<b>REQUEST:</b>			<b>ANSWER:</b>			
See attached CD RFI # 445 SK1 to SK3 for items 1 to 5: 1) It is not possible to supply a stiffener plate per 11/S1-7630 as requested in the CS6 approval submittal because it will foul the sloping beam connection. Confirm that is acceptable. 2) It is not possible to supply a stiffener plate per 11/S1-7630 as requested in the CS6 approval submittal because it will foul the sloping beam connection. Confirm that is acceptable. 3) It is not possible to supply a full depth stiffener plate per 1/S1-7600. Confirm that it is acceptable to terminate the stiffener 1" below the beam. 4) It is not possible to supply a stiffener plate at this location per 11/S1-7630 as requested in the CS6 approval submittal because the beam will not be erectable with the stiffener below the beam. Confirm that is acceptable. 5) It is not possible to supply a 12" high stiffener plate at this location per 11/S1-7630 because it will foul the bolts for the beam connection on the far side as shown. Confirm it is acceptable to terminate the stiffener as shown.			See attached CD RFI # 445 SK1 to SK3 for items 1 to 5: 1) It is not possible to supply a stiffener plate per 11/S1-7630 as requested in the CS6 approval submittal because it will foul the sloping beam connection. <b>REQUEST:</b>			<b>ANSWER:</b>			
<p>On Thursday, May 22, 2014, there was slurry intrusion through dewatering well #34, from the Transbay Tower Project. After the Transbay Tower Project placed a lean mix to plug the slurry intrusion, only water has come out of the well at a pressurized rate, not yet experienced on this project prior to the event.</p> <p>The water in this well has been confirmed acceptable by the SFPUC to discharge into the City's combined sewer system, on 6/5/14. A plug has been placed in this well in order to keep the jobsite from flooding due to the volume of water pushing through the well. We want to replace the dewatering pump in this well, but are concerned that we may end up dewatering the Transbay Tower Project and possibly draw the water table on their project outside of the requirements of our specification.</p> <p>1) Please confirm that it is acceptable to re-install the dewatering pump in well #34.</p> <p>2) Please let us know if there are certain steps or durations that you want us to pump in an effort for ARUP to monitor the water table on Transbay Tower's Project and/or other adjacent properties.</p> <p>3) Please confirm that in performing this activity, we are not held to the requirement of Spec Section 31 56 13-13.F.1. in regards to "The performance of the shoring wall shall be such that the groundwater levels around the excavation are maintained within 3 feet from the pre-excavation levels" since there is the potential of us drawing their groundwater through our well.</p>			<p>On Thursday, May 22, 2014, there was slurry intrusion through dewatering well #34, from the Transbay Tower Project. Due to constructability of formwork to build this portion of the block-out clouded on the attached comprehensive drawings, SCCI propose to pour this section back with the concourse. The difficulty arises due to forming through the embedded column steel at these locations in the shear walls.</p> <p>Please confirm this is acceptable.</p>

<b>T-1473</b>	<b>BGP - Lower Concourse Service Corridor Dimensions on West Wall</b>	<b>Closed</b>	<b>01</b>	<b>06/25/2014</b>	<b>07/05/2014</b>	<b>07/02/2014</b>
<div><div><b>From:</b> Webcor Construction LP</div><div>Claude Titcher</div></div>						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Please reference RFI T-0576 regarding the offset of the West Foundation Walls to account for the CDSM Encroachment. The west wall (GL 1) was offset 3 1/8" to the east while the southwest wall (GL XI-1) was offset 1 7/8" to the northeast. Currently there are no dimensions explicitly shown in the contract drawings for the width of the service corridor that runs along the very western edge of the Lower Concourse in Area 1 and 3. However there is a dimension shown on A1-3006 & A1-7004 that shows the eastern face of the service corridor at 5' to the west of GL 1.4 which translates into a service corridor width of 9' -8 7/8". Is it the designers intent to offset the service corridor walls similar to the foundation walls to maintain the 10' corridor width, or is it the designers intent to shrink the width of the service corridor and keep the interior walls in place? Please provide dimensions for the service corridor width.			Please reference RFI T-0576 regarding the offset of the West Foundation Walls to account for the CDSM Encroachment. <b>REQUEST:</b>			<b>ANSWER:</b>			
With the response from RFI T-1473 and the contract drawings, SCCI has enough dimensions to model the service corridor running north-south in Area 3. However there is not enough information to model the alignment of the service corridor running northwest-southeast. Please provide a work point with dimensions somewhere along the east face of the service corridor (preferably at the southernmost point of the service corridor at Shear Wall 390A) or provide an angle at which the service corridor changes direction above Gridline K. SCCI is in receipt of response to Submittal TG0600-122 for Comprehensive Layout Drawings at the Lower Concourse A8-9 on 6/20/2014. On this submittal response, it was noted on pg D2.33: "For future washroom wall layout and plumbing penetrations- Refer to forthcoming Confirming RFI."						
RFI T-1410 revised the plumbing penetrations in this area. Please provide concourse blackout sizes for these penetrations (including "future plbg").						
Sketch is based on A1-2844

<b>REQUEST:</b>			<b>ANSWER:</b>			
Shimmick is planning to use a similar form system for the fourth lift of the foundation wall to that used on the second wall lift. However, the second wall lift form system is a cantilever system and is supported by 1 row of anchors, excerpting significant force on the wall lift below. Shimmick proposes to add a tie to the top of the forms and connect to the CDSM soldier piles in addition to using the third lift anchor to provide better support. The soldier piles extend above the ground level and this added tie would not affect the waterproofing (installed by others). See the attached marked up drawings for reference			Shimmick is planning to use a similar form system for the fourth lift of the foundation wall to that used on the second wall lift. However, the second wall lift form system is a cantilever system and is supported by 1 row of anchors, excerpting significant force on the wall lift below. T-1487	SSS - Shear Plate Weld Connection Clarification	Closed	CR	07/02/2014	07/12/2014	07/14/2014
<div><div>From: Webcor Construction LP</div><div>Gregory Kemerer</div></div>						
REQUEST:			ANSWER:			
<p>For roof level shear plate connection details at GL11D &amp; GL11F, S1-2603 refers to 3/S1-5013. This detail calls for a 3sided PJP weld at the shear plates, with a t-1/8 bevel (t=shear plate thickness). The shear plate located at the center of the web has a thickness of 2 ½", which results in a 2 3/8" bevel. The column web at this location has a thickness of 1 ¼"; the stiffener plates top and bottom have a thickness of ½". A 2 3/8" PJP weld will greatly distort the ½" stiffener plates. The weld size should not exceed the thickness of the thinnest member. Also, Detail 3/S1-5013 refers to Connection Detail 4/S1-5013 which in turn refers to Shear Connection Detail 3/S1-5013. Since both sides of the shear plate are accessible (note 1), is a ½" fillet both sides as shown in 3/S1-5011 acceptable for this location?</p>			<p>For roof level shear plate connection details at GL11D &amp; GL11F, S1-2603 refers to 3/S1-5013. <b>REQUEST:</b>						
Per the breakout meeting held after the TTC progress meeting on 7/9 @10:30, and email correspondence between Adib Sassine and Walter Melville (Attached). Please confirm the following items regarding the grounding mesh in electrical room B1441 at Grid Lines 15/G.5.						
- Due to constructability issues please confirm that the attached PUC approved alternate detail is acceptable and will be incorporated into lower concourse electrical room B1441 at GL15/G.5						
- The attached alternate detail incorporates a 4/0 field fabricated grid in lieu of the original #6 mesh and 4/0 ground ring. Please confirm that the alternate detail 4/0 grid will suffice to also act as the ground ring, and all pigtails can be attached to the grid.						
- Please confirm the grounding grid spacing is 4' on center with connections to mat rebar at 8' on center.						
- Please confirm that cadweld or use listed irreversible compression connections to cross-grid and ground mat at 8' on center minimum is acceptable.						
- Please confirm ground potential rise study at each switch gear room is not required.						
- Please confirm which specification governs, IEEE142 per Transbay Transit Center contract documents or per PUC referenced specification IEEE80, which will require "Ground Grid Test". (See attached email).						
- Please confirm the layout of grid does not extend past the walls in South Electrical room B1441.						
- Please confirm that exothermic or irreversible compression connections listed for concrete encasement are required for all pigtails main grid connections, (outside edge to cross members, corners, and main cross connectors), and connections to building ground wires (shown with "G" on plan).						
- Please confirm that SFPUC and DBI will be the only entities inspecting the grounding grid.

<b>REQUEST:</b>			<b>ANSWER:</b>			
Per attached correspondence, WOJV has directed SCCI to install future wall formsavers according to the details attached that clarify the Contract Drawings. However, due to congestion created by the increased amount of reinforcing within the beam components, ample space to install the future wall formsaver bars at the design spacing does not always exist. See attached pictures.			Per attached correspondence, WOJV has directed SCCI to install future wall formsavers according to the details attached that clarify the Contract Drawings. However, due to congestion created by the increased amount of reinforcing within the beam components, ample space to install the future wall formsaver bars at the design spacing does not always exist. See attached pictures.			
Because the CMU contract has not been solicited or awarded, please confirm that it is acceptable to offset the bars out of alignment +/- 4" in attempts to maintain proper spacing, and/or increase or decrease the specified spacing +/- 6" such that the future wall formsaver bars can be installed and the correct number of dowels is maintained. The same flexibility is also requested for the "ends, intersection and corner" detail per the attached document. <div><div><b>From:</b> Webcor Construction LP</div><div>Gregory Kemerer</div></div>						
<b>REQUEST:</b>			<b>ANSWER:</b>			
This is a follow-up to the response of RFI T-1532.			This is a follow-up to the response of RFI T-1532.			
As per the response, restricting welding to only the girder flange creates several issues: 1. See detail 17 on SK1 - an additional 4" would be required on the vertical leg of the angle to allow welding to the girder flange. This creates a 12" vertical leg, welded at the bottom toe to the girder and supporting a 13" concrete slab. Our decker does not believe this is adequate support. This occurs at 9 locations.  2. See detail 5 & 17 on SK1 - overhead welding will be required from the underside to weld to the girder flange. Detail 5 occurs at 67 locations and 17 occurs at 9 locations. Our decker will incur additional labor and equipment costs for this work.  If welding to the base plate is prohibited, an alternative solution which will have lower additional cost impact is to use Hilti pins to attach the gauge angle to base plate or girder flange. See attached product data and application details. See attached SK2 for clarification.  Please confirm if welding to the column base plate is prohibited, Skanska can use Hilti pins as per SK2. <b>REQUEST:</b> <p>This is a follow-up to the response of RFI T-1532.1</p> <p>As per the response to the above RFI, direction to drawing A1-9317 (which was provided as part of FO 27) indicates a deck closure/support angle separated 1" from the column base plate, with no structural information provided. As a detail for deck support around the column base plate is not provided in the structural drawings and Skanska's proposals have been rejected in previous RFI responses, this remains an open issue. We require a detail in order to proceed with the detailing of shop drawings. Please note this condition occurs at CS1 and throughout the central zone and is currently holding up the resubmittal of the metal deck shop drawings for the central zone.</p> <p>Additionally, the RFI response identified a "no weld zone" that was not shown on the design documents. As this was not called out on the contract drawings, this zone is not being identified with paint strips as per the protected zone requirements. This may lead to trade workers accidentally welding in the field. Please provide direction for the identification requirements for the base plate "no weld zone".</p>						<b>ANSWER:</b> <p>This is a follow-up to the response of RFI T-1532.1</p> <p>As per the response to the above RFI, direction to drawing A1-9317 (which was provided as part of FO 27) indicates a deck closure/support angle separated 1" from the column base plate, with no structural information provided. <b>From:</b> Webcor Construction LP Claude Titcher						
<b>REQUEST:</b> Drawing SI-3201 and other similar foundation wall sections call out a 2" concrete cover on the terminators of the foundation wall vertical rebar. These vertical bars have no adjustability because one end is a terminator and the other end is a male coupler end. The elevation of the top of terminator will be dependent on the coupler elevation above the Lift 3 Foundation Wall. The ground floor slab is 10" thick and sloped along the top of foundation wall.  To allow for maximum deviation to accommodate for the slope of the slab, tolerances in rebar fabrication and location from the previous wall lifts and the final wall lift: 1. Shimmick proposes to change the concrete cover from 2" to 5" and increase the tolerance to 2.5". Please confirm this is acceptable. 2. If the proposal is not acceptable, please provide a concrete cover and tolerance that is acceptable.						<b>ANSWER:</b> Drawing SI-3201 and other similar foundation wall sections call out a 2" concrete cover on the terminators of the foundation wall vertical rebar. 	<p>Please reference RPI response T-1568, attached photo of bridge pier/sleeve at Grid Lines 34.5/E and attached sketch.</p> <p>SCCI is in receipt of RFI response T-1568. The bridge pier in question is not fully contained within the sumps pits referenced in RPI response T-1568 (see photo attached). The galvanized pile sleeve encroaches into the Eastern most sump pit approximately 5/8".</p> <p>In order to facilitate the installation of this sump pit the provided contract details will need to be modified. The pile will need to be cut off at a lower elevation than the typical detail, which will require a larger block-out. The typical contract rebar details will need to be altered, as well as the typical waterproofing details.</p> <p>1. Please confirm the attached sketch showing revised rebar and formwork details is acceptable. 2. In order to install a deeper blockout, the galvanized sleeve will be cut down to 4" above bottom Of blockout. This cut will remove the sleeve flange. Please confirm this is acceptable.</p> <p>All waterproofing detail revisions will be performed per Grace's recommendation and referenced mat slab "Ready-to-Pour" sign-off document for Mat Slab 16</p>					<p>Please reference RPI response T-1568, attached photo of bridge pier/sleeve at Grid Lines 34.5/E and attached sketch.</p> <p>SCCI is in receipt of RFI response T-1568. <b>REQUEST:</b>						<b>ANSWER:</b>
SCCI is in receipt of RFI response T-1568.1. Please see attached sketch for reference.						SCCI is in receipt of RFI response T-1568.1. Please see attached sketch for reference.
SCCI offers this response for Item #2.						SCCI offers this response for Item #2.
1. Galvanizing will be removed from surface of the installed sleeve in order to weld a new identical flange centered 19" down from the top of sleeve. Weld will be a ¼" fillet weld, both top and bottom of flange all the way around the sleeve. The sleeve will then be repaired with approved cold galv spray.						1. <b>REQUEST:</b>			<b>ANSWER:</b>			
See attached diagram of a wall lift construction joint overlay on the ground floor plan. Per Specification Section 03 30 02 - 3.2, Foundation wall and ground floor construction joints shall align with the location of joint below in TG06 and will not impair the strength of the structure. A conflict occurs at the noted areas of the attached diagram, where the wall joint placed according to specification, will intersect at a moment frame beam. SCCI proposes to move wall construction joints in order to avoid conflicting with the moment frame beams.			See attached diagram of a wall lift construction joint overlay on the ground floor plan. <b>From:</b> Webcor Construction LP      Claude Titcher						
<b>REQUEST:</b>		<b>ANSWER:</b>				
<p>A unique support system is necessary for the foundation wall under the temporary bridges (First, Fremont, Beale). Shimmick proposes that in these areas, the form work will kick to support brackets mounted to the underside of the bridges to provide better support. Without this, the form system will be a cantilever system supported by 1 row of anchors which will exert a significant force on the wall lift below.</p> <p>Please confirm it is acceptable for the fourth lift form system to be supported by the bridge underside.</p>		<p>A unique support system is necessary for the foundation wall under the temporary bridges (First, Fremont, Beale). <b>REQUEST:</b>		<b>ANSWER:</b>				
<p>Per Specification Section 03 20 02-1.4-A-7, "test results for [pendulum] bearings with similar size" are to be submitted for approval. Per Mageba, they have test data on pendulum bearings (isolators) with similar sizes which they believe have been tested under more severe conditions than the ones required for this project. See attached email correspondence with Mageba for further explanation and more specific details in regards to their test and how the results apply to satisfy the requirements in the specifications. The referenced Annex documents in the email are also attached. Only a sample of the data has been included for preliminary approval; full test data will be submitted once this data is confirmed acceptable.</p> <p>Please confirm that the mentioned test reports could serve as evidence of the proper functioning of mageba pendulum bearings, as well as the fulfillment for the requirements in the specifications.</p>		<p>Per Specification Section 03 20 02-1.4-A-7, "test results for [pendulum] bearings with similar size" are to be submitted for approval. <b>T-1598</b>	<b>SSS - Supplemental Pin Testing</b>	<b>Void</b>	<b>CR</b>	<b>08/11/2014</b>	<b>08/21/2014</b>	
<b>From:</b> Webcor Construction LP                      Gregory Kemerer						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Based on review of structural and referenced specification section it appears that Supplemental destructive testing of galvanized pins is not required after pins are galvanized per para 2.3.J. As per our previous QAQC meeting of June 17, 2014, it was requested by the TJPA representative that additional galvanized steel pin samples (ASTM A668 Class M) with associated nuts for each pin size be provided for destructive testing by TJPA representative testing lab and as follow: 1. 7" dia. X 2'-1" (A1551 as shown on 1551 of Pin shop drawings) 2. 7" dia. X 1'-2 3/16" (A1553 as shown on 1553 of Pin shop drawings). 3. 7" dia. X 1'-6 7/8" (A1554 as shown on 1554 of Pin shop drawings). 4. 8" dia. X 2'-7" (A1555 as shown on 1555 of Pin shop drawings). 5. 6" dia. X 1'- 8 13/16" (A13001 as shown on 13001 of Pin shop drawings).  Please provide the following: 1. Provide testing criteria to the testing lab agency after pins have been galvanized and in addition to the specified forged steel pins ASTM 668 Class M testing requirements.  2. Provide WOJV with a CR to supply and ship these additional pins and nuts to the testing lab. 3. If additional samples of other pins on the project are required, please specify. 4. BRB pins are not included in this RFI to be tested. Please confirm. From: Webcor Construction LPGregory Kemerer						
REQUEST: Skanska's transfer girder fabricator, TMF, has drilled girder A628's top flange hole pattern 5/16" north of the designed location. Please confirm it is acceptable to offset the hole pattern and machined grooves on the column base plate to account for the offset on the girder. This will allow the column to be positioned at the required location while accommodating the offset holes. The girder short stiffeners will also need to be shifted 5/16" to allow bolt clearance. See attached 628AC & 628AB for as-built hole locations, also see attached p4284 for proposed offset on column base plate. <div><div>From: Webcor Construction LP</div><div>Gregory Kemerer</div></div>						
REQUEST:			ANSWER:			
<p>At grid C3 the BU perimeter beam butts into the transfer girder TR3. The deck support angle in the web of the BU beam stops back 4' 9-5/16" from the center of the girder. This results in a region of about 4'-4" without deck support at an end bearing.</p> <p>Design drawings do not provide a specific detail for this condition. Deck support at column detail 1/S1-5001 should not be used as this detail typically only supports one or two flutes of deck. The condition described above has 4 ½ unsupported flutes in an end bearing condition with 10" of nominal weight concrete. This is too much for a 12 gauge angle. Please advise.</p>			<p>At grid C3 the BU perimeter beam butts into the transfer girder TR3. The deck support angle in the web of the BU beam stops back 4' 9-5/16" from the center of the girder. <b>T-1647</b>	<b>SCS - 12" Thick Partition Walls over 24' height</b>	<b>Closed</b>	<b>01</b>	<b>08/25/2014</b>	<b>09/04/2014</b>	<b>08/27/2014</b>
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Partition walls taller than 24'-0", as indicated in Section 3/S1-9050, have vertical reinforcing of #7 bars @12" centers. Section 4/S -9051 indicates that the vertical bars will have a 90 degree tail at the top end of the bar. The standard tail length for #7 bars is 14" and will not fit within the 12" thick walls. Rotating the #7 bar tails to clear the concrete face by 1 1/2" clash with one another. Harris Rebar requests permission to utilize #7 straight vertical bars with a #5 'U' shaped cap with 30" lap@ 6" centers at the top of walls. Is this acceptable?			Partition walls taller than 24'-0", as indicated in Section 3/S1-9050, have vertical reinforcing of #7 bars @12" centers. Section 4/S -9051 indicates that the vertical bars will have a 90 degree tail at the top end of the bar. The standard tail length for #7 bars is 14" and will not fit within the 12" thick walls. Harris Rebar requests permission to utilize #7 straight vertical bars with a #5 'U' shaped cap with 30" lap@ 6" centers at the top of walls. Is this acceptable?			
In order to minimize multiple varying lengths of the #7 vertical wall bars, the #7 threaded vertical dowel bar length will be increased from 49" to 56". The #7 wall vertical bar will be held up to the top of wall elevation, less clear cover, and maintain a minimum 49" lap splice at the Concourse Level. Is this acceptable?			In order to minimize multiple varying lengths of the #7 vertical wall bars, the #7 threaded vertical dowel bar length will be increased from 49" to 56". <b>T-1650</b>	<b>SCS - Requesting Approval for Precast Panels in Lieu of Cast-In-Place</b>	<b>Closed</b>	<b>01</b>	<b>08/27/2014</b>	<b>09/06/2014</b>	<b>09/15/2014</b>
<b>From:</b> Webcor Construction LP Claude Titcher						
<b>REQUEST:</b> See attached Exhibits A through D as a possible means of precast installation method. Using a precast yard facility in lieu of concrete cast in place will reduce the construction duration for the scallop, perimeter, and sky light elliptical wall operations since production can start prior to the construction start date. Precasting concrete elements also results in a better final product. Quality advantages of using a precast yard facility over cast in place methods are improved formwork design, curing procedures, temperature control, and form striping methods since work space, formwork weight, formwork relocation and reassembly, and hoisting equipment restrictions are greatly reduced if not eliminated.  shimmick requests approval from the engineer to allow precast manufactured panels in lieu of the cast in place walls shown on S1-2752 & S1-3282 scallop walls, S1- 2602 stair well, S1-2603 elliptical skylight, S1-2604 light column opening, S1-2606 stair shaft, and S1-2607 elevator shaft.						<b>ANSWER:</b> See attached Exhibits A through D as a possible means of precast installation method. <b>T-1657</b>	<b>SCS - Lower Concourse MEP Room Construction Joints</b>	<b>Closed</b>	<b>01</b>	<b>09/03/2014</b>	<b>09/13/2014</b>	<b>09/12/2014</b>
<b>From:</b> Webcor Construction LP Claude Titcher						
<b>REQUEST:</b> ASI 121 issued new wall CJ locations. Reference sheet AI-2203, Detail I/AI-3008 and B/AI-9240.  A. On the south wall of the room at GL 13-B.2 there is a construction joint (see plan attached indicated as location "A") running through one of the MEP blocks outs. That creates a cantilever section below the beams cutout and above the MEP block out. Is that acceptable? If not, where should the CJ be relocated?  B. On the same wall there is a construction joint ( see plan attached indicated as location "B"), the distance between the MEP block and the construction joint is 5' 5/8", which is not enough to place diagonal trim bars on the comers of the MEP block out that are closer to the construction joint. Please provide detail for this location.  C. In the same wall, the construction joints are not shown in the area cover by the spall plate, do the CJ's start at the top of the wall plates? Please confirm intent and provide further direction.					<b>ANSWER:</b> ASI 121 issued new wall CJ locations. Reference sheet AI-2203, Detail I/AI-3008 and B/AI-9240.  A. On the south wall of the room at GL 13-B.2 there is a construction joint (see plan attached indicated as location "A") running through one of the MEP blocks outs. That creates a cantilever section below the beams cutout and above the MEP block out. Is that acceptable? If not, where should the CJ be relocated?  B. On the same wall there is a construction joint ( see plan attached indicated as location "B"), the distance between the MEP block and the construction joint is 5' 5/8", which is not enough to place diagonal trim bars on the comers of the MEP block out that are closer to the construction joint. Please provide detail for this location.  C. In the same wall, the construction joints are not shown in the area cover by the spall plate, do the CJ's start at the top of the wall plates? Please confirm intent and provide further direction.

