T-1622	BGP - Top of Vertical Wall Interface with Ground Level MFB	Closed	01	08/18/2014	08/28/2014	08/22/2014
From: Webcor Construction LP Claude Titcher						
REQUEST:						
The current design indicates the top of the # 11 vertical wall reinforcing terminating with a terminator maintaining 2" concrete clear cover above the bar as seen in Section 1 on S-3201 .						
A # 11 555 t-head is 11/ 16" thick and a #11 Lenton Terminator is 11/16" thick. The Ground Moment Frame Beams appear in Section 5 of S1-3600. The concrete clear cover indicated over the stirrup is 2 3/4".						
Due to the designed concrete clear cover called for, the thicknesses of the different terminator products and the allowable tolerance in fabrication and placement per ACI a conflict with the two interfacing componets is expected to occur at the top bars of the MFB.						
Please confirm if the tenninator on the vertical bar can terminate below the ground level MFB top bars to avoid the expected conflict similiar to that allowed between the column and concourse MFB as indicated within RFI T-0917.						
Should this proposed solution not be acceptable please provide direction how to proceed.						
ANSWER:						
The current design indicates the top of the # 11 vertical wall reinforcing terminating with a terminator maintaining 2" concrete clear cover above the bar as seen in Section 1 on S-3201 .						
A # 11 555 t-head is 11/ 16" thick and a #11 Lenton Terminator is 11/16" thick. The Ground Moment Frame Beams appear in Section 5 of S1-3600. The concrete clear cover indicated over the stirrup is 2 3/4".						
Due to the designed concrete clear cover called for, the thicknesses of the different terminator products and the allowable tolerance in fabrication and placement per ACI a conflict with the two interfacing componets is expected to occur at the top bars of the MFB.

T-1625	SCS - Embedded Column Inner Vertical Bars at Foundation Walls	Closed	01	08/19/2014	08/29/2014	08/22/2014
From: Webcor Construction LP Claude Titcher						
REQUEST: See attached marked up contract drawings. The TG0600 rebar subcontractor is using HRC 420 friction welded standard couplers at the top end of the 3rd lift foundation walls and embedded columns C21, C33, C34 vertical bars. The inner set of embedded column vertical bars are indicated in sections as having a 90 degree SH tail at the top of bar. It isn't possible to install the bar with the 90 tail into the 3rd lift HRC 420 standard coupler as the tail of the bar needs to spin circular to engage the threads into the coupler with the final tail orientation dictated by torquing of the bar into the coupler. A possible solution to this issue is to utilize the HRC 555 Forged head in lieu of the 90 degree tail. The top of the inner vertical bar 555 head could be held 4" below the top of the outer vertical bar 555 head for concrete encapsulation. Please confirm that the proposed solution is acceptable for the typical embedded column in foundation walls.						
					ANSWER: See attached marked up contract drawings. The TG0600 rebar subcontractor is using HRC 420 friction welded standard couplers at the top end of the 3rd lift foundation walls and embedded columns C21, C33, C34 vertical bars. The inner set of embedded column vertical bars are indicated in sections as having a 90 degree SH tail at the top of bar. It isn't possible to install the bar with the 90 tail into the 3rd lift HRC 420 standard coupler as the tail of the bar needs to spin circular to engage the threads into the coupler with the final tail orientation dictated by torquing of the bar into the coupler. A possible solution to this issue is to utilize the HRC 555 Forged head in lieu of the 90 degree tail. T-1647	SCS - 12" Thick Partition Walls over 24' height	Closed	01	08/25/2014	09/04/2014	08/27/2014
From: Webcor Construction LP Claude Titcher						
REQUEST: Partition walls taller than 24'-0", as indicated in Section 3/S1-9050, have vertical reinforcing of #7 bars @12" centers. Section 4/S -9051 indicates that the vertical bars will have a 90 degree tail at the top end of the bar. The standard tail length for #7 bars is 14" and will not fit within the 12" thick walls. Rotating the #7 bar tails to clear the concrete face by 1 1/2" clash with one another. Harris Rebar requests permission to utilize #7 straight vertical bars with a #5 'U' shaped cap with 30" lap@ 6" centers at the top of walls. Is this acceptable? In order to minimize multiple varying lengths of the #7 vertical wall bars, the #7 threaded vertical dowel bar length will be increased from 49" to 56". The #7 wall vertical bar will be held up to the top of wall elevation, less clear cover, and maintain a minimum 49" lap splice at the Concourse Level. Is this acceptable?						ANSWER: Partition walls taller than 24'-0", as indicated in Section 3/S1-9050, have vertical reinforcing of #7 bars @12" centers. T-1650	SCS - Requesting Approval for Precast Panels in Lieu of Cast-In-Place	Closed	01	08/27/2014	09/06/2014	09/15/2014
From: Webcor Construction LP Claude Titcher						
REQUEST: See attached Exhibits A through D as a possible means of precast installation method. Using a precast yard facility in lieu of concrete cast in place will reduce the construction duration for the scallop, perimeter, and sky light elliptical wall operations since production can start prior to the construction start date. Precasting concrete elements also results in a better final product. Quality advantages of using a precast yard facility over cast in place methods are improved formwork design, curing procedures, temperature control, and form striping methods since work space, formwork weight, formwork relocation and reassembly, and hoisting equipment restrictions are greatly reduced if not eliminated. shimmick requests approval from the engineer to allow precast manufactured panels in lieu of the cast in place walls shown on S1-2752 & S1-3282 scallop walls, S1- 2602 stair well, S1-2603 elliptical skylight, S1-2604 light column opening, S1-2606 stair shaft, and S1-2607 elevator shaft. T-1655	SCS - Additional Information Needed to Cut CDSM Soldier Pile Beam.	Closed	01	08/28/2014	09/07/2014	08/28/2014
From: Shimmick Construction Company, Inc. Henry Chiang						
REQUEST:			ANSWER:			
<p>Direction provided is limited to: EXHIBIT A - TRADE SUBCONTRACTOR BID PACKAGE MANUAL AND FORMS, IV. SCOPE OF PACKAGE, D - 13. pg-13 - "Cut Interior Flange and Web of the CDSM Shoring Wall Steel Soldier Pile. Assume that the cutting of the pile will occur between 2' and 8' below the finish grade surface. The precise elevations for the cutting of the pile beams will be determined by a future design requirement."</p> <p>In order to perform this work the elevation of the cut is needed.</p> <p>Shimmick was informally provided a copy of the attached drawing from Webcor Obayashi Joint Venture which only identifies a vertical distance in elevation from finished grade elevations. Shimmick was then informed by WOJV that Thornton Tomassetti is currently making corrections to the site grading civil drawings C1-1000's to C1-8000's Rev 0 Dated 03/31/14 which show top of curb elevations. The civil drawings do not provide complete curb elevations to determine the elevation of the cut at all piles.</p> <p>1. Confirm that the attached drawing which identifies a vertical distance in elevation from finished grade elevation is to be used.</p> <p>2. Are the top of curb elevations in the civil drawings to be used as finish grade elevations for the depth of cut on the CDSM piles?</p> <p>a. Provide finished grade elevations for cutting the interior flange and web of the CDSM piles or provide a height from top of concrete elevations shown on the ground level deck on plans sheet A1- 2862 to A1-2781. Also, please provide a drawing identifying the type of cut required ie., horizontal, angling up, or angling down.</p>			<p>Direction provided is limited to: EXHIBIT A - TRADE SUBCONTRACTOR BID PACKAGE MANUAL AND FORMS, IV. REQUEST: The beam spacing does not meet the 6'-0 max. spacing requirement in 10/S1-5004. Please clarify the beam locations to match 10/S1-5004.					ANSWER: The beam spacing does not meet the 6'-0 max. spacing requirement in 10/S1-5004. Please clarify the beam locations to match 10/S1-5004.	
T-1657	SCS - Lower Concourse MEP Room Construction Joints	Closed	01	09/03/2014	09/13/2014	09/12/2014
From: Webcor Construction LP Claude Titcher						
REQUEST: ASI 121 issued new wall CJ locations. Reference sheet AI-2203, Detail I/AI-3008 and B/AI-9240. A. On the south wall of the room at GL 13-B.2 there is a construction joint (see plan attached indicated as location "A") running through one of the MEP blocks outs. That creates a cantilever section below the beams cutout and above the MEP block out. Is that acceptable? If not, where should the CJ be relocated? B. On the same wall there is a construction joint (see plan attached indicated as location "B"), the distance between the MEP block and the construction joint is 5' 5/8", which is not enough to place diagonal trim bars on the comers of the MEP block out that are closer to the construction joint. Please provide detail for this location. C. In the same wall, the construction joints are not shown in the area cover by the spall plate, do the CJ's start at the top of the wall plates? Please confirm intent and provide further direction.					ANSWER: ASI 121 issued new wall CJ locations. Reference sheet AI-2203, Detail I/AI-3008 and B/AI-9240. A. T-1660	SCS - ST201 Thickened foundation wall	Closed	CR	09/04/2014	09/14/2014	09/12/2014
<div><div>From: Webcor Construction LP</div><div>Stephanie Azzolino</div></div>						
REQUEST:			ANSWER:			
The contract drawings do not provide a section view for the foundation wall at Stair Tower 201. S1-2302 calls out the foundation wall as a uniform 3' thickness. S1-3201 provides a typical foundation wall section, shown with uniform thickness. Shimmick has been provided with updated sketches that call out a thickened foundation wall of 4' 3 1/2" at Stair Tower 201 as opposed to the uniform 3' thickness.			The contract drawings do not provide a section view for the foundation wall at Stair Tower 201. S1-2302 calls out the foundation wall as a uniform 3' thickness. T-1667	SCS - Foundation Wall Conduit Penetration Locations	Closed	CR	09/08/2014	09/18/2014	09/08/2014
From: Webcor Construction LP Claude Titcher						
REQUEST:						
Reference drawings: A1-2862 to A1-2871, E1-2862 to E1-2871 and E1-3208 to E1-3210.						
Please see attached marked up drawings noting atypical set of conduit penetrations. A1-2862 provides a lateral distance relative to a grid line to set of conduits; however 3/E1-3208 details the set of conduits as not aligned. On top of this, the referenced drawings do not provide an elevation for the conduit penetrations. SCCO requires the locations of these penetrations to proceed with foundation wall rebar detailing.						
Please provide information on the location of the electrical conduit foundation wall penetrations.						
ANSWER:

T-1701	SSS - Insufficient Cope for Erection Clearance From: Webcor Construction LP Gregory Kemerer REQUEST: Please refer to beams highlighted in S1-2503 (SK1) and work with this RFI. The 1' 11 ½" cope is not sufficient for erection clearance as shown on A4644, A4645 (SK2, SK3). The Type 4 (V) drag connection on the other end of the beam limits the position in which the beam can be erected (See SK4, SK5). The beam needs to be erected from below and positioned through the shear plate on the moment frame column. As you slowly lift the back side that is currently coped, a ¼" clash transpires between the top flange of W40x327 and the shear plates on the bus deck casting. Please advise. T-1702.1	SSS - Weld Terminations on Moment Frame Column Shafts	Closed	CR	10/01/2014	10/11/2014	10/17/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST: As a follow-up to SK RFI 821 (T-1702.1), please note the following: It is unclear on how to exactly fix the weld terminations that currently do not conform with Section 5.17.1- Figure 5.2 from the AWS D1.1 Structural Welding Code. Skanska proposes two options that would allow the transitions to be permissible as per AWS code. Option 1: Remove material from the web/CJP that would allow for a proper transition down to the flange. See SK1. Option 2: Add additional weld metal to the CJP that would allow for a proper transition down to the flange. See SK2. Please confirm that both options are acceptable & it is at the fabricators discretion to choose which method.

2) The maximum joint spacing for the Ramp and Ramp Walls can be increased to 90 feet as no movement joints are required below the vehicle or bike ramps.			2) The maximum joint spacing for the Ramp and Ramp Walls can be increased to 90 feet as no movement joints are required below the vehicle or bike ramps.			
T-1707	BGP - Conflict Between Mezzanine and Vehicle Ramp Slab	Closed	01	09/17/2014	09/27/2014	10/01/2014
From: Webcor Construction LP Claude Titcher						
REQUEST:			ANSWER:			
See attached drawing showing the Mezzanine Slab conflicting with the Vehicle Ramp Slab. There is nothing in the contract drawings showing a detail of this intersection, or acknowledging this intersection occurs. Please confirm this intersection of the Mezzanine and Vehicle Ramp Slab is the designer's intent. If this is the designer's intent, please provide further drawing details on the interface of the two components. T-1711	SCS - Roof Shear Key and Pylon Rebar Epoxy Connection	Closed	CR	09/19/2014	09/29/2014	09/29/2014
From: Webcor Construction LP Stephanie Azzolino						
REQUEST:		ANSWER:				
<p>Per S1-3282 detail 9 "SHEAR KEY AT ROOF" calls for vertical #4 rebar dowels to be cast with the structural deck. Per S1-3281 detail 7 "SIGNAGE PYLON FOOTING DETAIL" calls for vertical #5 rebar dowels to be cast with structural deck. For constructability reasons it is essential that Shimmick's operations maintain open access for roof top small cranes and man lifts for all trades. Per specification section 03 20 02 Part 2.3 F. 3. Adhesive for dowels in existing concrete b. HIT-RE 500_SD injectable adhesive by HIL TI, Inc., is an approved method. The minimum embedment depth requirement for #4 rebar is 2.75 inches and the concrete thickness requirement is 4 inches at the shear keys. The minimum embedment depth requirement for #5 rebar is 3.125 inches and the concrete thickness requirement is 4.375 inches for the signage pylon. The roof deck is 7" with 3" tall flutes leaving a clear space of 4 inches. Shimmick's solution for the 4.375 inch concrete thickness requirement is to pour an additional .5 inches of concrete at the concrete deck where the pylons will be installed. See drawing attachment "A" and product data attachment "B" on page 4 for rebar drill and epoxy requirements.</p> <p>Shimmick requests approval for the shear keys and the pylons be drill and epoxy rebar doweled connections after the roof top deck has been poured and larger operations have been completed.</p>		<p>Per S1-3282 detail 9 "SHEAR KEY AT ROOF" calls for vertical #4 rebar dowels to be cast with the structural deck. T-1712	BGP - Bike Ramp Blockout for Steel Column at GL 5-G.7	Closed	CR	09/19/2014	09/29/2014	10/01/2014
From: Webcor Construction LP Claude Titcher						
REQUEST:						
The structural details for the blackout in the Bike Ramp for the steel column at GL 5-G.7 is called out in S1-2202. The drawing calls out for the ramp walls to be blocked out 2'-0" to the east and west of Gridline 5.						
The architectural details for the blackout in the Bike Ramp for the steel column at GL 5-G.7 is called out in A 1-2202 and A 1-9209. The drawings on A 1-9209 show a plan view detail at 3 different levels with no supplementary elevation views. Detail 4-A 1-9209 appears to call out for the ramp walls to be blocked out 2'-1" to the east and west of Gridline 5 at the base of the column. Detail 5-A 1-9209 appears to call out for the ramp walls and slab at the ramp slab level to be blocked out 1'-1 1/2" to the east and west and 1'-2" to the south of the center of the column and perpendicular to the ramp wall.						
Please provide an elevation detail for the column-ramp interface at GL 5-G.7 that clarifies the discrepancy between S 1-2202 and A1-9209 as well as clarifies the elevation at which the wall blackout changes from Detail 4-A1-9209 to Detail 5-A1-9209 (if A1-9209 is correct).

T-1725.1	SSS - Missing Skewed Connection Details at Light Column	Closed	CR	10/07/2014	10/17/2014	10/10/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST:			ANSWER:			
The previous response to this RFI (T-1725) does not take into account the difference in geometry between the light column and W27x84 on the north side of GL E when compared to the W27x84 on the south side of GL E. Please refer to SK RFI 052.1 (T-0770.1), which provided different dimensions for the two locations. In addition, this connection clarification was requested in SK RFI 122 (T-1087). See attached CD RFI # 612 SK1: Details 7 & 8/S1-5010 do not give the necessary information for the connection when skewed connections occur on both sides. This information was requested in RFI T-1087 (SK 122, CD 094) but the requested typical connection information was not provided. Confirm the connection as shown is acceptable. T-1742	SCS - ST201 Slope of Grade Beams	Closed	CR	09/25/2014	10/05/2014	10/07/2014
From: Webcor Construction LP		Stephanie Azzolino				
REQUEST:		ANSWER:				
Please see attached SKA-4052 (per RFI #T-1661), SKS-0398 & SKS-0400 (confirmed in RFI #T-1661and 1658), and Markup A1-2960A (per email from TT on 8/8). SKS-0400 visually shows the grade beams sloping but does not provide the exact percent of slope. Cross referencing the available sheets provides conflicting slopes for each beam.		Please see attached SKA-4052 (per RFI #T-1661), SKS-0398 & SKS-0400 (confirmed in RFI #T-1661and 1658), and Markup A1-2960A (per email from TT on 8/8). SKS-0400 visually shows the grade beams sloping but does not provide the exact percent of slope. Cross referencing the available sheets provides conflicting slopes for each beam.				
The grade beams GBI and GB2 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Constant Slope: Projection of Ground Level Slab". SKA-4052 calls out a single west-east slab slope of 1.2%. However, SKS-0398 provides two unique end of beam top elevations for GB1 and GB2, suggesting that the beams have two different slopes. The grade beams GB3 and GB4 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Slope to Foundation Wall", where the grade break occurs at the west face of the foundation wall at EL + 15' 7". 3/SKS-0400 visually indicates the grade break at the east face of the foundation wall. No elevation on the east end of GB3 or GB4 is provided. The top of slab is provided, but 1/S1-5023 does not show a difference between top of slab and top of beam.		The grade beams GBI and GB2 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Constant Slope: Projection of Ground Level Slab". SKA-4052 calls out a single west-east slab slope of 1.2%. However, SKS-0398 provides two unique end of beam top elevations for GB1 and GB2, suggesting that the beams have two different slopes. The grade beams GB3 and GB4 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Slope to Foundation Wall", where the grade break occurs at the west face of the foundation wall at EL + 15' 7". 3/SKS-0400 visually indicates the grade break at the east face of the foundation wall. No elevation on the east end of GB3 or GB4 is provided. The top of slab is provided, but 1/S1-5023 does not show a difference between top of slab and top of beam.				
1) What are the slopes for GBI, GB2, GB3, and GB4? 2) What creates a difference in top elevation between GB 1 and GB2? 3) Where does the grade break for GB3 and GB4 occur? 4) What is the top elevation of GB3 and GB4 at the east face of the foundation wall? 5) What is the top elevation of GB3 and GB4 at GL 1.4, per 1/S 1-5023?		1) What are the slopes for GBI, GB2, GB3, and GB4? 2) What creates a difference in top elevation between GB 1 and GB2? 3) Where does the grade break for GB3 and GB4 occur? 4) What is the top elevation of GB3 and GB4 at the east face of the foundation wall? 5) What is the top elevation of GB3 and GB4 at GL 1.4, per 1/S 1-5023?

