<b>T-1014</b>	<b>BGP - Moment Frame Beam Tie Configuration</b>	<b>Closed</b>	<b>CR</b>	<b>12/11/2013</b>	<b>12/21/2013</b>	<b>12/12/2013</b>
<b>From:</b> Webcor Construction LP      Jackson Tukuafu						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Please refer to detail 2/S1-3600.			Please refer to detail 2/S1-3600.			
Due to the possibility of limited access during the installation of the individual moment frame hairpins as detailed in 2/S1-3600, SCCI/Gerdau proposes to modify the typical moment frame beam tie configuration to what is shown in the attached SCCI sketch SK-RFI-399.			Due to the possibility of limited access during the installation of the individual moment frame hairpins as detailed in 2/S1-3600, SCCI/Gerdau proposes to modify the typical moment frame beam tie configuration to what is shown in the attached SCCI sketch SK-RFI-399.			
Please confirm if this is acceptable.			Please confirm if this is acceptable.			
<b>T-1015</b>	<b>BGP - Moment Frame Cap Ties at shear Key Blockout</b>	<b>Closed</b>	<b>CR</b>	<b>12/11/2013</b>	<b>12/21/2013</b>	<b>12/12/2013</b>
<b>From:</b> Webcor Construction LP      Jackson Tukuafu						
<b>REQUEST:</b>			<b>ANSWER:</b>			
In order to avoid the shear key blockout and anchor bolts in the MF joint, SCCI/Gerdau proposes to eliminate up to two cap ties where the spacing is 4" and one cap tie where the spacing is 6". Cap ties will resume at regular spacing no further than 1" from the beyond the anchor bolts or blockout.			In order to avoid the shear key blockout and anchor bolts in the MF joint, SCCI/Gerdau proposes to eliminate up to two cap ties where the spacing is 4" and one cap tie where the spacing is 6". Cap ties will resume at regular spacing no further than 1" from the beyond the anchor bolts or blockout.

T-1037	<b>SSS - Typical Kicker Brace Detail</b>	Closed	CR	12/12/2013	12/22/2013	12/26/2013
<b>From:</b> Webcor Construction LP                      Gregory Kemerer						
<b>REQUEST:</b> Reference the bracing connection details provided on S1-5015. At conditions where a full depth shear plate and bracing are required, there is consistently a conflict between the bottom gusset plate and shear plate. Based on the weld requirements for the kicker brace connection, the following is proposed to avoid this conflict: 1) Connect the kicker directly to the shear plate 2) Eliminate the bottom gusset 3) Offset the top gusset (below the beam) by the width of the beam web to align with the shear plate 4) Match the thickness of the gusset and stitch plates to the shear plate thickness 5) Shape the bottom of the shear plate, where necessary, to achieve the required angle brace weld  Please confirm this is an acceptable typical solution for the conditions shown in the sketches attached and at other typical locations where bracing and a full depth shear plate are required.			<b>ANSWER:</b> Reference the bracing connection details provided on S1-5015. **REQUEST:**

- See attached CD RFI # 352 SK1:
- 1) S1-8008 ~ Sequence 'CS2' approval drawings 4769, 4770, 4815, 4816 & 4919 request that the slab edge plate be extended up to the 1st concrete pour but 'CS2' approval drawings 4777 & 4823 do not have the comment. Note that the details on S1-8008 do not show the edge plate extending up to the concrete construction joint (1st concrete pour). Detail 9/S1-8008 does not show the concrete construction joint. RFI T-1056 (SK 210, CD 159) confirmed that the details on S1-8008 remain as shown and that the edge plate terminates at the top of slab. Please clarify the designer's requirement for this edge of slab bent plate.
  - 2) S1-8006 ~ Detail 1 shows the edge plate extending up to the top of slab and not to the 1st concrete pour. Please review RFI T-1056 (SK 210, CD 159) and confirm that remains the intent. If not, issue a revised detail showing the vertical dimension locating the construction joint (1st concrete pour).
  - 3) S1-8016 ~ RFI T-1056 (SK 210, CD 159) confirmed that the edge plate terminates on top of the slab as shown in details 1,3,4/S1-8016. Confirm this remains the intent. If not, issue a revised detail showing the vertical dimension locating the construction joint (1st concrete pour).