<b>REQUEST:</b>			<b>ANSWER:</b>			
The contract drawings do not provide a section view for the foundation wall at Stair Tower 201. S1-2302 calls out the foundation wall as a uniform 3' thickness. S1-3201 provides a typical foundation wall section, shown with uniform thickness. Shimmick has been provided with updated sketches that call out a thickened foundation wall of 4' 3 1/2" at Stair Tower 201 as opposed to the uniform 3' thickness. <b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Please reference drawing S1-3001.			Please reference drawing S1-3001.			
See attached marked up drawing 4/S1-3207 details typical wall opening reinforcement, noting to use additional bars for 10" to 30" wall openings with lengths LTS + W. The typical vertical bars used for the foundation walls are #11 rebar and the added bar length is 19'-6" (LTS + W + W + LTS + W = 102" + 1 0" + 10 + 102" + 10"). Depending on the location of the penetration, the added bar would have to extend LTS + W beyond the opening, which in the 10" opening case is 9'-4" (102" + 10"). This is not possible considering the foundation walls under TG07.2 scope of work are between 8' to 12'.			See attached marked up drawing 4/S1-3207 details typical wall opening reinforcement, noting to use additional bars for 10" to 30" wall openings with lengths LTS + W. The typical vertical bars used for the foundation walls are #11 rebar and the added bar length is 19'-6" (LTS + W + W + LTS + W = 102" + 1 0" + 10 + 102" + 10"). This is not possible considering the foundation walls under TG07.2 scope of work are between 8' to 12'.			
Additionally these additional vertical bars will potentially conflict with moment frame beam rebar at ground level by adding to the rebar congestion. See attached marked up drawings for example conflict.			Additionally these additional vertical bars will potentially conflict with moment frame beam rebar at ground level by adding to the rebar congestion. See attached marked up drawings for example conflict.			
1. Please provide an alternative to the current wall opening detail for the foundation wall. 2. Please provide an alternative detail for cases where additional vertical bars conflicting with moment frame beam rebar.			1. T-1701	<b>SSS - Insufficient Cope for Erection Clearance</b>  From: Webcor Construction LP                      Gregory Kemerer  <b>REQUEST:</b>  Please refer to beams highlighted in S1-2503 (SK1) and work with this RFI.  The 1' 11 ½" cope is not sufficient for erection clearance as shown on A4644, A4645 (SK2, SK3). The Type 4 (V) drag connection on the other end of the beam limits the position in which the beam can be erected (See SK4, SK5). The beam needs to be erected from below and positioned through the shear plate on the moment frame column. As you slowly lift the back side that is currently coped, a ¼" clash transpires between the top flange of W40x327 and the shear plates on the bus deck casting.  Please advise. <b>REQUEST:</b>  As a follow-up to SK RFI 821 (T-1702.1), please note the following:  It is unclear on how to exactly fix the weld terminations that currently do not conform with Section 5.17.1- Figure 5.2 from the AWS D1.1 Structural Welding Code.  Skanska proposes two options that would allow the transitions to be permissible as per AWS code. Option 1: Remove material from the web/CJP that would allow for a proper transition down to the flange. See SK1. Option 2: Add additional weld metal to the CJP that would allow for a proper transition down to the flange. See SK2.  Please confirm that both options are acceptable & it is at the fabricators discretion to choose which method.

T-1711	SCS - Roof Shear Key and Pylon Rebar Epoxy Connection	Closed	CR	09/19/2014	09/29/2014	09/29/2014
From: Webcor Construction LP                      Stephanie Azzolino						
REQUEST:		ANSWER:				
<p>Per S1-3282 detail 9 "SHEAR KEY AT ROOF" calls for vertical #4 rebar dowels to be cast with the structural deck. Per S1-3281 detail 7 "SIGNAGE PYLON FOOTING DETAIL" calls for vertical #5 rebar dowels to be cast with structural deck. For constructability reasons it is essential that Shimmick's operations maintain open access for roof top small cranes and man lifts for all trades. Per specification section 03 20 02 Part 2.3 F. 3. Adhesive for dowels in existing concrete b. HIT-RE 500_SD injectable adhesive by HIL TI, Inc., is an approved method. The minimum embedment depth requirement for #4 rebar is 2.75 inches and the concrete thickness requirement is 4 inches at the shear keys. The minimum embedment depth requirement for #5 rebar is 3.125 inches and the concrete thickness requirement is 4.375 inches for the signage pylon. The roof deck is 7" with 3" tall flutes leaving a clear space of 4 inches. Shimmick's solution for the 4.375 inch concrete thickness requirement is to pour an additional .5 inches of concrete at the concrete deck where the pylons will be installed. See drawing attachment "A" and product data attachment "B" on page 4 for rebar drill and epoxy requirements.</p> <p>Shimmick requests approval for the shear keys and the pylons be drill and epoxy rebar doweled connections after the roof top deck has been poured and larger operations have been completed.</p>		<p>Per S1-3282 detail 9 "SHEAR KEY AT ROOF" calls for vertical #4 rebar dowels to be cast with the structural deck. T-1712	<b>BGP - Bike Ramp Blockout for Steel Column at GL 5-G.7</b>	Closed	CR	09/19/2014	09/29/2014	10/01/2014
From: Webcor Construction LP Claude Titcher						
<b>REQUEST:</b>						
The structural details for the blackout in the Bike Ramp for the steel column at GL 5-G.7 is called out in S1-2202. The drawing calls out for the ramp walls to be blocked out 2'-0" to the east and west of Gridline 5.						
The architectural details for the blackout in the Bike Ramp for the steel column at GL 5-G.7 is called out in A 1-2202 and A 1-9209. The drawings on A 1-9209 show a plan view detail at 3 different levels with no supplementary elevation views. Detail 4-A 1-9209 appears to call out for the ramp walls to be blocked out 2'-1" to the east and west of Gridline 5 at the base of the column. Detail 5-A 1-9209 appears to call out for the ramp walls and slab at the ramp slab level to be blocked out 1'-1 1/2" to the east and west and 1'-2" to the south of the center of the column and perpendicular to the ramp wall.						
Please provide an elevation detail for the column-ramp interface at GL 5-G.7 that clarifies the discrepancy between S 1-2202 and A1-9209 as well as clarifies the elevation at which the wall blackout changes from Detail 4-A1-9209 to Detail 5-A1-9209 (if A1-9209 is correct).

<b>REQUEST:</b>			<b>ANSWER:</b>			
Following further review of this detail it was found the varying web thickness of the framing beams are significantly less than the 7/16" fillet required as per 3/S1-7632: Typical framing beams are as follows: - W12x44 - tw 3/16" (max 3/16" fillet as per D1.1 Fig 2.1) - W16x26 - tw 1/4" (max 3/16" fillet as per D1.1 Fig 2.1) - W18x65 - tw 7/16" (max 3/8" fillet as per D1.1 Fig 2.1) - W21x44 - tw 3/8" (max 5/16" fillet as per D1.1 Fig 2.1)  Confirm these weld sizes are acceptable or alternatively if welding the shear tab on 3 sides (7/16" fillet) as originally requested is acceptable. <b>REQUEST:</b>			<b>ANSWER:</b>			
S1-3282 detail 3 Concrete wall detail at seismic joint. Shows a construction joint above the chamfer. This seismic wall must accommodate both the roof top structural deck change in elevation of 1'-1 1/2" and a top of wall continuous elevation with a pop out detail. Per these restrictions, the control and change in elevation must occur at the bottom of the wall form and requires a starter wall above the chamfer. Refer to drawing attachment A for further explanation.			S1-3282 detail 3 Concrete wall detail at seismic joint. Shows a construction joint above the chamfer. T-1742	SCS - ST201 Slope of Grade Beams	Closed	CR	09/25/2014	10/05/2014	10/07/2014
From: Webcor Construction LP		Stephanie Azzolino				
REQUEST:		ANSWER:				
Please see attached SKA-4052 (per RFI #T-1661), SKS-0398 & SKS-0400 (confirmed in RFI #T-1661 and 1658), and Markup A1-2960A (per email from TT on 8/8). SKS-0400 visually shows the grade beams sloping but does not provide the exact percent of slope. Cross referencing the available sheets provides conflicting slopes for each beam.		Please see attached SKA-4052 (per RFI #T-1661), SKS-0398 & SKS-0400 (confirmed in RFI #T-1661 and 1658), and Markup A1-2960A (per email from TT on 8/8). SKS-0400 visually shows the grade beams sloping but does not provide the exact percent of slope. Cross referencing the available sheets provides conflicting slopes for each beam.				
The grade beams GB1 and GB2 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Constant Slope: Projection of Ground Level Slab". SKA-4052 calls out a single west-east slab slope of 1.2%. However, SKS-0398 provides two unique end of beam top elevations for GB1 and GB2, suggesting that the beams have two different slopes. The grade beams GB3 and GB4 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Slope to Foundation Wall", where the grade break occurs at the west face of the foundation wall at EL + 15' 7". 3/SKS-0400 visually indicates the grade break at the east face of the foundation wall. No elevation on the east end of GB3 or GB4 is provided. The top of slab is provided, but 1/S1-5023 does not show a difference between top of slab and top of beam.		The grade beams GB1 and GB2 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Constant Slope: Projection of Ground Level Slab". SKA-4052 calls out a single west-east slab slope of 1.2%. However, SKS-0398 provides two unique end of beam top elevations for GB1 and GB2, suggesting that the beams have two different slopes. The grade beams GB3 and GB4 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Slope to Foundation Wall", where the grade break occurs at the west face of the foundation wall at EL + 15' 7". 3/SKS-0400 visually indicates the grade break at the east face of the foundation wall. No elevation on the east end of GB3 or GB4 is provided. The top of slab is provided, but 1/S1-5023 does not show a difference between top of slab and top of beam.				
1) What are the slopes for GB1, GB2, GB3, and GB4? 2) What creates a difference in top elevation between GB 1 and GB2? 3) Where does the grade break for GB3 and GB4 occur? 4) What is the top elevation of GB3 and GB4 at the east face of the foundation wall? 5) What is the top elevation of GB3 and GB4 at GL 1.4, per 1/S 1-5023?		1) What are the slopes for GB1, GB2, GB3, and GB4? 2) What creates a difference in top elevation between GB 1 and GB2? 3) Where does the grade break for GB3 and GB4 occur? 4) What is the top elevation of GB3 and GB4 at the east face of the foundation wall? 5) What is the top elevation of GB3 and GB4 at GL 1.4, per 1/S 1-5023?

<b>From:</b> Webcor Construction LP Gregory Kemerer						
<b>REQUEST:</b>  Upper basket column pipes located at gridline 1/G and 1/C are shown to be concrete filled to top of pipe in S1-4018 Rev 4. Details shown in B/S1-4018 require a 2" diameter vent hole in the roof level cast nodes. Roof level cast nodes at these locations are 72-36 and 72-37 and according to machining drawing CN-0127 Rev 4 (issued 12/19/13), neither of these cast nodes have vent or grout holes.  Currently, pipes are detailed with (2) - 5/8" vent holes approx. 7" from the top of the pipe so the pipes could be filled to this point. Please confirm currently detailed pipe vent holes can remain as is or provide new vent hole details for the pipe and/or cast nodes.  Please note cast nodes 72-36 and 72-37 have already been released to Oregon Iron Works by Bradken.						<b>ANSWER:</b>  Upper basket column pipes located at gridline 1/G and 1/C are shown to be concrete filled to top of pipe in S1-4018 Rev 4. REQUEST:			ANSWER:			
See attached CD RFI # 629 SK1 The model has been built per the dimensions in 3 & 5/S1-7004. This approval comment directs us to confirm locations per A1-7004 in AS1-121 and introduces conflicting dimensions as A1-7004 shows different post locations than S1-7004. Per the American Institute of Steel Construction Code of Standard Practice Section 3. Design Drawings and Specifications, subsection 3.1, the structural drawings are the document Skanska used to locate the stair posts. Please clarify the conflicting information. T-1767	<b>SSS - Weld Clearance Hole Size at Moment Frame Column Cruciform</b>  From: Webcor Construction LP Gregory Kemerer	Closed	CR	10/01/2014	10/11/2014	10/13/2014
<b>REQUEST:</b>  Several Moment Frame Columns have cruciform sections that weld over column web splice joints. The splice joint provides a transition from thick web to thin web. In a majority of these cases, the cruciform web as detailed has a 1" radius cutout to clear the column web splice joint. The 1" radius cutout is insufficient to adequately clear the tapered double bevel splice joint and provide space for runoff tabs necessary for the CJP weld.  Please confirm it is acceptable to provide a weld clearance hole in the cruciform section wide enough to clear the bevels of the column web splice joint plus 1" on each side of the bevel for weld runoff tabs. See attached sketch. If confirmed, this information needs to be shown on detail drawings.		<b>ANSWER:</b>  Several Moment Frame Columns have cruciform sections that weld over column web splice joints. REQUEST:			ANSWER:			
Please see the attached clouded drawings, S1-9050, S1-9002, and S1-9001. Note 5 on detail 9/S1-9050 refers to detail 1/S1-9002 for the typical top of pier bracing details. Detail 3/S1-9001 depicts the bracing of an interior CMU/Concrete Pier below a metal deck. There are no other details shown on the contract drawings that depict bracing of interior CMU/Concrete pier below concrete concourse deck. Please confirm it is acceptable to omit the 3/8" thick plate on Detail 3/S1-9001 for bracing below concrete concourse deck. Otherwise, please provide a detail for bracing the top of an interior concrete pier to the concrete deck.			Please see the attached clouded drawings, S1-9050, S1-9002, and S1-9001. <b>REQUEST:</b>						
Reference attached sketch.						
Steel erection begins in Area C01, which is between gridlines 10-11.						
1) The construction Joints in the trainbox walls do not line up with gridlines. Is it acceptable to align the fourth lift foundation wall construction joints with gridlines? Note that ground level slabs will also follow this layout as shown in the attached sketch.						
2) WOJV believes that the formed and metal deck concrete at ground level GL 10-11 needs to be placed before pouring any other metal decks above this level. Please confirm this is correct. If required to place more east/west concrete at ground level prior to placing decks above, please provide requirements.						
3) Please provide the required cure time of ground floor concrete before the placing of concrete in metal decks above ground level can be poured.						
4) Once the ground level concrete reaches required strength is it acceptable to pour the 2nd level, bus deck level (1st 10" thick slab only), and roof level consecutively with no cure time requirement between deck pours?

<b>REQUEST:</b> RFI # T-1697 requested confirmation for the use of snap ties for perimeter wall, scallop wall, and sky light wall locations. TJPA answer: "The Design Team does not object to the use of Snap-off ties only at skylight wall locations." Spec 031001 - 2.2 B. 7. h. allows the use of snap ties for walls that will not be exposed. Architectural drawings AI-5002 and AI-8604 -through 8613 shows the roof level perimeter walls and seismic walls as not being exposed due to the GFRC fascia prior to ASI 0124. Questions:  1. Please confirm that per ASI 0124 the concrete roof perimeter walls/scallops will now be required to meet the specification requirements for exposed concrete walls.  2. Please confirm that the concrete roof perimeter walls/scallops will not need to meet requirements for cast-in-place architectural concrete.

<b>From:</b> Shimmick Construction Company, Inc. Henry Chiang						
<b>REQUEST:</b>			<b>ANSWER:</b>			
After searching through sky light drawings AI-8401 through AI-8479 and SI-8000 through SI-8020 Shimmick was not able find information providing the sky light attachment to top of wall embed sizes, anchor bolt length, and spacing of embeds. For the central sky light from grid line 19.1 to 22 on page A 1-8451 which shows the structural truss frames for the sky light, which determines the embed layout, the truss frames are called out as equally spaced between each grid line. This does not give you the complete perimeter and requires too many assumptions. Also on AI-8401Note2. Dimensional control sub part A. "Dimensional control shall be derived from the three dimensional (3D) computer model and the two dimensional (2d) drawings." Sub part B. "See sheet AI-0009 for an index of 3D models". The 3D models referenced on AI-0009 are models that Shimmick TG07 Superstructure currently does not have access to. Shimmick would prefer to have the embed information on a drawing sheet equivalent to what is provided for the roof park railing details on sheets AI-8680 to AI-8685. REQUEST:			ANSWER:			
This is a follow-up RFI to RFI T-1815 (SK 878, CD 653) See attached CD RFI # 653.1 SK1 for items 1 & 2: 1) The response to item 1 in RFI T-1815 (SK 878, CD 653) does not work because the vertical leg of the angle cannot be placed between the 1 1/2 dia. bolts per S1-5018 and the angle cannot be welded to the beam flange as it fouls the web stiffener plates per S1-5016. Review and supply a workable solution.  2) The (3) noted bolts for the bottom tie plate per 1/S1-5018 extend past the end of the coped bottom beam flange or do not meet the required edge distance. Provide a solution.			This is a follow-up RFI to RFI T-1815 (SK 878, CD 653) See attached CD RFI # 653.1 SK1 for items 1 & 2: 1) The response to item 1 in RFI T-1815 (SK 878, CD 653) does not work because the vertical leg of the angle cannot be placed between the 1 1/2 dia. bolts per S1-5018 and the angle cannot be welded to the beam flange as it fouls the web stiffener plates per S1-5016. Review and supply a workable solution.  2) The (3) noted bolts for the bottom tie plate per 1/S1-5018 extend past the end of the coped bottom beam flange or do not meet the required edge distance. Provide a solution.

<b>REQUEST:</b>		<b>ANSWER:</b>				
See attached sketch. This RFI is related to RFI T-1467.		See attached sketch. This RFI is related to RFI T-1467.				
Ground level moment frame beams tie into the foundation wall. Due to level shoring towers, the moment frame beams will be step in elevation. The level moment frame beams will be interfacing with the sloped 4th lift foundation wall causing issues in alignment and constructability in the remaining foundation wall. SCCI proposes to have the top of 4th lift be 3'-11" below top of slab. This method will clear the alignment issues, provide a starter wall edge and will result in a 1" ± 1/4" encroachment of 4th lift wall into the moment frame beam.		Ground level moment frame beams tie into the foundation wall. Due to level shoring towers, the moment frame beams will be step in elevation. This would provide an attachment point for temporary access Dayton C49 brackets. Once the deck and wall are poured the attachment coil rod will be removed and the C68 will remain in the concrete hooked to the EFB link beam.

<b>T-1858</b>	<b>SCS - Opening blockouts through Ground Level</b>	<b>Closed</b>	<b>01</b>	<b>10/30/2014</b>	<b>11/09/2014</b>	<b>11/12/2014</b>
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Due to the North to South shoring along the Lower Concourse Level, the concrete partition walls cannot be built until the Ground Level is poured and struts have been removed. Since the Ground Level will be completed before the partition walls are built, SCCI proposes installing blockouts in the Ground Level above the walls in order to complete the concrete pours and vibrate for the partition walls in GL 10 to GL 13. The blockouts will be 8" diameter circle, the rebar detail will be the one shown at 9/S1-5003. The blockouts will not be farther than 5' O.C. or closer than 2' 6" O.C. See the attached drawing for blockouts layout. Please confirm this is acceptable. <b>T-1859</b>	<b>SCS - Vertical Trim Bar Termination</b>	<b>Closed</b>	<b>01</b>	<b>10/30/2014</b>	<b>11/09/2014</b>	<b>11/05/2014</b>
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Please reference drawing 4/S1-3207, RFI T-1666, RFI T-1698 and see attached spreadsheet listing out the length of trim bar to be embedded into poured spans of 3rd lift for relevant openings.  The foundation wall penetration detail 4/S1-3207 requires vertical trim bar of LTS + W above and below the opening. RFI T-1666 and RFI T-1695 responses have noted that a hook or head may be used to terminate trim bars where bar length exceeds height of wall. However the third lift will require embedded trim bars for all foundation wall openings where this detail is applied. seer proposes to terminate trim bars with hooks at the bottom of the 4th lift, similar to RFI T- 1666's response for the top of wall.  Please confirm if terminating trim bars with hooks at the bottom of the 4th lift is acceptable or provide parameters for cases where this would be acceptable. <b>REQUEST:</b>			<b>ANSWER:</b>			
Shop drawings have been detailed with a note to "cut flange flush with web." Where there are web doubler plates (web stiffener plates) installed, the thickness of the web plus doubler plates controls erection clearances. Please confirm that there is no need for the flange to be ground flush with the web in these locations, and that flange metal can sit proud of the web but not thicker than the thickness of the web plus doubler plates. <b>REQUEST:</b>						
Please reference RFI T-1625 regarding column vertical bar constructability.						
See attached Bartec splicing system product data.						
In the revised response to RFI T-1625, it is stated that hooks shall be provided as shown in construction drawings. This detail is not constructible with to the HRC 420 couplers at the top of the 3rd lift. SCCI proposes to utilize a position splice coupler from Bartec in lieu of the HRC 400 series on the rebar with hook. The Bartec coupler complies with Specification Section 03 20 02 - 2.3 - B.3 for type 2 couplers.						
Please confirm if Bartec couplers are acceptable to be used at embedded columns to allow hook installation.

<b>T-1899</b>	<b>SST - Terrazzo SS Riser Clarification</b>	<b>Closed</b>	<b>CR</b>	<b>11/08/2014</b>	<b>11/18/2014</b>	<b>11/12/2014</b>
<b>From:</b> Webcor Construction LP Gregory Kemerer						
<b>REQUEST:</b>  Attached are drawings A1-7511 and A1-7512 regarding the details for the stainless steel risers at the terrazzo stair treads (affected stairs are 205, 307, 308 and 309). Need clarification on the following items:  Stair 307 specifies etched risers, while stairs 205, 308 and 309 are to be perforated. Please clarify the desired "etch". Do the risers on stair 307 have the same hole-pattern as stairs 205, 308 and 309? Is the etch an alternate finish? Please clarify design intent.  With regard to the hole pattern, there is not enough information for the desired stagger or border (if required). Please clarify design intent.  Olson Steel priced all of the risers as grade 304 stainless steel. Please confirm this is the desired grade versus grade 304L, 316,316L etc.  Olson Steel priced all of the risers with a mill finish. Please confirm the risers do not receive any alternate finish (#4 brush, etc.).		<b>ANSWER:</b>  Attached are drawings A1-7511 and A1-7512 regarding the details for the stainless steel risers at the terrazzo stair treads (affected stairs are 205, 307, 308 and 309). <b>REQUEST:</b>			<b>ANSWER:</b>			
Q1. From the General Structural Notes note CD-13 on sheet S-0006, it is our understanding that the stair structure should not impose torsion on the superstructure members. However, for Stair 401 sheet A1-7111 shows the stair columns located eccentrically from the centerlines of the superstructure beams. In addition, Structural sheet S1-2404 calls out detail 9/S1-5027 which shows the superstructure beam supporting the stair column eccentrically. Is it acceptable to detail this connection as shown in 9/S1-5027 even though it applies torsion to the beam?			Q1. <b>REQUEST:</b>  See attached markup of S1-3500 including detail 1/S1-3001 showing the rebar splice schedule. S1-3500 has been marked up with dimensions showing typical MFB span (6 eq spans in between 42' 6" grids). CJs will be placed in the span west of each grid. The requirements for rebar splices and CJ placement are shown. Two conflicts are noted below, involving the RCS 2 slab's #5 top layer of rebar.  1) Midspan LCS of 1' 7" is greater than the available 1/3rd span (per spec) for CJs of 1' 6 1/4". Please confirm it is acceptable for the splice length to exceed the central third of the slab's span.  2)Reference CAD mock up combining CJ spec requirements and S1-3500 splice requirements. Splice length of 1'7" conflicts with required 0.3LN spacing intended to center the splice. Please confirm it is acceptable for the LCS to extend into the 0.3LN span.