T-1751	SSS - Upper Basket Column Pipes at Gridline 1	Closed	CR	09/26/2014	10/06/2014	10/08/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST: Upper basket column pipes located at gridline 1/G and 1/C are shown to be concrete filled to top of pipe in S1-4018 Rev 4. Details shown in B/S1-4018 require a 2" diameter vent hole in the roof level cast nodes. Roof level cast nodes at these locations are 72-36 and 72-37 and according to machining drawing CN-0127 Rev 4 (issued 12/19/13), neither of these cast nodes have vent or grout holes. Currently, pipes are detailed with (2) - 5/8" vent holes approx. 7" from the top of the pipe so the pipes could be filled to this point. Please confirm currently detailed pipe vent holes can remain as is or provide new vent hole details for the pipe and/or cast nodes. Please note cast nodes 72-36 and 72-37 have already been released to Oregon Iron Works by Bradken. T-1759	SSS - Transfer Girder Fillet Weld on Intermediate Flange	Closed	CR	10/01/2014	10/11/2014	10/09/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST:			ANSWER:			
See attached CD RFI # 635 SK1: On the approval return of WS07 transfer girder 664, the design team has asked for a CJP weld at the left end where the intermediate flange plate slots into the web. The typical detail for the intermediate flange as it slots around the web calls out a fillet weld to the girder web, both sides. The contract drawing detail B/S1-4301 does not show the typical fillet weld but it is indicated on the right end of this girder as a 5/8" fillet. Please confirm the 5/8" fillet is the design intent and no revision to 664AB is required. T-1767	SSS - Weld Clearance Hole Size at Moment Frame Column Cruciform From: Webcor Construction LP Gregory Kemerer	Closed	CR	10/01/2014	10/11/2014	10/13/2014
REQUEST: Several Moment Frame Columns have cruciform sections that weld over column web splice joints. The splice joint provides a transition from thick web to thin web. In a majority of these cases, the cruciform web as detailed has a 1" radius cutout to clear the column web splice joint. The 1" radius cutout is insufficient to adequately clear the tapered double bevel splice joint and provide space for runoff tabs necessary for the CJP weld. Please confirm it is acceptable to provide a weld clearance hole in the cruciform section wide enough to clear the bevels of the column web splice joint plus 1" on each side of the bevel for weld runoff tabs. See attached sketch. If confirmed, this information needs to be shown on detail drawings.		ANSWER: Several Moment Frame Columns have cruciform sections that weld over column web splice joints. T-1771	BGP - Geothermal Sleeve Reinforcement at GL 13	Closed	01	10/02/2014	10/12/2014	10/15/2014
From: Webcor Construction LP Claude Titcher						
REQUEST: Detail 4 on plan sheet S1-3207 provides the trim detail for wall penetrations. Note 1 states that wall penetrations not shown in the structural drawings are not allowed unless approved by the SEOR. 1) Please confirm the geothermal sleeves may be installed in the foundation walls as shown in the Architectural drawings. 2) Currently the Geothermal Sleeves conflict with the foundation walls at two locations, GL 13(See attached photo). Please confirm two(2) bars at each location (one in the front curtain and one in the back curtain) can be abandoned to facilitate the installation of the Geothermal Sleeves. T-1773.1	SSS - AB Analysis - TB Column Base Plates	Closed	CR	10/20/2014	10/20/2014	10/22/2014
<p>From: Webcor Construction LP Gregory Kemerer</p>						
<p>REQUEST:</p> <p>This is a confirming RFI following our October 9, 2014 structural coordination meeting. The following items / actions were discussed:</p> <ol style="list-style-type: none"> 1. For anchor bolts that do not clash with the column base plates but are out of AISC tolerance thus limiting the ability to adjust for structural steel fabrication and erection tolerances, the EOR takes no exception to modifying the base plate holes in the shop or field to suit the as-built anchor bolt position. 2. The EOR takes no exception to reducing the size of the plate washers above and below the horizontal stiffener/anchor plate in the column. This will be done to clear the fillet weld for the vertical stiffener below the horizontal anchor plate and to allow for consistent plate washer sizes. The plate washers will be larger than the major diameter of the anchor nuts. The attached spreadsheet details the sizes we will use at each location. 3. The EOR takes no exception to adding a spacer plate below the horizontal anchor plate and above the nut at the 2-1/2" anchor rod locations where necessary. This is necessary to accommodate out of tolerance anchor bolts so that the nut can clear the fillet weld between the horizontal anchor plate and the vertical stiffener below. <p>Please confirm the above items.</p>			<p>ANSWER:</p> <p>This is a confirming RFI following our October 9, 2014 structural coordination meeting. T-1778	SCS - Ground, Second, Bus, and Roof Level Concrete Placement Sequence	Closed	01	10/06/2014	10/16/2014	10/13/2014
From: Webcor Construction LP Claude Titcher						
REQUEST:						
Reference attached sketch.						
Steel erection begins in Area C01, which is between gridlines 10-11.						
1) The construction Joints in the trainbox walls do not line up with gridlines. Is it acceptable to align the fourth lift foundation wall construction joints with gridlines? Note that ground level slabs will also follow this layout as shown in the attached sketch.						
2) WOJV believes that the formed and metal deck concrete at ground level GL 10-11 needs to be placed before pouring any other metal decks above this level. Please confirm this is correct. If required to place more east/west concrete at ground level prior to placing decks above, please provide requirements.						
3) Please provide the required cure time of ground floor concrete before the placing of concrete in metal decks above ground level can be poured.						
4) Once the ground level concrete reaches required strength is it acceptable to pour the 2nd level, bus deck level (1st 10" thick slab only), and roof level consecutively with no cure time requirement between deck pours?

To clarify the applicability of the reference code, Skanska's fabricator has provided details on the fabrication of the column assemblies:</p> <ul style="list-style-type: none">· The web welds (splices) are welded first and NDT is performed- no access holes needed at ends of welds.· Web plates are fit/assembled to flanges.· Flange to web welds are made - again, no access holes are required.· There is no welding being performed through access holes for these conditions. <p>There is no code or project requirement to install weld access holes given the order of operations. AWS D1.1, Section 2.8.2 addresses weld transition from full penetration to fillet welds as required on these flange to web welds.</p> <p>Given that the three welds are not done concurrently, please confirm that it is acceptable to eliminate unnecessary access holes.</p>						
T-1791	SCS - Foundation Wall Telecom Sleeve Elevations	Closed	01	10/06/2014	10/16/2014	10/15/2014
From: Webcor Construction LP Claude Titcher						
REQUEST: <p>Reference 4/TE1-5200, 1/TE1-8007 and 2/TE1-8007</p> <p>Attached slab edge drawing note lateral locations of telecom sleeves through the foundation wall. Section detail 2/TE1-8007 depicts two embedded sleeves, one directly above the other, alongside the moment frame beams. Details 4/TE1-5200 and 1/TE1-8007 detail the corresponding opening for TSER room to lie between the moment frame beams. Elevations for the foundation wall telecom sleeves are not provided in the above drawings.</p> <p>Please provide elevations for the foundation wall telecom sleeves.</p>

T-1793	SCS - Exposed Concrete Roof Perimeter Wall Per ASI 0124	Closed	01	10/07/2014	10/17/2014	10/10/2014
From: Webcor Construction LP Claude Titcher						
REQUEST: RFI # T-1697 requested confirmation for the use of snap ties for perimeter wall, scallop wall, and sky light wall locations. TJPA answer: "The Design Team does not object to the use of Snap-off ties only at skylight wall locations." Spec 031001 - 2.2 B. 7. h. allows the use of snap ties for walls that will not be exposed. Architectural drawings AI-5002 and AI-8604 -through 8613 shows the roof level perimeter walls and seismic walls as not being exposed due to the GFRC fascia prior to ASI 0124. Questions: 1. Please confirm that per ASI 0124 the concrete roof perimeter walls/scallops will now be required to meet the specification requirements for exposed concrete walls. 2. Please confirm that the concrete roof perimeter walls/scallops will not need to meet requirements for cast-in-place architectural concrete. T-1796	SCS - Sky Light Embed Layout Dimensions	Closed	01	10/07/2014	10/17/2014	10/07/2014
From: Shimmick Construction Company, Inc. Henry Chiang						
REQUEST:			ANSWER:			
After searching through sky light drawings AI-8401 through AI-8479 and SI-8000 through SI-8020 Shimmick was not able find information providing the sky light attachment to top of wall embed sizes, anchor bolt length, and spacing of embeds. For the central sky light from grid line 19.1 to 22 on page A 1-8451 which shows the structural truss frames for the sky light, which determines the embed layout, the truss frames are called out as equally spaced between each grid line. This does not give you the complete perimeter and requires too many assumptions. Also on AI-8401Note2. Dimensional control sub part A. "Dimensional control shall be derived from the three dimensional (3D) computer model and the two dimensional (2d) drawings." Sub part B. "See sheet AI-0009 for an index of 3D models". The 3D models referenced on AI-0009 are models that Shimmick TG07 Superstructure currently does not have access to. Shimmick would prefer to have the embed information on a drawing sheet equivalent to what is provided for the roof park railing details on sheets AI-8680 to AI-8685. T-1801	BGP - D201&202 RCS-1 & RCS-7 Reinforcing Steel Field Change Confirmation	Closed	01	10/09/2014	10/19/2014	10/14/2014
From: Webcor Construction LP Claude Titche						
REQUEST:						
Please confirm the following: 1. Arrangement of RCS-1 top reinforcing hooks at the west foundation wall may be per the attached sketch. 2. Matching hooks may be spliced to RCS-7 top reinforcing above the knockout wall to conform to Detail 4/S1-3204. 3. Minimum splice length for RCS7 hooks is acceptable at 76" based on a 23" embedment of the typical bar into the foundation wall. 4. RCS-7 hooks may be omitted where congestion results in inadequate clear spacing. All such locations will be reviewed by the Structural Field Representative before inspection. 5. Top formsaver in Detail 4/S1-3204 may be relocated immediately below the top reinforcing of B60 to reduce top steel congestion in RCS-7.

	<p>Once the first pair of cross lot struts have been de-stressed and removed, the WOJV installed survey points (targets) on the inside face of the soldier beams of the CDSM shoring wall, the Global Analyzer and Arup inclinometers would measure internal bracing performance over the following 24 hours after de-stressing. If little or no movement has been recorded, the contractor can then proceed and begin de-stressing and removing the next pair of wailers and struts to the east. Contract Specification 31-09-13 would be followed in case of movement, and the work would stop and the MRP Movement Review Panel would be convened.</p> <p>Please note the following:</p> <p>1) The east end rebracing sequence indicated in this RFI is the same rebracing sequence that has previously been implemented in Zone 4 for Level D bracing removal as described in RFI T 1558.</p> <p>2) The east end rebracing sequence is also the sequence performed successfully in west end of the transit center excavation Zone 1.</p> <p>3) The east end rebracing will have raker bracing similar to the west end, the east end does again have additional reinforcing bar in structural concrete walls where rebracing rakers are supported per details on sheet SH-5301 in Submittal TG0300-553.</p> <p>4) The east end rebracing cross-lot or perpendicular sections are in accordance with submittal TG0300-553 and as has previously and successfully re-braced in zones 1, 2, and 3.</p> <p>If acceptable, please specify 1) the movement tolerance for a given waler removed, 2) the observation period for analyzing movement, and 3) the acceptable means for monitoring for movement (survey, inclinometer, or both).</p>					<p>would be de-stressed and removed at any one time. T-1838	SCS - 4th Lift Foundation Wall - Moment Frame Beam Alignment	Closed	01	10/22/2014	11/01/2014	10/31/2014
From: Webcor Construction LP Claude Titché						
REQUEST:		ANSWER:				
See attached sketch. This RFI is related to RFI T-1467.		See attached sketch. This RFI is related to RFI T-1467.				
Ground level moment frame beams tie into the foundation wall. Due to level shoring towers, the moment frame beams will be step in elevation. The level moment frame beams will be interfacing with the sloped 4th lift foundation wall causing issues in alignment and constructability in the remaining foundation wall. SCCI proposes to have the top of 4th lift be 3'-11" below top of slab. This method will clear the alignment issues, provide a starter wall edge and will result in a 1" ± 1/4" encroachment of 4th lift wall into the moment frame beam. SI-4205 Detail I EBF LINK BEAM DETAIL Note, "Welded, bolted, screwed or shot-in attachments for perimeter edge angles exterior facades, Partitions, duct work, piping or other construction shall not be placed within protected zone.		SI-4205 Detail I EBF LINK BEAM DETAIL Note, "Welded, bolted, screwed or shot-in attachments for perimeter edge angles exterior facades, Partitions, duct work, piping or other construction shall not be placed within protected zone.				
Please confirm that it is acceptable to use Dayton C68-TY-Down Hanger's hooked to the back of the EFB link beam at the protected zone. This would provide an attachment point for temporary access Dayton C49 brackets. Once the deck and wall are poured the attachment coil rod will be removed and the C68 will remain in the concrete hooked to the EFB link beam. T-1875.1	SSS - ST401 Slab Opening Dimension Clarifications From: Webcor Construction LP Andrew Kitchen	Closed	01	01/22/2015	02/01/2015	01/30/2015
REQUEST: Contract Doc Ref: T-1875, S1-2304 (ASI 128) Location: GL 15-16 Add'l Doc Ref: CD RFI 672.1 SK1 The noted W33 beams were located 9" from the edge of slab opening. ASI-127 revised the dimensions from the edge of opening to the W33's as shown. RFI T-1875 confirmed that the beams may remain where they were prior to ASI-127 but the edge plates are to be moved to suit ASI-127. That will result in the slab opening dimensions changing to what is shown in blue. Confirm that is the intent.		ANSWER: Contract Doc Ref: T-1875, S1-2304 (ASI 128) Location: GL 15-16 Add'l Doc Ref: CD RFI 672.1 SK1 The noted W33 beams were located 9" from the edge of slab opening. ASI-127 revised the dimensions from the edge of opening to the W33's as shown. RFI T-1875 confirmed that the beams may remain where they were prior to ASI-127 but the edge plates are to be moved to suit ASI-127. That will result in the slab opening dimensions changing to what is shown in blue. Confirm that is the intent.

T-1892	SCS - CDSM follow up question in response to RFI#T-1655 answer	Closed	01	11/06/2014	11/16/2014	11/06/2014
From: Shimmick Construction Company, Inc. Henry Chiang						
REQUEST:			ANSWER:			
RFI T-1655 SCS -0013 Response provided the following: A. Confirmed notching depths with an updated sketch. B. Referenced ASI 123 roadway at curb (low point) elevations to be used to calculate notching elevation. Shimmick was the able to determine cut elevations for Minna Street from grid line 1 to grid line 18. CI-2001 shows extent of below grade train box and shoring wall at STA: 2+30.85. Using the same reference point on CI-4001 to determine the North West corner of the shoring wall in relation to roadway stationing Shimmick was then able to follow the south flow line proposed grade profile as the bottom of curb elevation for the south side of Minna Street elevations. T-1902	SST - Terrazzo Tread Clarification From: Webcor Construction LP REQUEST: One of the specified terrazzo tread suppliers, Wausau, has indicated that using only marble chips in the aggregate mix for the terrazzo stair treads is "unusual" as per Spec Section 09 66 14, section 2.4.C. Olson Steel priced the terrazzo stair treads from Wausau per this spec. Please confirm the design intent does not include any glass/mirror into the aggregate mix. Under Spec section 09 66 23 Epoxy Terrazzo Flooring, section 2.3.B.5 the terrazzo stair landings are specified to use an aggregate mix of 50% recycled glass/mirror and 50% natural marble/stone. The aggregate mix for the landings differs from the tread; please confirm this was the design intent.	Closed	CR	11/08/2014	11/18/2014	12/11/2014

T-1906	SCS - RCS 2 Splice Layout Requirements	Closed	01	11/13/2014	11/23/2014	11/21/2014
From: Webcor Construction LP Claude Titché						
REQUEST:			ANSWER:			
See attached markup of S1-3500 including detail 1/S1-3001 showing the rebar splice schedule. S1-3500 has been marked up with dimensions showing typical MFB span (6 eq spans in between 42' 6" grids). CJs will be placed in the span west of each grid. The requirements for rebar splices and CJ placement are shown. Two conflicts are noted below, involving the RCS 2 slab's #5 top layer of rebar. T-1910	BGP - As-Built Condition of Rebar Dowels for Shear Walls W390B and W390D	Closed	01	11/14/2014	11/24/2014	11/17/2014
<div><div>From: Webcor Construction LP</div><div>Claude Titcher</div></div>						
REQUEST:			ANSWER:			
<p>SCCI recently performed an as-built survey of the western-most Shear Wall rebar dowels for the 3rd Lift that were cast into the 2nd Lift Shear Walls and Lower Concourse. These dowels dictate the western face of the 3rd Lift Shear Walls as well as a couple of columns on the West Throat Slab and a B130/B131 Beam alignment. Out of the walls that were surveyed, two of the walls had rebar dowels that were several inches to the west of where they should have been. Based on the results shown in the attached drawings, please confirm that the resulting as-built conditions are acceptable for construction:</p> <ol style="list-style-type: none">1. Encroachment of the western faces of W390B and W390D into the adjacent corridor.2. New location of C19 Column above W390B (roughly 8" to the southwest in alignment with the western face of W390B below).3. New alignment of B130/B131 Beam below the Vehicle Ramp as a result of the new C19 Column location above W390B			<p>SCCI recently performed an as-built survey of the western-most Shear Wall rebar dowels for the 3rd Lift that were cast into the 2nd Lift Shear Walls and Lower Concourse. T-1930.1	SSS - Stud Spacing Detail	Closed	CR	12/18/2014	12/28/2014	12/29/2014
From: Webcor Construction LP Gregory Kemerer						
REQUEST: Contract Doc Ref: 1/S1-5000 Location: Bus Deck Grid Line: Throughout Add'l Doc Ref's: The response to RFI T-1930 item 2(C) indicated that if studs are required where there is no rib over the beam due to flange plates, studs should be welded to the flange plates and centered on the beam. On the gusset plate on the SLRS framing at the bus level, the 12" studs indicated will project through the topping slab. The decker can provide 10" studs at no additional cost but these will only project 1-3/4" into the topping slab and not meet the 2" min requirement. If a custom stud length is required the decker will have additional material and labor costs as the stud welding equipment will need to be modified to shoot the custom length stud. Please confirm it is acceptable to use 10" studs at the flange plates. ANSWER:

Contract Doc Ref: A1-2862, A1-2864, A1-2867

Location: Zone 1 to 4, Ground Level

Gridline: B/1.4-2, B/15-16, C.3&F.7/33-34

Add'l Doc Ref: N/A

Please see attached slab edge plan drawings with markings of slab opening curbs.

The elevations are not provided for the curbs around the following openings:

- North and South Service Vault openings noted on Drawing AI-2867
- Diesel Fuel Fill openings on Drawings AI-2862, AI-2864

SCCI requires confirmation on curb elevations in order to appropriately plan for construction of openings on the ground level.

Please provide top of curb elevations for Diesel Fuel Fill opening curbs and the North & South Service Vault opening curbs.

ANSWER:

Contract Doc Ref: (ASI 128 dated 12/16/14)
Specification Section 13 34 24
Sheet E1-2310
Sheet E1-2306
Sheet E1-2502

Location: N/A

Closest Column Line Intersection: N/A

Add'l Doc Ref's: N/A

Specification Section 13 34 24 (2.3) N Prefabricated Guard Booths indicates that Sheets E1-2310, E1-2306, and E1-2502 are to be used for installation of electrical within the prefabricated guard booths.

Sheets E1-2310, E1-2306, and E1-2502 show the electrical for prefabricated guard booths as home runs to electrical panels within electrical rooms not integrated with the booths.

Specification Section 13 34 24 (3.2) C indicates that there is to be a single booth panel board.

Please revise the electrical drawings to show a single booth panel board which feeds all electrical to the booth, or revise the specification to agree with the drawings.

