outstanding issues or deficiencies in the materials or the installation of the materials and provide the commissioning team with dates and times for the required corrections and any re-testing.

23.0 Remedial Work

General considerations for the repair of defects and replacement of components should include the following:

- 23.1 Determine the effect, if any; the repairs have on the structure, surroundings, and operations of the building.
- 23.2 Ensure proper preparation of surfaces to be repaired and provide chemical and mechanical bonds for new materials.
- 23.3 Material selection should include an understanding of performance limitations and should rely on the products past acceptable performance. Material selections should include consideration of the following:
 - ✓ Compatibility
 - ✓ Maintenance
 - ✓ Life cycle

24.0 Project Commissioning Closeout

WEBCOR/OBAYASHI, the Owner, and/or the Owner's representative shall determine when the Trade Subcontractor commissioning process has been satisfactorily completed and when to submit the final report information and all other documentation to Webcor.

As part of the project turnover, the quality of all work will be reviewed to determine whether it is within specific and manufacturers' guidelines, industry standards, and code compliance.

WEBCOR/OBAYASHI, the Owner, and/or the Owner's representative consultant must be completely satisfied that the commissioning procedures have been performed accurately and professionally.

In the event the commissioning information or performance requirements outlined in the Waterproofing Quality Commissioning Procedure & Guidelines have not been met, WEBCOR/OBAYASHI may elect to withhold or make appropriate adjustments to the Trade Subcontractor's final billing.