<b>REQUEST:</b> See attached CD RFI # 493.3 SK1 & SK2: The response to RFI T-1692 (SK 681, CD 493) re the HSS6x6 to be continuous was implemented in the model and the Mill Order has been revised to maintain current submittal schedules as sis shown on attached SK2. The response in RFI T 1692.1 (SK 681.1, CD 493.1) confused this direction. At this time, for Skanska to move forward, they require a splice location and splice weld for the continuous HSS6x6x1/4 column. Confirm the proposed splice location and weld as shown on SK2 are acceptable.		<b>ANSWER:</b> See attached CD RFI # 493.3 SK1 & SK2: The response to RFI T-1692 (SK 681, CD 493) re the HSS6x6 to be continuous was implemented in the model and the Mill Order has been revised to maintain current submittal schedules as sis shown on attached SK2. T-1936	BGP - Steel Jacket GL 1.4/D.4 - Ring Base Plate	Closed	01	11/21/2014	12/01/2014	12/25/2014
<div><div>From: Webcor Construction LP</div><div>Claude Titcher</div></div>						
REQUEST:			ANSWER:			
The column at Gridlines 1.4/D.4 requires a post installed steel jacket. Please reference the attached clouded detail 6/SI-3503. Due to the added reinforcement around the column and field experience with drill and epoxy rebar dowels in this area, the possibility of post installing the ring base plate with postinstalled expansion anchors at shop drilled holes location is highly unlikely. Please confirm it is acceptable to exclude the ring base plate or please provide an additional detail that is more constructible for post-installed column jacket base plate attachment. The connections as shown cause a dimension to change and also cause a potential conflict with CP6 colt hole connections.  1) With the 1 1/2" stiffener plate per 4/S1-8003 centered about the CP6 connection, the W40x149 will be located 5'-9 11/16 west of Grid 33.5. Confirm that is acceptable.  2) The edge of the web reinforcing plate per 1/S1-5017 is 1 1/2" clear of the bolt holes for the CP6 connection. Confirm that is acceptable or supply a solution.		<b>ANSWER:</b> Contract Doc Ref: S1-2507 Location: Zone 4, Bus Deck Grid Line: H & 33.5, B & 33.5 Add'l Doc Ref's: CD RFI # 738 SK1  Drawing S1-2507 shows CP6 connections at grid lines B/H and 33.5.  The connections as shown cause a dimension to change and also cause a potential conflict with CP6 colt hole connections.  1) With the 1 1/2" stiffener plate per 4/S1-8003 centered about the CP6 connection, the W40x149 will be located 5'-9 11/16 west of Grid 33.5. Confirm that is acceptable.  2) The edge of the web reinforcing plate per 1/S1-5017 is 1 1/2" clear of the bolt holes for the CP6 connection. Confirm that is acceptable or supply a solution.				
T-2001	SSS - AESS and Erection Aid Approval Comment Clarifications GL 24	Closed	CR	12/09/2014	12/09/2014	01/06/2015
From: Webcor Construction LP Stephanie Azzolino						

T-2001.1	SSS - AESS/IFRM-1 Requirement at Roof Level GL 23E	Closed	01	01/19/2015	01/29/2015	01/21/2015
----------	--	--------	----	------------	------------	------------

**From:** Webcor Construction LP                      Andrew Kitchen

**REQUEST:**

Contract Doc Ref: T-2001, S1-2605  
Location: GL 23E

Contrary to the response in RFI T-2001, the extent of the painting for the beam on Grid E @ Grid 24 was not provided in the Submittal TG0701-121 (ES4). Supply the extent of the AEISS/IFRM-1 requirement.

**ANSWER:**

Contract Doc Ref: E/A1-8660 & A/A1-8662  
Location: Zone 3  
Grid Line: E/24  
Add'l Doc Ref's: CD RFI # 734 SK1, Skanska Shop  
Drawings 6805, TG0701-121

The AAI comments on drawing 6805 in submittal package TG0701-121 noted "AESS with IFRM-1 per E/A1-8660 and A/A1-8662".

The approval comment is a revision to the contract documents as E/A1-8660 & A/A1-8662 are sections along Grid 23 and do not indicate that this beam on Grid E/24 requires AESS/IFRM-1.

If painting is required on this beam, supply the extent on this drawing and on the MF beam on Grid 24 if required.

**ANSWER:**

Contract Doc Ref: T-2001, S1-2605  
Location: GL 23E

Contrary to the response in RFI T-2001, the extent of the painting for the beam on Grid E @ Grid 24 was not provided in the Submittal TG0701-121 (ES4). Supply the extent of the AESS/IFRM-1 requirement.

With regards to the treatment of the perforated metal panels, are the loads shown in figures 4 and 5 of the RWDI report to be applied to the solid area of the panel, or to the entire area of the panel (solid area and perforations?)			With regards to the treatment of the perforated metal panels, are the loads shown in figures 4 and 5 of the RWDI report to be applied to the solid area of the panel, or to the entire area of the panel (solid area and perforations?)			
RWDI's response was - For the wind pressures on the W-1 awning panels, you can use the wind pressures presented in our June 7, 2013 report on the solid areas of the panel. This is based on the porosity of the W-1 panel being 35-40% open and the guidance given in Figure 6-22 for open signs and lattice framework from ASCE 7-05. requirements for the Moment Frame Columns.

2) Please clarify the Table 2-1 remark under welds not described below, "MT 25% of joints, full length". It is our understanding that 1 out of every 4 joints will receive full length MT inspection and the next 3 joints will not receive MT. Please confirm.

If this is not accurate, please supply the NDT requirements for the Moment Frame Columns.

2) Please clarify the Table 2-1 remark under welds not described below, "MT 25% of joints, full length". It is our understanding that 1 out of every 4 joints will receive full length MT inspection and the next 3 joints will not receive MT. Please confirm.

**ANSWER:**

Contract Doc Ref: N/A  
Location: West Foundation Wall. W379. W380  
Grid Line: N/A  
Add' Doc Ref: Field Report SS10-073, attached sketches.

Please see attached sketches and field report #SS8510-073, sections 073.3.2 and 073.3.3, authored by Sean McNeill.

Due to a variance in concrete cover at foundation walls W379 and W380 SCCI proposes the following solutions.

073.3.2: Where the 4 instances occur, SCCI proposes to excavate behind the vertical dowel approximately 6" down to allow for field bending of the dowel in order to achieve specified cover. Vertical will be identified, concrete will be excavated and dowel will be field bent away from face of wall. (Please reference attached sketch referencing issue #073.3.2)  
Please confirm this is acceptable.

073.3.3: Where condition occurs at wall W80, a 12"x 12" grid of #4 temperature steel will be added. This grid of temperature steel will be bled off of existing contract bars in order to achieve specified cover. The approximate height of the grid will be 3' to 6' and approximately 15' to 20' in length. At the top of the wall clear cover will be set to specified amount. (Please reference attached sketch referencing issue #073.3.3)  
Please confirm this is acceptable.

RFI P1-2040

Per the response to RFI T-2040, the "NIC" within the plans is to remain.

During the QBD meeting on 01/09/2014, it was agreed that the electrical work within the prefabricated units is to be included in the contract work.

Please confirm that the electrical work within the prefabricated units is to be included in the contract work, and update the electrical drawings to remove the "NIC" notes at these locations. (Note: See the attached drawings showing the notes to be struck)

**ANSWER:**

Contract Doc Ref: (ASI 128 dated 12/16/14)  
Sheet M1-2306  
Specification Section 13 34 24

Location:  
Restrooms 01640, 01641, 01620, 01621

Closest Column Line Intersections:  
30 & 31 - C  
30 & 31 - F.7

Add'l Doc Ref's: N/A

Sheet M1-2306 indicates that there are exhaust fans and supply air from the heat pump within Restrooms 01640, 01641, 01620, and 01621.

No make-up air or return plenums are indicated on the mechanical plans. No louvers are called out within Specification Section 13 34 24 Prefabricated Guard Booths or on the architectural drawings. This condition may prevent the restroom doors from properly working.

Please confirm no make-up air is required at these locations.

Contract Doc Ref: (ASI 128 dated 12/16/14)  
Specification Section 13 34 24  
Sheet E1-2310  
Sheet E1-2306  
Sheet E1-2502

Location: N/A

Closest Column Line Intersection: N/A

Add'l Doc Ref's: N/A

Specification Section 13 34 24 (2.3) N Prefabricated Guard Booths indicates that Sheets E1-2310, E1-2306, and E1-2502 are to be used for installation of electrical within the prefabricated guard booths.

Sheets E1-2310, E1-2306, and E1-2502 show the electrical for prefabricated guard booths as home runs to electrical panels within electrical rooms not integrated with the booths.

Specification Section 13 34 24 (3.2) C indicates that there is to be a single booth panel board.

Please revise the electrical drawings to show a single booth panel board which feeds all electrical to the booth, or revise the specification to agree with the drawings.

<b>REQUEST:</b>						
Contract Doc Ref: S1-2607 Location: Zone 4, Roof Park Gridline: B/32.2 Add'l Doc Ref's: SK1						
Drawing S1-2607 shows a diaphragm beam being intersected by a tapered girder near gridline B/32.2.						
The small diaphragm beam highlighted in attached sketch is not erectable given the specified connections (double angle both side of tapered roof girder).						
Considering the size and location of the beam, please confirm the beam can be eliminated or supply a solution

<b>REQUEST:</b>			<b>ANSWER:</b>			
Contract Doc Ref: S1-5022 Location: Ground Level Grid Line: C and G Add'l Doc Ref's: Attached			Contract Doc Ref: S1-5022 Location: Ground Level Grid Line: C and G Add'l Doc Ref's: Attached			
Please reference Sheet S 1-5022 showing the typical steel to concrete connection at the ground level. Note the 1:1 slope from bottom of beam to bottom of flange in Detail 1B and 4A. Insufficient rebar details are available in this 1:1 slope in SI-5022. The details direct to the SI-37XX series for further rebar details. Sections are taken at various GLs at N/S Transfer Girders, but not between GLs at the E/W perimeter steel. The bottom bar embedment varies: 90 degree, 45 degree, and terminator ends are all used.			Please reference Sheet S 1-5022 showing the typical steel to concrete connection at the ground level. Note the 1:1 slope from bottom of beam to bottom of flange in Detail 1B and 4A. Insufficient rebar details are available in this 1:1 slope in SI-5022. The details direct to the SI-37XX series for further rebar details. Sections are taken at various GLs at N/S Transfer Girders, but not between GLs at the E/W perimeter steel. The bottom bar embedment varies: 90 degree, 45 degree, and terminator ends are all used.			
Shimmick requires further rebar details in the 1:1 sloped region of the MFBs between GLs at the E/W perimeter steel along GL C and G to produce shop drawings. This RFI affects Submittal TG0702-076 for Ground Level 13-19 Rebar and has potential changes for Submittal TG0702-075 for Ground Level 10-13.			Shimmick requires further rebar details in the 1:1 sloped region of the MFBs between GLs at the E/W perimeter steel along GL C and G to produce shop drawings. This RFI affects Submittal TG0702-076 for Ground Level 13-19 Rebar and has potential changes for Submittal TG0702-075 for Ground Level 10-13.			
1. Please provide a new rebar detail applicable to all MFB between grid lines, one each for GL C and GL G. Please include bent bottom bar requirements and stirrup requirements as applicable.			1. Please provide a new rebar detail applicable to all MFB between grid lines, one each for GL C and GL G. Please include bent bottom bar requirements and stirrup requirements as applicable.			
2. Are bent bars, similar to those shown in the SI-37XX markups, required in the 1:1 sloped region of the MFBs between TRs along GL C and G?			2. Are bent bars, similar to those shown in the SI-37XX markups, required in the 1:1 sloped region of the MFBs between TRs along GL C and G?			
3. If bent bars are required per #2, please provide criteria on when to apply each of the following bottom bar end conditions: 90 degree, 45 degree, and terminator ends. Shimmick would propose the criteria as the size of the 1:1 slope region.			3. If bent bars are required per #2, please provide criteria on when to apply each of the following bottom bar end conditions: 90 degree, 45 degree, and terminator ends. Shimmick would propose the criteria as the size of the 1:1 slope region.			
4. If bent bars are required per #2, Shimmick proposes that the bottom bent bars are added with a splice to facilitate placing the bar. Propose (a) splice length per splice schedule on S1-3001, to extend from start of 1:1 toward foundation wall, (b) to reduce bent bar size from matching MFB to a #5, (c) splice length per larger bar size.			4. If bent bars are required per #2, Shimmick proposes that the bottom bent bars are added with a splice to facilitate placing the bar. Propose (a) splice length per splice schedule on S1-3001, to extend from start of 1:1 toward foundation wall, (b) to reduce bent bar size from matching MFB to a #5, (c) splice length per larger bar size.			
5. Please provide a distance from the GL G and C at

<b>T-2098</b>	<b>SCS - Welded Bars At Cast Node/TRs Near Roadway Slab 1</b>	<b>Closed</b>	<b>01</b>	<b>01/16/2015</b>	<b>01/26/2015</b>	<b>01/27/2015</b>
<b>From:</b> Webcor Construction LP Claude Titche						
<b>REQUEST:</b> Contract Doc Ref: S1-2304-S1-2306, S1-4109, S1-4304, S1-4354, 3/S1-4354 Location: Ground Level Grid Line: N/A Add'l Doc Ref's: Attached.  Please reference the following sheet path to reference welded bar conflicts at the Cast Node/TR connections: SI-2305 -> B/SI-4109-> B/SI-4304-> SI-4354. The below apply to 6 locations: C/16.9, G/16.9, C/19.1, G/19.1, C/24.9, G/24.9.  1. In detail 3/S1-4354, the bottom bars on the transfer girders show a "TYPE 2 MECH COUPLER" joining the bent bar to the flange. Use of a standard coupler will not ensure correct final orientation of the 45 degree bend. Use of positional couplers for each bottom bar is cost prohibitive, since 26 bars are required at each of the 6 cast node connections. Results in a minimum of 156 couplers. Propose to eliminate the positional coupler in detail 3/S 1-4534 and use a single one piece bar, welded to the top of the bottom flange. Eliminates 156 couplers. Please confirm this proposal is acceptable.  2. In detail I/S1-4354, 1 of the bottom bars is shown with a Lenton half coupler similar to the top bars. Similar to above, the use of a standard coupler will not ensure correct final orientation of the 45 degree bend. Propose to eliminate this coupler and drape bar on either side of the plate, weld to plate or flange. Can place 1 bar on each face if needed. Please confirm this proposal is acceptable and if I bar on each face is needed.		<b>ANSWER:</b> Contract Doc Ref: S1-2304-S1-2306, S1-4109, S1-4304, S1-4354, 3/S1-4354 Location: Ground Level Grid Line: N/A Add'l Doc Ref's: Attached. <b>REQUEST:</b>  Contract Doc Ref: S1-2304 Location: Ground Level Grid Line: 14-15 Add'l Doc Ref's: Attached.  Reference S1-2304 for the ground level bollard pit (South of GL G, between GL 14 and 15). Per approved submittal TG0702-027, the beam soffits are typically level in the east-west direction. The slab soffit slopes in the east-west direction. In the ground level bollard pit area, maintaining both the level beam bottoms and the sloping soffit will result in a reveal in the bottom of the concrete beams. See the attached sketch noting the expected 3/8" beam reveal.  Please reference the attached sketch. Please confirm the beam layout in the sketch is acceptable.		<b>ANSWER:</b>  Contract Doc Ref: S1-2304 Location: Ground Level Grid Line: 14-15 Add'l Doc Ref's: Attached. 	<p>Location: Ground Level Grid Line: 13,15,21,23 Add'l Doc Ref's: Attached.</p> <p>Several concrete sections reference a widened concrete MFB, but their location in plan view do not show the widened beam. Reference section 2/SI-3705 as an example. The section is first cut at GL C/11, where the widened end is shown in plan. Section 2/SI-3705 is later cut at GL 13, 15, 21, and 23, where the widened end is not shown in plan.</p> <p>Please confirm that the MFBs with widened ends occur when indicated the S 1-230# plans, and not when referenced by the concrete section. This solution would also apply to conflicts between plans and sections on Details: 9/SI-3701, 8/SI-3702, 9/SI-3702, I/SI-3704, 2/SI-3704, 2/SI-3705, 6/SI-3707.</p>					
T-2103	SCS - Ground Level Air Vent - Moment Frame Beam Conflict	Closed	01	01/16/2015	01/26/2015	01/26/2015
	<p>From: Webcor Construction LP Claude Titcher</p> <p><b>REQUEST:</b></p> <p>Contract Doc Ref: S1-2304, S1-2864 Location: Ground Level Grid Line: 14/G Add'l Doc Ref's: Attached.</p> <p>Reference S1-2304 and AI-2864 for the Ground Level air vents. Cross referencing the two sheets results in a conflict between the openings, the TR girder running north/south, and the widened MFB. Find attached markup showing a partial plan view through the air vent slab opening at GL 14-G illustrating this conflict.</p> <p>To resolve this conflict, Shimmick proposes to center the openings between the MFB CLs. This will result in 4.5" from edge of opening to face of beam, and 3' 9" from GL 14 to CL of opening. This proposed solution will apply at all GL intersections where this air vent opening conflict occurs.</p> <p>Please confirm this solution is acceptable, and/or please</p>

<b>T-2104</b>	<b>SCS - Rebar Detail for MFB14 at G16.9 - Roadway Slab Area</b>	<b>Closed</b>	<b>01</b>	<b>01/16/2015</b>	<b>01/26/2015</b>	<b>01/27/2015</b>
<b>From:</b> Webcor Construction LP      Claude Titcher						
<b>REQUEST:</b>						<b>ANSWER:</b>
Contract Doc Ref: 1/S1-3703, S1-2304 Location: Ground Level Grid Line: 16.9/19.1 Add'l Doc Ref's: Attached.						Contract Doc Ref: 1/S1-3703, S1-2304 Location: Ground Level Grid Line: 16.9/19.1 Add'l Doc Ref's: Attached.
Please reference Detail 1/SI-3703, showing the rebar detail for the MFBs bordering the roadway slab at GL 16.9/19.1. The detail shows the bottom of the concrete beam below the bottom of steel. At MFB14 at G/16.9, the bottom of the concrete beam is above the bottom of steel. Please see attached SI-2304 mark up cross referencing contract elevations. The above elevation conflict removes the need for the 4' 90 degree embedment and the welded couplers/bars at the bottom flange shown in SI-3703. No detail is currently available for the above situation.						Please reference Detail 1/SI-3703, showing the rebar detail for the MFBs bordering the roadway slab at GL 16.9/19.1. The above elevation conflict removes the need for the 4' 90 degree embedment and the welded couplers/bars at the bottom flange shown in SI-3703. No detail is currently available for the above situation.
Please provide a new rebar detail applicable when the bottom of beam is above top of steel for MFB 14 at G/16.9. Please include an alternative for the 4' vertical embedment and the welded couplers/bars on bottom flange, both of which are not applicable in this case. Note that the new bottom bar end condition must correlate with the stiffener plates on the bottom of flange. 	<p>Per ASI 128 narrative summary change description for drawing E1-4603, it states "No content revisions to sheet, previously issued version included with new date (markup)".</p> <p>1. This creates an inconstructibility issue with the jet fountain lighting system as the +/-60 type E18 fixtures would remain NIC"[along with other electrical scope] per Add4 issued on 06/20/14.</p> <p>2. In addition to the E18 fixtures, E2 is also shown as "NIC". Should this drawing be updated to include fixtures label "NIC"?</p>

T-2168	SSS - Light Column Pipe to Cast Node Joints	Void	01	02/03/2015	02/13/2015	
From: Webcor Construction LP                      Andrew Kitchen						
<b>REQUEST:</b>		<b>ANSWER:</b>				
Contract Doc Ref: S1-6005, S1-6006 Location: GL 23 Add'l Doc Ref: AWS D1.1		Contract Doc Ref: S1-6005, S1-6006 Location: GL 23 Add'l Doc Ref: AWS D1.1				
<p>Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. Pipe has been ordered and delivered in conformance with this specification. Detail 6/S1-6006 shows the intended fit between the vertical pipe legs and the cast nodes. The castings have a machined feature on each nozzle end that is intended to slide into the pipe ends and act as a backing ring. The corresponding weld between these two components is called out as a complete joint penetration weld in the same detail. In accordance with AWS D1.1 Section 5.22.1.1, the separation between faying surfaces of butt joints landing on a backing shall not exceed 1/16". The allowable tolerances for API 5L Grade X52 pipe do not require concentricity (between internal and external bores) or even a constant wall thickness that would be required by AWS D1.1 to provide a complete joint penetration weld. Further, there is no requirement in the contract documents for additional machining to the internal bores of the pipe ends as would be required by AISC Code of Standard Practice.</p> <p>As a result our fabricator has encountered the following conditions;</p> <ol style="list-style-type: none"><li>1. Pipe does not fit over the machined backing ring at the cast node nozzle end as intended without additional grinding and/or machining</li><li>2. Pipe fits over cast node backing ring; however, pipe ID is not circular or concentric, resulting in excessive gaps that exceed fit tolerance requirements for a complete joint penetration weld. Further, the lack of concentricity may result in misalignment of the pipe and cast nodes in the vertical legs.</li><li>3. Ring pipe segments will be made from different pipe sections. Pipe ends from such sections will have varying and unmatched IDs again inhibiting the installation of a tight fitting backing ring required to complete a CJP.</li></ol> <p>For demonstration please refer to attached SK RFI 1015 SK 1 and SK 2 which shows actual dimensions for the first pipe section cut by our fabricator (p16056) and corresponding measurements from cast nodes 702-01 and 702-02 machined backing ring (see attached sketches).</p>		<p>Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. 	<p>The sketches compare the measured pipe ID to the cast node backing ring OD. This piece does not fit against either of the cast nodes.</p> <p>To resolve these issues we see the following options / solutions;</p> <ol style="list-style-type: none"><li>1. Grind internal bores of pipe ends to allow fit against castings. This option would not permit the completion of complete joint penetration welds so the CJP weld designation requirement would have to be modified to a PJP by the design team. Gaps exceeding PJP allowances would have to be built up with weld metal. Please note; however, that this option does not ensure a correct alignment between the vertical pipe and cast nodes.</li><li>2. Machine internal bores of pipe ends to ensure a tight fit against the castings and correct alignment between the pipe and castings. The actual machining work to achieve this would be minimal; however, building machining fixtures and set up time for each pipe end would be significant</li><li>3. For pipe to pipe welds in the ring sections, we suggest removing the CJP weld designation.</li></ol> <p>Please advise or provide a solution as the above options have cost and schedule impacts.</p>					
	<p>for the first pipe section cut by our fabricator (p16056) and corresponding measurements from cast nodes 702-01 and 702-02 machined backing ring (see attached sketches). The sketches compare the measured pipe ID to the cast node backing ring OD. This piece does not fit against either of the cast nodes.</p> <p>To resolve these issues we see the following options / solutions;</p> <ol style="list-style-type: none"><li>1. Grind internal bores of pipe ends to allow fit against castings. This option would not permit the completion of complete joint penetration welds so the CJP weld designation requirement would have to be modified to a PJP by the design team. Gaps exceeding PJP allowances would have to be built up with weld metal. Please note; however, that this option does not ensure a correct alignment between the vertical pipe and cast nodes.</li><li>2. Machine internal bores of pipe ends to ensure a tight fit against the castings and correct alignment between the pipe and castings. The actual machining work to achieve this would be minimal; however, building machining fixtures and set up time for each pipe end would be significant</li><li>3. For pipe to pipe welds in the ring sections, we suggest removing the CJP weld designation.</li></ol> <p>Please advise or provide a solution as the above options have cost and schedule impacts.</p>

Contract Doc Ref: S1-6005, S1-6006 Location: GL 23 Add'l Doc Ref: AWS D1.1						
The cast node ring has been laid out, plumbed, aligned and leveled. The ring layout has been optimized to maintain circularity as well as vertical and horizontal alignment to the greatest extent possible.						
The weld joint design being used for these welds is BC-P2-GF which allows for a root opening of zero and corresponding "As Fit-Up" tolerance of +1/8", -1/16". Please find attached AWS D1.1 extract for this joint.						
Following layout and fit using the primary criteria of maintaining circularity of the ring and both vertical and horizontal alignment of the ring geometry, some root openings exceed the allowable fit up tolerance (see attached Photos 1 and 2). Please confirm we can proceed by "buttering" the joints at these locations (closing gaps with weld metal).