T-2054	SCS - Step in CIP Slab at GL G, Zone 1 and 2	Closed	01	01/05/2015	01/15/2015	01/15/2015
From: Webcor Construction LP Claude Titcher						
REQUEST:			ANSWER:			
Contract Doc Ref: 1/S1-3700, 2/S1-3702, 4/A1-2863, and S1-1003. Location: Zone 1, 2 Grid Line: G Add'l Doc Ref's: Attached mark-ups Please find attached detail 1/SI-3700, 2/S1-3702, 4/A1-2863, and S1-1003. The elevation difference between the noted bottom of step and top of slab at Gridline G averages less than 4" per detail 1/S1 3700. The elevation difference required in detail 2/S1-3702 is nearly 1". See 4/A1-2863 markups attached noting the contract elevations provided. These small, top of slab differences will require an additional set of formwork and slow the schedule. Note that the slab steps will be later covered in 18" of asphalt as noted in S1-1003 and the concrete steps will not be seen. Please confirm the following is acceptable: 1. Eliminate the first step at Gridline G in Zones 1 and 2 by sloping the top of CIP slab to the elevation of the metal deck slab, as shown in attached detail 1/S1-3700. 2. Eliminate the step in 2/S1-3702 by sloping the slab to meet the elevation at the top of step. This would be applicable for all locations where this detail and similar occur. T-2055	SCS - Cast In Place Bus Crash Rail Detail	Closed	01	01/06/2015	01/16/2015	01/07/2015
From: Webcor Construction LP Claude Titcher						
REQUEST: Contract Doc Ref: S1-8000 ASI 127 Location: Bus Deck Grid Line: N/A Add'l Doc Ref's: N/A Reference attached markups on Sheet S1-8000 of ASI 127 1) The CIP Bus Deck Crash Rail detail is currently shown as poured monolithic with the structural topping slab of the Bus Level composite deck. For forming reasons it isn't practical to place this wall with the same pour as the deck it sits on. Please confirm if the horizontal keyed joint for the crash rail can be relocated to the top of the structural deck as shown in the attached markups or advise how else the detail may be modified to separate vertical and horizontal elements. 2) It appears the highlighted rebar callout of #5 @ 8" OC EF (Total) is a transcription typo. Please confirm the note should read #5 continuous EF?

Reference S1-2304 for the ground level bollard pit (South of GL G, between GL 14 and 15). Per approved submittal TG0702-027, the beam soffits are typically level in the east-west direction. The slab soffit slopes in the east-west direction. In the ground level bollard pit area, maintaining both the level beam bottoms and the sloping soffit will result in a reveal in the bottom of the concrete beams. See the attached sketch noting the expected 3/8" beam reveal.			Reference S1-2304 for the ground level bollard pit (South of GL G, between GL 14 and 15). T-2141	SST - Stair and Railing Mock-Up Location From: Webcor Construction LP Claude Titcher REQUEST: As discussed in Olson Steel's QA-QC Meeting of Mutual Understanding on 12/23/14 with Turner/WOJV, and again in Olson's Preparatory and Initial DFOV meetings on 1/5/15, it was agreed that the Stair and Tailing Mock-up (One complete floor to floor exit stair mock-up complete with landing and railing per 05 51 00, 1.8 Quality Control, Part C) will encompass the Stair #403 stringers and landings from the Train Platform EL.-20'-0" to EL -18'-7 1/8". Olson Steel is currently fabricating this mock-up, and as agreed with Turner/WOJV, the mock-up will be fully assembled in Olson's San Leandro shop for the Design Team to review. This RFI is being submitted for record to revise the location of the mock-up to Olson's fabrication shop in San Leandro, CA. Since the mock-up is an actual portion of Stair #402, a secondary review can take place if needed once the stair is installed onsite. Please confirm this is acceptable.	Closed	01	01/29/2015	02/08/2015	02/10/2015
		ANSWER: As discussed in Olson Steel's QA-QC Meeting of Mutual Understanding on 12/23/14 with Turner/WOJV, and again in Olson's Preparatory and Initial DFOV meetings on 1/5/15, it was agreed that the Stair and Tailing Mock-up (One complete floor to floor exit stair mock-up complete with landing and railing per 05 51 00, 1.8 Quality Control, Part C) will encompass the Stair #403 stringers and landings from the Train Platform EL.-20'-0" to EL -18'-7 1/8". Olson Steel is currently fabricating this mock-up, and as agreed with Turner/WOJV, the mock-up will be fully assembled in Olson's San Leandro shop for the Design Team to review. This RFI is being submitted for record to revise the location of the mock-up to Olson's fabrication shop in San Leandro, CA. Since the mock-up is an actual portion of Stair #402, a secondary review can take place if needed once the stair is installed onsite. Please confirm this is acceptable.				
T-2142	SSS - Approval Comment Clarification at Beam Connection GL29-30 From: Webcor Construction LP Stephanie Azzolino REQUEST: Contract Doc: 1/S1-5012, S1-2306 Location: Zone 4, Ground Level Gridline: D.8 /29 - 30 Add'l Doc Ref's: CD RFI #753 SK1, TG0701-135 The attached CD RFI #753 SK1 references Shop drawing 7094 from submittal TG0701-135 where TT commented "Copying of bottom flange not acceptable". Contract Doc Ref: S1-6005, S1-6006 Location: GL 23 Add'l Doc Ref: AWS D1.1						Contract Doc Ref: S1-6005, S1-6006 Location: GL 23 Add'l Doc Ref: AWS D1.1
<p>Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. Pipe has been ordered and delivered in conformance with this specification. Detail 6/S1-6006 shows the intended fit between the vertical pipe legs and the cast nodes. The castings have a machined feature on each nozzle end that is intended to slide into the pipe ends and act as a backing ring. The corresponding weld between these two components is called out as a complete joint penetration weld in the same detail. In accordance with AWS D1.1 Section 5.22.1.1, the separation between faying surfaces of butt joints landing on a backing shall not exceed 1/16". The allowable tolerances for API 5L Grade X52 pipe do not require concentricity (between internal and external bores) or even a constant wall thickness that would be required by AWS D1.1 to provide a complete joint penetration weld. Further, there is no requirement in the contract documents for additional machining to the internal bores of the pipe ends as would be required by AISC Code of Standard Practice.</p> <p>As a result our fabricator has encountered the following conditions;</p> <ol style="list-style-type: none">1. Pipe does not fit over the machined backing ring at the cast node nozzle end as intended without additional grinding and/or machining2. Pipe fits over cast node backing ring; however, pipe ID is not circular or concentric, resulting in excessive gaps that exceed fit tolerance requirements for a complete joint penetration weld. Further, the lack of concentricity may result in misalignment of the pipe and cast nodes in the vertical legs.3. Ring pipe segments will be made from different pipe sections. Pipe ends from such sections will have varying and unmatched IDs again inhibiting the installation of a tight fitting backing ring required to complete a CJP. <p>For demonstration please refer to attached SK RFI 1015 SK 1 and SK 2 which shows actual dimensions for the first pipe section cut by our fabricator (p16056) and corresponding measurements from cast nodes 702-01 and 702-02 machined backing ring (see attached sketches).</p>						<p>Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. 	<p>The sketches compare the measured pipe ID to the cast node backing ring OD. This piece does not fit against either of the cast nodes.</p> <p>To resolve these issues we see the following options / solutions;</p> <p>1. Grind internal bores of pipe ends to allow fit against castings. This option would not permit the completion of complete joint penetration welds so the CJP weld designation requirement would have to be modified to a PJP by the design team. Gaps exceeding PJP allowances would have to be built up with weld metal. Please note; however, that this option does not ensure a correct alignment between the vertical pipe and cast nodes.</p> <p>2. Machine internal bores of pipe ends to ensure a tight fit against the castings and correct alignment between the pipe and castings. The actual machining work to achieve this would be minimal; however, building machining fixtures and set up time for each pipe end would be significant</p> <p>3. For pipe to pipe welds in the ring sections, we suggest removing the CJP weld designation.</p> <p>Please advise or provide a solution as the above options have cost and schedule impacts.</p>

Ref spec section Elevators 14-21-00 Dated December 16, 2014 and RFI 2242 response.		Ref spec section Elevators 14-21-00 Dated December 16, 2014 and RFI 2242 response.				
After review with current scope phasing as of ASI 128, WOJV is unable to confirm with the elevator contractor whether this dimensional deviation will be workable as elevator PE203 is not in the current project. Can the as built condition in RFI 2242 be accepted and incorporated into design and as-built drawings for Phase 2 buyout of this future elevator? Based on normal clearances typically incorporated into the sizing of elevator shafts their internal guiderail supports, it is anticipated this should be feasible. T-2258	BGP - Bike and Vehicle Ramp Column Reinforcing Termination	Closed	01	02/18/2015	02/28/2015	02/19/2015
From: Webcor Construction LP Claude Titcher						
REQUEST:			ANSWER:			
Contract Doc Ref: S1-2251 Location: Bike/Vehicle Ramp Grid Line: N/A Add'l Doc Ref's: Attached			Contract Doc Ref: S1-2251 Location: Bike/Vehicle Ramp Grid Line: N/A Add'l Doc Ref's: Attached			
Rebar for the columns and pilasters in the Bike and Vehicle Ramp were fabricated and installed per the TG0600-331.1 shop drawing submittal. The shop drawings show the column rebar for the C37 columns extending past the ramp slab with couplers for future connection. It was later discovered after pouring the B301 and V301 slab that these columns are meant to terminate below the slab per 2/S1-3303. Please confirm the following actions are acceptable for the 3-C37 columns:			Rebar for the columns and pilasters in the Bike and Vehicle Ramp were fabricated and installed per the TG0600-331.1 shop drawing submittal. The shop drawings show the column rebar for the C37 columns extending past the ramp slab with couplers for future connection. It was later discovered after pouring the B301 and V301 slab that these columns are meant to terminate below the slab per 2/S1-3303. Please confirm the following actions are acceptable for the 3-C37 columns:			
1. C37 at GL J/4: Cut column bars only that fall outside of partition wall 2" below TOC. Incorporate column bars that are that are within partition wall to partition wall reinforcing. Install partition wall formsavers over column with 48" embedment.			1. C37 at GL J/4: Cut column bars only that fall outside of partition wall 2" below TOC. Incorporate column bars that are that are within partition wall to partition wall reinforcing. Install partition wall formsavers over column with 48" embedment.			
2. C37 at GL G/3: Cut column bars only that fall outside of partition wall 2" below TOC. Incorporate column bars that are within partition wall to partition wall reinforcing. Install (5) Ushaped caps bars transverse to the beam framing to match the column verticals: Dimensions approximately B=28, C=I 9, D=28. Install partition wall formsavers over column with 28" embedment (just above last pour).			2. C37 at GL G/3: Cut column bars only that fall outside of partition wall 2" below TOC. Incorporate column bars that are within partition wall to partition wall reinforcing. Install (5) Ushaped caps bars transverse to the beam framing to match the column verticals: Dimensions approximately B=28, C=I 9, D=28. Install partition wall formsavers over column with 28" embedment (just above last pour).			
3. C37 at GL F.4/4: Cut column bars that are outside of partition wall at top of lowest tie set. Incorporate column bars that are within partition wall to partition wall reinforcing. Pour concrete cap on pilaster falling outside of partition wall at some future date providing 1-1/2" cover to highest reinforcing. Ghost partition wall formsavers over column.			3. C37 at GL F.4/4: Cut column bars that are outside of partition wall at top of lowest tie set. Incorporate column bars that are within partition wall to partition wall reinforcing. Pour concrete cap on pilaster falling outside of partition wall at some future date providing 1-1/2" cover to highest reinforcing. Ghost partition wall formsavers over column.			
Also please confirm it is acceptable for the C14 column at GL X/H.5 to be poured monolithically with the 5000 PSI ramp slab and wall mix per Submittal TG0600-204 from the top of Lower Concourse (EL -5' -5") to the top of the Bike Ramp 8302 Slab (EL 7'-3").			Also please confirm it is acceptable for the C14 column at GL X/H.5 to be poured monolithically with the 5000 PSI ramp slab and wall mix per Submittal TG0600-204 from the top of Lower Concourse (EL -5' -5") to the top of the Bike Ramp 8302 Slab (EL 7'-3").

T-2282	TTC - Wall Thickness Contradiction	Closed	CR	02/23/2015	03/05/2015	03/08/2015
From: Webcor Construction LP Stephanie Azzolino						
REQUEST:						ANSWER:
Contract Doc: S1-2351;A-0022; A1-2963 Location: Zone 1, Ground Level Gridline: D-F/4-7 Add'l Doc Ref's: Virtual Building CR #112						Contract Doc: S1-2351;A-0022; A1-2963 Location: Zone 1, Ground Level Gridline: D-F/4-7 Add'l Doc Ref's: Virtual Building CR #112
See attached Virtual Building CR #112.						See attached Virtual Building CR #112.
There is a contradiction between the structural floor plan (S1-2351) and the architectural plans (A1-2862; A1-2963). The CMU walls are annotated with 12" wide on the architectural plans. The A1-2862 slab edge plan refers to the structural plans. The structural plan (S1-2351) shows 8" and 12" CMU walls in this area .The actual thickness of walls are 7 5/8" and 11 5/8" in the wall schedule (A-0022). Using actual wall thicknesses results in different dimensions on the architectural plan (A1-2963).						There is a contradiction between the structural floor plan (S1-2351) and the architectural plans (A1-2862; A1-2963). The CMU walls are annotated with 12" wide on the architectural plans. The A1-2862 slab edge plan refers to the structural plans. The structural plan (S1-2351) shows 8" and 12" CMU walls in this area .The actual thickness of walls are 7 5/8" and 11 5/8" in the wall schedule (A-0022). Using actual wall thicknesses results in different dimensions on the architectural plan (A1-2963).
Issue with 12" concrete walls is solved, but S1-2351 (03/31/14, ISSUED FOR CONSTRUCTION) still includes noted 12" CMU walls. The 8" CMU still do not have dimension. ASI128 does not solve the issue.						Issue with 12" concrete walls is solved, but S1-2351 (03/31/14, ISSUED FOR CONSTRUCTION) still includes noted 12" CMU walls. Please find attached Mageba's RFI and Technical Proposal.		Please find attached Mageba's RFI and Technical Proposal.				
1. In the attached technical proposal Mageba have considered the maximum load stated at static, even though the isolators can handle the load at maximum displacement. For dynamic displacement, Mageba have indicated the maximum load possible considering the need for re-centering capabilities of the devices. This consideration had been done due to the following reasons:		1. In the attached technical proposal Mageba have considered the maximum load stated at static, even though the isolators can handle the load at maximum displacement. For dynamic displacement, Mageba have indicated the maximum load possible considering the need for re-centering capabilities of the devices. This consideration had been done due to the following reasons:				
- The nominal friction coefficient of Robo Slide for these devices is approximately 4.0%. considering the loads indicated in the specification, in case of displacement, such loads multiplied by the friction coefficient would be too high., and the static re-centering will not be possible, especially due to the relatively small displacements.		- The nominal friction coefficient of Robo Slide for these devices is approximately 4.0%. considering the loads indicated in the specification, in case of displacement, such loads multiplied by the friction coefficient would be too high., and the static re-centering will not be possible, especially due to the relatively small displacements.				
- After reviewing the design of the pendulum isolators, we Mageba, found that the only way Mageba can ensure re-centering is by adjusting the displacement to 5.9 inches, where we would have re-centering with the proposed maximum loads under seismic conditions.		- After reviewing the design of the pendulum isolators, we Mageba, found that the only way Mageba can ensure re-centering is by adjusting the displacement to 5.9 inches, where we would have re-centering with the proposed maximum loads under seismic conditions.				
The maximum loads proposed for these isolators under seismic conditions and displacement of 5.9 are: Type A: 1,708 Kips Type B: 1,236 Kips		The maximum loads proposed for these isolators under seismic conditions and displacement of 5.9 are: Type A: 1,708 Kips Type B: 1,236 Kips				
- Note that for horizontals loads, the proposed devices would actually reach the minimum displacement for 4" with the requested maximum horizontal force, which are: Type A: 125 Kips Type B: 90 Kips		- Note that for horizontals loads, the proposed devices would actually reach the minimum displacement for 4" with the requested maximum horizontal force, which are: Type A: 125 Kips Type B: 90 Kips				
However please note that due to the short displacement, high loads and friction coefficient, the static re-centering will not be fulfilled, only the dynamic re-centering would be ensured.		However please note that due to the short displacement, high loads and friction coefficient, the				
Please confirm if the loads indicated are acceptable or

ANSWER:

Contract Doc: A1-8634; A1-8630; A-0002
Location: Zone 3, Roof Park Level
Gridline: F-H/21
Add'l Doc Ref's: Virtual Building CR #641

Please see attached Virtual Building CR #641.

Missing dimensions of laminated glass beams (marked yellow) from the Roof Park Cafe on the W-20 Cafe Roof Plan (2/A1-8630) and Roof Edge Section @ Gutter (2/A1-8634). (The detail plan about roof edge (A1-8639; marked red and yellow) are missing from our drawings, but the drawing index shows it on the sheet A-0002. It was reported in CR#279.)

The missing dimensions are scaled from the Roof Edge Section @ Gutter(2/A1-8634). They are indicated on the screenshots with red.

The A1-8634 sheet is not included in ASI 128 package. The latest version of A1-8634 (rev #0 03/31/14 IFC) does not show the missing dimensions.

Please provide a revised sheet A1-8634 including the missing dimensions.

T-2341	TTC - Contradicting Wall Types	Open	01	03/11/2015	03/21/2015	
From: Webcor Construction LP Julia John						
REQUEST:						
Contract Doc: 1/A1-9012; 4/A1-9352 Location: Zone 1, Second Level Gridline: C.3-D/8-9 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #221						
See attached Virtual Building PH3(ASI)-CR #221.						
There is a contradiction between 1/A1-9012 and 4/A1-9352. The 1/A1-9012 shows a type 8W(marked with yellow) and a type 6(marked with green) wall but the 4/A1-9352 detail shows a type 8 and a type 7 wall at the same places. The 4/A1-9352 detail shows CC2 curb below the wall 8 and CC1 curb below the wall 7 but the 1/A1-9012 shows CC curbs below both.						
Walls and curbs will be created according to the 1/A1-9012 plan.						
Please provide correct wall and curb type.						
ANSWER:						
Contract Doc: 1/A1-9012; 4/A1-9352 Location: Zone 1, Second Level Gridline: C.3-D/8-9 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #221

T-2350	SCS - Beam B141 Corbel Support at West Foundation Wall	Closed	01	02/26/2015	03/08/2015	03/08/2015
From: Webcor Construction LP Claude Titcher						
REQUEST:			ANSWER:			
Contract Doc Ref: A1-2251, S1-3411 Location: West Foundation Wall Grid Line: GL V Add'l Doc Ref's: Attached			Contract Doc Ref: A1-2251, S1-3411 Location: West Foundation Wall Grid Line: GL V Add'l Doc Ref's: Attached			
See attached S1-2251 and S1-3411 regarding the Beam B141 corbel support at west foundation wall. Sheet SI-2251 indicates that the B141 beams intersect the west foundation wall at an angle. The B141 beams are 4' -0" wide. Because the beams frame into the wall at an angle, the connection widths at the wall for the two beams are about 4' 1 1/2" and 4' 3 3/8". Detail 10/SI-3411 indicates the end support width as 4'-0". A rebar detail similar to Section F on Detail 10/S1-3411 is required for the 4' 1 1/2" and 4' 3 3/8" end conditions.			See attached S1-2251 and S1-3411 regarding the Beam B141 corbel support at west foundation wall. Sheet SI-2251 indicates that the B141 beams intersect the west foundation wall at an angle. The B141 beams are 4' -0" wide. Because the beams frame into the wall at an angle, the connection widths at the wall for the two beams are about 4' 1 1/2" and 4' 3 3/8". 	<p>into the Lower Concourse. At the south boundary column depicted in Detail 5/S 1-3204, #7 formsavers were installed in lieu of the required matching #10's. Additionally, some of the required starter bars do not fall within the boundary column envelope. Please confirm that it will be acceptable to use a combination of existing #7 formsavers and drilled-and-bonded #7's to reestablish the starter bar layout. All four of the southernmost dowels are to be fully developed. Of these four, two will be developed into existing form saver sockets and the remaining two will be drilled and bonded to a 22" embedment. The remaining (4) boundary column starter bars will be drilled and bonded to 7-7 /8" embedment or developed into existing formsaver sockets (see attached sketch). The south face of boundary column will fonn the face of corridor as shown on Sheet No. CD-3a in the rebar shop drawings TG0600-374.1. Additionally, there is conflict in the number of boundary reinforcing bars as shown on Detail 5/S1-3204 and Elevation A/S1-3203. Please confirm that only (8) bars are required and that the longitudinal tie in the center of the wall in Detail 5/S1-3204 is not required.</p> <p>2. North Pilaster: Formsavers for the northern-most pilaster were installed in the Lower Concourse 4" to the south of where they needed to be. Please confirm it is acceptable to drill and epoxy #9 dowels at 10 1/8" embedment so the pilaster can be poured in the correct location (see attached sketch).</p> <p>3. 2nd Northern-most Pilaster: Formsavers for the 2nd northern-most pilaster were not installed. In order to accommodate the horizontal bars for the East Ramp Wall, please confinn it is acceptable to drill and epoxy #9 dowels at 10 1/8" embedment in the configuration shown in the attached sketch.</p> <p>4. Formsavers Without Proper Clearance: Per a walk with the SEOR, please confirm it is acceptable to abandon 9 select formsavers in the Lower Concourse out of the 160 vertical dowels in the East Ramp Wall due to clearance issues. Dowels will be installed at abandoned formsaver locations similar to RFI T-2065 and spacing of the vertical dowels will not be more than 16".</p>