T-2179	FSP - Fire Storage Tank Capacity	Open	CR	02/04/2015	02/14/2015	
<b>From:</b> Webcor Construction LP                      Aseem Goyal						
<b>REQUEST:</b>		<b>ANSWER:</b>				
Contract Doc Ref: P1-5040, 21 13 19-3 Location: Train Platform Level Closest Column Line Intersection: Between B,C.3 & 4,5 Add'l Doc Ref's: N/A		Contract Doc Ref: P1-5040, 21 13 19-3 Location: Train Platform Level Closest Column Line Intersection: Between B,C.3 & 4,5 Add'l Doc Ref's: N/A				
P1-5040 calls out the Fire Water Storage Tank as a 45,000 Gallon Tank. The Tank should be sized for the worst case hazard classification of the building. Per Specification 211319-3, the Bus Deck Level is Classified as Extra Hazard Group 1 with a design density of .24 over 4,000 sq. ft. If sizing the tank for this density it should hold 131,400 gallons.		P1-5040 calls out the Fire Water Storage Tank as a 45,000 Gallon Tank. The Tank should be sized for the worst case hazard classification of the building. Per Specification 211319-3, the Bus Deck Level is Classified as Extra Hazard Group 1 with a design density of .24 over 4,000 sq. ft. If sizing the tank for this density it should hold 131,400 gallons.				
4,000 x .24 = 960 gallons 960 gallons + 500 gallons hose allowance = 1,460 gallons 1,460 gal. x 90 minutes duration = 131,400 gallons		4,000 x .24 = 960 gallons 960 gallons + 500 gallons hose allowance = 1,460 gallons 1,460 gal. x 90 minutes duration = 131,400 gallons				
Please confirm water storage tank sizing?		Please confirm water storage tank sizing?

	<p><b>ANSWER:</b></p> <p>Reference Drawing: 1/S1-5131</p> <p>Please see attached blow up of Plan Sheet S1-5131 Detail 1 View D (Front View). Please provide the location for the center of the 8" radius.</p>					

**ANSWER:**

Reference specification sections

- 03 30 20 (Dated August 30, 2012)
- 09 67 24 (Dated March 31, 2014)

Reference Drawings

- A1-2202 thru A1-2211 (Dated March 31, 2014)
- A1-9523, A1-9524, A1-9525 (Dated March 31, 2014)
- A1-9602 (Dated March 31, 2014)

Per specification 03 30 20-3.6, B.1 Concrete Finishes: Scratch finish is specified with FF/FL and is clarified in RFI T-777. (see attached)

New Lower Concourse drawings A1-9523, A1-9524 & A1-9525 issued in IFC set dated 3.31.14 delineate certain areas of structural concrete slab to remain as exposed and will not receive topping slab. These sheets do not show any reference for concrete surface finish other than what is specified under specification 03 30 20 and RFI T-777. The contractor has stated that this finish will be provided using a Fine Broom.

Please confirm this understanding is in alignment with the designer's intent for the areas of structural slab that will remain exposed.

Also, please confirm for all Concourse floor areas (topping slab, interim topping slab or no topping slab) that are to receive floor coating FC-3 the specified scratch finish is the designer's intent for concrete finish. FC-3 Spec section 09 67 24 located per floor finish plans A1-22\_\_ Series drawings and Floor finish schedule A1-9602.

A. Confirm \$25,000 dollar policy is required. Conflicts w/ 16.4 (page 11) of the LONG FORM SUBCONTRACT document. However, 16.9 says more stringent of requirements apply.			A. Confirm \$25,000 dollar policy is required. Conflicts w/ 16.4 (page 11) of the LONG FORM SUBCONTRACT document. However, 16.9 says more stringent of requirements apply.			
B. Confirm duration of E & O insurance. EXB-A Section 4.F states insurance shall be maintained "...10 years beyond the Contract Final Completion Date..." Considering the internal bracing, trestle, and bridges are temporary shouldn't the policy only apply when the system is in use. Once removed (street level construction complete), the liability should shift to the permanent structure's design team as the station superstructure is erected. Taken literally, this could require the E & O maintained 17 years (7 years of construction + 10 years beyond).			B. Confirm duration of E & O insurance. <b>REQUEST:</b>			<b>ANSWER:</b>			
<p>Exhibit A, II, "Key Dates for Bidding Process" of the Project Bidding Manual establishes the Bid Due Date as Sept. 14, 2010, 6 weeks from the date of bid package issuance.</p> <p>Six weeks is an insufficient amount of time to adequately prepare a \$200M estimate and bid. We therefore request that the Bid Due Date be extended an additional 8 weeks for the following reasons</p> <p>Design-Build The SBE package includes major deisgn-build elements. The extent of the design work related to shoring, bracing, trestle, cross-street bridging and dewatering that the BSE Trade Subcontractor will be responsible for performing became fully apparent to the prequalified contractors only when the bid package was issued. Developing these required Trade Contractor designs far enough to allow accurate pricing to begin will take time.</p> <p>Considering the magniute and location of the construction work, the risk accompanying the design is also extremely high. A memorandum of understanding that adequately addresses this risk must be negotiated with the Trade Subcontractor's Professional Engineer before design can even beign. This will take time.</p> <p>Similarly, the Trade Subcontractor will likely enlist the services of an independent Professional Engineer to act as a peer reviewer to check the work of the Trade Subcontractor's principal engineer. Reconciliation of any differences identified during this review will take time.</p> <p>Liquidated Damges Liquidated damages associated with not meeting the CM/GC's schedule for Substantial Completion are extraordinarily high. It appears to us that the BSE Trade Subcontractor's time for substantial completion, i.e. 1,825 days following Notice to Proceed with pre-construction services, is highly interconnected with the work of other trade subcontractors and also contingent on their performance. If this is the case, it becomes very difficult to accurately assess risk of exposure to liquidated damages. The Joint Venture will need time to clarify with the CM/GC the relationship between the other trade subcontractors' work and the BSE Trade Subcontractor's</p>			<p>Exhibit A, II, "Key Dates for Bidding Process" of the Project Bidding Manual establishes the Bid Due Date as Sept. 14, 2010, 6 weeks from the date of bid package issuance.</p> <p>Six weeks is an insufficient amount of time to adequately prepare a \$200M estimate and bid. <b>REQUEST:</b>			<b>ANSWER:</b>			
Reference Transbay Terminal Center Bid Package TG03 Shoring, Buttress and Excavation (Cont.)			Reference Transbay Terminal Center Bid Package TG03 Shoring, Buttress and Excavation (Cont.)			
<p>Q - We have started into our second week of intensive review of bid documents and drawings in which to grasp what is prescriptive work and what requires additional contractor design and scheduling in our bid proposal preparation. Having been involved in not only pre-bid contractor designed support-of-excavations but final design and construction of numerous deep supported excavations in urban environments in numerous cities in California, we look forward to working on this unique and challenging project. This project brings additional elements to be considered during design of support-of-excavation and traffic supported trestles that would not normally be considered in below street level construction. One, the width of the supported excavation at approximately one hundred and eighty L.F., will require at least two intermediate vertical piles to support the horizontal bracing levels. Second, the need to incorporate both longitudinal and transverse traffic trestle decking whose vertical support locations will add to the constraints and interference with the location of the horizontal bracing levels. Third, the phasing of the shoring and excavation will require various locations of bracing levels of the CDSM cut-off walls. Fourth, the tie-down anchors will have to be designed to meet project specifications. Fifth, the volume of information including as-builts and the myriad of geotechnical information provided will consume considerable time which our designers can ill afford not to digest the pertinent information. And lastly, the tremendous coordination and evaluation of the various key subcontractors scopes and proposals will be itself a considerable effort since various proprietary information will be provided to them for pricing Tutor-Saliba's in-house designs. For these various reasons, we strongly urge a postponement of at least four weeks to the current scheduled bid date of September 14th in which we can properly develop the most complete and competitive design concepts and pricing proposal to Webcor/Obayashi. It is very important that you evaluate this request in a timely manner in which we can allocate the limited time available to our engineering and estimating forces. Your timely written response is appreciated.</p>			<p>Q - We have started into our second week of intensive review of bid documents and drawings in which to grasp what is prescriptive work and what requires additional contractor design and scheduling in our bid proposal preparation. TG03.00-0056	TG03 Question 0056 - Access Trestle Permanent Structure	Closed	06	08/16/2010	08/22/2010	08/20/2010
<b>From:</b> Webcor/Obayashi Joint Venture      Manuel Saldana						
<b>REQUEST:</b> Reference Exhibit A, Attachment 3 A.  Q - We note that the access trestle is to be coordinated with permanent construction, not conflict with the permanent structure except for penetrations, and is to be at the same level of the temporary bridges at the connections. This would appear to require that the trestle deck be below the bottom of the ground floor permanent structure section, with built-up ramps to match the street bridges. We also note that the permanent ground level structure is lower at the street crossings than elsewhere. This would push the trestle deck further down, conflicting with the limits of placement of the top level bracing strut. No guidance is given regarding how the future Trade Subcontractor will want to use the trestle to construct the ground floor or the superstructure. Please clarify where the top of trestle deck is intended to be located, and whether it is acceptable to locate the trestle deck at ground floor level, such that it could be used for sequential construction of the ground floor and superstructure. Is there an upturned longitudinal beam down the middle of the street crossings? . Schedule A on S1-3201 only indicates a 30" slab.  Submitted by Charles M. Gardner Kiewit Infrastructure West Co. 08/13/2010		<b>ANSWER:</b> Reference Exhibit A, Attachment 3 A. Q - Please help to clarify the strut and waler system stiffness requirements. Our initial interpretation and the associated analyses indicate that strut and waler sizes increase very significantly over what would be required by strength considerations alone. Please provide a sample calculation or procedure for determining stiffness for comparison with the values given in kip per foot, per foot of wall. B. Pre-loading will take out a portion of the axial shortening of the struts. We assume that it is appropriate to subtract out that deflection from the stiffness calculation. Please confirm. <b>REQUEST:</b>			<b>ANSWER:</b>			
Our QBD 1 sent on 8/9/10 requested an 8-week extension to the bidding period and provided reasons for our request. We would like to reiterate our concern that it is not possible to provide an accurate design-build bid of this magnitude within the currently allocated 6-week period. (Bidder Name - hidden) requests that the CM/GC decide as soon as possible whether or not the bid period will be extended and notify all bidders of the decision. If SST does not receive notification of a bid extension by Friday, Aug. 20, it may determine that it cannot continue to participate in this procurement. <b>REQUEST:</b>						<b>ANSWER:</b>
Reference Exhibit A						Reference Exhibit A
Attachment 3, Access Trestle Criteria, states "The level of the access trestle shall be the same as the level of the Temporary Bridges at the connections." Attachment 3 also states "The layout for each member of the Access Trestle, shall not conflict with the permanent structure." Tying the trestle to the cross streets will cause the trestle structure (which is approx 7' deep) to conflict with the concrete roof of the follow on structure. It is our understanding that the CM/GC understands this and will coordinate the removal of the access trestle and the temp streets such that the concrete roof can be constructed after these conflicting structures are removed. Pls confirm.						Attachment 3, Access Trestle Criteria, states "The level of the access trestle shall be the same as the level of the Temporary Bridges at the connections." Section states "Contractor shall provide uniformed...police officers, as required by the TJPA representative..." It is our understanding that per the contract definitions, the Contractor is defined to be Webcor/Obbayashi. Please confirm that Webcor/Obbayashi will direct and pay the costs for the uniformed officers described herein. If it is the intent of the contract that the Trade Subcontractor direct and pay the costs for these officers, please provide specific guidelines on when these officers will be required. Simply stating "as required by TJPA" will result in exorbitant bid costs due to the lack of specific information provided. Suggest an allowance for this. From: Webcor/Obayashi Joint Venture      Manuel Saldana						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Reference specification 39 09 13			Reference specification 39 09 13			
<p>The plans show geotechnical instrumentation including inclinometers, MPBXs, piezometers and settlement points. Specification Section 39 09 13 states that "... Geotechnical instrumentation consists of inclinometers, settlement casings, settlement monitoring points, survey reference points, piezometers and multiple point borehole extensometers." The plans state that the geotechnical instruments for monitoring the TBT excavation and shoring work are to be drilled and installed by the TJPA representative. However, the specifications call for "...furnishing, installing, monitoring, reading, recording, maintaining, protecting ..... geotechnical instrumentation." The specifications go on to state that "...where shown on the drawings, the Contractor will procure and install the specified instrumentation." We find no notes on the plans calling for the Contractor to procure and install the specified instrumentation nor notes as to who is responsible for monitoring the shoring performance. The plans appear to be inconsistent with local practice in that it is customary in Northern California for the Contractor to furnish, install and monitor appropriate geotechnical instrumentation when the Contractor is responsible for constructing works involving deep excavations and shoring. We recognize the Internal Bracing Specification requires a monitoring program for struts, but is silent on exterior monitoring.</p> <p>1. What is the Owner's intent in this regard?</p> <p>2. Will the TJPA be responsible for the exterior monitoring</p>			<p>The plans show geotechnical instrumentation including inclinometers, MPBXs, piezometers and settlement points. <b>REQUEST:</b>		<b>ANSWER:</b>				
Reference drawing sheet GT-1111, Legend		Reference drawing sheet GT-1111, Legend				
(TG0300-0058) requested: A. Please help to clarify the strut and waler system stiffness requirements. Our initial interpretation and the associated analyses indicate that strut and waler sizes increase very significantly over what would be required by strength considerations alone. Please provide a sample calculation or procedure for determining stiffness for comparison with the values given in kip per foot, per foot of wall. B. Pre-loading will take out a portion of the axial shortening of the struts. We assume that it is appropriate to subtract out that deflection from the stiffness calculation. Please confirm. REQUEST:		ANSWER:				
Response to question TG003-0044 states "Protect in place New active sewers constructed as part of the Relocation of Utilities Project as shown on the plans." Please confirm that the project referenced is TG 04.5.1. As these are the only utility relocation plans available to the Trade Subcontractor, we need confirmation that these are the only drawings that must be reviewed prior to bid. If there are other plans the Trade Subcontractor must review in order to ascertain the impacts of new utility relocations, advise where they can be obtained. TG03.00-0159	TG03 Question 0159 - Temporary Bridge	Closed	06	09/03/2010	09/10/2010	09/13/2010
From: Webcor/Obayashi Joint Venture      Manuel Saldana						
REQUEST:			ANSWER:			
Schedule A on S1-3201 identifies top of structure elevations. When these elevations are cross referenced against the elevations of the cross streets the temporary bridges that tie into it will be several feet above grade, unless there is a provision for a concrete "leave out" Drawing A 5206 shows First Street Elevation at 14.94. The top of structure at this zone is from 12.79' to 13.47', this allows less than 2' for the temporary bridge installation. Depending on the final Temp. bridge design and clearance necessary to construct box structure below the bridge deck may be as much as 6' above the city street. Is it the owners intent to ramp up on the city street to the temp bridge elevation? If so what is the max grade allowed for the approach ramp?			Schedule A on S1-3201 identifies top of structure elevations. When these elevations are cross referenced against the elevations of the cross streets the temporary bridges that tie into it will be several feet above grade, unless there is a provision for a concrete "leave out" Drawing A 5206 shows First Street Elevation at 14.94. Is it the owners intent to ramp up on the city street to the temp bridge elevation? If so what is the max grade allowed for the approach ramp?			
Also, please comment on the intent for side sloping, access for business, support of fill, etc. This condition applies to Beale street as well.			Also, please comment on the intent for side sloping, access for business, support of fill, etc. This condition applies to Beale street as well.

<b>REQUEST:</b>						
<p>The response to previous question TG0300-0054 states that the rebracing loads can be determined based on the information provided on GT-1110. Please identify the specific information on GT-1110 that is to be used to determine these loads. We note that the computation of these loads will depend upon the assumed degree of CDSM wall fixity at the base slab, the assumed distribution of seismic loads, as well as, other inherent assumptions. The CDSM wall analysis and design computations (which we assume must have included an analysis of the bracing removal/rebracing stages) have not been made available to the bidders so it is not possible to ascertain the basic loading and support conditions assumed by the CDSM wall designer for the bracing removal/rebracing conditions. We recommend that the static and seismic components of the rebracing design loads be provided so that all bidders are designing the rebracing for bracing demands that are consistent with the CDSM wall designer's computations.</p> <p>Submitted by Rich Zito Shimmick / Skanska / Traylor JV (SST) 09/07/2010</p>

TG03.00-0199	TG03 Question 0199 - Retention	Closed	CR	09/13/2010	09/19/2010	09/14/2010
<b>From:</b> Webcor/Obayashi Joint Venture      Manuel Saldana						
<b>REQUEST:</b>  Reference Answers to Pre-Bid Meeting Questions.  The answer to Question 13 says that retention is withheld for the duration of each subcontractor's scope of work rather than the entire project. Most of the SBE Subcontractor's scope of work will be complete with the placing of the rat slabs. However, the contract will continue until the SBE Subcontractor's responsibility for shoring/bracing removal and trestle/bridge removal is complete. The schedule for this work is contingent on other Trade Subcontractors and the completion date for the entire scope of the SBE Trade Subcontract Package is unknown. Will Webcor/Obayashi release retention attributable to all work completed up until the placing of the rat slabs when the placing of the rat slabs is complete?						<b>ANSWER:</b>  Reference Answers to Pre-Bid Meeting Questions. <b>TG043-0007</b>	<b>Bid Form Clarification</b>	<b>Closed</b>	<b>CR</b>	<b>11/02/2010</b>	<b>11/16/2010</b>	<b>11/02/2010</b>
<b>From:</b> Webcor Construction LP      David Hungerford						
<b>REQUEST:</b>			<b>ANSWER:</b>			
The bid form is far too complex. We can possibly understand the need for the data indicated by the bid form from the subcontractor awarded the project, but we can see no need for each and every bidder to fill out every space in a ten page bid form. In addition the bid form requires us to fill in the quantities. As every subcontractor will have different quantities, this seems somewhat odd. A typical SF PUC style bid form, with quantities provided, would result in bids that could be confidently compared with each other- ¿Apples to Apples¿, not¿ Oranges to Apples¿. We request that such a bid form be provided. If the bid form is not simplified greatly, we will not be able to bid this project, since it will take more time to complete the form than actually estimate the project. <b>TG043-0009</b>	<b>Exhibit I Schedule and Exhibit A.V</b>	<b>Closed</b>	<b>CR</b>	<b>11/02/2010</b>	<b>11/16/2010</b>	<b>11/04/2010</b>
<b>From:</b> Webcor Construction LP      David Hungerford						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Exhibit I, Schedule, appears to show the physical work occurring between 1/27/11 and 3/31/11, approximately 68 calendar days (CD). This is approximately 48 working days. In this amount of time we are to install the sewer, install the water, get SFWD to do the tie ins (which often takes 2 weeks) and then do all the demolition and restoration. Please confirm that this is your intent. Also note that Exhibit A.V appears to require (under milestones) that the water work be completed within 80 CD of NTP-thus it seems that the water will have to be completed prior to the sewer. Please confirm this is your			Exhibit I, Schedule, appears to show the physical work occurring between 1/27/11 and 3/31/11, approximately 68 calendar days (CD). This is approximately 48 working days. TG043-0010	Bid Package Drawing Clarification	Closed	CR	11/02/2010	11/16/2010	11/02/2010
From: Webcor Construction LPDavid Hungerford						
REQUEST: Exhibit A.IV, Clarification of Bid Package. It states that The issued for construction drawings and the Field Order revisions are for construction of Bid Package TG04.5.1 ONLY. However the Delta 1- Field Order- revisions state that the revisions (are) for TG04.3 and TG 04.4. So if they are for construction of Bid Package TG04.5.1 ONLY, why are they revisions for TG04.3 and TG04.4? Are you trying to say- Use all the drawings as provided, and then when we give you a contract we will reissue the drawings, without changes, other than stating that they are now issued for construction? Please clarify exactly what you mean.						ANSWER: Exhibit A.IV, Clarification of Bid Package. <b>TG043-0040</b>	<b>Permanent Pavement Restoration Requirements</b>	<b>Closed</b>	<b>CR</b>	<b>11/02/2010</b>	<b>11/16/2010</b>	<b>11/03/2010</b>
<b>From:</b> Webcor Construction LP      David Hungerford						
<b>REQUEST:</b> Specs. 321724.  Typically in SF all permanent pavement restoration is provided by SF at no cost. Are we to provide permanent restoration of pavement markings or will SF provide at no cost?					<b>ANSWER:</b> Specs. 321724.  Typically in SF all permanent pavement restoration is provided by SF at no cost. Are we to provide permanent restoration of pavement markings or will SF provide at no cost?	
<b>TG043-0041</b>	<b>Fire Hydrant Procurement Clarification</b>	<b>Closed</b>	<b>CR</b>	<b>11/02/2010</b>	<b>11/16/2010</b>	<b>11/04/2010</b>
<b>From:</b> Webcor Construction LP      David Hungerford						
<b>REQUEST:</b> Specs 331100.1.1.B & 331100.3.3.C&D.  There is ambiguity regarding fire hydrants. It appears SFFD installs fire hydrants. Do they supply the hydrants? If not, do we have to pay for the hydrants and valves etc.? If we have to pay, EXACTLY what must we obtain and EXACTLY what is the cost? If we are required to purchase something from one source only, we need to be provided with information regarding what we are buying and what it will cost.					<b>ANSWER:</b> Specs 331100.1.1.B & 331100.3.3.C&D.  There is ambiguity regarding fire hydrants. It appears SFFD installs fire hydrants. Do they supply the hydrants? If not, do we have to pay for the hydrants and valves etc.? TG043-0044	Water Dist. Piping & Valves Clarification	Closed	CR	11/02/2010	11/16/2010	11/04/2010
	From: Webcor Construction LP      David Hungerford					
REQUEST:						
Specs. 331100.3.2.E.						
See items 2 and 5. What do they mean? This does not make any sense as written. Please provide rewritten specification that can be understood.						
What material is that? Perhaps we will understand the fire hydrant situation if previous question, above is answered, but what material is SFWD providing that we have to move? For connections, SFWD has always transported their own material. Please specify exactly what material we need to transport.