See attached Virtual Building PH3(ASI)-CR #584.		See attached Virtual Building PH3(ASI)-CR #584.				
There are contradicting information on Train Platform Level Mech. Room and Sections (B/A1-9226). Typical CMU Details (2/S1-9003) defines the type of the Concrete LID which is S1. Typical Metal Deck Details (2/S1-5000) defines the thickness of Concrete LID which is 7 1/2". If the Concrete LID is modeled according to the dimension line (marked with red arrows) it will be higher than the elevation line shows. If the Concrete LID is modeled according to the elevation line (marked with green arrow) it will be lower than the dimension line shows: 15' 9 1/2" instead of 16' 0".		There are contradicting information on Train Platform Level Mech. Room and Sections (B/A1-9226). Typical CMU Details (2/S1-9003) defines the type of the Concrete LID which is S1. T-2419	ELV- Telecommunication Underground Pull box	Open	CR	03/13/2015	03/23/2015	
From: Webcor Construction LP Justin Graham						
REQUEST: Contract Doc Ref: (ASI 128/TE-0010, TE1-2602 thru TE1-2607/27 05 33) Location: Zone 02 - 07, Level Roof Park Closest Column Line Intersection is N/A Add'l Doc Ref's: N/A Per the response to RFI T-2158, it states "Please read specification 27 05 43 Section 2.1 A-G for Underground vault and pull box sizes. Use appropriate size unit for number of conduits and cables." The specification 27 05 43 section 2.1 C-G list different dimensions for vaults and pull box. Based on the RFI response, it is unclear if this symbol "U", as shown on the legend (TE-0010), only represents a pull box. Fisk is not the designer and therefore will need to know what type of box is required for each location shown on the plans. Please advise.						
						ANSWER: Contract Doc Ref: (ASI 128/TE-0010, TE1-2602 thru TE1-2607/27 05 33) Location: Zone 02 - 07, Level Roof Park Closest Column Line Intersection is N/A Add'l Doc Ref's: N/A Per the response to RFI T-2158, it states "Please read specification 27 05 43 Section 2.1 A-G for Underground vault and pull box sizes. Use appropriate size unit for number of conduits and cables." The specification 27 05 43 section 2.1 C-G list different dimensions for vaults and pull box. Based on the RFI response, it is unclear if this symbol "U", as shown on the legend (TE-0010), only represents a pull box. Fisk is not the designer and therefore will need to know what type of box is required for each location shown on the plans. Please advise.
T-2420	TTC - Missing Information and Contradiction	Open	01	03/13/2015	03/23/2015	
From: Webcor Construction LP Julia John						
REQUEST: Contract Doc: A1-7821 Location: Ground Level Gridline: Global Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #257 See attached Virtual Building PH3(ASI)-CR #257. The 4/A1-7821 plan shows a type 3 wall but it does not have any information about the place of wall. The detail shows there should be a curb below the wall but according to the A1-2867 plan the curb has an exact position that is why the curb could not be below the type 3 wall even though the 4/A1-7821 shows this. The wall will be modeled 2-1/4" distance from the face of the elevator wall and the type 3 wall will float. Please confirm.

T-2455	ELV - 600V Wire and Cable Quality Assurance Clarification	Open	CR	03/16/2015	03/26/2015	
From: Webcor Construction LP Aseem Goyal						
REQUEST:		ANSWER:				
Contract Doc Ref:[ASI 128/26 05 19] Location: Zone[N/A], Level [N/A] Closest Column Line Intersection is [N/A] Add'l Doc's Ref's: N/A		Contract Doc Ref:[ASI 128/26 05 19] Location: Zone[N/A], Level [N/A] Closest Column Line Intersection is [N/A] Add'l Doc's Ref's: N/A				
The contract specification Section 26 05 19 for the 600 Volt wire and cable, under Article 1.3 Quality Assurance; states that wire and cable shall be of the same manufacturer for the project duration. Multiple manufacturers shall not be permitted.		The contract specification Section 26 05 19 for the 600 Volt wire and cable, under Article 1.3 Quality Assurance; states that wire and cable shall be of the same manufacturer for the project duration. Multiple manufacturers shall not be permitted.				
Based on the listed manufacturers provided within this specification section, the contractor view's Article 1.3 to mean that all cable shall be from one manufacturer for each type of cable listed, not a sole source for the entire list of cable. This would mean that all THHN or THWN shall be from a single manufacturer, all RHH/RHW-2 cable would be form a single manufacturer, as well as all Metal clad cable would be from a single manufacturer. We believe that this is the intent as Division 25 and 27 outline other manufacturers for the various other cables such as CAT 5 and CAT6.		Based on the listed manufacturers provided within this specification section, the contractor view's Article 1.3 to mean that all cable shall be from one manufacturer for each type of cable listed, not a sole source for the entire list of cable. This would mean that all THHN or THWN shall be from a single manufacturer, all RHH/RHW-2 cable would be form a single manufacturer, as well as all Metal clad cable would be from a single manufacturer. We believe that this is the intent as Division 25 and 27 outline other manufacturers for the various other cables such as CAT 5 and CAT6.				
Based on the specification there is no one single cable manufacturer that can produce all of the specified cable. Therefore the contractor, will be submitting on multiple manufacturers for each type of cable, and once approved the contractor will select a single manufacturer for each type of cable and will only procure and install the selected single manufacturer for each type of cable throughout the project. Fisk standard submittal packages will at a minimum include three manufacturers, who are either listed or an approved equal. We would like to continue with this standard policy in order to avoid having one manufacturer as a sole supply source. Please confirm this as acceptable. Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #138		Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #138				
See attached Virtual Building PH3(ASI)-CR #138.		See attached Virtual Building PH3(ASI)-CR #138.				
The architectural floor plan A1-3005 refers to the partition detail 1/A1-9858. This plan shows the operable partition, but the structure of the operable partitions are not clear (the expandable panel nose is missing, the panel thickness is not marked, the references on plan are incorrect - marked with red fill). Some note on the plan A1-9858 refer to structural details, but the structural plans does not show anything in this area. Some note on the plan A1-9858 refer to structural details, but the structural plans does not show anything in this area.				
The operable partitions are not modeled. There is a wall with the type 20D (marked with blue) above the operable partition which was modeled according to the section 3/A1-9858(the section number is incorrect - see the PH3-CR#127 issue). The bottom elevation of 20 D wall is 5'-6" AFF which was scaled from the section 3/A1-9858. The dimensions shown on the last screenshot will be used to model the wall on the floor plan. TRANSWORLD 038	Concrete mix design for concrete repair work	Closed	CR	06/08/2011	06/18/2011	06/08/2011
From: Webcor Construction LP David Hungerford						
REQUEST: This is to respond to submittal title TA1010.S-5000.A01 Rapid Set for Concrete Repair (TCI #31) Please identify a product or a custom mix design that would meet these specifications. In our past practice we have successfully used the suggested grout product as a concrete patch. In our investigations with suppliers and other contractors, it seems that the general conclusion is that using a grout product (such as the one proposed) would be the appropriate product for this application and condition. The proposed grout seems to offer greater strength and structural performance than the original concrete that has since been removed. Is there another product that you could identify that would achieve these specifications? Since we are not the project designers, we can only suggest those products that would generally be used and accepted in our standard of practice It was based on this standard of practice that we submitted the RapidSet grout product. U-0066.1	Minna St Station 2+09 - 4in Water Service Lateral Encountered	Closed	03	01/10/2011	01/20/2011	01/14/2011
From: Webcor Construction LP Jason Dunne						
REQUEST: Reference Sheet U-3107 and Trinet RFI 059.1 This is a follow up to the engineer's response to Trinet RFI #59 (RFI#U-0066). Upon further evaluation of the 4" fire service connection at 83 Minna by Tom Farhnam (SFWD Senior Inspector), the water department proposed the attached installation detail for an 8"x4" tee in the 8" main, to be performed by Trinet, and the connection detail to the existing 4" service, to be performed later by the SFWD crew. This change was proposed to avoid conflicting utilities running along the south side of teh new 8" main. AECOM's Design Engineer, Eric Zagol, was advised of the changed design plan proposed by SFWD in the field on 12/28/2010. Please confirm if the attached plan is acceptable and approved for construction.

U-0072	Fremont St traffic Signal Pole to be removed and salvaged - has Muni Cable attach	Closed	03	01/10/2011	01/20/2011	01/18/2011
From: Webcor Construction LP		David Hungerford				
REQUEST:		ANSWER:				
Reference Sheet U-3302 and Trinet RFI 65		Reference Sheet U-3302 and Trinet RFI 65				
Per contract, Trinet is required to remove and salvage the existing light pole indicated in the attached drawing. Through observation in the field, the existing light pole has a MUNI cable attached which runs to the intersection of Fremont St. and Mission St.. Based on these findings, should the light pole be removed as indicated? Mario Saldana from W/O was present when this item was observed and issue has been discussed with Eric Zagol from AECOM. U-0075	Water Main Connection at 2nd St and Minna St - expose new line for SFWD	Closed	03	01/11/2011	01/21/2011	01/12/2011
From: Webcor Construction LP Mario Saldana						
REQUEST:						
Reference Sheet U-3107 and attached photos						
At the intersection of 2nd St and Minna St, there is an existing 2in gas line running directly on top and next to the existing 8in main to be tied into. SFWD cannot make the Tee connection due to the bells of the fittings with the 2in gas line so close.						
The end of the new line installed by Trinet will need to be exposed about 2ft for SFWD to move the end of the line by 1ft east so that SFWD can make the connection without moving the gas line. This will require extra work for Trinet to expose the new line for SFWD. Eric Zangol from AECOM and Dan Helminiak from SFWD were present during the discussion of this issue.						
Please provide direction as soon as possible as this will impact the chlorination and tie-in schedule.

U-0080	Proposed Design Change for MH #501	Closed	03	01/17/2011	01/27/2011	01/28/2011
	From: Webcor Construction LP Nhi Tran					
	REQUEST: Reference Sheet U-2021 and attached drawings Trinet proposes to change the design of sewer manhole #501 from a Modified Box Manhole (per SF Standard Plan #87,184) to a Precast Concrete Manhole (per SF Standard Plan #87,181 - see attached drawing). The proposal includes the installation of a temporary 24" PVC pipe stub, extending south from the manhole and connected to the brick sewer per SF Standard Plan #87,197. The proposed manhole design will facilitate construction around the many utilities identified in the excavation - see RFI # U-0021 (Trinet RFI 04). It is also the preferred manhole design for 24in pipe per the SF Standard Drawings, especially since the brick sewer on the south side will later be abandoned and plugged (in the manhole) by the owner. This plan will also facilitate the later abandonment of the outlet to the south, as the owner will just have to plug the 24in outlet pipe and not a 3x5 brick sewer. Please consider. An expedited response is requested. U-0080.1	Proposed Design Change for MH #501	Closed	03	02/09/2011	02/18/2011	02/22/2011
From: Webcor Construction LP Nhi Tran						
REQUEST: Reference Sheet U-2021, RFI #U-0080, and attached drawings In response to the Engineer's concerns with the number and size of pipes in Trinet's original revised detail for MH 501 (RFI#U-0080), Trinet has changed their proposed installation drawing to include a 5' I.D. cast-in-place MH base. The lower precast section of the MH will be 5' I.D., with a precast reducer section transitioning from 60" to 48" I.D. placed above. Attached is the revised drawing for MH 501 and shop drawings for the precast MH sections. The design was discussed with Cliff Wong from the SF Bureau of Engineering, Hydraulics Department, and he did not have a problem with a 5' I.D. manhole. Trinet requests an expedited response. U-0084	Water Main Alignment on Beale Street	Closed	03	01/21/2011	01/31/2011	01/25/2011
From: Webcor Construction LP Nhi Tran						
REQUEST:						
Reference Sheet U-3124						
M Squared potholed at Sta 1+10 on Beale Street. We discovered that the 10in High pressure water line is 9ft-5in from the FOC. The existing 12in water line is 14ft-8in from the FOC. The 10in High Pressure line is closer to the FOC that shown on contract drawings. This now means that there is a larger window between the 10in high pressure water and the existing 12in water main.						
M Squared would like to install the new 12in water line at 12ft-3in from center line of the pipe to the FOC. This would mean the new 12in water line would be outside the parking strip and the parking strip would stay in tact. SFWD would also prefer it outside the parking strip for maintenance purposes.						
Please confirm that it is acceptable to install the new 12in water line at 12ft-3in from FOC, going from Sta 0+60 to Sta 1+90.

	<div><div>REQUEST:</div><div>Reference Sheet U-3125 and attached sketch</div><div>The existing 4no. 4in AT&T lines on Beale Street at Sta 6+10 are not as shown on the contract drawings. See attached sketch. Contract drawings show the conduit crossing M Squared's trench for 6 or 7 feet, however the duct bank is in the trench for 37 feet due to the alignment and width of the duct bank. The conduits are covered with a 2 foot wide concrete cap and appear in the trench for the new 12in water main at Sta 6+12 before leaving the trench at Sta 5+75. M Squared cannot lay the pipe on top of the concrete cap as the pipe will not have the required coverage. Due to this M Squared is unable to install the new 12in water as shown. Juan with AT&T advised that M Squared remove the concrete cap from the conduits to allow for excavation of this portion of trench. With the cap removed it is more likely that the pipe will have the necessary minimum coverage. Please confirm that this is how M Squared is to proceed. An expedited reponse is requested.</div></div>

REQUEST:			ANSWER:			
Reference San Francisco Standard Specification Section 703.08, attached			Reference San Francisco Standard Specification Section 703.08, attached			
Trinet requests authorization from the Engineer to compact the sewer trench backfill sand by jetting in accordance with the San Francisco Standard Specification Section 703.08.			Trinet requests authorization from the Engineer to compact the sewer trench backfill sand by jetting in accordance with the San Francisco Standard Specification Section 703.08.			
The native material along Minna, which Trinet is re-using for trench backfill, is a clean well grade dune sand. Trinet believes jetting is an ideal method of compaction for this type of material. It is also an effective means of compacting the sand around the top and sides of the pipe without disturbing the pipe, and backfilling any voids left from removal of the shoring or that might have formed behind the shoring. This method of compaction is commonly utilized in San Francisco for sewer projects in similar ground conditions. U-0088	Minna St 18in Sewer Conflict with PG&E MH#1355 at STA 1+77	Closed	03	01/28/2011	02/07/2011	03/24/2011
From: Webcor Construction LP Nhi Tran						
REQUEST:			ANSWER:			
Reference Sheet U-2007 and attached drawings			Reference Sheet U-2007 and attached drawings			
During layout for the installation of the new 18in Sewer Main on Minna St., Trinet observed that the alignment of the 18in Sewer Main is in conflict with existing PG&E MH #1355 at STA 1+77.50, which is to remain in place. The center line of the new sewer main is 0.10ft north of the outside edge of the manhole wall, as depicted in the attached drawing. The north side wall of the manhole is constructed on top of the existing 3ft x 5ft brick sewer. The brick sewer structure extends approximately 16in into the vault along its entire length. The brick sewer therefore cannot be demolished without undermining the north wall of the electric vault. Eric Z. of AECOM was notified of this issue via phone call on 01/21/2011. U-0090	46 Minna St 6in Fire Service Connection	Closed	03	02/01/2011	02/11/2011	02/03/2011
From: Webcor Construction LP Nhi Tran						
REQUEST:		ANSWER:				
Reference Sheet U-3108 and attached sketch and photos		Reference Sheet U-3108 and attached sketch and photos				
The original plan for connection of the 6in Fire Service Lateral @ 46 Minna St. was to leave the existing 6in gate valve (which is located at FOC) in place and connect the new 6in fire line to the downstream side of the old valve (See attached photo and sketch). This plan was proposed by SFWD inspectors, Tom Farhnam and Dan Helminiak, at a field meeting on 12/28/10. On Friday 1/28/11 the SFWD, plumbers when taking measurements for the tie-in, proposed a different plan. They want to extend the new 6in fire line beyond the curb and into the basement, and connect to the homeowners fire line inside the basement (under the sidewalk). They want to extend the new 6in fire line beyond the curb and into the basement, and connect to the homeowners fire line inside the basement (under the sidewalk).				
Note: This will require coordination with building owner to put a hole through their foundation. Layout and a detail would need to be provided for the wall penetration, as well a detail to plug the hole where the existing water line is entering the basement. 	<p>Webcor/Obayashi has received Bid Addendum #1 for the TG04.2R bid. As part of this addendum, note number 8 under "General Notes" on sheet U-0008 is deleted. This note had previously placed a constraint on the AWSS construction schedule that the Mission Street work must be complete prior to cutting both the Beale Street and the 1st Street lines. It was acceptable to abandon one or the other prior to the Mission Street work but not both.</p> <p>Based on the deletion of this note, it is our understanding that there is no schedule constraint on any of the AWSS system modifications other than the cutting & capping procedures at 1st Street and Beale Street which are required for construction of the TTC Building. Please confirm.</p>					
U-0093	46 Minna 6in FS Water & 1in Copper Water Service Lateral at STA 5+17 Tie-In	Closed	03	02/03/2011	02/13/2011	02/07/2011

U-0111	Minna St. Joint Trench Conflict with (E) 8" elbow and thrust block	Closed	CR	03/04/2011	03/14/2011	03/09/2011
From: Webcor Construction LP Nhi Tran						
REQUEST:						
Reference drawing sheet U-3409 and attached sketch.						
During our excavation for the joint trench on the east end of Minna St. (STA 9+29) Trinet encountered the (E) 8" water main in Trinet's trench line, approximately 1 foot from our termination point. The existing alignment is different from what is shown in the contract drawings. The drawings do not show the water line crossing the joint trench. The alignment and grade of the water main changed in Trinet's excavation to avoid the adjacent catch basin. A 22.5 degree elbow is located in the center of the joint trench excavation. The elbow is rolled up to accommodate the grade change and there is a thrust block under the footing. Trinet does not believe that it would be safe to excavate under the water main for Trinet's duct bank without having the line shutoff. Extending the PG&E ducts to FOC will also place the connection point for PG&E's extension of the duct bank directly under the water main fittings and elbows. There is adequate clearance to install the 4" gas line above the water main and extend it out to FOC per contract. The top of the water main is 49" below FG at the south side of the joint trench, at the location of the ags line.						
Trinet proposes to terminate the concrete encased duct bank approximately 5 ft. back from FOC. This would allow adequate room for Trinet to mandrel the ducts after the joint trench is installed without undermining the water main. PG&E could then extend their duct bank under the water main to connect to Trinet's water main. Please advise.

U-0129	Sewer Conflicts @ Second and Natoma	Closed	03	04/13/2011	04/25/2011	04/28/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST: M Squared is unable to excavate/shore/install the 18" VCP from the existing manhole at Sta 0+45 to MH#301 at Sta 0+81 as shown on sheet U-3010. While excavating for the sewer installation M Squared encountered several unknown utilities which were unmarked and not shown on the contract drawings. Also, some of the known utilities are at different locations and elevations than indicated on the drawings. Due to the quantity and proximity of these utilities it is not possible to excavate and shore between MH#301 and the existing MH at Sta 0+45. Additionally PGE have yet to relocate their gas and electric utilities out of the area of the proposed MH#301. See attached drawings illustrating M Squared's pothole findings. Please advise on how to proceed.						ANSWER: M Squared is unable to excavate/shore/install the 18" VCP from the existing manhole at Sta 0+45 to MH#301 at Sta 0+81 as shown on sheet U-3010. While excavating for the sewer installation M Squared encountered several unknown utilities which were unmarked and not shown on the contract drawings. Also, some of the known utilities are at different locations and elevations than indicated on the drawings. Due to the quantity and proximity of these utilities it is not possible to excavate and shore between MH#301 and the existing MH at Sta 0+45. Additionally PGE have yet to relocate their gas and electric utilities out of the area of the proposed MH#301. See attached drawings illustrating M Squared's pothole findings. Please advise on how to proceed.

U-0131	Minna St PG&E Duct Bank Termination Points From: Webcor Construction LP Colin Azevedo REQUEST: PG&E has confirmed Trinet is to terminate the PG&E duct back 3' outside the east and west walls of manhole 1319. Please confirm that the termination points of the PG&E duct bank as described will fulfill Trinet's scope of work and the future completion of the duct bank will be performed by PG&E. Please note terminating the duct bank 3' outside the west wall of MH 1319 will leave the end of the ducts directly under the 24" high pressure water main. This may create an issue with future access for complete the duct bank by PG&E. Please advise.	Closed	03	04/19/2011	04/29/2011	04/22/2011
U-0132	Minna St Sewer Pressure Test From: Webcor Construction LP Colin Azevedo REQUEST: The SFDPW inspector Jason Chin has advised Trinet that he will be requesting a pressure test of the newly installed 18" and 24" VCP sewer main. The contract specification and drawings to do not specify any form of testing for the sewer mains. Please advise if pressure testing of the sewer main will be required. U-0139	Existing Water Line on Beale in Conflict with New Sewer	Closed	03	05/09/2011	05/09/2011	05/10/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST: Today while trying to execute the USAR for the existing 12" water line on Beale Dan Helminiak with SFWD informed Webcor/Obayashi and M Squared that the existing water line will remain active until the water tie in at First and Natoma is completed and the existing 8" is capped at First and Howard as shown on sheet U-3116. The water tie in and capping of the existing line on First Street is currently being delayed by separate issues and it is unclear when this work will be completed. Dan Helminiak suggested that the existing 8" water line running down Howard could be capped by the water department at one of the existing tees which would allow the decommissioning of the existing line on Beale. Please advise.		ANSWER: Today while trying to execute the USAR for the existing 12" water line on Beale Dan Helminiak with SFWD informed Webcor/Obayashi and M Squared that the existing water line will remain active until the water tie in at First and Natoma is completed and the existing 8" is capped at First and Howard as shown on sheet U-3116. U-0143.1	(E) PG&E Duct Bank from EMH #1320 to Demolished EMH #1355	Closed	03	06/14/2011	06/24/2011	06/14/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST: After further investigation of the existing PG&E duct bank between EMH #1320 and demolished EMH # 1355 (@ Anchor & Hope), Trinet found that there is only one unobstructed conduit between the two manholes. The unobstructed conduit is the one that already had a pull rope in place. Trinet had demolished a section of this conduit during excavation for sewer MH # 201 because it was in conflict with the shoring. Trinet replaced the damaged section (approx. 8 LF) on Saturday 6/1, and reconnected the pull rope in the conduit run. A sketch of the conduit run, depicting the section replaced, is attached. Please review and advise if one 4" conduit will be adequate from EMH #1320 to the west end of demolished EMH #1355. U-0149	MH#701 Conflicts with existing utilities	Closed	03	05/27/2011	06/06/2011	06/09/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST:			ANSWER:			
The 14" AWSS line west of MH#701 was found to be constructed thru the roof of the existing 3x5 sewer. Several bends were used in the AWSS line construction and these bends included lugs and tie rods. As a result of the presence of these tie rods and fittings we can now not move MH#701 any further west. To install the new 24" VCP in a straight line (perpendicular to MH wall), and in order to get by the existing PGE MH we will have to pour the pipe wall and 2" of the internal diameter of the pipe into the west wall of MH 701. Please advise on how to proceed.			The 14" AWSS line west of MH#701 was found to be constructed thru the roof of the existing 3x5 sewer. U-0151	Additional Sewer Lateral Connection for 100 1st Street	Closed	03	06/02/2011	06/12/2011	06/08/2011
From: Webcor Construction LP Colin Azevedo						
REQUEST:			ANSWER:			

<i>Number</i>	<i>Subject</i>	<i>Status</i>	<i>Choice Required</i>	<i>Date Created</i>	<i>Date Required</i>	<i>Date Answered</i>
U-0151.1	Additional Sewer Lateral Connection From: Webcor Construction LP Jonathan Flaming REQUEST: This is a follow-up to the request by the Engineer in his response to W/O RFI #U-0151 (Trinet RFI #097) for additional information relating to the 2nd sewer lateral connection for the 100 1st St building. Trinet also clarifies the issue of the existing 4" trap on the line, which was raised in the original RFI. The sewer lateral is located @ Stn. 7+09 and the invert elevation of the 4" cast iron sewer lateral pipe at face-of-curb is 14.6'. The elevation for the top of the new concrete encased ductbank @ Stn 7+09 is 13.85'. The sewer lateral was therefore not in conflict with the new joint trench utilities. With regards to the existing 4" trap on the line, Trinet checked with the SF Plumbing department which advised that a 4" cast iron trap was adequate for a 4" sewer lateral. The existing trap was therefore in compliance with the SF plumbing code. Trinet advised Jason Chin of this in the field and he agreed that the trap did not need to be replaced. The 4" cast iron vent pipe for the trap did not extend to street level but was capped-off approximately 18" below grade. Per field discussions with Jason Chin, Trinet	Closed	CR	06/29/2011	07/09/2011	07/05/2011

U-0182.3	AWSS - Design Route at 2nd Street Intersection	Closed	CR	02/06/2013	02/16/2013	02/28/2013
From: Webcor Construction LP Jackson Tukuafu						
REQUEST: Per the response to RFI U-0182.2, M Squared has field verified a new alignment for the 16" AWSS at 2nd & Mission St. (See attached drawing). Due to several PG&E conflicts this is the only available route capable of accepting a 16" pipe; M Squared is unable to locate an alignment per the sketch attached to the response to RFI U-0182.2. By proceeding with this alignment M Squared will again return the AWSS pipe through the structure of an AT&T vault and a PG&E Vault. It does not appear from our field work that there are other options for a workaround. Based on information M Squared currently have attained from the trenching; restraining each joint, per the original contract will require the following: <ul style="list-style-type: none">- 4 additional 16-inch 45deg bends- 2 additional 16-inch 90deg bends- 1 additional 16-inch bell collar- 15 additional stop collars					ANSWER: Per the response to RFI U-0182.2, M Squared has field verified a new alignment for the 16" AWSS at 2nd & Mission St. (See attached drawing). Due to several PG&E conflicts this is the only available route capable of accepting a 16" pipe; M Squared is unable to locate an alignment per the sketch attached to the response to RFI U-0182.2. By proceeding with this alignment M Squared will again return the AWSS pipe through the structure of an AT&T vault and a PG&E Vault. It does not appear from our field work that there are other options for a workaround. Based on information M Squared currently have attained from the trenching; restraining each joint, per the original contract will require the following: <ul style="list-style-type: none">- 4 additional 16-inch 45deg bends

REQUEST:						ANSWER:
Refer to drawing MA-3 and MA-13						Refer to drawing MA-3 and MA-13
Please refer to previous RFI 182 series for history.						Please refer to previous RFI 182 series for history.
As M Squared must connect to an existing 16" line at 2nd & Mission Street, M Squared performed additional trenching which has now opened up the possibility of a different and more straight forward alignment for 2nd Street piping.						As M Squared must connect to an existing 16" line at 2nd & Mission Street, M Squared performed additional trenching which has now opened up the possibility of a different and more straight forward alignment for 2nd Street piping.
This new alignment shall replace the alignment sent in the previous RFI-0182.3.						This new alignment shall replace the alignment sent in the previous RFI-0182.3.
1. Please confirm the new alignment shown in the attached M Squared sketch SK-008.3 is acceptable. 2. Please confirm where the 16" to 12" reducer is to be located. The location of this reducer will decide whether M Squared will need to purchase two (2) more 16" 45-deg elbows or 12" 45-deg elbows.						1. Please confirm the new alignment shown in the attached M Squared sketch SK-008.3 is acceptable. 2. Please confirm where the 16" to 12" reducer is to be located. The location of this reducer will decide whether M Squared will need to purchase two (2) more 16" 45-deg elbows or 12" 45-deg elbows.

U-0228.1	AWSS - Sidewalk Expansion between First Street and Beale Street	Closed	CR	02/07/2014	02/17/2014	02/24/2014
From: Webcor Construction LP Jackson Tukuafu						
REQUEST:		ANSWER:				
As per RFI response to U-0228, the "TJPA has not received confirmation from the SFPUC that the new AWSS service can be installed per the contract drawings," due to the following purported sidewalk expansion between First Street and Beale Street:		As per RFI response to U-0228, the "TJPA has not received confirmation from the SFPUC that the new AWSS service can be installed per the contract drawings," due to the following purported sidewalk expansion between First Street and Beale Street:				
"Per the attached email it appears that the City's intent is to move the curb lines south between First St & Fremont by 3' and also between Fremont & Beale Street by 4'.		"Per the attached email it appears that the City's intent is to move the curb lines south between First St & Fremont by 3' and also between Fremont & Beale Street by 4'.				
First to Fremont St - In moving out the curb line by 3' the AWSS Line on this block will be pretty close to being under the new curb line, therefore making any maintenance of the AWSS line in the future very difficult. There would also be an impact to the gate valve location on the east side of the 1st and Mission intersection and the west side of Fremont & Mission due to the new curb coming south. It is possible a modified roof to the vault would be required as half of the vault would be in the street and another half would be in the sidewalk (judging from rough field measurements). The AWSS Fire hydrant would also need to be relocated as it would now be in the middle of a widened sidewalk, whereas the distance acceptable is 24" to 26" from FOC.		First to Fremont St - In moving out the curb line by 3' the AWSS Line on this block will be pretty close to being under the new curb line, therefore making any maintenance of the AWSS line in the future very difficult. U-0230	REQUEST: Reference: Attached Photo Please confrim that the new 16" AWSS is acceptable to be in the position shown as there is not the required clearance with the PGE vault #1329	Closed	01	07/18/2013	07/28/2013	07/19/2013
	ANSWER: Reference: Attached Photo Please confrim that the new 16" AWSS is acceptable to be in the position shown as there is not the required clearance with the PGE vault #1329					
U-0230	AWSS - AWSS Vault at 2nd Street From: Webcor Construction LP Jackson Tukuafu	Closed	01	07/18/2013	07/28/2013	07/19/2013
	REQUEST: Due to the grade of the 16" AWSS gate valve, combined with the valve actuators the roof of the AWSS valve vault at 2nd Street will not be under the surface of the street. Previous AWSS valve vaults have 2" AC/8" concrete street base on top of the roof of the vault. If M Squared installs the vault roof and then covers it with 2" AC then there is a danger that future contractors will saw cut through the roof of the vault while cutting out their trenches. Our suggestion is to pour the vault roof to the same grade as the current street surface on 2nd Street. There does not appear to be any room for adjustment here and we are unaware of any other options in this case. Please confirm it is acceptable to construct the vault roof in this manner, with a concrete broom finish.

U-0236	RUP - AWSS Pipe Configuration at PG&E Vault #1722	Closed	CR	12/10/2013	12/20/2013	12/19/2013
From: Webcor Construction LP Jackson Tukuafu						
REQUEST: See attached sketches. Due to the proximity of PGE's Vault #1722 to the new AWSS line M Squared believes the following changes are needed to keep all pipe joints and fittings outside the limits of existing utility vaults. M Squared proposes installing the 14" x 12" reducer further east, until we are outside the limits of the vault. The pipe between the new cross piece and the new reducer will be 14-inch pipe, rather than the 12-inch shown on the plans. M Squared will be able to eliminate the need for the 12-inch sleeve here and tie 12-inch pipe into the existing main from the reducer. All joints will be restrained using stop collars. Please confirm that this configuration is preferred to in lieu having fittings and joints within the limits of the PGE Vault. Please advise.						ANSWER: See attached sketches. It has not encroached on the AWSS Main alignment and there is enough clearance from AWSS main most of that time. It has impacted excavation but should not pose too much of a problem for pipe installation.			
2. PG&E Duct bank #2 sits on top of the existing 12" AWSS Main and runs directly on top of the AWSS Main for a large portion of the intersection. Due to this duct bank we are unable to excavate down to the AWSS Main, unable to remove pipe and will be unable to install new 16-inch AWSS.			2. PG&E Duct bank #2 sits on top of the existing 12" AWSS Main and runs directly on top of the AWSS Main for a large portion of the intersection. Due to this duct bank we are unable to excavate down to the AWSS Main, unable to remove pipe and will be unable to install new 16-inch AWSS.			
3. PG&E Duct bank #3 runs underneath the existing 12" AWSS main, it is concrete encased and part of the concrete encasement encroaches onto the existing 12" AWSS Main. This duct bank appears to leave our trench after 10ft or so.			3. PG&E Duct bank #3 runs underneath the existing 12" AWSS main, it is concrete encased and part of the concrete encasement encroaches onto the existing 12" AWSS Main. This duct bank appears to leave our trench after 10ft or so.			
Where duct bank #2 and duct bank #3 cross each other there is only 11-inch between the two duct banks. Not enough space to install a 16inch pipe with tie rods and stop collars. The AWSS is pinched between these 2 duct banks for approx. 10ft with one duct bank on top of the 12-inch main and one touching the main from underneath. While all duct banks impede us it seems there is a higher chance of making this work with the removal of duct bank #2. U-0248	AWSS - Restraints at the Intersection of Mission and Fremont St.	Open	CR	06/04/2014	06/14/2014	
From: Webcor Construction LP Lynn Kowallis						
REQUEST:						
Please refer to drawing MA-16 and M Squared Sketch-TG04.2-072.1 and TG04.2-072.2.						
Question #1 - Does every joint between the new GV west of Fremont Street, and the new 16"x10" tee in Fremont Street intersection need to be restrained with bell & stop collars? This distance is approx. 50ft. Question #2 - Currently there does not appear to be enough space to install the new 16" pipe WITH bell & stop collars through the utilities in the Fremont St intersection. There does appear to be space to install 16" pipe without the stop/bell collars on.						
- Our suggestion would be to install the 16"x10" tee and restrain that tee on one joint heading east. Install piping across the Fremont St intersection without stop/bell collars, delete the 16" GV at that location (we believe we will not be able to fit one anyway), and tie off the last piece of pipe coming into the hydrant tee east of Fremont Street.						
Please clarify if this is acceptable.

U-0249	AWSS - Hydrant Location at Fremont St.	Closed	CR	06/23/2014	07/03/2014	07/10/2014
From: Webcor Construction LP Jackson Tukuafu						
REQUEST:						
Please refer to drawing MA-15 and attached M2 sketch SK-TG04.2-073.						
1. Please confirm that it is acceptable to install the new hydrant at Fremont St. (Location #4, STA 12+50), 31" from face of concrete (FOC) at approx. STA. 7+15 on drawing MA-16. The revised location is a result of various conflict in the vicinity that prevent the hydrant from being installed as shown on MA-15. 2. Due to the 10" main being relatively deep, additional fittings will be required to install the hydrant at the revised location (STA 7+15). Please confirm it is acceptable to install the hydrant as shown in the attached sketch SK-TG04.2-073.						
ANSWER:						
Please refer to drawing MA-15 and attached M2 sketch SK-TG04.2-073.						
1. Please confirm that it is acceptable to install the new hydrant at Fremont St. (Location #4, STA 12+50), 31" from face of concrete (FOC) at approx. STA. 7+15 on drawing MA-16. The revised location is a result of various conflict in the vicinity that prevent the hydrant from being installed as shown on MA-15. 2. Due to the 10" main being relatively deep, additional fittings will be required to install the hydrant at the revised location (STA 7+15). Please confirm it is acceptable to install the hydrant as shown in the attached sketch SK-TG04.2-073.

U-182.5	Tie Back Requirements on 2nd Street	Closed	01	06/21/2013	07/01/2013	06/27/2013
From: Webcor Construction LP Jackson Tukuafu						

ANSWER:

See attached email from EOR.

M Squared has returned the 45deg bends to SFWD, and in turn we have procured 22deg bends for this location. As a result we must now replace and tie back a minimum of 18ft of new 10" Ductile Iron Pipe. As the existing 10" pipes are 12ft lengths we will have to remove 24ft (2 lengths) of pipe to expose the closest possible bell.

Please confirm this is the intention.

CR **06/15/2012** **06/25/2012** **06/18/2012**

ANSWER:

Please reference the attached COMM0999 provided to TCCO on Friday, June 6, 2012.

As outlined in M Squared's letter dated 6/8/12, M Squared realigned the AWSS main on Howard Street and repacked the lead joints (time card attached for reference). During the Hydrostatic Test by SFWD, the lead joint leaked and failed to hold the test eventhough it was repacked.

As a result, it has become apparent that the AWSS joints have been compromised. Please provide direction on how M Squared is to proceed the with next course of action.

Transbay Transit Center – San Francisco, CA

Noise and Vibration Mitigation Management Plan

Webcor/Obayashi

September 07, 2012

GENERAL:

The Webcor/Obayashi (W/O or CM/GC) Noise and Vibration Mitigation Management policy that will be implemented on the Transbay Transportation Center Project will be an overall project policy, with each Trade Subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to comply with Specification Section 00 08 13, 00 08 13/APB, the San Francisco Noise Control Ordinance, regulations and requirements and section 01 35 65, Specific Project mitigation measures and monitoring requirements as applicable to the various phases of work.

When required by the specifications, W/O will ensure its Trade Subcontractors comply with this plan as well as the San Francisco Noise Control Ordinance.

To expedite the project or minimize impacts, W/O will ensure that its Trade Subcontractors apply for written waivers of some of the noise requirements by application to the TJPA in accordance with Section 00 08 13 Specific Project Requirements when required by the specifications or contract. Written waivers shall be uploaded to Constructware by CM/GC. It is anticipated that some Work may require multiple shifts or for other reasons need to be performed outside of typical weekday daytime construction hours. Trade Subcontractors shall minimize construction activities during evening, nighttime, weekend, and holiday periods and shall obtain specific permits before performing construction in noise sensitive areas during these periods.

Night noise permits requests shall be submitted to the TJPA at least 7 days in advance of work. Noise permit request shall include:

1. Name of person in charge of work and phone number
2. Hours to be worked
3. Narrative of scope of work including necessity of doing work at night, maps, and truck routes
4. List of noise/vibration/light making equipment including make and model
5. Mitigation and monitoring methods being used

W/O will ensure that its Trade Subcontractors provide noise inspections and testing of equipment to ensure that all equipment onsite is in good condition and effectively muffled per manufacturer's recommendation. If inspection or testing documents are requested by the TJPA, or any of its representatives, W/O will require its Trade Subcontractors to provide requested documentation in a timely manner. Trade Subcontractors shall provide inspection and testing documents to CM/GC prior to start of work and as the equipment is replaced. CM/GC shall upload documents to a file location within Constructware.

W/O will ensure that its Trade Subcontractors minimize use of vehicle backup alarms and demonstrate how backup alarms will be minimized by using mitigation measures such as designing the construction site with a circular flow pattern that minimizes backing up of trucks and other heavy equipment. Trade Subcontractors shall submit quarterly reports of measures to reduce back up alarms. W/O shall upload these reports to a specific location within Constructware.

W/O will ensure that all its Trade Subcontractors' equipment onsite is equipped with broadband back-up alarms that will automatically adjust based on the ambient noise during nighttime hours (between 8 p.m. and 7 a.m.) when ambient noise is low. If safety considerations and applicable regulations will not allow use of broadband back-up alarms, Contractor shall request an exemption in writing to the TJPA

Representative including the applicable safety regulations (Cal/OSHA, OSHA). Trade Subcontractors shall comply with the TJPA's request for broadband back-up alarms for all work between 8 p.m. and 7 a.m. If requested by the TJPA or its representative, Trade Subcontractors shall provide W/O with equipment specifications showing broadband back-up alarms for submission via Constructware.