REQUEST:		ANSWER:				
We need direction for the electrical installation inside the new concrete stem wall. We are planning on installing the formwork for the south-side of the wall starting Wednesday morning. As such, we need to install the electrical conduits and boxes tomorrow, Tuesday, at the latest to meet our schedule. Please provide detailed information on the entire conduit run and the elevation of the boxes. It is our understanding that we are completing abandoning the originally anticipated electrical lighting work as anticipated in our contract documents. <b><i>Number</i></b>	<b><i>Subject</i></b>	<b><i>Status</i></b>	<b><i>Choice Required</i></b>	<b><i>Date Created</i></b>	<b><i>Date Required</i></b>	<b><i>Date Answered</i></b>
	<p>Field verified measurements and layout for the location of the structural steel does not coordinate with the stucco inset locations as shown on detail C/S-5000. In addition framing around the perimeter of the wall (aluminum panel locations) had to be modified due to assembly and installation methods. (See attached pictures and sketches. This RFI addresses three framing issues. All issues have been discussed in the weekly 301 Mission Wall subcontractor meeting with URS, Turner, Transworld, TJPA and Webcor-Obayashi.</p> <p>1.) In two of the four stucco slot locations, field conditions show that a portion of the base plate conflicts with the stucco slot. This base plate encroaches into the stucco panel per dimensions shown on the attached sketch. Please advise.</p> <p>2.) The structural steel had been relocated to CL of the wall (per RFI T-0098) and therefore studs around the steel per B/A-6000 could not be set per plan. Transworld has installed hat channel metal framing to the face of the structural steel tube using fasteners into the structural steel as per RFI T-0106 as well as modified the boxed framing per attached sketches around the perimeter of the wall. Sizes of metal framing were used to align with adjacent framing per plan. This work is currently installed, please confirm framing modifications per attached marked up details are acceptable.</p> <p>3.) Blocking at the top of the wall at the north side (between the framing and 8"x 8" tube steel) was not installed, as there was no room between the framing and steel. Framing was attached directly to the tube steel. See attached.</p> <p>Please confirm that the framing modifications in item 2 and 3 are acceptable and provide direction at the base plate conflict per item 1.</p>

U-0035	Installlation Depth of Storm Drain New Catch Basins	Closed	03	12/09/2010	12/13/2010	12/13/2010
From: Webcor Construction LP                      David Hungerford						
REQUEST:		ANSWER:				
Reference: Sheet U-3023, U-3033 (Detail B), Attached detail from Department of Public Works Buearu of Engineering		Reference: Sheet U-3023, U-3033 (Detail B), Attached detail from Department of Public Works Buearu of Engineering				
Trinet is concerned that the installation depth for many of the new catch basin does not comply with SFDPW Sewer Departent guidelines, specifically regarding access to the traps for the maintenance department. The DPW sewer maintenance crews need to have ready access to the p-trap during flooding emergencies. DPW crews need to be able to reach the p-trap to, either remove the cleanout cap and release the flow to the culvert pipe (if the trap bottom is plugged), or rod the culvert line through the trap (if the culvert is plugged). To get some clarification of the installation guidelines, Trinet had informally talked to one of the design engineers at the SF Bureau of Engineerring, Hydraulics Department. He advised Trinet that new catch basins should be installed with center of trap and discharge piping grade located between 3 and 4 feet below the culvert runs to cross under existing utilities that are in conflict with a direct run to the discharge manhole. Bends should be 22 1/2 degrees where possible as required, and if 45 degree bends must be used we should limit the number to two (2). U-0043	Fire Hydrant at St. 5+70 on Minna	Closed	03	12/13/2010	12/23/2010	12/14/2010
<b>From:</b> Webcor Construction LP                      Mario Saldana Sr.						
<b>REQUEST:</b>  INFORMATION NEEDED See the attached picture of the proposed fire hydrant location as indicated by drawings on Minna St. at Stn. 5+70. This location is in conflict with an existing driveway apron not shown on drawing # U-2008. Eric Zagol from AECOM is aware and has seen this issue in the field. NOTE - Due to the 8" water line currently being installed, the location for the "T" section oinstall could be as early as Tuesday the 14th. Please provide direction by 12-14-10 if possible.  We propose to move the fire hydrant location 6½ West to Stn. 5+64. Please advise.		<b>ANSWER:</b>  INFORMATION NEEDED See the attached picture of the proposed fire hydrant location as indicated by drawings on Minna St. at Stn. 5+70. During excavation for the 8" water main along Minna Street, Trinet encountered a 1" Polyethylene service lateral at station 3+08, that extended into the vacant lot on the south side of the street. The service was broken during construction and Trinet has temporarily capped it. The utility was not shown on any utility plans. There is also no new service lateral, or reconnection of an existing, depicted on the new water main drawings at or adjacent to this location. Please advise on what should be done with the service. The repair is only temporary and a permanent reconnection will need to be performed by the SFWD if the service is to be maintained active. If the service is to be de-activated, then Trinet recommends that it be shut off at the connection to the old main.			During excavation for the 8" water main along Minna Street, Trinet encountered a 1" Polyethylene service lateral at station 3+08, that extended into the vacant lot on the south side of the street. The service was broken during construction and Trinet has temporarily capped it. The utility was not shown on any utility plans. There is also no new service lateral, or reconnection of an existing, depicted on the new water main drawings at or adjacent to this location. Please advise on what should be done with the service. The repair is only temporary and a permanent reconnection will need to be performed by the SFWD if the service is to be maintained active. If the service is to be de-activated, then Trinet recommends that it be shut off at the connection to the old main.

U-0066	Minna St Station 2+09 - 4" Water Service Lateral Encountered	Closed	03	12/23/2010	01/02/2011	12/28/2010
<div><div>From: Webcor Construction LP</div><div>David Hungerford</div></div>						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Refer to Sheet U-3107			Refer to Sheet U-3107			
During the water installation on Minna St we encountered an existing 4" water service lateral at Sta 2+09. The 4" service extends from the old 8" water main to 83 Minna St (Anchor & Hope Restaurant). This is in addition to a 1" service lateral to the same building which we encountered at station 2+09. The contract drawings only show the 1" water lateral service connecting to the new main. This is in addition to a 1" service lateral to the same building which we encountered at station 2+09. The contract drawings only show the 1" water lateral service connecting to the new main.			
Please advise if the existing 4" service lateral is active and if it must be connected to the new water main. There was no material on site to install a tee in the line, and to avoid delaying the work, the new water main installation continued past the 4" service lateral. The recommendation is that if the 4" service line needs to be connected to the new main, work can be performed by SFWD as an additional tie-in. U-0075	Water Main Connection at 2nd St and Minna St - expose new line for SFWD  From: Webcor Construction LP Mario Saldana  REQUEST: Reference Sheet U-3107 and attached photos  At the intersection of 2nd St and Minna St, there is an existing 2in gas line running directly on top and next to the existing 8in main to be tied into. SFWD cannot make the Tee connection due to the bells of the fittings with the 2in gas line so close.  The end of the new line installed by Trinet will need to be exposed about 2ft for SFWD to move the end of the line by 1ft east so that SFWD can make the connection without moving the gas line. This will require extra work for Trinet to expose the new line for SFWD. Eric Zangol from AECOM and Dan Helminiak from SFWD were present during the discussion of this issue.  Please provide direction as soon as possible as this will impact the chlorination and tie-in schedule.	Closed	03	01/11/2011	01/21/2011	01/12/2011

	<b>REQUEST:</b>  Reference Sheet U-3123 and attached detail  During Trinet's installation of the temporary water line in Fremont St., Trinet encountered an existing AT&T duct that was in direct conflict with the temporary water line. Trinet was directed by Eugene Chu of SFWD/SFPUC to run the temporary water line over the existing AT&T duct using 45 degree bends. This resulted in less cover for the piping than what is required by the Water Department. Due to the lack of cover, Trinet was directed to install a 1/2in steel plate beneath the concrete base along the trench as depicted in the attached detail. The plate was approximately 2ft wide by 6ft long and extended to the limits of the installed 45 degree bends.

<b>U-0080</b>	<b>Proposed Design Change for MH #501</b>	<b>Closed</b>	<b>03</b>	<b>01/17/2011</b>	<b>01/27/2011</b>	<b>01/28/2011</b>
	<b>From:</b> Webcor Construction LP                      Nhi Tran					
	<b>REQUEST:</b>  Reference Sheet U-2021 and attached drawings  Trinet proposes to change the design of sewer manhole #501 from a Modified Box Manhole (per SF Standard Plan #87,184) to a Precast Concrete Manhole (per SF Standard Plan #87,181 - see attached drawing). The proposal includes the installation of a temporary 24" PVC pipe stub, extending south from the manhole and connected to the brick sewer per SF Standard Plan #87,197.  The proposed manhole design will facilitate construction around the many utilities identified in the excavation - see RFI # U-0021 (Trinet RFI 04). It is also the preferred manhole design for 24in pipe per the SF Standard Drawings, especially since the brick sewer on the south side will later be abandoned and plugged (in the manhole) by the owner. This plan will also facilitate the later abandonment of the outlet to the south, as the owner will just have to plug the 24in outlet pipe and not a 3x5 brick sewer.  Please consider. An expedited response is requested.				<b>ANSWER:</b>  Reference Sheet U-2021 and attached drawings  Trinet proposes to change the design of sewer manhole #501 from a Modified Box Manhole (per SF Standard Plan #87,184) to a Precast Concrete Manhole (per SF Standard Plan #87,181 - see attached drawing). Question from U-0083:		Question from U-0083:				
Reference Sheet U-3118		Reference Sheet U-3118				
Potholes on Beale Street at Sta 14+00, Sta 14+90 and Sta 16+25 reveal a 6in steel line that is unmarked and not shown on contract drawings. The line is 18ft south of the Howard St centerline. This is the proposed alignment for the new 12in water main. The pothole at Sta 14+00 also reveals a 3in steel conduit which is 16ft south of the Howard St centerline. Also there is a 6in x 6in wooden telecom duct bank that runs east to west on Howard Street at 15ft south of the Howard Street centerline. This location offers the closest window for the new 12in water line to the original alignment shown in the contract drawings.		Potholes on Beale Street at Sta 14+00, Sta 14+90 and Sta 16+25 reveal a 6in steel line that is unmarked and not shown on contract drawings. The line is 18ft south of the Howard St centerline. Reference Sheet U-3124						
M Squared potholed at Sta 1+10 on Beale Street. We discovered that the 10in High pressure water line is 9ft-5in from the FOC. The existing 12in water line is 14ft-8in from the FOC. The 10in High Pressure line is closer to the FOC that shown on contract drawings. This now means that there is a larger window between the 10in high pressure water and the existing 12in water main.						
M Squared would like to install the new 12in water line at 12ft-3in from center line of the pipe to the FOC. This would mean the new 12in water line would be outside the parking strip and the parking strip would stay in tact. SFWD would also prefer it outside the parking strip for maintenance purposes.						
Please confirm that it is acceptable to install the new 12in water line at 12ft-3in from FOC, going from Sta 0+60 to Sta 1+90.

<b>REQUEST:</b>			<b>ANSWER:</b>			
Reference Sheet U-2007 and attached drawings			Reference Sheet U-2007 and attached drawings			
During layout for the installation of the new 18in Sewer Main on Minna St., Trinet observed that the alignment of the 18in Sewer Main is in conflict with existing PG&E MH #1355 at STA 1+77.50, which is to remain in place. The center line of the new sewer main is 0.10ft north of the outside edge of the manhole wall, as depicted in the attached drawing. The north side wall of the manhole is constructed on top of the existing 3ft x 5ft brick sewer. The brick sewer structure extends approximately 16in into the vault along its entire length. The brick sewer therefore cannot be demolished without undermining the north wall of the electric vault. Eric Z. of AECOM was notified of this issue via phone call on 01/21/2011. The original plan for connection of the 6in Fire Service Lateral @ 46 Minna St. was to leave the existing 6in gate valve (which is located at FOC) in place and connect the new 6in fire line to the downstream side of the old valve (See attached photo and sketch). This plan was proposed by SFWD inspectors, Tom Farhnam and Dan Helminiak, at a field meeting on 12/28/10. On Friday 1/28/11 the SFWD, plumbers when taking measurements for the tie-in, proposed a different plan. They want to extend the new 6in fire line beyond the curb and into the basement, and connect to the homeowners fire line inside the basement (under the sidewalk). Note: This will require coordination with building owner to put a hole through their foundation. Layout and a detail would need to be provided for the wall penetration, as well a detail to plug the hole where the existing water line is entering the basement. 	<p>Webcor/Obayashi has received Bid Addendum #1 for the TG04.2R bid. As part of this addendum, note number 8 under "General Notes" on sheet U-0008 is deleted. This note had previously placed a constraint on the AWSS construction schedule that the Mission Street work must be complete prior to cutting both the Beale Street and the 1st Street lines. It was acceptable to abandon one or the other prior to the Mission Street work but not both.</p> <p>Based on the deletion of this note, it is our understanding that there is no schedule constraint on any of the AWSS system modifications other than the cutting &amp; capping procedures at 1st Street and Beale Street which are required for construction of the TTC Building. Please confirm.</p>

U-0100	<b>Minna St MH#207 Proposed Relocation</b>  <b>From:</b> Webcor Construction LP                      Nhi Tran	Closed	03	02/18/2011	02/28/2011	02/22/2011
	<b>REQUEST:</b> Reference Revised Sheet U-3009 and attached sketches  The current location of MH#207 at STA 9+25.87 will place a cap on the existing water main (installed by SFWD on 02/17/2011) in Trinet's excavation. Trinet is concerned that the old water main may not be adequately restrained and could create a dangerous condition for their excavation for MH#207. Trinet proposes to move MH#207 4 feet west to STA 9+21.87 +/-, as shown in the attached sketch, so that the cap is outside of Trinet's MH excavation. The revised invert elevation for the new MH location is shown on the attached sketch.  Please confirm if this is acceptable,

<b>REQUEST:</b>  Please clarify the following items relating to the re-design of CB#206:  1) The only specification section addressing mortar coating is in 33 31 10 Paragraph 2.1.I, which specifies a "Wet Spray Mortar" application. This process would be cost prohibitive for coating only one catch basin. Trinet proposes the use of "SikaTop 123 Plus" mortar - product data sheets are attached. Please advise if this product is acceptable or specify an alternate material.  2) The RFI response directs Trinet to use ductile iron pipe for culvert runs with less than 3' of cover. If 22.5% DI bends are required to construct the culverts Trinet would prefer to use Mechanical Joint Fittings. Please advise if these are acceptable.						<b>ANSWER:</b>  Please clarify the following items relating to the re-design of CB#206:  1) The only specification section addressing mortar coating is in 33 31 10 Paragraph 2.1.I, which specifies a "Wet Spray Mortar" application. U-0111	Minna St. Joint Trench Conflict with (E) 8" elbow and thrust block	Closed	CR	03/04/2011	03/14/2011	03/09/2011
<b>From:</b> Webcor Construction LP      Nhi Tran						
<b>REQUEST:</b>		<b>ANSWER:</b>				
Reference drawing sheet U-3409 and attached sketch.		Reference drawing sheet U-3409 and attached sketch.				
During our excavation for the joint trench on the east end of Minna St. (STA 9+29) Trinet encountered the (E) 8" water main in Trinet's trench line, approximately 1 foot from our termination point. The existing alignment is different from what is shown in the contract drawings. The drawings do not show the water line crossing the joint trench. The alignment and grade of the water main changed in Trinet's excavation to avoid the adjacent catch basin. A 22.5 degree elbow is located in the center of the joint trench excavation. The elbow is rolled up to accommodate the grade change and there is a thrust block under the footing. Trinet does not believe that it would be safe to excavate under the water main for Trinet's duct bank without having the line shutoff. Extending the PG&E ducts to FOC will also place the connection point for PG&E's extension of the duct bank directly under the water main fittings and elbows. There is adequate clearance to install the 4" gas line above the water main and extend it out to FOC per contract. The top of the water main is 49" below FG at the south side of the joint trench, at the location of the ags line.		During our excavation for the joint trench on the east end of Minna St. (STA 9+29) Trinet encountered the (E) 8" water main in Trinet's trench line, approximately 1 foot from our termination point. The existing alignment is different from what is shown in the contract drawings. The drawings do not show the water line crossing the joint trench. The alignment and grade of the water main changed in Trinet's excavation to avoid the adjacent catch basin. A 22.5 degree elbow is located in the center of the joint trench excavation. There is adequate clearance to install the 4" gas line above the water main and extend it out to FOC per contract. The top of the water main is 49" below FG at the south side of the joint trench, at the location of the ags line.				
Trinet proposes to terminate the concrete encased duct bank approximately 5 ft. back from FOC. This would allow adequate room for Trinet to mandrel the ducts after the joint trench is installed without undermining the water main. PG&E could then extend their duct bank under the water main to connect to Trinet's water main. Please advise.		Trinet proposes to terminate the concrete encased duct bank approximately 5 ft. back from FOC. REQUEST:			ANSWER:			
The revised drawings for the Joint Trench alignment dated 3/16/2011 show the reconfigured AT&T ducts running through an existing tree well on the east side of the AT&T vault at Stn. 3+71. RFI U-0112 (Minna St, Joint Trench, AT&T Vault and Conduit Configuration) also shows the reconfigured AT&T ducts running through an existing tree well on the east side of the vault. This conduit layout in consistent with discussions with the AT&T inspector in the field was reflected in the shop drawings. The revised drawings do not address relocation and/or removal of the impacted trees and the related irrigation changes. Please review and advise. REQUEST:			ANSWER:			
Sheet U-3022 shows MH601 @ Sta 0+70 on Fremont Street. This location is also in the middle of the crosswalk on Fremont Street. USA markings show the existing traffic signal conduits crossing thru the center of the manhole. By moving the manhole approx 8¿ north the conflict with the traffic signal conduits would be avoided and it would also avoid having a manhole cover in a crosswalk. Please advise on how you would like to proceed.			Sheet U-3022 shows MH601 @ Sta 0+70 on Fremont Street. This location is also in the middle of the crosswalk on Fremont Street. <b>From:</b> Webcor Construction LP      Colin Azevedo						
<b>REQUEST:</b>  After further investigation of the existing PG&E duct bank between EMH #1320 and demolished EMH # 1355 (@ Anchor & Hope), Trinet found that there is only one unobstructed conduit between the two manholes. The unobstructed conduit is the one that already had a pull rope in place. Trinet had demolished a section of this conduit during excavation for sewer MH # 201 because it was in conflict with the shoring. Trinet replaced the damaged section (approx. 8 LF) on Saturday 6/1, and reconnected the pull rope in the conduit run. A sketch of the conduit run, depicting the section replaced, is attached. Please review and advise if one 4" conduit will be adequate from EMH #1320 to the west end of demolished EMH #1355.						<b>ANSWER:</b>  After further investigation of the existing PG&E duct bank between EMH #1320 and demolished EMH # 1355 (@ Anchor & Hope), Trinet found that there is only one unobstructed conduit between the two manholes. U-0151.1	<b>Additional Sewer Lateral Connection</b>  From: Webcor Construction LP Jonathan Flaming  <b>REQUEST:</b>  This is a follow-up to the request by the Engineer in his response to W/O RFI #U-0151 (Trinet RFI #097) for additional information relating to the 2nd sewer lateral connection for the 100 1st St building. Trinet also clarifies the issue of the existing 4" trap on the line, which was raised in the original RFI.  The sewer lateral is located @ Stn. 7+09 and the invert elevation of the 4" cast iron sewer lateral pipe at face-of-curb is 14.6'. The elevation for the top of the new concrete encased ductbank @ Stn 7+09 is 13.85'. The sewer lateral was therefore not in conflict with the new joint trench utilities.  With regards to the existing 4" trap on the line, Trinet checked with the SF Plumbing department which advised that a 4" cast iron trap was adequate for a 4" sewer lateral. The existing trap was therefore in compliance with the SF plumbing code. Trinet advised Jason Chin of this in the field and he agreed that the trap did not need to be replaced.  The 4" cast iron vent pipe for the trap did not extend to street level but was capped-off approximately 18" below grade. Per field discussions with Jason Chin, Trinet	Closed	CR	06/29/2011	07/09/2011	07/05/2011

<b>U-0182.3</b>	<b>AWSS - Design Route at 2nd Street Intersection</b>  <b>From:</b> Webcor Construction LP                      Jackson Tukuafu	<b>Closed</b>	<b>CR</b>	<b>02/06/2013</b>	<b>02/16/2013</b>	<b>02/28/2013</b>
<b>REQUEST:</b>  Per the response to RFI U-0182.2, M Squared has field verified a new alignment for the 16" AWSS at 2nd & Mission St. (See attached drawing).  Due to several PG&E conflicts this is the only available route capable of accepting a 16" pipe; M Squared is unable to locate an alignment per the sketch attached to the response to RFI U-0182.2. By proceeding with this alignment M Squared will again return the AWSS pipe through the structure of an AT&T vault and a PG&E Vault. It does not appear from our field work that there are other options for a workaround.  Based on information M Squared currently have attained from the trenching; restraining each joint, per the original contract will require the following: <ul style="list-style-type: none"><li>- 4 additional 16-inch 45deg bends</li><li>- 2 additional 16-inch 90deg bends</li><li>- 1 additional 16-inch bell collar</li><li>- 15 additional stop collars</li></ul>		<b>ANSWER:</b>  Per the response to RFI U-0182.2, M Squared has field verified a new alignment for the 16" AWSS at 2nd & Mission St. (See attached drawing). U-0226.1	AWSS - TCG Duct Bank at 1st Street Intersection	Closed	CR	06/25/2013	07/05/2013	07/08/2013
<b>From:</b> Webcor Construction LP Jackson Tukuafu						
<b>REQUEST:</b>  Please refer to response for RFI U-0226.  As per response to RFI U-0226, M Squared is directed to "Remove the existing gate valve and connect to the existing pipe. Install an I-beam behind the 16" Tee...as an alternative restraint system" in order to avoid two PG&E duct banks in conflict with the AWSS. As a result of the I-Beam being installed at this location, a TCG duct bank would need to be moved 2-feet west.  TCG has determined that the duct bank would take several months to re-locate their duct bank. Therefore, TCG has opted to avoid the conflict by pursuing the suggested 22deg bends as an offset from the 16" tee in RFI U-0226.  Please confirm additional restraints are not required at the 22deg bends or provide all necessary restraints required to for the 10" line at this location.		<b>ANSWER:</b>  Please refer to response for RFI U-0226. U-0228	AWSS - Sidewalk Expansion Evaluation between First Street and Beale Street	Closed	CR	05/31/2013	06/10/2013	10/18/2013
<div> <div> <b>From:</b> Webcor Construction LP           Jackson Tukuafu         </div> <div> <b>REQUEST:</b> <p>Per the attached email it appears that the City's intent is to move the curb lines south between First St &amp; Fremont by 3' and also between Fremont &amp; Beale Street by 4'.</p> <p>First to Fremont St - In moving out the curb line by 3' the AWSS Line on this block will be pretty close to being under the new curb line, therefore making any maintenance of the AWSS line in the future very difficult. There would also be an impact to the gate valve location on the east side of the 1st and Mission intersection and the west side of Fremont &amp; Mission due to the new curb coming south. It is possible a modified roof to the vault would be required as half of the vault would be in the street and another half would be in the sidewalk (judging from rough field measurements). The AWSS Fire hydrant would also need to be relocated as it would now be in the middle of a widened sidewalk, whereas the distance acceptable is 24" to 26" from FOC.</p> <p>Fremont to Beale Street - The current alignment for the AWSS along Mission between Fremont &amp; Beale is close to the curb on the north side (in order to avoid 3 PG&amp;E utility vaults). By moving the curb 4' south the AWSS line will now be underneath the sidewalk on this block. Similar to above the gate valve vaults would be partially under the sidewalk here and modifications/relocations may be required.</p> <p>Please advise if M Squared is to continue with the AWSS install per plan. Alternatively please provide direction on the conflicts that moving the sidewalk creates for the main.</p> </div> <div> <b>ANSWER:</b> <p>Per the attached email it appears that the City's intent to is to move the curb lines south between First St &amp; Fremont by 3' and also between Fremont &amp; Beale Street by 4'.</p> <p>First to Fremont St - In moving out the curb line by 3' the AWSS Line on this block will be pretty close to being under the new curb line, therefore making any maintenance of the AWSS line in the future very difficult. <b>U-0236</b>	<b>RUP - AWSS Pipe Configuration at PG&amp;E Vault #1722</b>	<b>Closed</b>	<b>CR</b>	<b>12/10/2013</b>	<b>12/20/2013</b>	<b>12/19/2013</b>
<b>From:</b> Webcor Construction LP Jackson Tukuafu						
<b>REQUEST:</b> See attached sketches.  Due to the proximity of PGE's Vault #1722 to the new AWSS line M Squared believes the following changes are needed to keep all pipe joints and fittings outside the limits of existing utility vaults.  M Squared proposes installing the 14" x 12" reducer further east, until we are outside the limits of the vault. The pipe between the new cross piece and the new reducer will be 14-inch pipe, rather than the 12-inch shown on the plans. M Squared will be able to eliminate the need for the 12-inch sleeve here and tie 12-inch pipe into the existing main from the reducer. All joints will be restrained using stop collars.  Please confirm that this configuration is preferred to in lieu having fittings and joints within the limits of the PGE Vault. Please advise.						<b>ANSWER:</b> See attached sketches. 						Please confirm that this 8inch slump is acceptable on Bode Mix 604CC (attached).
<b>U-0241</b>	<b>AWSS - Proposed Fire Hydrant Re-Location on Mission and Fremont Street</b>	<b>Closed</b>	<b>CR</b>	<b>01/21/2014</b>	<b>01/31/2014</b>	<b>02/13/2014</b>
<b>From:</b> Webcor Construction LP Jackson Tukuafu						
<b>REQUEST:</b>						<b>ANSWER:</b>
As per AWSS Coordination Meeting on 01/17/2014, the location of this fire hydrant near the intersection of Fremont and Mission is potentially going to need to be moved to accommodate the new sidewalk expansion. The purpose of the RFI is for Michael Smith with SFWD to analyze, consider and direct the feasibility of relocating the fire hydrant further north.						As per AWSS Coordination Meeting on 01/17/2014, the location of this fire hydrant near the intersection of Fremont and Mission is potentially going to need to be moved to accommodate the new sidewalk expansion. The purpose of the RFI is for Michael Smith with SFWD to analyze, consider and direct the feasibility of relocating the fire hydrant further north.
If the hydrant is to be located somewhere other than is shown on the drawing please provide a detail for this work as additional fittings may need to be ordered. <b>U-0242</b>	<b>AWSS - Hydrant Lateral Connection Conflict at Sta. 17+20</b>	<b>Closed</b>	<b>CR</b>	<b>01/21/2014</b>	<b>01/31/2014</b>	
<b>From:</b> Webcor Construction LP Jackson Tukuafu						
<b>REQUEST:</b>						<b>ANSWER:</b>
Sheet MA-16 shows that the hydrant tee is to be rolled down 45-degrees in order to tie in to the lateral piping. However, when M Squared excavated this section, they discovered that the hydrant lateral piping is shallow and the main is approx. 2-feet deeper.						Sheet MA-16 shows that the hydrant tee is to be rolled down 45-degrees in order to tie in to the lateral piping. However, when M Squared excavated this section, they discovered that the hydrant lateral piping is shallow and the main is approx. 2-feet deeper.
In order to install the piping, the hydrant tee will need to be rolled UP 45 degrees. In additon to this M Squared will need to order a customized 8-inch DIP flanged spool to join the tee to the flanged 45-degree elbow.						In order to install the piping, the hydrant tee will need to be rolled UP 45 degrees. In additon to this M Squared will need to order a customized 8-inch DIP flanged spool to join the tee to the flanged 45-degree elbow.
Please confirm it is acceptable to proceed with the customized flange or provide direction.						Please confirm it is acceptable to proceed with the customized flange or provide direction.

<b>REQUEST:</b>			<b>ANSWER:</b>			
Please refer to attached drawing MA-16 and attached photos.			Please refer to attached drawing MA-16 and attached photos.			
After trenching to remove the AWSS, M Squared exposed the 12-inch VCP sewer culvert on the NW corner of Beale & Mission street spanning from the catch basin to the sewer main. The joint was open by 4-inches and was covered in cardboard and duct tape. There was also a reverse flow on the pipe by 15 degrees. Where duct bank #2 and duct bank #3 cross each other there is only 11-inch between the two duct banks. Not enough space to install a 16inch pipe with tie rods and stop collars. The AWSS is pinched between these 2 duct banks for approx. 10ft with one duct bank on top of the 12-inch main and one touching the main from underneath. While all duct banks impede us it seems there is a higher chance of making this work with the removal of duct bank #2. U-0248	AWSS - Restraints at the Intersection of Mission and Fremont St.	Open	CR	06/04/2014	06/14/2014	
<b>From:</b> Webcor Construction LP      Lynn Kowallis						
<b>REQUEST:</b>						
Please refer to drawing MA-16 and M Squared Sketch-TG04.2-072.1 and TG04.2-072.2.						
Question #1 - Does every joint between the new GV west of Fremont Street, and the new 16"x10" tee in Fremont Street intersection need to be restrained with bell & stop collars? This distance is approx. 50ft.						
Question #2 - Currently there does not appear to be enough space to install the new 16" pipe WITH bell & stop collars through the utilities in the Fremont St intersection. There does appear to be space to install 16" pipe without the stop/bell collars on.						
- Our suggestion would be to install the 16"x10" tee and restrain that tee on one joint heading east. Install piping across the Fremont St intersection without stop/bell collars, delete the 16" GV at that location (we believe we will not be able to fit one anyway), and tie off the last piece of pipe coming into the hydrant tee east of Fremont Street.						
Please clarify if this is acceptable.

Please confirm the use of the 24" riser.						ANSWER:  Per response to RFI U-0249, M Squared last night investigated the use of a hydrant riser. It appears that a 24" hydrant riser will be possible in this situation.  Please confirm the use of the 24" riser.
U-0250	AWSS - Hydrant Lateral Connection at STA 13+75 (MA-16)	Closed	CR	06/23/2014	07/03/2014	07/08/2014
From: Webcor Construction LP Jackson Tukuafu						
REQUEST:  Please refer to attached excerpt drawing MA-16 and M2 sketch SK-TG04.2-074.  The piping on this lateral is partially encased in the 3x5 sewer and appears to be ductile iron from 5 ft north of the 3x5 sewer heading south to the hydrant location.  Please confirm that it is acceptable to weld lugs on the existing ductile and restrain new ductile iron pipe from this point to the new 16" AWSS Main. Note additional fittings are required as shown in the attached sketch. (8inch 45deg elbows also required and additional bell and stop collars)						ANSWER:  Please refer to attached excerpt drawing MA-16 and M2 sketch SK-TG04.2-074.  The piping on this lateral is partially encased in the 3x5 sewer and appears to be ductile iron from 5 ft north of the 3x5 sewer heading south to the hydrant location. **Transbay Transit Center – San Francisco, CA**

**Noise and Vibration Mitigation Management Plan**

**Webcor/Obayashi**

**September 07, 2012**

## **GENERAL:**

The Webcor/Obayashi (W/O or CM/GC) Noise and Vibration Mitigation Management policy that will be implemented on the Transbay Transportation Center Project will be an overall project policy, with each Trade Subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to comply with Specification Section 00 08 13, 00 08 13/APB, the San Francisco Noise Control Ordinance, regulations and requirements and section 01 35 65, Specific Project mitigation measures and monitoring requirements as applicable to the various phases of work.

When required by the specifications, W/O will ensure its Trade Subcontractors comply with this plan as well as the San Francisco Noise Control Ordinance.

To expedite the project or minimize impacts, W/O will ensure that its Trade Subcontractors apply for written waivers of some of the noise requirements by application to the TJPA in accordance with Section 00 08 13 Specific Project Requirements when required by the specifications or contract. Written waivers shall be uploaded to Constructware by CM/GC. It is anticipated that some Work may require multiple shifts or for other reasons need to be performed outside of typical weekday daytime construction hours. Trade Subcontractors shall minimize construction activities during evening, nighttime, weekend, and holiday periods and shall obtain specific permits before performing construction in noise sensitive areas during these periods.

Night noise permits requests shall be submitted to the TJPA at least 7 days in advance of work. Noise permit request shall include:

1. Name of person in charge of work and phone number
2. Hours to be worked
3. Narrative of scope of work including necessity of doing work at night, maps, and truck routes
4. List of noise/vibration/light making equipment including make and model
5. Mitigation and monitoring methods being used

W/O will ensure that its Trade Subcontractors provide noise inspections and testing of equipment to ensure that all equipment onsite is in good condition and effectively muffled per manufacturer's recommendation. If inspection or testing documents are requested by the TJPA, or any of its representatives, W/O will require its Trade Subcontractors to provide requested documentation in a timely manner. Trade Subcontractors shall provide inspection and testing documents to CM/GC prior to start of work and as the equipment is replaced. CM/GC shall upload documents to a file location within Constructware.

W/O will ensure that its Trade Subcontractors minimize use of vehicle backup alarms and demonstrate how backup alarms will be minimized by using mitigation measures such as designing the construction site with a circular flow pattern that minimizes backing up of trucks and other heavy equipment. Trade Subcontractors shall submit quarterly reports of measures to reduce back up alarms. W/O shall upload these reports to a specific location within Constructware.

W/O will ensure that all its Trade Subcontractors' equipment onsite is equipped with broadband back-up alarms that will automatically adjust based on the ambient noise during nighttime hours (between 8 p.m. and 7 a.m.) when ambient noise is low. If safety considerations and applicable regulations will not allow use of broadband back-up alarms, Contractor shall request an exemption in writing to the TJPA

Representative including the applicable safety regulations (Cal/OSHA, OSHA). Trade Subcontractors shall comply with the TJPA's request for broadband back-up alarms for all work between 8 p.m. and 7 a.m. If requested by the TJPA or its representative, Trade Subcontractors shall provide W/O with equipment specifications showing broadband back-up alarms for submission via Constructware.

Through W/O's requirement of the submittals outlined in this noise and vibration plan, W/O will verify Trade Subcontractors' construction operations are performed in such a manner to minimize noise.

W/O will verify that its Trade Subcontractors perform noise monitoring to demonstrate compliance with noise limits and endeavor to minimize construction activities during off hours except for those required and deemed acceptable per the Contract Documents. Trade Subcontractors shall submit monthly monitoring reports to W/O for submission via Constructware.

W/O will verify Trade Subcontractors haul routes to ensure that they minimize noise intrusion into residential areas, and control noise during nighttime hours.

W/O will require all Trade Subcontractors to use procedures and equipment, when it would be effective, that produce lower noise levels than normal when required by the specifications or contract. W/O will require the Trade Subcontractor to submit manufacturer special noise control kit information. If none is available, then the Trade Subcontractor needs to submit a statement of this. Upon receipt and review of the information, W/O and the Trade Subcontractor will identify the events when the noise control measures should be used based on the specifications.

W/O will require all Trade Subcontractors plans to include use of temporary barriers near noisy activities as required by the specifications or contract. Such barriers shall be located close enough to the noise source to achieve noise attenuation. As necessary and when it is shown it would be effective, Trade Subcontractors shall construct shed-like structures or complete buildings to contain the noise from nighttime activities.

W/O shall require haul route map, plan and storage location to be part of Trade Subcontractor's plan and included within its submittal.

#### VIBRATION CONTROL

Vibration limits are based upon the Federal Transit Administration's Planning and Environment Transit Noise and Vibration Impact Assessment guidelines. W/O will require all Trade Subcontractors' to limit or prohibit use of construction techniques that create high vibration levels when it affects adjacent properties.

If construction techniques that create high vibration levels are used, W/O will require all Trade Subcontractors' to comply with the following additional restrictions:

1. Provide advance notice to TJPA of any vibration intensive activities. Perform vibration intensive activities only during daytime hours between 7 a.m. and 8 p.m. unless otherwise allowed by special permit or variance, as required by the specifications or contract. Perform vibration monitoring during vibration intensive activities during daytime hours between 7 a.m. and 8 p.m. unless otherwise allowed by special permit or variance, as required by the specifications or contract. Recorded data should be part of the Trade Subcontractor Daily report. A summary shall be submitted monthly and uploaded to Constructware.

2. Investigate alternative construction methods and practices to reduce the impacts if present and implement alternative methods and practices as reasonable.
3. Provide a plan to measure vibration levels including but not limited to measurement locations, times and metrics. Plan shall also include contingency plan if operations exceed the limits. This plan shall be uploaded into Constructware by W/O.
4. Limit or prohibit use of construction techniques that create high vibration levels.

Trade Subcontractors shall be responsible for providing technical information, as required by the specifications, in their plan. Trade Subcontractor's plan shall be submitted via Constructware for Record Only.

**Transbay Transit Center – San Francisco, CA**

**Air Quality Plan**

Webcor/Obayashi

January 16, 2012

## **GENERAL PLAN:**

The Webcor/Obayashi (W/O) Air Quality Plan that will be implemented on the Transbay Transit Center Project will be an overall policy with each subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to comply with the Bay Area Air Quality Management District regulations and requirements.

W/O will require its Trade Subcontractors to establish a plan that complies with all requirements set for in specification sections 00 08 13, and 01 35 65 prior to starting Work onsite. W/O shall check and verify trade subcontractor's compliance with air quality requirements on a daily basis. Any non-compliant trade subcontractors will receive both verbal and written notice through Safe Site One (W/O internal program). Additional, W/O will require trade subcontractors to demonstrate they are actively monitoring air quality by providing checklists or documentation on each Trade Subcontractors daily report. W/O shall verify its Trade Subcontractors Air Quality plan includes the following but not necessary limited to:

1. Specific measures to minimize impacts to sensitive receptors associated with exposure to respirable nuisance dust (PM10) and achieve a goal of No Visible Emissions.
2. W/O shall verify Trade Subcontractors comply with City Dust Control Order (DPW Order No. 171,378. Water active construction areas at least twice daily to control dust using non-potable water in accordance with San Francisco Ordinance 175-91
3. Identify specific measures to minimize dust generation; to reduce health risks to workers and the public.
4. Mist the immediate excavation area with a water spray to prevent airborne dust particles. Perform continuous water spraying during dust-generating activities. Mist or spray in such a way as to prevent puddling or generation of runoff, which could potentially reach storm drains or catch basins.
5. Minimize the amount of excavated material or demolished debris stored at the Site. Remove excavated material and demolished debris, with the exception of hazardous materials or suspected hazardous materials, from the Site no later than the end of each workday. If hazardous materials or suspected hazardous materials are stored on site, store such materials in accordance with all applicable California Environmental Protection Agency regulations, including providing storage in proper containers and protection from exposure to the elements. Remove such materials from the Site as soon as possible for disposal or recycling in accordance with applicable laws and regulations.
6. Wet all exposed soil surfaces at least 3 times daily during dry weather or more frequently if dust is blowing or if required by the TJPA. Immediately wet sweep serpentine residuals from the street.
7. Keep the Site and adjacent areas clean and perform wet sweeping at the end of each shift. Sweep daily (with water sweepers) all paved access roads, parking areas and staging areas at construction sites. Sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public streets.
8. Load haul trucks carrying excavated material so that the material does not extend above the walls or back of the truck bed. Wet before covering and tightly cover the surface of each load before the haul truck leaves the loading area. Cover trucks hauling soil, sand, and other loose materials or require trucks to maintain at least 2 feet of freeboard
9. Clean up spillage on City streets, whether directly or indirectly caused by Contractor's operations.

10. Minimize use of on-site diesel construction equipment, particularly unnecessary idling. Shut off construction equipment to reduce idling when not in direct use. Where feasible, replace diesel equipment with electrically powered machinery.
11. Retain receipts of ultra-low sulphur fuel (ULSF) purchase and equipment tuning and repair and make these available to the TJPA Representative or to the Federal Transit Administration (FTA) designee upon request.
12. Locate diesel engines, motors, or equipment as far away as possible from existing residential areas.
13. Properly tune and maintain diesel power equipment. To manufacturer's specification and frequency.
14. Suspend grading operations during first and second stage smog alerts, and during high winds (i.e., winds greater than 25 miles per hour).
15. Upon completion of the construction phase, buildings with visible signs of dirt and debris from the construction site shall be power-washed and/or painted (provided that permission is obtained from the property owner to access and wash the property with no fee charged by the owner). Trade Contractor shall request CMGC to contact Singer and Associates to notify property owners for access. If permission from property owners for access is not granted, Trade Contractor is not responsible for power-washing or painting.
16. Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites.
17. If applicable, replant vegetation in disturbed areas as quickly as possible.

W/O will verify Trade Subcontractors comply with the requirements of the Bay Area Air Quality Management District (BAAQMD) Regulation 6 (for particulate matter and visible emissions), Regulation 7 "Odorous Substances," Regulation 11 "Hazardous Pollutants," and the California Health and Safety Code Division 26 "Air Resource", Chapter 3 "Emission Limitations," Section 41700 "Prohibited Conduct," and related regulations. Trade Subcontractors shall notify the BAAQMD 10 working days prior to commencing demolition or hazardous materials abatement work.

1. Such notification shall include the names and addresses of operations and persons responsible; description and location of the structure to be demolished or altered including size, age and prior use, and the approximate amount of friable asbestos; scheduled starting and completion dates of demolition or abatement; nature of planned work and methods to be employed; procedures to be employed to meet BAAQMD requirements; and the name and location of the disposal site.
2. The BAAQMD randomly inspects removal operations and will respond to any complaints received. Contractor shall cooperate with and facilitate all BAAQMD authorized inspections.\
3. Notifications shall be documented and provided to CM/GC for submission to the TJPA via ConstructWare.

Trade Subcontractors shall be responsible for providing technical information, as required by the specifications, in their plan. All trade subcontractors plans shall be submitted for Record Only via ConstructWare.

**Transbay Transit Center – San Francisco, CA**

**Waste Management and Construction Debris Plan Revision 6**

Webcor/Obayashi  
November 7, 2013

## **GENERAL PLAN:**

Webcor/Obayashi Joint Venture (Webcor/Obayashi) understands that the building contractor plays a critical role in the management of jobsite produced construction waste. Webcor/Obayashi has adopted a waste reduction and recycling policy that will be implemented on the Transbay Transportation Center Project. This policy will be an overall policy with each subcontractor contributing their specific plan as they come on board to the project.

The primary goal of the plan is to divert as much construction generated debris & unused material from landfills as possible. At a minimum, Webcor/Obayashi and its trade subcontractors will divert 75% of the waste generated on the construction project from landfills. Trade subcontractors Construction Waste Management Plan shall be prepared and submitted in compliance with the Owner's LEED project requirements and the requirements of the City and County of San Francisco.

The Trade Subcontractors are required to comply with Specification Sections 00 08 15, 01 74

00, and 01 81 13 as well as any or all of the procedures listed below. If a conflict in percentages exists between this section and Section 01 81 13, General LEED Building Design and Construction Requirements, the most stringent section shall govern.

- Use of approved debris haulers with documented recycling levels.
- Source separated debris boxes will be provided onsite for mixed debris and recyclable items such as lumber and wood related products, dirt, concrete and asphalt, cardboard & metals.
- Trade Subcontractors are required to handle and dispose of any generated hazardous waste.
- Requesting Trade Subcontractors and vendors to utilize reusable packaging when possible.
- Trade Subcontractor shall provide a Construction Waste Management Plan.

All Trade Subcontractors shall develop their own Waste Management and Construction Debris Plan that complies with the Contract Documents and this plan. Trade Subcontractors shall submit this plan in accordance with the specifications and it shall become part of Webcor/Obayashi's overall project plan. All technical requirements defined in the contract documents shall be fulfilled by Trade Subcontractors and submitted to the Construction Management Oversight (CMO) For Record Only through ConstructWare

Webcor/Obayashi will ensure the Trade Subcontractors are effectively implementing the procedures and are in compliance with Specifications.

Webcor/Obayashi will verify that after Award of Contract and before commencement of the Work at the site, the Trade Subcontractor conducts a Reuse/Recycle Assessment as part of their Solid Waste Management Plan (SWMP): Trade Subcontractor's assessment shall

estimate the types and quantities of materials for the Project that are anticipated to be feasible for source separation for recycling or reuse, either onsite or offsite, and note the procedures intended for a recycling, reuse, and salvage program. Documentation of the trade subcontractor's plan shall consist of the following:

- Trade subcontractor and vendor waste management strategies.
- Trade subcontractor required to provide a monthly summary of the total waste material with backup documentation (weight tickets) if processed offsite.
- The amount recycled (in tons), material types, recycling procedures, and processing facility locations to which materials were diverted if processed offsite.

Trade Subcontractor's Construction Waste Management Plan shall also include estimated wastes, disposal, and handling with the following:

A. List of materials that comprise source separated materials include, but are not limited to:

- Concrete, Wood, Mud, Mixed Aggregates, Yard waste, Metals, and Cardboard.
- Yard waste is not included in our overall diversion rate calculation on the template or corresponding spreadsheet per the requirements from the LEED BD&C v3.0 Reference Guide.