Through W/O's requirement of the submittals outlined in this noise and vibration plan, W/O will verify Trade Subcontractors' construction operations are performed in such a manner to minimize noise.

W/O will verify that its Trade Subcontractors perform noise monitoring to demonstrate compliance with noise limits and endeavor to minimize construction activities during off hours except for those required and deemed acceptable per the Contract Documents. Trade Subcontractors shall submit monthly monitoring reports to W/O for submission via Constructware.

W/O will verify Trade Subcontractors haul routes to ensure that they minimize noise intrusion into residential areas, and control noise during nighttime hours.

W/O will require all Trade Subcontractors to use procedures and equipment, when it would be effective, that produce lower noise levels than normal when required by the specifications or contract. W/O will require the Trade Subcontractor to submit manufacturer special noise control kit information. If none is available, then the Trade Subcontractor needs to submit a statement of this. Upon receipt and review of the information, W/O and the Trade Subcontractor will identify the events when the noise control measures should be used based on the specifications.

W/O will require all Trade Subcontractors plans to include use of temporary barriers near noisy activities as required by the specifications or contract. Such barriers shall be located close enough to the noise source to achieve noise attenuation. As necessary and when it is shown it would be effective, Trade Subcontractors shall construct shed-like structures or complete buildings to contain the noise from nighttime activities.

W/O shall require haul route map, plan and storage location to be part of Trade Subcontractor's plan and included within its submittal.

VIBRATION CONTROL

Vibration limits are based upon the Federal Transit Administration's Planning and Environment Transit Noise and Vibration Impact Assessment guidelines. W/O will require all Trade Subcontractors' to limit or prohibit use of construction techniques that create high vibration levels when it affects adjacent properties.

If construction techniques that create high vibration levels are used, W/O will require all Trade Subcontractors' to comply with the following additional restrictions:

1. Provide advance notice to TJPA of any vibration intensive activities. Perform vibration intensive activities only during daytime hours between 7 a.m. and 8 p.m. unless otherwise allowed by special permit or variance, as required by the specifications or contract. Perform vibration monitoring during vibration intensive activities during daytime hours between 7 a.m. and 8 p.m. unless otherwise allowed by special permit or variance, as required by the specifications or contract. Recorded data should be part of the Trade Subcontractor Daily report. A summary shall be submitted monthly and uploaded to Constructware.

2. Investigate alternative construction methods and practices to reduce the impacts if present and implement alternative methods and practices as reasonable.
3. Provide a plan to measure vibration levels including but not limited to measurement locations, times and metrics. Plan shall also include contingency plan if operations exceed the limits. This plan shall be uploaded into Constructware by W/O.
4. Limit or prohibit use of construction techniques that create high vibration levels.

Trade Subcontractors shall be responsible for providing technical information, as required by the specifications, in their plan. Trade Subcontractor's plan shall be submitted via Constructware for Record Only.

Transbay Transit Center – San Francisco, CA

Air Quality Plan

Webcor/Obayashi

January 16, 2012

GENERAL PLAN:

The Webcor/Obayashi (W/O) Air Quality Plan that will be implemented on the Transbay Transit Center Project will be an overall policy with each subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to comply with the Bay Area Air Quality Management District regulations and requirements.

W/O will require its Trade Subcontractors to establish a plan that complies with all requirements set for in specification sections 00 08 13, and 01 35 65 prior to starting Work onsite. W/O shall check and verify trade subcontractor's compliance with air quality requirements on a daily basis. Any non-compliant trade subcontractors will receive both verbal and written notice through Safe Site One (W/O internal program). Additional, W/O will require trade subcontractors to demonstrate they are actively monitoring air quality by providing checklists or documentation on each Trade Subcontractors daily report. W/O shall verify its Trade Subcontractors Air Quality plan includes the following but not necessary limited to:

1. Specific measures to minimize impacts to sensitive receptors associated with exposure to respirable nuisance dust (PM10) and achieve a goal of No Visible Emissions.
2. W/O shall verify Trade Subcontractors comply with City Dust Control Order (DPW Order No. 171,378. Water active construction areas at least twice daily to control dust using non-potable water in accordance with San Francisco Ordinance 175-91
3. Identify specific measures to minimize dust generation; to reduce health risks to workers and the public.
4. Mist the immediate excavation area with a water spray to prevent airborne dust particles. Perform continuous water spraying during dust-generating activities. Mist or spray in such a way as to prevent puddling or generation of runoff, which could potentially reach storm drains or catch basins.
5. Minimize the amount of excavated material or demolished debris stored at the Site. Remove excavated material and demolished debris, with the exception of hazardous materials or suspected hazardous materials, from the Site no later than the end of each workday. If hazardous materials or suspected hazardous materials are stored on site, store such materials in accordance with all applicable California Environmental Protection Agency regulations, including providing storage in proper containers and protection from exposure to the elements. Remove such materials from the Site as soon as possible for disposal or recycling in accordance with applicable laws and regulations.
6. Wet all exposed soil surfaces at least 3 times daily during dry weather or more frequently if dust is blowing or if required by the TJPA. Immediately wet sweep serpentine residuals from the street.
7. Keep the Site and adjacent areas clean and perform wet sweeping at the end of each shift. Sweep daily (with water sweepers) all paved access roads, parking areas and staging areas at construction sites. Sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public streets.
8. Load haul trucks carrying excavated material so that the material does not extend above the walls or back of the truck bed. Wet before covering and tightly cover the surface of each load before the haul truck leaves the loading area. Cover trucks hauling soil, sand, and other loose materials or require trucks to maintain at least 2 feet of freeboard
9. Clean up spillage on City streets, whether directly or indirectly caused by Contractor's operations.

10. Minimize use of on-site diesel construction equipment, particularly unnecessary idling. Shut off construction equipment to reduce idling when not in direct use. Where feasible, replace diesel equipment with electrically powered machinery.
11. Retain receipts of ultra-low sulphur fuel (ULSF) purchase and equipment tuning and repair and make these available to the TJPA Representative or to the Federal Transit Administration (FTA) designee upon request.
12. Locate diesel engines, motors, or equipment as far away as possible from existing residential areas.
13. Properly tune and maintain diesel power equipment. To manufacturer's specification and frequency.
14. Suspend grading operations during first and second stage smog alerts, and during high winds (i.e., winds greater than 25 miles per hour).
15. Upon completion of the construction phase, buildings with visible signs of dirt and debris from the construction site shall be power-washed and/or painted (provided that permission is obtained from the property owner to access and wash the property with no fee charged by the (owner). Trade Contractor shall request CMGC to contact Singer and Associates to notify property owners for access. If permission from property owners for access is not granted, Trade Contractor is not responsible for power-washing or painting.
16. Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites.
17. If applicable, replant vegetation in disturbed areas as quickly as possible.

W/O will verify Trade Subcontractors comply with the requirements of the Bay Area Air Quality Management District (BAAQMD) Regulation 6 (for particulate matter and visible emissions), Regulation 7 "Odorous Substances," Regulation 11 "Hazardous Pollutants," and the California Health and Safety Code Division 26 "Air Resource", Chapter 3 "Emission Limitations," Section 41700 "Prohibited Conduct," and related regulations. Trade Subcontractors shall notify the BAAQMD 10 working days prior to commencing demolition or hazardous materials abatement work.

1. Such notification shall include the names and addresses of operations and persons responsible; description and location of the structure to be demolished or altered including size, age and prior use, and the approximate amount of friable asbestos; scheduled starting and completion dates of demolition or abatement; nature of planned work and methods to be employed; procedures to be employed to meet BAAQMD requirements; and the name and location of the disposal site.
2. The BAAQMD randomly inspects removal operations and will respond to any complaints received. Contractor shall cooperate with and facilitate all BAAQMD authorized inspections.\
3. Notifications shall be documented and provided to CM/GC for submission to the TJPA via ConstructWare.

Trade Subcontractors shall be responsible for providing technical information, as required by the specifications, in their plan. All trade subcontractors plans shall be submitted for Record Only via ConstructWare.

Transbay Transit Center – San Francisco, CA

Waste Management and Construction Debris Plan Revision 6

Webcor/Obayashi
November 7, 2013

GENERAL PLAN:

Webcor/Obayashi Joint Venture (Webcor/Obayashi) understands that the building contractor plays a critical role in the management of jobsite produced construction waste. Webcor/Obayashi has adopted a waste reduction and recycling policy that will be implemented on the Transbay Transportation Center Project. This policy will be an overall policy with each subcontractor contributing their specific plan as they come on board to the project.

The primary goal of the plan is to divert as much construction generated debris & unused material from landfills as possible. At a minimum, Webcor/Obayashi and its trade subcontractors will divert 75% of the waste generated on the construction project from landfills. Trade subcontractors Construction Waste Management Plan shall be prepared and submitted in compliance with the Owner's LEED project requirements and the requirements of the City and County of San Francisco.

The Trade Subcontractors are required to comply with Specification Sections 00 08 15, 01 74

00, and 01 81 13 as well as any or all of the procedures listed below. If a conflict in percentages exists between this section and Section 01 81 13, General LEED Building Design and Construction Requirements, the most stringent section shall govern.

- Use of approved debris haulers with documented recycling levels.
- Source separated debris boxes will be provided onsite for mixed debris and recyclable items such as lumber and wood related products, dirt, concrete and asphalt, cardboard & metals.
- Trade Subcontractors are required to handle and dispose of any generated hazardous waste.
- Requesting Trade Subcontractors and vendors to utilize reusable packaging when possible.
- Trade Subcontractor shall provide a Construction Waste Management Plan.

All Trade Subcontractors shall develop their own Waste Management and Construction Debris Plan that complies with the Contract Documents and this plan. Trade Subcontractors shall submit this plan in accordance with the specifications and it shall become part of Webcor/Obayashi's overall project plan. All technical requirements defined in the contract documents shall be fulfilled by Trade Subcontractors and submitted to the Construction Management Oversight (CMO) For Record Only through ConstructWare

Webcor/Obayashi will ensure the Trade Subcontractors are effectively implementing the procedures and are in compliance with Specifications.

Webcor/Obayashi will verify that after Award of Contract and before commencement of the Work at the site, the Trade Subcontractor conducts a Reuse/Recycle Assessment as part of their Solid Waste Management Plan (SWMP): Trade Subcontractor's assessment shall

estimate the types and quantities of materials for the Project that are anticipated to be feasible for source separation for recycling or reuse, either onsite or offsite, and note the procedures intended for a recycling, reuse, and salvage program. Documentation of the trade subcontractor's plan shall consist of the following:

- Trade subcontractor and vendor waste management strategies.
- Trade subcontractor required to provide a monthly summary of the total waste material with backup documentation (weight tickets) if processed offsite.
- The amount recycled (in tons), material types, recycling procedures, and processing facility locations to which materials were diverted if processed offsite.

Trade Subcontractor's Construction Waste Management Plan shall also include estimated wastes, disposal, and handling with the following:

A. List of materials that comprise source separated materials include, but are not limited to:

- Concrete, Wood, Mud, Mixed Aggregates, Yard waste, Metals, and Cardboard.
- Yard waste is not included in our overall diversion rate calculation on the template or corresponding spreadsheet per the requirements from the LEED BD&C v3.0 Reference Guide.

B. List of materials that comprise Miscellaneous Construction Debris include, but are not limited to:

- Wood, Scrap Metal, Drywall, Plastics, Film Plastics, Wire, Cable, Glass.
- The total quantity estimated, inception to completion Disposal.
- Total Project Generation, Diversion + Disposal.
- Project Diversion Rate.

Webcor/Obayashi will verify that Construction and Demolition Waste; Non-hazardous solid resources resulting from Trade Subcontractor's construction, remodeling, repair, and demolition operations for the Project are properly transferred to a C&D Recycling Facility. The C&D Recycling Facility shall be a facility that receives only C&D (construction and demolition) material. Trade Subcontractors shall provide Webcor/Obayashi a summary sheet, including all receipts for transport materials each month with the progress billing if any materials are processed offsite.

Webcor/Obayashi will verify that of the inevitable waste generated, Trade Subcontractor's reuse, salvage, or recycle as many of the waste materials as economically feasible.

Webcor/Obayashi will participate/attend a meeting with Trade Subcontractor, the TJPA Representative and representatives of the City's Solid Waste Management and recycling programs prior to commencement of work. Webcor/Obayashi will

ensure all Trade Subcontractors are made aware of the LEED requirements for C&D diversion before being allowed to work on the site.

Webcor/Obayashi will verify that Trade Subcontractors submit a Monthly Disposal and Recycling Summary Report; quantifying the construction and demolition waste generated and recycled, reused or disposed of at Class 3 Landfill. Contractor shall also send a copy of this report to the TJPA Representative and the SWMP to the City Government Recycling Coordinator. The Comprehensive Disposal and Recycling Summary Report shall be submitted quantifying the construction and demolition waste generated and recycled, reused or disposed of at Class 3 Landfill, on a monthly basis. This report is a condition of progress payment and failure to submit this information shall render the Applications for Payment incomplete. The Trade Subcontractors/trades are also responsible for contracting with a regional facility to haul any hazardous materials from the site. The Trade Subcontractor shall calculate the C&D diversion rate for both LEED requirements (excluding yard waste) and the requirements set by the City (including yard waste) for all materials processed offsite. The W/O LEED representative will screen every C&D Submittal and review Trade Subcontractor and lower-tier subcontractors C&D Plans for clarity, completeness, and compliance with City/LEED requirements.

Webcor/Obayashi will verify that Trade Subcontractors develop and implement procedures for source separation to the greatest extent feasible.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for transporting commingled (mixed) construction and demolition waste that cannot be feasibly source-separated if the intent is to process it offsite instead of using debris boxes provided onsite.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for Salvage and Reuse.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement practices for this project that will reduce waste at the source.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for materials that are recycled and/or reused onsite

Webcor/Obayashi will verify that Trade Subcontractors participate in reuse programs by reviewing each Trade Subcontractors Monthly Disposal report for any material processed offsite. For such reuse programs, Trade Subcontractor shall refer to the City's construction and demolition recycling program.

Webcor/Obayashi shall review the environmental goals of this Project with all Trade Subcontractors during the preconstruction meeting. Webcor/Obayashi shall make a proactive effort to increase awareness of these goals among the job site workers. Webcor/Obayashi will make a proactive effort to increase awareness of these goals among the site workers by requiring that each Subcontractor take Click Safety training prior to stepping on the jobsite. As part of this Click Safety training, there is a module dedicated to teaching and reviewing the

Exhibit P

LEED requirements of the project during construction activity.

Webcor/Obayashi will verify that Trade Subcontractors are using registered transporters and registered facilities. Only registered transporters can remove mixed construction and demolition debris from the construction site, and they must take this material to a registered facility. NOTE: A Registered facility: is any facility that accepts mixed construction and demolition debris for processing and recycling must be registered with the City and County of San Francisco and must demonstrate an overall minimum recycling rate of 65% for mixed construction and demolition debris. A registered facility must have applied for and received a registration from the San Francisco Department of the Environment. Webcor/Obayashi will ensure that Waste Management Companies that service San Francisco and retained by the Trade Subcontractors are registered transporters and meet the City/LEED requirements. Trade Subcontractors shall refer to SFEnvironment.org for the City's most current list of registered transporters.

Webcor/Obayashi will verify that Trade Subcontractors are implementing the following:

1. Eliminate the procurement of unneeded supplies.
2. Reduce waste by printing and copying double-sided.
3. Submit all submittals, reports, and forms in electronic format (PDF) unless otherwise noted.
4. Fully participate in available and required recycling and composting programs.
5. Purchase products made with recycled content such as paper and recycled aggregate.

Webcor/Obayashi will verify that Trade Subcontractors shall submit:

1. Construction and Demolition Debris Management Plan.
2. Construction and Demolition Debris Recovery Monthly Summary Report and supporting documentation for any materials processed offsite.
3. Construction and Demolition Debris Recovery Final Report for all materials processed offsite.

Trade Subcontractor's plan shall comply with specification section 02 41 00. All Trade Subcontractors will remove and dispose of all waste materials from the site for off-site disposal in compliance with all applicable laws, ordinances, rules, and regulations. Webcor/Obayashi and all Trade Subcontractors will work with the TJPA representative so that the representative may characterize the waste materials as required by law to the extent required by Webcor/Obayashi's selected disposal facilities.

Trade Subcontractor's plan shall comply with specification section 01 15 00. Trade Subcontractor's shall perform work in a manner to minimize generation of dust, dirt, rubbish, and other debris, to prevent dust and debris from interfering with the progress of the work, and to keep dust and debris from accumulating at the work site or adjacent areas. Trade Subcontractor's shall remove debris and rubbish from the site on a daily basis.

Trade Subcontractor's plan shall comply with specification section 01 13 50, by preventing the mixing of hazardous and non-hazardous materials.

Trade Subcontractor's shall be required to provide technical information, as required by the specifications including compliance with the City and County of San Francisco Ordinance 27-Exhibit P

Construction Waste Management Plan

06, in their plan which will be submitted For Record Only to the CMO.

Mr. Rick Buellesbach
Senior Project Manager - Transbay Transit Center
Webcor/Obayashi Joint Venture
175 Beale Street
San Francisco, CA 94105

Re: Transbay Transit Center Quality Control Surveys
Subject: December 2011 Control Verification Survey Results

Dear Mr. Buellesbach:

The field work for subject surveys was conducted by Chaudhary & Associates December 5 - 8, 2011. The surveys included verification of Chaudhary & Associates control (as shown on the Survey Control Plan dated 11-10-2011), with the exception of control point 217 which was destroyed sometime between the November 2011 and December 2011 control verification surveys.

Horizontal control values for point numbers 54, 208, 209, 213, 101, 105, 215, and 227 were constrained in this control network horizontal adjustment. The elevation values remain unchanged from the November 2011 surveys. The table below shows both the 11-10-2011 and the 12-21-2011 values for the remaining control points. Because data values can be impacted by environmental factors (temperature and humidity), seismic activity, and the various combinations of back sight and foresight data available on any given day, only the values which differ by 0.01' or more are adjusted and shown on the following table (and updated on the 12/2011 control map to be sent to you tomorrow). Field note copies and Star Net Reports have been mailed to you.

Horizontal Values

Point #	November 10, 2011		December 2011		Description

Transbay Transit Center – San Francisco, CA

Traffic Control Plan

Webcor/Obayashi

WO-TCP0001

REVISION 2

8/22/2012

GENERAL

The Webcor/Obayashi Joint Venture (W/O) Traffic Control Plan that will be implemented on the Transbay Transportation Center Project is an overall project policy, with each trade subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to provide a framework to insure compliance with Specification Section 01 15 70. To assist in this effort, W/O has enlisted the services of a traffic control consultant (TCC) – Sandis Engineering. Award of this contract between Sandis Engineering and W/O was based on a competitive request for proposal (RFP) process referred to as TG05.4.

TCC is responsible for participating in all aspects of traffic control planning and implementation including, but not limited to:

- Traffic control design oversight;
- Coordination between trade subcontractor traffic control designs;
- Interface with City of San Francisco and other agencies as necessary;
- Participate in coordination efforts of the TJPA Representative;
- Oversight of implementation of approved traffic plans;
- Provide daily reports regarding status of traffic control measures;
- On call traffic control services as requested.

TRAFFIC PLAN REVIEW AND COORDINATION

TCC shall prepare a detailed “as built” traffic plan for approximately four blocks in all directions from the jobsite. This map will be based on SFMTA maps and will be augmented as appropriate per field review of existing conditions. This map will include all striping, signage, curb lines, curb cuts, curb painting, buildings and any other feature of the street layout and traffic control. Beyond the four block distance, the map will include street layout and striping configuration.