B. List of materials that comprise Miscellaneous Construction Debris include, but are not limited to:

- Wood, Scrap Metal, Drywall, Plastics, Film Plastics, Wire, Cable, Glass.
- The total quantity estimated, inception to completion Disposal.
- Total Project Generation, Diversion + Disposal.
- Project Diversion Rate.

Webcor/Obayashi will verify that Construction and Demolition Waste; Non- hazardous solid resources resulting from Trade Subcontractor's construction, remodeling, repair, and demolition operations for the Project are properly transferred to a C&D Recycling Facility. The C&D Recycling Facility shall be a facility that receives only C&D (construction and demolition) material. Trade Subcontractors shall provide Webcor/Obayashi a summary sheet, including all receipts for transport materials each month with the progress billing if any materials are processed offsite.

Webcor/Obayashi will verify that of the inevitable waste generated, Trade Subcontractor's reuse, salvage, or recycle as many of the waste materials as economically feasible.

Webcor/Obayashi will participate/attend a meeting with Trade Subcontractor, the TJPA Representative and representatives of the City's Solid Waste Management and recycling programs prior to commencement of work. Webcor/Obayashi will

ensure all Trade Subcontractors are made aware of the LEED requirements for C&D diversion before being allowed to work on the site.

Webcor/Obayashi will verify that Trade Subcontractors submit a Monthly Disposal and Recycling Summary Report; quantifying the construction and demolition waste generated and recycled, reused or disposed of at Class 3 Landfill. Contractor shall also send a copy of this report to the TJPA Representative and the SWMP to the City Government Recycling Coordinator. The Comprehensive Disposal and Recycling Summary Report shall be submitted quantifying the construction and demolition waste generated and recycled, reused or disposed of at Class 3 Landfill, on a monthly basis. This report is a condition of progress payment and failure to submit this information shall render the Applications for Payment incomplete. The Trade Subcontractors/trades are also responsible for contracting with a regional facility to haul any hazardous materials from the site. The Trade Subcontractor shall calculate the C&D diversion rate for both LEED requirements (excluding yard waste) and the requirements set by the City (including yard waste) for all materials processed offsite. The W/O LEED representative will screen every C&D Submittal and review Trade Subcontractor and lower-tier subcontractors C&D Plans for clarity, completeness, and compliance with City/LEED requirements.

Webcor/Obayashi will verify that Trade Subcontractors develop and implement procedures for source separation to the greatest extent feasible.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for transporting commingled (mixed) construction and demolition waste that cannot be feasibly source-separated if the intent is to process it offsite instead of using debris boxes provided onsite.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for Salvage and Reuse.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement practices for this project that will reduce waste at the source.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for materials that are recycled and/or reused onsite

Webcor/Obayashi will verify that Trade Subcontractors participate in reuse programs by reviewing each Trade Subcontractors Monthly Disposal report for any material processed offsite. For such reuse programs, Trade Subcontractor shall refer to the City's construction and demolition recycling program.

Webcor/Obayashi shall review the environmental goals of this Project with all Trade Subcontractors during the preconstruction meeting. Webcor/Obayashi shall make a proactive effort to increase awareness of these goals among the job site workers. Webcor/Obayashi will make a proactive effort to increase awareness of these goals among the site workers by requiring that each Subcontractor take Click Safety training prior to stepping on the jobsite. As part of this Click Safety training, there is a module dedicated to teaching and reviewing the

Exhibit P

LEED requirements of the project during construction activity.

Webcor/Obayashi will verify that Trade Subcontractors are using registered transporters and registered facilities. Only registered transporters can remove mixed construction and demolition debris from the construction site, and they must take this material to a registered facility. NOTE: A Registered facility: is any facility that accepts mixed construction and demolition debris for processing and recycling must be registered with the City and County of San Francisco and must demonstrate an overall minimum recycling rate of 65% for mixed construction and demolition debris. A registered facility must have applied for and received a registration from the San Francisco Department of the Environment. Webcor/Obayashi will ensure that Waste Management Companies that service San Francisco and retained by the Trade Subcontractors are registered transporters and meet the City/LEED requirements. Trade Subcontractors shall refer to SFEnvironment.org for the City's most current list of registered transporters.

Webcor/Obayashi will verify that Trade Subcontractors are implementing the following:

1. Eliminate the procurement of unneeded supplies.
2. Reduce waste by printing and copying double-sided.
3. Submit all submittals, reports, and forms in electronic format (PDF) unless otherwise noted.
4. Fully participate in available and required recycling and composting programs.
5. Purchase products made with recycled content such as paper and recycled aggregate.

Webcor/Obayashi will verify that Trade Subcontractors shall submit:

1. Construction and Demolition Debris Management Plan.
2. Construction and Demolition Debris Recovery Monthly Summary Report and supporting documentation for any materials processed offsite.
3. Construction and Demolition Debris Recovery Final Report for all materials processed offsite.

Trade Subcontractor's plan shall comply with specification section 02 41 00. All Trade Subcontractors will remove and dispose of all waste materials from the site for off-site disposal in compliance with all applicable laws, ordinances, rules, and regulations. Webcor/Obayashi and all Trade Subcontractors will work with the TJPA representative so that the representative may characterize the waste materials as required by law to the extent required by Webcor/Obayashi's selected disposal facilities.

Trade Subcontractor's plan shall comply with specification section 01 15 00. Trade Subcontractor's shall perform work in a manner to minimize generation of dust, dirt, rubbish, and other debris, to prevent dust and debris from interfering with the progress of the work, and to keep dust and debris from accumulating at the work site or adjacent areas. Trade Subcontractor's shall remove debris and rubbish from the site on a daily basis.

Trade Subcontractor's plan shall comply with specification section 01 13 50, by preventing the mixing of hazardous and non-hazardous materials.

Trade Subcontractor's shall be required to provide technical information, as required by the specifications including compliance with the City and County of San Francisco Ordinance 27-Exhibit P

Construction Waste Management Plan

06, in their plan which will be submitted For Record Only to the CMO.

Mr. Rick Buellesbach  
Senior Project Manager - Transbay Transit Center  
Webcor/Obayashi Joint Venture  
175 Beale Street  
San Francisco, CA 94105

Re: Transbay Transit Center Quality Control Surveys  
Subject: December 2011 Control Verification Survey Results

Dear Mr. Buellesbach:

The field work for subject surveys was conducted by Chaudhary & Associates December 5 - 8, 2011. The surveys included verification of Chaudhary & Associates control (as shown on the Survey Control Plan dated 11-10-2011), with the exception of control point 217 which was destroyed sometime between the November 2011 and December 2011 control verification surveys.

Horizontal control values for point numbers 54, 208, 209, 213, 101, 105, 215, and 227 were constrained in this control network horizontal adjustment. The elevation values remain unchanged from the November 2011 surveys. The table below shows both the 11-10-2011 and the 12-21-2011 values for the remaining control points. Because data values can be impacted by environmental factors (temperature and humidity), seismic activity, and the various combinations of back sight and foresight data available on any given day, only the values which differ by 0.01' or more are adjusted and shown on the following table (and updated on the 12/2011 control map to be sent to you tomorrow). Field note copies and Star Net Reports have been mailed to you.

## Horizontal Values

Point #	November 10, 2011		December 2011		Description
	Northing	Easting	Northing	Easting

#### Traffic Control Plan

Webcor/Obayashi

WO-TCP0001

**REVISION 2**

**8/22/2012**

## **GENERAL**

The Webcor/Obayashi Joint Venture (W/O) Traffic Control Plan that will be implemented on the Transbay Transportation Center Project is an overall project policy, with each trade subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to provide a framework to insure compliance with Specification Section 01 15 70. To assist in this effort, W/O has enlisted the services of a traffic control consultant (TCC) – Sandis Engineering. Award of this contract between Sandis Engineering and W/O was based on a competitive request for proposal (RFP) process referred to as TG05.4.

TCC is responsible for participating in all aspects of traffic control planning and implementation including, but not limited to:

- Traffic control design oversight;
- Coordination between trade subcontractor traffic control designs;
- Interface with City of San Francisco and other agencies as necessary;
- Participate in coordination efforts of the TJPA Representative;
- Oversight of implementation of approved traffic plans;
- Provide daily reports regarding status of traffic control measures;
- On call traffic control services as requested.

## **TRAFFIC PLAN REVIEW AND COORDINATION**

TCC shall prepare a detailed “as built” traffic plan for approximately four blocks in all directions from the jobsite. This map will be based on SFMTA maps and will be augmented as appropriate per field review of existing conditions. This map will include all striping, signage, curb lines, curb cuts, curb painting, buildings and any other feature of the street layout and traffic control. Beyond the four block distance, the map will include street layout and striping configuration.

Once a trade subcontractor is under contract, W/O shall provide the trade subcontractor with the as-built plan in CADD format. The trade subcontractor will then be required to use this base map for preparation of all their traffic control plans. A summary of the below criteria can be found in the attached Traffic Control Plan Preparation Packet.

The trade subcontractor is required to prepare and submit a complete traffic plan consistent with requirements of the project specification and all requirements per the City of San Francisco. The submittal must be made in a timely fashion to allow for the review timeframe prescribed in the specifications plus an additional four weeks for review by the TCC.

Upon receipt of the submittal from trade subcontractor, W/O will forward it to the TCC for review. The plan will be reviewed for adherence to specifications and for compatibility with previously submitted plans. Comments will be returned to the trade subcontractor who will make modifications as is appropriate.

When the trade subcontractor’s traffic control plan is reviewed and coordinated with the TCC, it will be submitted to the TJPA Representative for approval. Submittal will be in compliance with Specification Section 01 15 70, paragraph 1.4B.

Upon approval by the TJPA Representative and SFMTA, the TCC will update the baseline traffic

control plan as appropriate. The baseline plan will be updated only when a change to the traffic pattern will be in place for three or more months. If the traffic control plan will be in place for less than three months, the plan will be superimposed over the base map for coordination but the baseline drawing will not be modified.

#### **FIELD IMPLEMENTATION**

It is intended that the TCC will maintain a regular, but not full time, presence on site. Similar to the traffic control design review, their scope of work is to review the trade subcontractor's adherence to city standards, project specifications and approved traffic control plans.

TCC review and assistance in field coordination includes but is not necessarily limited to:

- Perform site review of traffic control;
- Note traffic control deficiencies;
- Coordinate correction of site deficiencies with W/O and trade subcontractor;
- Provide daily report of traffic control observations and corrective measures;
- Attend site meetings as necessary to review short term Special Traffic Permit and coordinate between subcontractors and SFMTA;
- Miscellaneous coordination with SFMTA as necessary;
- Review of pedestrian protection as it relates to vehicle traffic;
- Provide traffic control devices and personnel as required to augment traffic control efforts;
- Confirm proper training of subcontractor flagging personnel;
- Provide continuous oversight of traffic control for major construction operations as determined by CM/GC.

#### **TASKS NOT CURRENTLY ANTICIPATED BY TCC**

Training of flaggers for the trade subcontractors although it is an option should it become apparent that subcontractor employees need additional training.

Coordination of the 10b police officers between subcontractors will be the responsibility of the CMO.

Pedestrian control unless it is specifically impacted by vehicle traffic.

## **TRANSBAY TRANSIT CENTER – TRAFFIC CONTROL PLAN PREPARATION PACKET**

### ***Overview***

The purpose of this packet is to provide the contractor with the information necessary to prepare a Traffic Control Plan (TCP) for their work in accordance with the requirements of the Project Specifications and the City and County of San Francisco (CCSF). It includes procedures, timing, a base map, plan sheet template and examples for use when preparing and submitting Traffic Control Plans (TCPs) for review and approval. The documents included in the TCP Packet are described below.

### ***Flow Diagram***

The flow diagram included within the TCP packet identifies the specific components and required time intervals for TCP submittal, review and approval. Please note time requirements for Plan review and approval. No work will be allowed without an approved plan. It is the contractor's responsibility to anticipate and allow for required lead times.

### ***Base Map File***

The AutoCAD drawing of the Base Map file included in this packet represents the City of San Francisco street layout as of the date indicated on the Base Map file title block. ALL proposed TCPs shall be created using this Base Map file as a starting point. It is crucial that proposed TCPs be provided on the same coordinate system as the Base Map file so multiple approved TCPs can be overlain in a composite exhibit. TCPs prepared using a different base or plan template will be rejected.

### ***TCP Standards***

#### ***Design Standards***

The Traffic Control Plans shall be prepared and submitted in accordance with the following documents:

1. Transbay Transit Center Project Specification Section 011570 – Traffic Routing Work, dated September 23, 2010. A copy of this specification is included in the TCP Packet.
2. City and County of San Francisco Regulations for Working in San Francisco Streets (Bluebook), 7<sup>th</sup> Edition dated October 2006. Refer to the following link for a copy of this document: <http://www.sfmta.com/bluebook>

#### ***CAD Standards***

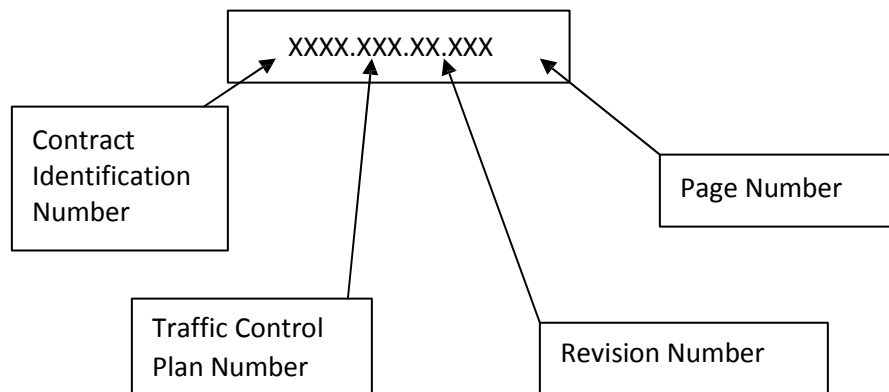

The sheet TCP-001 provides a template with title block, symbols, and specific details pertaining to the presentation and setup of drawings to be used when preparing a TCP. The CAD standards identified under the Vendor Submittal Instructions, including layering configuration, title block, and symbols, shall be referenced and followed when creating all TCP AutoCAD drawings. The contractor shall include additional signs in the form of blocks, notes, and details as needed.

### ***TCP Samples***

There are three sample Traffic Control Plans included in this packet. These samples provide an example of how the TCPs shall be set up and configured.

### ***TCP Submittals***

All proposed Traffic Control Plans shall be submitted at 1"=80' scale on 22"x34" sheet size in both pdf and AutoCAD 2007 formats. They are to be submitted electronically to Webcor-Obayashi's trade package project manager. An important item to be included on all TCP sheets is the submittal tracking number. The tracking number consists of four segments separated by a period. The first segment is the 4-digit contract identification number, the second segment the 3-digit TCP number (provided by Webcor), the third segment is the 2-digit revision number, and the fourth the 3-digit page number. Refer to the Submittal Tracking Number Diagram below for additional direction.

SHEET

VENDOR SUBMITTAL INSTRUCTIONS

TRAFFIC CONTROL PLANS SHALL BE SUBMITTED AS FOLLOWS:

- 1) FIVE (5) HARD COPIES

2) ELECTRONIC COPY IN PDF AND AUTOCAD 2007 FORMATS

3) 11"x17" SHEET SIZE

4) 1"=80' SCALE

5) SHEET NUMBERING "TCP-###"

6) ELECTRONIC FORMAT PER TEMPLATE PROVIDED: SINGLE CAD FILE CONTAINING MULTIPLE LAYOUT TABS WITH A SINGLE TCP PER TAB. THE TCP SHALL BE DRAFTED IN MODEL SPACE ON TOP OF THE STREET BASE FILE WITH NOTES/LEGEND IN PAPER SPACE. MODEL SPACE SHALL BE DRAFTED AS FOLLOWS:

a) EACH TCP PAGE SHALL CONSIST OF FIVE LAYERS WITH A PREFIX FOR THAT PAGE NUMBER. FOR EXAMPLE, PAGE 001 WOULD CONTAIN THE FOLLOWING LAYERS:

001-TCP-DIM

001-TCP-NOTES

001-TCP-SIGN

001-TCP-SIGNTEXT

001-TCP-STRIPELINE

001-TCP-WORKAREA

b) ALL SYMBOLS, BLOCKS AND DIMENSIONS SHALL MATCH THOSE ON THIS SHEET IN SIZE, COLOR, AND LAYER. CREATE NEW BLOCKS USING SIMILAR COLOR AND SIZE FOR SIGNS/DEVICES NOT SHOWN HERE.

c) INSERT STANDARD TITLE BLOCK PER SHEET. USE ATTRIBUTE EDITOR TO FILL IN TITLE BLOCK WITH APPLICABLE INFORMATION.

d) TABLES, NOTES, AND LEGENDS SHALL BE IN PAPER SPACE PER SHEET ON LAYER XXX-TCP-GENERAL, WHERE XXX IS THE PAGE NUMBER

e) STANDARD TEXT STYLES, SIZES, DIM STYLES PER TEMPLATE

f) STANDARD LAYER COLORS AND NAMES; AND CTB/PEN SETTINGS PER TEMPLATE

g) FREEZE LAYERS IN VIEWPORTS AS NECESSARY TO ONLY SHOW THOSE NEEDED FOR THAT INDIVIDUAL SHEET.

7) REFER TO PROVIDED SAMPLE TCP PLAN FOR AN EXAMPLE OF THE FORMAT BEING IMPLEMENTED.

## **Exhibit U      Submittal Schedule**

Trade Subcontractor's Schedule submission shall include a full submittal schedule per Specification Section 01 13 00 1.4 – Submittal Schedule.

1. All submittals are to be submitted to Webcor/Obayashi Joint Venture within 60 days of Award.
2. The Submittal Schedule shall contain additional data fields to indicate: 1) the duration in work days for procurement of the item starting from the date that the submittal is approved until the item is available for construction, and 2) the Activity ID of the earliest construction activity for which the item will be required (the submittal/procurement item's successor).
3. The Trade Subcontractor should use the attached data format, Submittal Schedule Excel Template, for the submission of Submittal Schedule as Microsoft Excel File. Contact Webcor/Obayashi Joint Venture to obtain the blank excel file of the Submittal Schedule.
4. The Trade Subcontractor shall show critical submittals in the Exhibit I Construction Schedule in addition to providing the comprehensive submittal schedule required herein. Critical submittals are those submittals considered vital to the timely progression of the project schedule. These items may include, but are not limited to, engineering submissions; long lead items; items required within the first 25% of Subcontractor's performance period; and items that are required for construction or installation of a task with less than 20 working days of total float in the overall project schedule. The last group of items may not be determined until after acceptance of the Trade Subcontractor Construction Schedule submission and its full incorporation into the project schedule. Therefore, the Subcontractor may be required to add items to its Primavera schedule file subsequent to approval of its Construction Schedule submission.

## QUALITY COMMISSIONING PROCEDURES AND GUIDELINES

### Exterior Skin and Waterproofing Systems

- ✓ Roofs
- ✓ Decks
- ✓ Windows
- ✓ Curtain Walls
- ✓ Exterior Wall Systems (Precast, Stucco, EIFS, GFRC)
- ✓ Water Shedding Systems
- ✓ Flashings
- ✓ Expansion Joints
- ✓ Caulking, Sealants
- ✓ Primary and Secondary Water Barrier Systems
- ✓ Above & Below Grade Waterproofing
- ✓ General Waterproofing Systems

#### 1.0 Purpose

The purpose of this procedure and guideline is to set forth a commissioning process, which will ensure that the building's exterior envelop and waterproofing systems perform and function in conformity with design intent and to provide a means of verifying the implementation of these systems based on the project specifications, design and applicable industry standards.

#### 2.0 Definition of Commissioning

The term "Commission" refers to a Quality Assurance process by which the building's exterior envelop and waterproofing systems (i.e., below and above-grade waterproofing, decks, roofs, caulking, plaster, precast concrete and GFRC, curtain-wall, flashing, expansion joints, etc.) are provided, installed and tested in order to verify the systems perform in accordance with the contract documents and the design intent.

Commissioning entails the development of a clear and complete process that verifies the systems design and operational intent. It also is to verify that the exterior envelop and waterproofing systems and its components are installed according to the contract documents, manufacturer's recommendations and published industry standards and that the system receives adequate installation and performance inspections by the installing contractor.

The process must include verifying and documenting the installation steps, phases, and system performance with respect to the design intent and the contract documents. Commissioning is a team effort that requires cooperation by all parties to succeed.

#### 3.0 Description of the Commissioning Process

Commissioning is a “**systematic**” process for achieving, validating and documenting the performance of building systems as so that it meets the design intent and requirements.

The process extends through all phases from design to occupancy, and extending through the warranty period. Numerous checks and inspections shall be performed at each stage of the process to ensure that established procedures are followed. The process also includes training of facility operational personnel to ensure continued efficient use of the exterior envelop and waterproofing systems as originally designed and installed.

This guideline provides a uniform, integrated and consistent approach for the commissioning of all waterproofing systems as well as assisting in insuring product and design compatibility. Since many building waterproofing systems are integrated, a deficiency in one system or component may result in sub-optimal performance and failure among others.

#### 4.0 Commissioning Plan

Commissioning is a **“Quality Process”** for validating the system and component design performance.

The reports from the commissioning process are not just test reports, but reports that document design, installation, inspections, and particular tests and or evaluation procedures. The commissioning plan is continually updated to reflect changes in program and design of the waterproofing system(s). Commissioning reports shall document and record the results of the commissioning process.

Each Trade Subcontractor’s specific commissioning plan must be neatly organized in a consistent manner that reflects the nature of the building systems and their performance. The commissioning plan shall include schedules, requirements and procedures.

Trade Subcontractor(s) shall be responsible for the timely and efficient completion of all commissioning in accordance with the Subcontract Agreement.

**At no time shall any work be permitted to commence without a WEBCOR/OBAYASHI’ approved Trade Subcontractor Waterproofing Commissioning Program.**

Failure to do so may require Trade Subcontractor to assume all related costs and expenses in accordance with the Subcontract Agreement.

In addition, Trade Subcontractor may also be required to assume all related cost should WEBCOR/OBAYASHI find it necessary to develop, manage and or perform any Trade Subcontractor commissioning work.

#### 5.0 Objectives

The fundamental objectives of the commissioning process are:

- 5.1 Create a procedure to verify and provide documentation that the waterproofing performance of the facility meet the design requirements.

- 5.2 Enhance communication by documenting data and decisions throughout all phases of the project.
- 5.3 Validate and report that the performance of waterproofing systems meets design intent.
- 5.4 Provide a means of Quality Control and Quality Assurance (QA/QC) throughout all phases of the waterproofing system(s) installation, inspection, and testing process.

## **6.0 Contractors Normally Participating in the Commissioning Process**

- ✓ Waterproofing Consultant
- ✓ Architect
- ✓ Structural Engineer
- ✓ Mechanical
- ✓ Plumbing
- ✓ Electrical
- ✓ Fire Sprinkler
- ✓ Glass Systems
- ✓ Caulking
- ✓ Brick, Tile, Precast, GFRC, and Stone
- ✓ Fountains and Ponds
- ✓ Swimming Pools & Spas
- ✓ Roofing
- ✓ Insulation
- ✓ Flashing & Sheetmetal
- ✓ Waterproofing Contractors
- ✓ Concrete (If waterproofing admixtures are included by design)
- ✓ Stucco, EIFS, DEFS systems
- ✓ Elastomeric Painting
- ✓ Rough Carpentry (Wood cladding)
- ✓ Architectural Metal Cladding
- ✓ Expansion Joint Systems
- ✓ Water Tanks
- ✓ Special Systems or Components

## **7.0 Commissioning Team**

The commissioning team members may consist of the following:

- ✓ WEBCOR/OBAYASHI - Project Team as required

- ✓ Owner - Designated representative of the owner, building operator/engineer, and/or the owner's construction management firm
- ✓ Engineers - Architect and Designers
- ✓ Waterproofing Contractor
- ✓ Waterproofing Consultant
- ✓ Flashing / Sheet Metal Contractor
- ✓ Exterior Skin Contractor
- ✓ Roof Contractor
- ✓ Glass and Curtain Contractor
- ✓ Caulking and Sealants Contractor
- ✓ Commissioning Agent (CA)
- ✓ Mechanical Contractor
- ✓ Plumbing Contractor
- ✓ Fire Sprinkler Contractor
- ✓ Electrical Contractor
- ✓ Testing Contractor
- ✓ Other as necessary

## 8.0 Meetings

Regularly scheduled commissioning meetings of **the entire team** shall be conducted for site coordination, communicating issues of concern, resolving conflicts, reporting on system process and status, identifying urgent work and all deficiencies.

Commissioning meetings are critical to the **Quality** of the commissioning process as well as timely completion of the project.

## **9.0 Trade Subcontractor Performance Requirements**

- 9.1 Designation of the primary person who will be responsible, accountable, and act as the main contact person for all commissioning communications. Provide organizational chart indicating personnel who will be involved in the project. The chart should indicate factory, office, and on-site field personnel.
- 9.2 Review of drawings and specifications for completeness, appropriateness of details, and acceptance by Trade Subcontractor thereof.
- 9.3 Review WEBCOR/OBAYASHI standard details.
- 9.4 Preparing and submitting documentation of Trade Subcontractor's respective materials and systems to be integrated into the overall Commissioning Plan.
- 9.5 Submitting information on the intended commissioning protocol used on materials, and the integration into the system as a whole.
- 9.6 Provide a presentation of the commissioning process to WEBCOR/OBAYASHI, the Owner and or the owner's representatives. Demonstration shall indicate compliance with the Trade Subcontractor Commissioning requirements as outlined in this document.
- 9.7 Submitting shop drawings detailing waterproofing system layout as outlined in the contract documents. Shop drawings shall reflect all conditions present in the building, including but not limited to the following:
  - a. Conditions where different materials meet (i.e. windows to plaster or stone to plaster).
  - b. Corner conditions.
  - c. Conditions where vertical planes meet horizontal planes (i.e. soffits and sills).
  - d. Expansion joints and control joints.
  - e. Flashing.
  - f. Penetrations (i.e. Z-ducts, electrical outlets, louvers).
  - g. Conditions typically utilized by Trade Subcontractor's common practices.

Shop drawings shall include installation drawings indicating the planned sequence of installation of all components.
- 9.8 Providing means and method for preliminary testing of the exterior envelop and waterproofing systems with manufacturer's representative present as required:
  - a. Caulking: Include complete coordination with the caulking manufacturer's representative to assure compatibility of the caulking system with the

surrounding substrate and finishes. Trade Subcontractor shall submit caulking samples including manufacturer's specifications for materials, color, cleaning procedure, required primers, proper backer rod, installation procedures, testing requirements and results. Testing of caulking samples between all combinations of materials shall be performed by qualified testing agencies in direct accordance with A.S.T.M. Standard Test Method C794 (75), including seven (7) day immersion. A letter from the Caulking Manufacturer shall be submitted approving all testing procedures, the installation procedure and the use of the specified materials for the intended application. Any materials installed without such approval that may be in conflict with the approved procedures or of unacceptable color and appearance will be removed and replaced at the Trade Subcontractor's expense.

- b. Windows and Sliding Glass Doors: Assemblies shall be field tested in accordance with American Architectural Manufacturers Association (AAMA) 502-02 Voluntary Specification for Field Testing of Windows and Sliding Glass Doors using Test Methods A and B, testing a minimum of 1% of the products for air leakage resistance and water penetration resistance as specified for various stages of the product installation.
- 9.9 Reviewing all required testing under the witnessing of WEBCOR/OBAYASHI, Building Owner, and or the Owners representatives.
  - 9.10 Correcting all system deficiencies at Trade Subcontractor expense.
  - 9.11 Obtaining all required permits, code required inspections and final certifications.
  - 9.12 Preparing complete as-built record drawings made from an original set that has been marked up throughout the duration of the project. Drawings must indicate all work as it was actually installed showing change order revisions, field changes required to meet the working conditions, and any other items that will affect or reflected in the operation and maintenance of the facility.
  - 9.13 Obtaining all manufacturer's warranties and guarantees.
  - 9.14 Organizing the O&M manuals, if any, from suppliers and manufacturers.
  - 9.15 Performing any specified training for the facility's operational staff.

## 10.0 Information Management

The management and continued organization of the commissioning information shall be the sole responsibility of the Trade Subcontractor.

WEBCOR/OBAYASHI and the Trade Subcontractor shall mutually agree on the location where all the commissioning information and documentation shall be stored.

The Trade Subcontractor shall make every effort to continually update and manage the information throughout the commissioning process. WEBCOR/OBAYASHI and the Building Owner may review the commissioning information provided by the Trade Subcontractor at any time for updates, accuracy and completeness.

WEBCOR/OBAYASHI may elect to withhold or make appropriate adjustments to the Trade Subcontractor's monthly progress billing in the event the commissioning information or performance requirements as described in the Waterproofing Quality Commissioning Procedures & Guidelines are not being performed, managed and updated by the Trade Subcontractor.

## 11.0 Trade Subcontractor Commissioning Submittal Requirement

Each Trade Subcontractor has a responsibility to WEBCOR/OBAYASHI and the Building Owner to comply with the terms of the contract and to verify that the design intent of the waterproofing systems for the project is achieved.

Each Trade Subcontractor is required to provide two completed commissioning manuals containing the information outlined in Section 19 - Commissioning Binder Tab Index of this guideline. Each proposed formatted "3-ring" binder containing all information, including blank forms shall be provided to WEBCOR/OBAYASHI and the Owner for "**review and comment**" before the commissioning process begins, or by an agreed upon date.

WEBCOR/OBAYASHI, the Owner and the owner representative shall review the information and return it to the Trade Subcontractor within **two-week** time with all comments.

Each Trade Subcontractor shall make all required changes as agreed, to the commissioning manuals and resubmit them to WEBCOR/OBAYASHI within **two-weeks**.

Each Trade Subcontractor shall schedule and provide a formal demonstration of their commissioning process to WEBCOR/OBAYASHI, the Owner and the Owners representative after all required changes to the manuals have been satisfactory completed. Demonstration shall indicate compliance with the Trade Subcontractor Waterproofing Commissioning requirements as outlined in this document.

Each Commissioning Manual **shall be neatly organized** using appropriate tabs, dividers, table of content, index, etc. as required for easy referencing. Refer to Section 19 Commissioning Binder Tab Index for a standard binder organization. All Commissioning Manual(s) **must be user friendly**.

## 12.0 Commissioning Binder Tab Index

- Tab 1. Project design criteria specifications** – Provide information that describes the overall design criteria and performance requirements for the waterproofing system(s).
- Tab 2. Manufacture products and components** – Provide complete submittal list of all components that shall be contractually provided and installed.
- Tab 3. Manufacture installation instructions** – Provide manufacture documentation insuring that the system and components installation complies with all Manufacture requirements to maintain performance and guarantee obligations.
- Tab 4. Manufacture details** – Provide manufacture details or published industry standards for penetrations and terminations interfacing with other installed systems.
- Tab 5. Design transition review** – Provide design review comments and concerns on transition interfaces to other s or other compatibility issues.
- Tab 6. Quality Assurance / Quality Control Program** – Provide QAQC program with complete field inspections and checklists.
- Tab 7. Documentation** – Trade Subcontractor shall maintain a separate field binder documenting the QAQC inspections and field-testing for all installed work.
- Tab 8. Field mock-up and testing** – Provide information on mock-up or field performance tests that shall be preformed for all installed system(s). Provide manufacture recommendations or published testing standards used. If no performance testing is preformed, Trade Subcontractor shall provide documentation on how each system is performing in accordance to the documented design intent and contract warranty requirements.
- Tab 9. Schedule** – Provide schedule for, shop drawing devolvement, submittals fabrication, delivery and installation.
- Tab 10. Agency and factory test reports** – Provide all factory, agency, and field performance-testing reports on installed systems.
- Tab 11. Factory and Trade Subcontractor guarantee information** – Provide warranty responsibilities and durations for all systems and components installed.
- Tab 12. Owner Training** – Provide (O&M) and training for all required service and maintenance requirements as it extends throughout each system to maintain warranty. Include owner sign-off sheets verifying training.

- Tab 13. Attic Stock** – Provide list of spare material that shall be supplied by Trade Subcontractor to owner – Paint, applied materials, gaskets, handles, glazing, or patching products.
- Tab 14. As-Built Drawings** – Provide completed set of drawing and details accurately reflecting all installed and completed work.
- Tab 15. Material Safety Data Sheets** – Provide all Material and Data Safety Sheets (MSDS).

### 13.0 Identifying the Defects

It is the intent of the commissioning process to avoid defects in waterproofing systems. A standard of care exhibited during the commissioning process should anticipate potential defects and determine appropriate solutions prior to the installation of these systems. In the event that defects do occur, proper defect identification will help determine the repair needed and assist in selecting the appropriate method and materials.

It is important to acknowledge which factors have caused deficiencies in the waterproofing system and its components, and how a deficiency in one system may influence or amplify another. Careful and thorough defect identification is critical to obtain long-lasting, quality repairs. It is critical and necessary to eliminate the cause of the defect and not solely treat the symptom.

Each Trade Subcontractor shall be responsible for determining the cause and origin of various problems as it pertains to their contractual scope of work. Failure to do so may require Trade Subcontractor to assume all related costs and expenses for damages, repairs performed by others, testing, special inspections, and consultant fees.

### 14.0 Applicable Industry Standards

Unless the Contract Documents include more stringent requirements, applicable published construction industry standards shall be utilized. Where compliance with two or more standards is specified for quality or quantity levels, comply with the most stringent requirement.

Where sections of the specifications require that a product, material, installation, or test complies with a specified industry standard, the Trade Subcontractor shall obtain copies directly from the publication(s) source and include the information in the submitted commissioning information.

Each Trade Subcontractor engaged in construction on the project must be familiar with published industry standards applicable to their construction activity.

### 15.0 Schedules

An initial schedule shall be developed by the Trade Subcontractor identifying dates, times, and durations for shop drawings, approval of submittals, material fabrication, product delivery, acceptance, installation, testing and completion.

The schedule shall also include any commissioning task that shall be performed on waterproofing systems that may involve or affect other related building systems.

Each Trade Subcontractor shall update schedules, daily, weekly, monthly, or as required to keep WEBCOR/OBAYASHI and the Owner informed of the activities performed. This schedule will indicate appropriate milestones during the installation to allow WEBCOR/OBAYASHI and or the Owner the ability to observe and witness system installations prior to being covered up by subsequent s. The schedule will indicate milestone dates for Trade Subcontractor inspection and testing.

#### **16.0 Execution of Inspections and Checklists**

Trade Subcontractor and or vendors shall schedule initial inspections and checklist review with the commissioning team. The inspections and reviews shall be directed, executed, and documented by the Trade Subcontractor or vendor.

To document the process, the Trade Subcontractor performing the task shall provide and complete all documentation forms and checklists. (See attached sample checklist)

#### **17.0 Field Inspections**

One of the most important commissioning activities for waterproofing systems is field inspections. The field inspection process shall serve as a method and means of documenting the installation process as well as indicate variations between contractual design and construction.

Each Trade Subcontractor shall identify in detail the scope of their field inspections, and the types of field procedures that will be required to obtain the necessary information to provide a complete waterproofing quality control evaluation at the completion of the job.

#### **18.0 Field Witnessing of Trade Subcontractor's Quality Control**

WEBCOR/OBAYASHI, the Owner, consultants and the Architect reserve the right to witness the waterproofing system installation at any time. Spot checks shall be conducted on a random basis. If inconsistencies are discovered in quality, performance, or if commissioning information differs from those submitted, the Trade Subcontractor may be required to completely remove and remedy all conditions where the inconsistencies occurred at no additional cost or impact to the schedule.

Witnessing shall include all or part of, but not limited to the following:

- 14.1 Mock ups
- 14.2 Waterproofing component and system installation
- 14.3 System inspection and checks
- 14.4 Performance tests

## 14.5 Special Inspections

## 19.0 Documentation

Trade Subcontractor shall maintain a separate field binder documenting quality control inspections and field-testing for all installed work. Documentation shall include dates, quality control field checklist, reports with inspected locations defined by grid lines and elevations. Provide a dated photo log, documenting inspected areas and general sequence of installed work for the duration of the project.

## 20.0 Testing and Methods

The objective of field-testing is to correlate paths of moisture infiltration and to observe the source of damages. Moisture entering a building during extreme weather may be obvious, but the most reliable method to discover the infiltrating path is to recreate the leakage condition in a controlled manner. Testing also allows verification of the theory for the cause of leakage.

As all system and component tests are unique to some degree, there may not be one standard or method for testing that can be applied to all. There are several methods, standards, governing requirements, and manufacture recommendations, etc., which should be applied.

There are three types of acceptable testing methods that can be used during the investigation. All of which must be approved by WEBCOR/OBAYASHI. These testing categories include:

- ✓ Non-Destructive Testing
- ✓ Destructive Testing
- ✓ Laboratory Testing

### 20.1 Non-Destructive Testing

Non-destructive testing uses a variety of non-invasive tools. This type of testing causes little or no damage or interference to the building envelope. The various methods of non-destructive testing include:

- a. *Rilem Tube* - This calibrated device is adhered to exterior masonry walls to determine the porosity and condition of brick masonry units, mortar joints, head joints, and embedment joints.
- b. *Water Spray Rack (ASTM E1105)* - This test simulates a wind-driven rain condition on a facility. It can assist in determining the specific cause and origin of moisture infiltration when it is used to test independent components of the envelope. Spraying water over a large area in an uncontrolled fashion will not reveal specific causes of water infiltration.
- c. *Hose Spray Test (AAMA 501.2)* - This test method also simulates wind-driven rain in small segmented areas using a standard garden hose in which a calibrated nozzle is attached with a pressure gauge. The spray is

directed at a specific joint, crack, or defect to reveal potential moisture intrusion.

- d. *Differential Pressure Test (ASTM E1105)* - A pressure chamber is constructed on the interior of the facility at a specific location to test moisture driven through an assembly or component. The assembly or component is subjected to a negative force while simultaneously a spray rack is directed at the assembly to draw the moisture into the facility to simulate a negative pressure under a wind-driven rain condition.
- e. *Infra-Red Thermography* - Infra-red Thermography photographs the building exterior to determine the locations of wet components. Components, such as insulation and sheathing, etc., will act as heat sinks if they contain high levels of moisture. During the day, moist and dry components absorb heat. At night, the moist areas release the heat much slower than the dry areas. By reading the heat signature, Infrared Thermography will help expose the problem areas. Small test cuts may be required to verify moisture areas.
- f. *Soundings (ASTM D4580)* - There are different ways to perform sounding tests including the hammer tap test. In this test, a 16 oz. hammer is tapped against concrete for sound. A hollow sound indicates areas where the concrete has separated from the reinforcing steel, typically due to exfoliation or corrosion of the steel. Another method of sounding is to chain drag a heavy 15 ft. link chain along a concrete surface to listen for hollow sounds, indicating defective concrete. This method can cover larger areas effectively and is commonly used on parking garages and loading docks.
- g. *Pachometer Survey* - This test uses a magnetic device used to locate embedded steel reinforcement and help determine the concrete cover over the reinforcement. Generally, the Pachometer is fairly accurate when measuring ¼ inch to 3-inch thick concrete cover and when reinforcing placement is not too congested.
- h. *Poly-sheet Tape-down* - This test determines the presence of moisture coming through a concrete surface, typically a slab-on-grade type of assembly where the typical problem is tile or membrane separation from the floor. A 2' x 2' section of polyethylene is sealed to the concrete with duct tape and removed 24 hours later. If there is moisture beneath the polyethylene, it is a good indication that there is a vapor drive through the concrete section.
- i. *Glass-Slide Epoxy or Crack-o-meter* - This device is sealed in place over a crack and periodically checked to determine if any movement has occurred. If movement has occurred, the glass will crack or the meter will record movement.
- j. *Optical Illuminated Boroscope* - A boroscope is inserted into a 5/8-in. diameter pilot hole through an exterior wall system and allows the cavity walls of brick veneer, stud wall backup of exterior insulated finish systems (EIFS), or other types of constructions to be observed without large-scale destructive testing.

- k. *Smoke/Dust Tracer* - The smoke/dust tracer helps to find air infiltration. It is moved across the interior face of a window to observe the smoke and dust particles coming through the assembly.
- l. *Moisture Meter* - A Delmhorst meter is a digital device that detects the presence of moisture in various building components. This test is typically accompanied by a gravimetric analysis (oven drying of samples), which is used to confirm the results of the Delmhorst meter.
- m. *Flashlight and mirror* - These simple tools can be very useful to detect problem areas. Placing the mirror into the plenum or behind difficult-to-access areas with the flashlight will allow observation of concealed conditions.

## 20.2 Destructive Testing

When the main objective is to determine the existing composition and configuration of concealed assembly conditions, destructive testing may be warranted. The most common methods of destructive testing are test cuts and borings.

Any type of destructive testing must be reviewed and approved by WEBCOR/OBAYASHI.

- a. *Roof Testing* - Test cuts in the roof assembly may be necessary to determine the condition of the underlying insulation and substrate. Cutting into the system may help verify whether roofing problems are causing corrosion of the steel deck, or a spalled and cracked concrete deck, etc. Test cuts may also expose the as-built configurations of the flashing components at roof-to-wall locations, curb locations, etc. This information is critical to the appropriate remedial design and/or repairs.
- b. *Exterior Wall/Skin Testing* - Test cuts on exterior walls may be required to identify the origin of moisture infiltration. For masonry walls, it is most effective to make test cuts at window heads and sills, and at any through-wall flashing locations that may be suspected of allowing moisture intrusion. Masonry test cuts may expose defective through-wall flashing that is allowing moisture intrusion. Test cuts may also help determine the underlying conditions of the steel components in wall systems, including wall ties, reinforcing steel, sub-steel columns, etc.

## 20.3 Laboratory Testing

Destructive testing is also used to obtain samples for lab analysis. Samples of sealants, coatings, painted finishes, roofing materials, etc. can be sent to a laboratory to determine the presence of lead or asbestos. Samples of masonry or concrete can also be tested to help identify causes of moisture/air infiltration (descriptions of these analyses follow).

Laboratory testing may help obtain a better understanding of existing material types, presence of contaminants, and the possibility of hazardous components.

This type of testing can also provide valuable information concerning proper surface preparation, material selection, and implementation of repairs. The following laboratory tests are some of the more useful when performing building envelope evaluations:

- a. *Gravimetric Analysis* - This test will determine moisture content. After weighing and recording the in-situ existing sample, completely dry the sample in an oven and re-weigh it. The weight difference indicates moisture content and is particularly useful for insulating materials. Testing moisture contents of samples is critical to verify results from non-destructive moisture scans.
- b. *Petrography* - Petrography determines the “make-up” of concrete. This test will indicate the size and type of aggregate, air/void ratio, type of cement, and general mix design data of the concrete. Most materials testing lab can perform this test.
- c. *Air Entrainment* - Provides an indication of the existing concrete’s durability and freeze-thaw resistance. Air entrainment is generally indicated by petrography.
- d. *Presence of Carbonization* - Accomplished by spraying a solution of phenothelene on the concrete substrate and recording the depth of the solution’s color change. This will indicate to what depth carbon dioxide has progressed into the concrete. Carbon dioxide will degrade the cement matrix of the concrete and lower the pH level of it. The layer surrounding the reinforcement is then destroyed, allowing corrosion of the reinforcing steel. Corrosion by carbonization usually occurs over a broad area.
- e. *Chloride Ion Content* - Chlorides from marine atmospheres or mists from road salts entering the concrete substrate, and salts originally introduced to the concrete via admixtures or aggregates can promote accelerated corrosion of reinforcing steel, usually at concentrated or specific locations. The chlorides are not consumed in the corrosion process but rather act as catalysts in the process. The corrosion will progress along the reinforcing bars causing concrete de-bonding, cracking, and spalling.
- f. *Reinforcement Placement, Depth, Quantity, and Type* - This information may be established with the use of a Pachometer or similar electronic metal detector. It is useful in determining required steel replacement and structural capacities during engineering analysis phases.

## 21.0 Engineering Analysis

Using information obtained from the field, laboratory results, and collected data, a comprehensive engineering analysis may be required. The engineering analysis should include an assessment of field and laboratory data, structural analysis as well as the following:

- ✓ Thermal Analysis
- ✓ Drainage Analysis

- ✓ Vapor Drive Analysis
- ✓ Fire Rating Requirements
- ✓ Cost Estimations

## **22.0 Deficiencies and Non-Conformance**

The Trade Subcontractor shall identify and list any outstanding deficiencies or procedures that were not completed successfully during any final testing. Documented deficiencies shall be submitted to WEBCOR/OBAYASHI within 48 hours of each test completion.

The Trade Subcontractor shall also provide in writing, the corrective action for each deficiency as required within 48 hours. The installing Trade Subcontractor and or vendor shall correct all outstanding issues or deficiencies in the materials or the installation of the materials and provide the commissioning team with dates and times for the required corrections and any re-testing.

## **23.0 Remedial Work**

General considerations for the repair of defects and replacement of components should include the following:

- 23.1 Determine the effect, if any; the repairs have on the structure, surroundings, and operations of the building.
- 23.2 Ensure proper preparation of surfaces to be repaired and provide chemical and mechanical bonds for new materials.
- 23.3 Material selection should include an understanding of performance limitations and should rely on the products past acceptable performance. Material selections should include consideration of the following:
  - ✓ Compatibility
  - ✓ Maintenance
  - ✓ Life cycle

## **24.0 Project Commissioning Closeout**

WEBCOR/OBAYASHI, the Owner, and/or the Owner's representative shall determine when the Trade Subcontractor commissioning process has been satisfactorily completed and when to submit the final report information and all other documentation to Webcor.

As part of the project turnover, the quality of all work will be reviewed to determine whether it is within specific and manufacturers' guidelines, industry standards, and code compliance.

WEBCOR/OBAYASHI, the Owner, and/or the Owner's representative consultant must be completely satisfied that the commissioning procedures have been performed accurately and professionally.

In the event the commissioning information or performance requirements outlined in the Waterproofing Quality Commissioning Procedure & Guidelines have not been met, WEBCOR/OBAYASHI may elect to withhold or make appropriate adjustments to the Trade Subcontractor's final billing.