Once a trade subcontractor is under contract, W/O shall provide the trade subcontractor with the as-built plan in CADD format. The trade subcontractor will then be required to use this base map for preparation of all their traffic control plans. A summary of the below criteria can be found in the attached Traffic Control Plan Preparation Packet.

The trade subcontractor is required to prepare and submit a complete traffic plan consistent with requirements of the project specification and all requirements per the City of San Francisco. The submittal must be made in a timely fashion to allow for the review timeframe prescribed in the specifications plus an additional four weeks for review by the TCC.

Upon receipt of the submittal from trade subcontractor, W/O will forward it to the TCC for review. The plan will be reviewed for adherence to specifications and for compatibility with previously submitted plans. Comments will be returned to the trade subcontractor who will make modifications as is appropriate.

When the trade subcontractor’s traffic control plan is reviewed and coordinated with the TCC, it will be submitted to the TJPA Representative for approval. Submittal will be in compliance with Specification Section 01 15 70, paragraph 1.4B.

Upon approval by the TJPA Representative and SFMTA, the TCC will update the baseline traffic

control plan as appropriate. The baseline plan will be updated only when a change to the traffic pattern will be in place for three or more months. If the traffic control plan will be in place for less than three months, the plan will be superimposed over the base map for coordination but the baseline drawing will not be modified.

FIELD IMPLEMENTATION

It is intended that the TCC will maintain a regular, but not full time, presence on site. Similar to the traffic control design review, their scope of work is to review the trade subcontractor's adherence to city standards, project specifications and approved traffic control plans.

TCC review and assistance in field coordination includes but is not necessarily limited to:

- Perform site review of traffic control;
- Note traffic control deficiencies;
- Coordinate correction of site deficiencies with W/O and trade subcontractor;
- Provide daily report of traffic control observations and corrective measures;
- Attend site meetings as necessary to review short term Special Traffic Permit and coordinate between subcontractors and SFMTA;
- Miscellaneous coordination with SFMTA as necessary;
- Review of pedestrian protection as it relates to vehicle traffic;
- Provide traffic control devices and personnel as required to augment traffic control efforts;
- Confirm proper training of subcontractor flagging personnel;
- Provide continuous oversight of traffic control for major construction operations as determined by CM/GC.

TASKS NOT CURRENTLY ANTICIPATED BY TCC

Training of flaggers for the trade subcontractors although it is an option should it become apparent that subcontractor employees need additional training.

Coordination of the 10b police officers between subcontractors will be the responsibility of the CMO.

Pedestrian control unless it is specifically impacted by vehicle traffic.

TRANSBAY TRANSIT CENTER – TRAFFIC CONTROL PLAN PREPARATION PACKET

Overview

The purpose of this packet is to provide the contractor with the information necessary to prepare a Traffic Control Plan (TCP) for their work in accordance with the requirements of the Project Specifications and the City and County of San Francisco (CCSF). It includes procedures, timing, a base map, plan sheet template and examples for use when preparing and submitting Traffic Control Plans (TCPs) for review and approval. The documents included in the TCP Packet are described below.

Flow Diagram

The flow diagram included within the TCP packet identifies the specific components and required time intervals for TCP submittal, review and approval. Please note time requirements for Plan review and approval. No work will be allowed without an approved plan. It is the contractor's responsibility to anticipate and allow for required lead times.

Base Map File

The AutoCAD drawing of the Base Map file included in this packet represents the City of San Francisco street layout as of the date indicated on the Base Map file title block. ALL proposed TCPs shall be created using this Base Map file as a starting point. It is crucial that proposed TCPs be provided on the same coordinate system as the Base Map file so multiple approved TCPs can be overlain in a composite exhibit. TCPs prepared using a different base or plan template will be rejected.

TCP Standards

Design Standards

The Traffic Control Plans shall be prepared and submitted in accordance with the following documents:

1. Transbay Transit Center Project Specification Section 011570 – Traffic Routing Work, dated September 23, 2010. A copy of this specification is included in the TCP Packet.
2. City and County of San Francisco Regulations for Working in San Francisco Streets (Bluebook), 7th Edition dated October 2006. Refer to the following link for a copy of this document: <http://www.sfmta.com/bluebook>

CAD Standards

The sheet TCP-001 provides a template with title block, symbols, and specific details pertaining to the presentation and setup of drawings to be used when preparing a TCP. The CAD standards identified under the Vendor Submittal Instructions, including layering configuration, title block, and symbols, shall be referenced and followed when creating all TCP AutoCAD drawings. The contractor shall include additional signs in the form of blocks, notes, and details as needed.

TCP Samples

There are three sample Traffic Control Plans included in this packet. These samples provide an example of how the TCPs shall be set up and configured.

TCP Submittals

All proposed Traffic Control Plans shall be submitted at 1"=80' scale on 22"x34" sheet size in both pdf and AutoCAD 2007 formats. They are to be submitted electronically to Webcor-Obayashi's trade package project manager. An important item to be included on all TCP sheets is the submittal tracking number. The tracking number consists of four segments separated by a period. The first segment is the 4-digit contract identification number, the second segment the 3-digit TCP number (provided by Webcor), the third segment is the 2-digit revision number, and the fourth the 3-digit page number. Refer to the Submittal Tracking Number Diagram below for additional direction.

SHEET

VENDOR SUBMITTAL INSTRUCTIONS

TRAFFIC CONTROL PLANS SHALL BE SUBMITTED AS FOLLOWS:

- 1) FIVE (5) HARD COPIES
- 2) ELECTRONIC COPY IN PDF AND AUTOCAD 2007 FORMATS
- 3) 11"x17" SHEET SIZE
- 4) 1"=80' SCALE
- 5) SHEET NUMBERING "TCP-###"
- 6) ELECTRONIC FORMAT PER TEMPLATE PROVIDED: SINGLE CAD FILE CONTAINING MULTIPLE LAYOUT TABS WITH A SINGLE TCP PER TAB. THE TCP SHALL BE DRAFTED IN MODEL SPACE ON TOP OF THE STREET BASE FILE WITH NOTES/LEGEND IN PAPER SPACE. MODEL SPACE SHALL BE DRAFTED AS FOLLOWS:

a) EACH TCP PAGE SHALL CONSIST OF FIVE LAYERS WITH A PREFIX FOR THAT PAGE NUMBER. FOR EXAMPLE, PAGE 001 WOULD CONTAIN THE FOLLOWING LAYERS:

001-TCP-DIM

001-TCP-NOTES

001-TCP-SIGN

001-TCP-SIGNTEXT

001-TCP-STRIPELINE

001-TCP-WORKAREA

b) ALL SYMBOLS, BLOCKS AND DIMENSIONS SHALL MATCH THOSE ON THIS SHEET IN SIZE, COLOR, AND LAYER. CREATE NEW BLOCKS USING SIMILAR COLOR AND SIZE FOR SIGNS/DEVICES NOT SHOWN HERE.

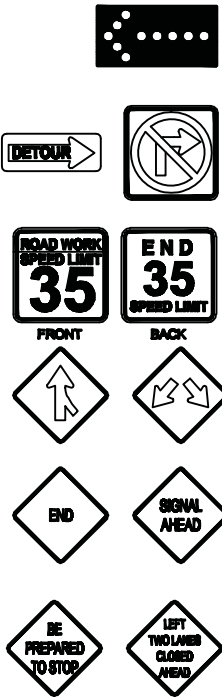

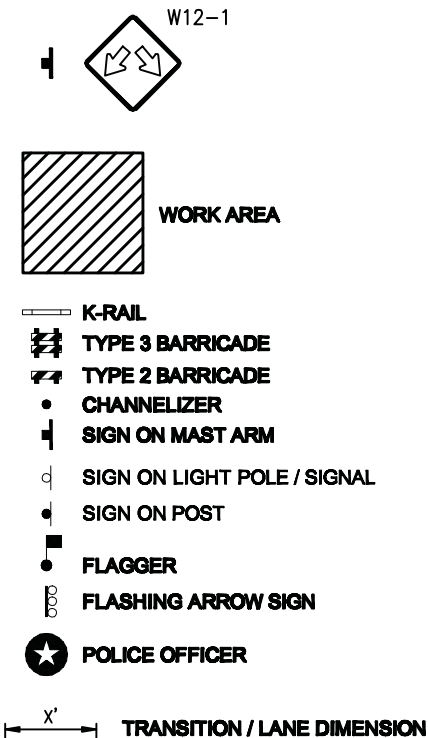

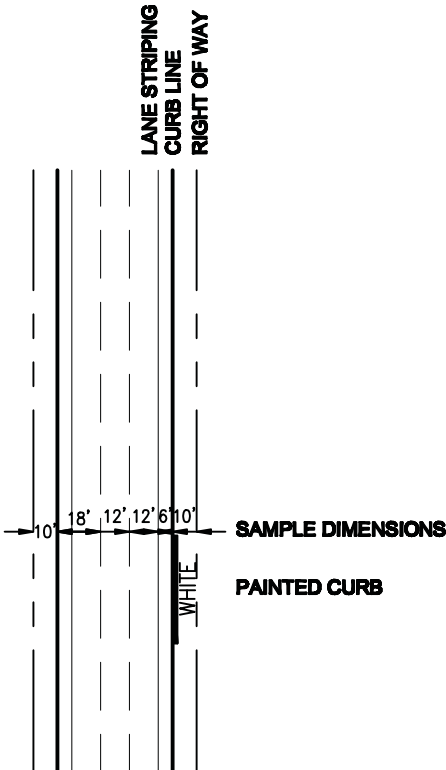

c) INSERT STANDARD TITLE BLOCK PER SHEET. USE ATTRIBUTE EDITOR TO FILL IN TITLE BLOCK WITH APPLICABLE INFORMATION.

d) TABLES, NOTES, AND LEGENDS SHALL BE IN PAPER SPACE PER SHEET ON LAYER XXX-TCP-GENERAL, WHERE XXX IS THE PAGE NUMBER

e) STANDARD TEXT STYLES, SIZES, DIM STYLES PER TEMPLATE

f) STANDARD LAYER COLORS AND NAMES; AND CTB/PEN SETTINGS PER TEMPLATE

g) FREEZE LAYERS IN VIEWPORTS AS NECESSARY TO ONLY SHOW THOSE NEEDED FOR THAT INDIVIDUAL SHEET.

7) REFER TO PROVIDED SAMPLE TCP PLAN FOR AN EXAMPLE OF THE FORMAT BEING IMPLEMENTED.

SHEET

Exhibit U Submittal Schedule

Trade Subcontractor's Schedule submission shall include a full submittal schedule per Specification Section 01 13 00 1.4 – Submittal Schedule.

1. All submittals are to be submitted to Webcor/Obayashi Joint Venture within 60 days of Award.
2. The Submittal Schedule shall contain additional data fields to indicate: 1) the duration in work days for procurement of the item starting from the date that the submittal is approved until the item is available for construction, and 2) the Activity ID of the earliest construction activity for which the item will be required (the submittal/procurement item's successor).
3. The Trade Subcontractor should use the attached data format, Submittal Schedule Excel Template, for the submission of Submittal Schedule as Microsoft Excel File. Contact Webcor/Obayashi Joint Venture to obtain the blank excel file of the Submittal Schedule.
4. The Trade Subcontractor shall show critical submittals in the Exhibit I Construction Schedule in addition to providing the comprehensive submittal schedule required herein. Critical submittals are those submittals considered vital to the timely progression of the project schedule. These items may include, but are not limited to, engineering submissions; long lead items; items required within the first 25% of Subcontractor's performance period; and items that are required for construction or installation of a task with less than 20 working days of total float in the overall project schedule. The last group of items may not be determined until after acceptance of the Trade Subcontractor Construction Schedule submission and its full incorporation into the project schedule. Therefore, the Subcontractor may be required to add items to its Primavera schedule file subsequent to approval of its Construction Schedule submission.

QUALITY COMMISSIONING PROCEDURES AND GUIDELINES

Exterior Skin and Waterproofing Systems

EXHIBIT "W"

The information, processes, techniques, material and other matters contained in the Quality Commissioning Procedures and Guidelines are proprietary, confidential, and unique to WEBCOR/OBAYASHI.

The Quality Commissioning Procedures and Guidelines shall only be used for WEBCOR/OBAYASHI only.

Any other use without the expressed written consent from an Officer of WEBCOR/OBAYASHI is prohibited. Any unauthorized use could give rise to liability under the California Civil Code Sections 3426 et seq. involving Uniform Secrets Act, the California Business and Professions Code Sections 17200 et seq. involving Unfair Competition and 17500 et seq. involving Unfair Practices, the common law of unfair competition and interference with contractual relations and prospective advantage.

QUALITY COMMISSIONING PROCEDURES AND GUIDELINES

Exterior Skin and Waterproofing Systems

- ✓ Roofs
- ✓ Decks
- ✓ Windows
- ✓ Curtain Walls
- ✓ Exterior Wall Systems (Precast, Stucco, EIFS, GFRC)
- ✓ Water Shedding Systems
- ✓ Flashings
- ✓ Expansion Joints
- ✓ Caulking, Sealants
- ✓ Primary and Secondary Water Barrier Systems
- ✓ Above & Below Grade Waterproofing
- ✓ General Waterproofing Systems

1.0 Purpose

The purpose of this procedure and guideline is to set forth a commissioning process, which will ensure that the building's exterior envelop and waterproofing systems perform and function in conformity with design intent and to provide a means of verifying the implementation of these systems based on the project specifications, design and applicable industry standards.

2.0 Definition of Commissioning

The term "Commission" refers to a Quality Assurance process by which the building's exterior envelop and waterproofing systems (i.e., below and above-grade waterproofing, decks, roofs, caulking, plaster, precast concrete and GFRC, curtain-wall, flashing, expansion joints, etc.) are provided, installed and tested in order to verify the systems perform in accordance with the contract documents and the design intent.

Commissioning entails the development of a clear and complete process that verifies the systems design and operational intent. It also is to verify that the exterior envelop and waterproofing systems and its components are installed according to the contract documents, manufacturer's recommendations and published industry standards and that the system receives adequate installation and performance inspections by the installing contractor.

The process must include verifying and documenting the installation steps, phases, and system performance with respect to the design intent and the contract documents. Commissioning is a team effort that requires cooperation by all parties to succeed.

3.0 Description of the Commissioning Process

Commissioning is a “**systematic**” process for achieving, validating and documenting the performance of building systems as so that it meets the design intent and requirements.

The process extends through all phases from design to occupancy, and extending through the warranty period. Numerous checks and inspections shall be performed at each stage of the process to ensure that established procedures are followed. The process also includes training of facility operational personnel to ensure continued efficient use of the exterior envelop and waterproofing systems as originally designed and installed.

This guideline provides a uniform, integrated and consistent approach for the commissioning of all waterproofing systems as well as assisting in insuring product and design compatibility. Since many building waterproofing systems are integrated, a deficiency in one system or component may result in sub-optimal performance and failure among others.

4.0 Commissioning Plan

Commissioning is a **“Quality Process”** for validating the system and component design performance.

The reports from the commissioning process are not just test reports, but reports that document design, installation, inspections, and particular tests and or evaluation procedures. The commissioning plan is continually updated to reflect changes in program and design of the waterproofing system(s). Commissioning reports shall document and record the results of the commissioning process.

Each Trade Subcontractor’s specific commissioning plan must be neatly organized in a consistent manner that reflects the nature of the building systems and their performance. The commissioning plan shall include schedules, requirements and procedures.

Trade Subcontractor(s) shall be responsible for the timely and efficient completion of all commissioning in accordance with the Subcontract Agreement.

At no time shall any work be permitted to commence without a WEBCOR/OBAYASHI’ approved Trade Subcontractor Waterproofing Commissioning Program.

Failure to do so may require Trade Subcontractor to assume all related costs and expenses in accordance with the Subcontract Agreement.

In addition, Trade Subcontractor may also be required to assume all related cost should WEBCOR/OBAYASHI find it necessary to develop, manage and or perform any Trade Subcontractor commissioning work.

5.0 Objectives

The fundamental objectives of the commissioning process are:

- 5.1 Create a procedure to verify and provide documentation that the waterproofing performance of the facility meet the design requirements.

- 5.2 Enhance communication by documenting data and decisions throughout all phases of the project.
- 5.3 Validate and report that the performance of waterproofing systems meets design intent.
- 5.4 Provide a means of Quality Control and Quality Assurance (QA/QC) throughout all phases of the waterproofing system(s) installation, inspection, and testing process.

6.0 Contractors Normally Participating in the Commissioning Process

- ✓ Waterproofing Consultant
- ✓ Architect
- ✓ Structural Engineer
- ✓ Mechanical
- ✓ Plumbing
- ✓ Electrical
- ✓ Fire Sprinkler
- ✓ Glass Systems
- ✓ Caulking
- ✓ Brick, Tile, Precast, GFRC, and Stone
- ✓ Fountains and Ponds
- ✓ Swimming Pools & Spas
- ✓ Roofing
- ✓ Insulation
- ✓ Flashing & Sheetmetal
- ✓ Waterproofing Contractors
- ✓ Concrete (If waterproofing admixtures are included by design)
- ✓ Stucco, EIFS, DEFS systems
- ✓ Elastomeric Painting
- ✓ Rough Carpentry (Wood cladding)
- ✓ Architectural Metal Cladding
- ✓ Expansion Joint Systems
- ✓ Water Tanks
- ✓ Special Systems or Components

7.0 Commissioning Team

The commissioning team members may consist of the following:

- ✓ WEBCOR/OBAYASHI - Project Team as required

- ✓ Owner - Designated representative of the owner, building operator/engineer, and/or the owner's construction management firm
- ✓ Engineers - Architect and Designers
- ✓ Waterproofing Contractor
- ✓ Waterproofing Consultant
- ✓ Flashing / Sheet Metal Contractor
- ✓ Exterior Skin Contractor
- ✓ Roof Contractor
- ✓ Glass and Curtain Contractor
- ✓ Caulking and Sealants Contractor
- ✓ Commissioning Agent (CA)
- ✓ Mechanical Contractor
- ✓ Plumbing Contractor
- ✓ Fire Sprinkler Contractor
- ✓ Electrical Contractor
- ✓ Testing Contractor
- ✓ Other as necessary

8.0 Meetings

Regularly scheduled commissioning meetings of **the entire team** shall be conducted for site coordination, communicating issues of concern, resolving conflicts, reporting on system process and status, identifying urgent work and all deficiencies.

Commissioning meetings are critical to the **Quality** of the commissioning process as well as timely completion of the project.

9.0 Trade Subcontractor Performance Requirements

- 9.1 Designation of the primary person who will be responsible, accountable, and act as the main contact person for all commissioning communications. Provide organizational chart indicating personnel who will be involved in the project. The chart should indicate factory, office, and on-site field personnel.
- 9.2 Review of drawings and specifications for completeness, appropriateness of details, and acceptance by Trade Subcontractor thereof.
- 9.3 Review WEBCOR/OBAYASHI standard details.
- 9.4 Preparing and submitting documentation of Trade Subcontractor's respective materials and systems to be integrated into the overall Commissioning Plan.
- 9.5 Submitting information on the intended commissioning protocol used on materials, and the integration into the system as a whole.
- 9.6 Provide a presentation of the commissioning process to WEBCOR/OBAYASHI, the Owner and or the owner's representatives. Demonstration shall indicate compliance with the Trade Subcontractor Commissioning requirements as outlined in this document.
- 9.7 Submitting shop drawings detailing waterproofing system layout as outlined in the contract documents. Shop drawings shall reflect all conditions present in the building, including but not limited to the following:
 - a. Conditions where different materials meet (i.e. windows to plaster or stone to plaster).
 - b. Corner conditions.
 - c. Conditions where vertical planes meet horizontal planes (i.e. soffits and sills).
 - d. Expansion joints and control joints.
 - e. Flashing.
 - f. Penetrations (i.e. Z-ducts, electrical outlets, louvers).
 - g. Conditions typically utilized by Trade Subcontractor's common practices.

Shop drawings shall include installation drawings indicating the planned sequence of installation of all components.
- 9.8 Providing means and method for preliminary testing of the exterior envelop and waterproofing systems with manufacturer's representative present as required:
 - a. Caulking: Include complete coordination with the caulking manufacturer's representative to assure compatibility of the caulking system with the

surrounding substrate and finishes. Trade Subcontractor shall submit caulking samples including manufacturer's specifications for materials, color, cleaning procedure, required primers, proper backer rod, installation procedures, testing requirements and results. Testing of caulking samples between all combinations of materials shall be performed by qualified testing agencies in direct accordance with A.S.T.M. Standard Test Method C794 (75), including seven (7) day immersion. A letter from the Caulking Manufacturer shall be submitted approving all testing procedures, the installation procedure and the use of the specified materials for the intended application. Any materials installed without such approval that may be in conflict with the approved procedures or of unacceptable color and appearance will be removed and replaced at the Trade Subcontractor's expense.

- b. Windows and Sliding Glass Doors: Assemblies shall be field tested in accordance with American Architectural Manufacturers Association (AAMA) 502-02 Voluntary Specification for Field Testing of Windows and Sliding Glass Doors using Test Methods A and B, testing a minimum of 1% of the products for air leakage resistance and water penetration resistance as specified for various stages of the product installation.
- 9.9 Reviewing all required testing under the witnessing of WEBCOR/OBAYASHI, Building Owner, and or the Owners representatives.
 - 9.10 Correcting all system deficiencies at Trade Subcontractor expense.
 - 9.11 Obtaining all required permits, code required inspections and final certifications.
 - 9.12 Preparing complete as-built record drawings made from an original set that has been marked up throughout the duration of the project. Drawings must indicate all work as it was actually installed showing change order revisions, field changes required to meet the working conditions, and any other items that will affect or reflected in the operation and maintenance of the facility.
 - 9.13 Obtaining all manufacturer's warranties and guarantees.
 - 9.14 Organizing the O&M manuals, if any, from suppliers and manufacturers.
 - 9.15 Performing any specified training for the facility's operational staff.

10.0 Information Management

The management and continued organization of the commissioning information shall be the sole responsibility of the Trade Subcontractor.

WEBCOR/OBAYASHI and the Trade Subcontractor shall mutually agree on the location where all the commissioning information and documentation shall be stored.

The Trade Subcontractor shall make every effort to continually update and manage the information throughout the commissioning process. WEBCOR/OBAYASHI and the Building Owner may review the commissioning information provided by the Trade Subcontractor at any time for updates, accuracy and completeness.

WEBCOR/OBAYASHI may elect to withhold or make appropriate adjustments to the Trade Subcontractor's monthly progress billing in the event the commissioning information or performance requirements as described in the Waterproofing Quality Commissioning Procedures & Guidelines are not being performed, managed and updated by the Trade Subcontractor.

11.0 Trade Subcontractor Commissioning Submittal Requirement

Each Trade Subcontractor has a responsibility to WEBCOR/OBAYASHI and the Building Owner to comply with the terms of the contract and to verify that the design intent of the waterproofing systems for the project is achieved.

Each Trade Subcontractor is required to provide two completed commissioning manuals containing the information outlined in Section 19 - Commissioning Binder Tab Index of this guideline. Each proposed formatted "3-ring" binder containing all information, including blank forms shall be provided to WEBCOR/OBAYASHI and the Owner for "**review and comment**" before the commissioning process begins, or by an agreed upon date.

WEBCOR/OBAYASHI, the Owner and the owner representative shall review the information and return it to the Trade Subcontractor within **two-week** time with all comments.

Each Trade Subcontractor shall make all required changes as agreed, to the commissioning manuals and resubmit them to WEBCOR/OBAYASHI within **two-weeks**.

Each Trade Subcontractor shall schedule and provide a formal demonstration of their commissioning process to WEBCOR/OBAYASHI, the Owner and the Owners representative after all required changes to the manuals have been satisfactory completed. Demonstration shall indicate compliance with the Trade Subcontractor Waterproofing Commissioning requirements as outlined in this document.

Each Commissioning Manual **shall be neatly organized** using appropriate tabs, dividers, table of content, index, etc. as required for easy referencing. Refer to Section 19 Commissioning Binder Tab Index for a standard binder organization. All Commissioning Manual(s) **must be user friendly**.

12.0 Commissioning Binder Tab Index

- Tab 1. Project design criteria specifications** – Provide information that describes the overall design criteria and performance requirements for the waterproofing system(s).
- Tab 2. Manufacture products and components** – Provide complete submittal list of all components that shall be contractually provided and installed.
- Tab 3. Manufacture installation instructions** – Provide manufacture documentation insuring that the system and components installation complies with all Manufacture requirements to maintain performance and guarantee obligations.
- Tab 4. Manufacture details** – Provide manufacture details or published industry standards for penetrations and terminations interfacing with other installed systems.
- Tab 5. Design transition review** – Provide design review comments and concerns on transition interfaces to other s or other compatibility issues.
- Tab 6. Quality Assurance / Quality Control Program** – Provide QAQC program with complete field inspections and checklists.
- Tab 7. Documentation** – Trade Subcontractor shall maintain a separate field binder documenting the QAQC inspections and field-testing for all installed work.
- Tab 8. Field mock-up and testing** – Provide information on mock-up or field performance tests that shall be preformed for all installed system(s). Provide manufacture recommendations or published testing standards used. If no performance testing is preformed, Trade Subcontractor shall provide documentation on how each system is performing in accordance to the documented design intent and contract warranty requirements.
- Tab 9. Schedule** – Provide schedule for, shop drawing devolvement, submittals fabrication, delivery and installation.
- Tab 10. Agency and factory test reports** – Provide all factory, agency, and field performance-testing reports on installed systems.
- Tab 11. Factory and Trade Subcontractor guarantee information** – Provide warranty responsibilities and durations for all systems and components installed.
- Tab 12. Owner Training** – Provide (O&M) and training for all required service and maintenance requirements as it extends throughout each system to maintain warranty. Include owner sign-off sheets verifying training.

- Tab 13. Attic Stock** – Provide list of spare material that shall be supplied by Trade Subcontractor to owner – Paint, applied materials, gaskets, handles, glazing, or patching products.
- Tab 14. As-Built Drawings** – Provide completed set of drawing and details accurately reflecting all installed and completed work.
- Tab 15. Material Safety Data Sheets** – Provide all Material and Data Safety Sheets (MSDS).

13.0 Identifying the Defects

It is the intent of the commissioning process to avoid defects in waterproofing systems. A standard of care exhibited during the commissioning process should anticipate potential defects and determine appropriate solutions prior to the installation of these systems. In the event that defects do occur, proper defect identification will help determine the repair needed and assist in selecting the appropriate method and materials.

It is important to acknowledge which factors have caused deficiencies in the waterproofing system and its components, and how a deficiency in one system may influence or amplify another. Careful and thorough defect identification is critical to obtain long-lasting, quality repairs. It is critical and necessary to eliminate the cause of the defect and not solely treat the symptom.

Each Trade Subcontractor shall be responsible for determining the cause and origin of various problems as it pertains to their contractual scope of work. Failure to do so may require Trade Subcontractor to assume all related costs and expenses for damages, repairs performed by others, testing, special inspections, and consultant fees.

14.0 Applicable Industry Standards

Unless the Contract Documents include more stringent requirements, applicable published construction industry standards shall be utilized. Where compliance with two or more standards is specified for quality or quantity levels, comply with the most stringent requirement.

Where sections of the specifications require that a product, material, installation, or test complies with a specified industry standard, the Trade Subcontractor shall obtain copies directly from the publication(s) source and include the information in the submitted commissioning information.

Each Trade Subcontractor engaged in construction on the project must be familiar with published industry standards applicable to their construction activity.

15.0 Schedules

An initial schedule shall be developed by the Trade Subcontractor identifying dates, times, and durations for shop drawings, approval of submittals, material fabrication, product delivery, acceptance, installation, testing and completion.

The schedule shall also include any commissioning task that shall be performed on waterproofing systems that may involve or affect other related building systems.

Each Trade Subcontractor shall update schedules, daily, weekly, monthly, or as required to keep WEBCOR/OBAYASHI and the Owner informed of the activities performed. This schedule will indicate appropriate milestones during the installation to allow WEBCOR/OBAYASHI and or the Owner the ability to observe and witness system installations prior to being covered up by subsequent s. The schedule will indicate milestone dates for Trade Subcontractor inspection and testing.

16.0 Execution of Inspections and Checklists

Trade Subcontractor and or vendors shall schedule initial inspections and checklist review with the commissioning team. The inspections and reviews shall be directed, executed, and documented by the Trade Subcontractor or vendor.

To document the process, the Trade Subcontractor performing the task shall provide and complete all documentation forms and checklists. (See attached sample checklist)

17.0 Field Inspections

One of the most important commissioning activities for waterproofing systems is field inspections. The field inspection process shall serve as a method and means of documenting the installation process as well as indicate variations between contractual design and construction.

Each Trade Subcontractor shall identify in detail the scope of their field inspections, and the types of field procedures that will be required to obtain the necessary information to provide a complete waterproofing quality control evaluation at the completion of the job.

18.0 Field Witnessing of Trade Subcontractor's Quality Control

WEBCOR/OBAYASHI, the Owner, consultants and the Architect reserve the right to witness the waterproofing system installation at any time. Spot checks shall be conducted on a random basis. If inconsistencies are discovered in quality, performance, or if commissioning information differs from those submitted, the Trade Subcontractor may be required to completely remove and remedy all conditions where the inconsistencies occurred at no additional cost or impact to the schedule.

Witnessing shall include all or part of, but not limited to the following:

- 14.1 Mock ups
- 14.2 Waterproofing component and system installation
- 14.3 System inspection and checks
- 14.4 Performance tests

14.5 Special Inspections

19.0 Documentation

Trade Subcontractor shall maintain a separate field binder documenting quality control inspections and field-testing for all installed work. Documentation shall include dates, quality control field checklist, reports with inspected locations defined by grid lines and elevations. Provide a dated photo log, documenting inspected areas and general sequence of installed work for the duration of the project.

20.0 Testing and Methods

The objective of field-testing is to correlate paths of moisture infiltration and to observe the source of damages. Moisture entering a building during extreme weather may be obvious, but the most reliable method to discover the infiltrating path is to recreate the leakage condition in a controlled manner. Testing also allows verification of the theory for the cause of leakage.

As all system and component tests are unique to some degree, there may not be one standard or method for testing that can be applied to all. There are several methods, standards, governing requirements, and manufacture recommendations, etc., which should be applied.

There are three types of acceptable testing methods that can be used during the investigation. All of which must be approved by WEBCOR/OBAYASHI. These testing categories include:

- ✓ Non-Destructive Testing
- ✓ Destructive Testing
- ✓ Laboratory Testing

20.1 Non-Destructive Testing

Non-destructive testing uses a variety of non-invasive tools. This type of testing causes little or no damage or interference to the building envelope. The various methods of non-destructive testing include:

- a. *Rilem Tube* - This calibrated device is adhered to exterior masonry walls to determine the porosity and condition of brick masonry units, mortar joints, head joints, and embedment joints.
- b. *Water Spray Rack (ASTM E1105)* - This test simulates a wind-driven rain condition on a facility. It can assist in determining the specific cause and origin of moisture infiltration when it is used to test independent components of the envelope. Spraying water over a large area in an uncontrolled fashion will not reveal specific causes of water infiltration.
- c. *Hose Spray Test (AAMA 501.2)* - This test method also simulates wind-driven rain in small segmented areas using a standard garden hose in which a calibrated nozzle is attached with a pressure gauge. The spray is

directed at a specific joint, crack, or defect to reveal potential moisture intrusion.

- d. *Differential Pressure Test (ASTM E1105)* - A pressure chamber is constructed on the interior of the facility at a specific location to test moisture driven through an assembly or component. The assembly or component is subjected to a negative force while simultaneously a spray rack is directed at the assembly to draw the moisture into the facility to simulate a negative pressure under a wind-driven rain condition.
- e. *Infra-Red Thermography* - Infra-red Thermography photographs the building exterior to determine the locations of wet components. Components, such as insulation and sheathing, etc., will act as heat sinks if they contain high levels of moisture. During the day, moist and dry components absorb heat. At night, the moist areas release the heat much slower than the dry areas. By reading the heat signature, Infrared Thermography will help expose the problem areas. Small test cuts may be required to verify moisture areas.
- f. *Soundings (ASTM D4580)* - There are different ways to perform sounding tests including the hammer tap test. In this test, a 16 oz. hammer is tapped against concrete for sound. A hollow sound indicates areas where the concrete has separated from the reinforcing steel, typically due to exfoliation or corrosion of the steel. Another method of sounding is to chain drag a heavy 15 ft. link chain along a concrete surface to listen for hollow sounds, indicating defective concrete. This method can cover larger areas effectively and is commonly used on parking garages and loading docks.
- g. *Pachometer Survey* - This test uses a magnetic device used to locate embedded steel reinforcement and help determine the concrete cover over the reinforcement. Generally, the Pachometer is fairly accurate when measuring ¼ inch to 3-inch thick concrete cover and when reinforcing placement is not too congested.
- h. *Poly-sheet Tape-down* - This test determines the presence of moisture coming through a concrete surface, typically a slab-on-grade type of assembly where the typical problem is tile or membrane separation from the floor. A 2' x 2' section of polyethylene is sealed to the concrete with duct tape and removed 24 hours later. If there is moisture beneath the polyethylene, it is a good indication that there is a vapor drive through the concrete section.
- i. *Glass-Slide Epoxy or Crack-o-meter* - This device is sealed in place over a crack and periodically checked to determine if any movement has occurred. If movement has occurred, the glass will crack or the meter will record movement.
- j. *Optical Illuminated Boroscope* - A boroscope is inserted into a 5/8-in. diameter pilot hole through an exterior wall system and allows the cavity walls of brick veneer, stud wall backup of exterior insulated finish systems (EIFS), or other types of constructions to be observed without large-scale destructive testing.

- k. *Smoke/Dust Tracer* - The smoke/dust tracer helps to find air infiltration. It is moved across the interior face of a window to observe the smoke and dust particles coming through the assembly.
- l. *Moisture Meter* - A Delmhorst meter is a digital device that detects the presence of moisture in various building components. This test is typically accompanied by a gravimetric analysis (oven drying of samples), which is used to confirm the results of the Delmhorst meter.
- m. *Flashlight and mirror* - These simple tools can be very useful to detect problem areas. Placing the mirror into the plenum or behind difficult-to-access areas with the flashlight will allow observation of concealed conditions.

20.2 Destructive Testing

When the main objective is to determine the existing composition and configuration of concealed assembly conditions, destructive testing may be warranted. The most common methods of destructive testing are test cuts and borings.

Any type of destructive testing must be reviewed and approved by WEBCOR/OBAYASHI.

- a. *Roof Testing* - Test cuts in the roof assembly may be necessary to determine the condition of the underlying insulation and substrate. Cutting into the system may help verify whether roofing problems are causing corrosion of the steel deck, or a spalled and cracked concrete deck, etc. Test cuts may also expose the as-built configurations of the flashing components at roof-to-wall locations, curb locations, etc. This information is critical to the appropriate remedial design and/or repairs.
- b. *Exterior Wall/Skin Testing* - Test cuts on exterior walls may be required to identify the origin of moisture infiltration. For masonry walls, it is most effective to make test cuts at window heads and sills, and at any through-wall flashing locations that may be suspected of allowing moisture intrusion. Masonry test cuts may expose defective through-wall flashing that is allowing moisture intrusion. Test cuts may also help determine the underlying conditions of the steel components in wall systems, including wall ties, reinforcing steel, sub-steel columns, etc.

20.3 Laboratory Testing

Destructive testing is also used to obtain samples for lab analysis. Samples of sealants, coatings, painted finishes, roofing materials, etc. can be sent to a laboratory to determine the presence of lead or asbestos. Samples of masonry or concrete can also be tested to help identify causes of moisture/air infiltration (descriptions of these analyses follow).

Laboratory testing may help obtain a better understanding of existing material types, presence of contaminants, and the possibility of hazardous components.

This type of testing can also provide valuable information concerning proper surface preparation, material selection, and implementation of repairs. The following laboratory tests are some of the more useful when performing building envelope evaluations:

- a. *Gravimetric Analysis* - This test will determine moisture content. After weighing and recording the in-situ existing sample, completely dry the sample in an oven and re-weigh it. The weight difference indicates moisture content and is particularly useful for insulating materials. Testing moisture contents of samples is critical to verify results from non-destructive moisture scans.
- b. *Petrography* - Petrography determines the “make-up” of concrete. This test will indicate the size and type of aggregate, air/void ratio, type of cement, and general mix design data of the concrete. Most materials testing lab can perform this test.
- c. *Air Entrainment* - Provides an indication of the existing concrete’s durability and freeze-thaw resistance. Air entrainment is generally indicated by petrography.
- d. *Presence of Carbonization* - Accomplished by spraying a solution of phenothelene on the concrete substrate and recording the depth of the solution’s color change. This will indicate to what depth carbon dioxide has progressed into the concrete. Carbon dioxide will degrade the cement matrix of the concrete and lower the pH level of it. The layer surrounding the reinforcement is then destroyed, allowing corrosion of the reinforcing steel. Corrosion by carbonization usually occurs over a broad area.
- e. *Chloride Ion Content* - Chlorides from marine atmospheres or mists from road salts entering the concrete substrate, and salts originally introduced to the concrete via admixtures or aggregates can promote accelerated corrosion of reinforcing steel, usually at concentrated or specific locations. The chlorides are not consumed in the corrosion process but rather act as catalysts in the process. The corrosion will progress along the reinforcing bars causing concrete de-bonding, cracking, and spalling.
- f. *Reinforcement Placement, Depth, Quantity, and Type* - This information may be established with the use of a Pachometer or similar electronic metal detector. It is useful in determining required steel replacement and structural capacities during engineering analysis phases.

21.0 Engineering Analysis

Using information obtained from the field, laboratory results, and collected data, a comprehensive engineering analysis may be required. The engineering analysis should include an assessment of field and laboratory data, structural analysis as well as the following:

- ✓ Thermal Analysis
- ✓ Drainage Analysis

- ✓ Vapor Drive Analysis
- ✓ Fire Rating Requirements
- ✓ Cost Estimations

22.0 Deficiencies and Non-Conformance

The Trade Subcontractor shall identify and list any outstanding deficiencies or procedures that were not completed successfully during any final testing. Documented deficiencies shall be submitted to WEBCOR/OBAYASHI within 48 hours of each test completion.

The Trade Subcontractor shall also provide in writing, the corrective action for each deficiency as required within 48 hours. The installing Trade Subcontractor and or vendor shall correct all outstanding issues or deficiencies in the materials or the installation of the materials and provide the commissioning team with dates and times for the required corrections and any re-testing.

23.0 Remedial Work

General considerations for the repair of defects and replacement of components should include the following:

- 23.1 Determine the effect, if any; the repairs have on the structure, surroundings, and operations of the building.
- 23.2 Ensure proper preparation of surfaces to be repaired and provide chemical and mechanical bonds for new materials.
- 23.3 Material selection should include an understanding of performance limitations and should rely on the products past acceptable performance. Material selections should include consideration of the following:
 - ✓ Compatibility
 - ✓ Maintenance
 - ✓ Life cycle

24.0 Project Commissioning Closeout

WEBCOR/OBAYASHI, the Owner, and/or the Owner's representative shall determine when the Trade Subcontractor commissioning process has been satisfactorily completed and when to submit the final report information and all other documentation to Webcor.

As part of the project turnover, the quality of all work will be reviewed to determine whether it is within specific and manufacturers' guidelines, industry standards, and code compliance.

WEBCOR/OBAYASHI, the Owner, and/or the Owner's representative consultant must be completely satisfied that the commissioning procedures have been performed accurately and professionally.

In the event the commissioning information or performance requirements outlined in the Waterproofing Quality Commissioning Procedure & Guidelines have not been met, WEBCOR/OBAYASHI may elect to withhold or make appropriate adjustments to the Trade Subcontractor's final billing.