**ANSWER:**

<b>From:</b> Webcor Construction LP                      Stephanie Azzolino						
<b>REQUEST:</b> As a follow up to SK RFI 301, 301.1, and ASI 111, please review the following requesting further clarification for the W2 kicker brace locations: 1) (SK1 & SK2) Detail 1/A1-8151 indicates mullions on the W-2 curtain wall from grade level to the bus deck level. However, the section cut 2/A1-8151 only shows bracing and stiffeners at the Bus Deck level framing, not the Second Level framing. Please confirm no kicker braces or stiffeners are required at W-2 mullions at the second level.  2) (SK1) Please advise if Bus Deck Level mullion spacing shown on A1-8155 is to be pulled from grid line 10 or 10.1. It appears that the spacing is typically for a 42-6" bay. 3) (SK3) Per A1-8151, kicker braces per 4/S1-8020 are required as shown. Please confirm. 4) (SK5) Per A1-8152, kicker braces per 4/S1-8020 are required as shown. Please confirm. 5) The mullion locations on A1-8157 cannot be located with the information provided. Please supply the dimensions off grid lines to locate the bracing and mullions. 6) It appears that W-2 mullions occur along the entire wall on grid line 1.4, however A1-8157 only shows mullions between grid lines C and D.4. If mullions occur south of GL D.4, please provide the dimensions required to locate the mullions, braces, and stiffeners. 7) A1-8158 is shown on grid line 2.5. Please advise if A1-8158 is to be mirrored on GL 3.5 or provide the required mullion spacing. 8) A1-8158 does not provide the locations of the mullions. Please supply the required dimensions off grid lines. 9) A1-8159 is shown on grid 8.5. Please advise if this elevation also applies on grid 9.5 or provide the required mullion spacing. 10) The locations of the mullions cannot be located with the information provided on A1-8159. Please provide a reference dimension off a grid line to locate the mullions. 11) A1-8152 is reference on A1-8150 between grid lines 2 and 3, with grid lines 2 and 3 shown on the elevation. Please confirm this detail also applies at the corners on grid lines 4, 8, 10, 12, and 14. 12) Please confirm details 1 and 4 on S1-8020 do not apply to drawings A1-8156, A1-8165, A1-8166. 13) A1-5167 is reference on the south portion of grid 16.9. Please advise if this detail also applies on the north portion of grid 16.9.			<b>ANSWER:</b> As a follow up to SK RFI 301, 301.1, and ASI 111, please review the following requesting further clarification for the W2 kicker brace locations: 1) (SK1 & SK2) Detail 1/A1-8151 indicates mullions on the W-2 curtain wall from grade level to the bus deck level. T-1060.1	SSS - Shop Primer Coat Exclusion Areas	Closed	CR	01/06/2014	01/16/2014	01/16/2014

From: Webcor Construction LP Gregory Kemerer

**REQUEST:**

While specification section 05 10 00-3.2 .P.3b excludes shop paint from areas to receive cementitious fireproofing, the response to SK RFI 319 (WOJV T-1060) indicates that all steel is to be prepped per the manufacturer's recommendations. The response to WOJV T-1060 provided three potential manufacturers for the SFRM-1 per the preliminary specification section 07 81 00-2.3.A.

1.) Based on the product data sheets published for the Grace Monokote Z-146 and Cafco Fendolite M-II products, Skanska understands that these products are recommended to be applied to bare steel that is free of oil, grease, excess rolling compounds, lubricants, loose mill scale, excess rust,..., or any other substance that will impair proper adhesion. Please confirm this interpretation is acceptable and the potential use of these products is intended for application on bare steel.

2.) The Carboline Pyrocrete 40 product does not require the use of a primer, however the published data sheets state that "Pyrocrete 40 neither promotes nor prevents corrosion". It is understood that the manufacturer finds application of Pyrocrete 40 to bare steel to be acceptable on the building interior, but recommends the Owner's consideration of a primer on steel exposed to corrosion. Please advise which areas, if any, are required to be primed prior to application of the Carboline Pyrocrete 40 product.

Please note that application of a primer for areas receiving any of the three SFRM-1 products will incur additional costs and schedule impacts, as these areas were originally specified to be bare steel per 05 10 00-3.2.P.3b.

<b>T-1062</b>	<b>BSE - Timber Pile Removal from CDSM Wall</b>	<b>Closed</b>	<b>01</b>	<b>01/03/2014</b>	<b>01/02/2014</b>	<b>01/13/2014</b>
<b>From:</b> Webcor Construction LP                      Robert Kjome						
<b>REQUEST:</b>			<b>ANSWER:</b>			
<p>BBII has located portions of timber piles in several CDSM wall panels along gridline A in zone 3 at excavation levels 4 and 5, between soldier piles 255-257 and 259-261. BBII believes any attempt to remove the piles has the potential to damage the CDSM wall. Given that there is no issue with water intrusion at the pile locations and the CDSM material is in good condition, BBII believes the best course of action is to leave them in place. To ensure a smooth surface for waterproofing, the piles have been ground down so that they are recessed from the face of wall. BBII will then patch over the panel to bring it flush with the CDSM piles. (Patching has already occurred on a portion of the affected areas - see attached photos of panels before and after the above procedure.)</p> <p>Please confirm this is acceptable</p>			<p>BBII has located portions of timber piles in several CDSM wall panels along gridline A in zone 3 at excavation levels 4 and 5, between soldier piles 255-257 and 259-261. T-1092	SSS - Ground Level Cast Nodes	Closed	CR	01/09/2014	01/19/2014	01/24/2014

From: Webcor Construction LP Gregory Kemerer

**REQUEST:**

In recent meetings, Webcor/Obayashi has made it clear that the same Ground Level Cast Node geometry will be used at multiple locations even though the angle of the lower Basket Columns changes at each Node. This adds a level of complexity and cost to the joint between the Cast Node and Basket Column Pipe due to the kink imposed on that joint as a result of the following:

- The Lower Pipe Columns will be required to be limiter cut" instead of a traditional square cut end. (Please note Spec Section OS 10 00, paragraph 3.2.M.1 states 11Bearing ends of columns shall be milled or sawn square perpendicular to axis of the column.")
- Miter cut Pipe will have an ellipse cross section and will not match the circular Casting Node.
- Backing bars used to full pen weld the Pipe Column to the Cast Node would need to be custom machined to match the ellipse Pipe and circular Node to eliminate weld gaps. This significantly increases the complexity and risk for successfully welding the joint, and reduces the adjustability for fit up of these joints in the shop and the field.

This kink can be accommodated either by machining the nozzle of the Cast Node to be perpendicular to the pipe, or by machining the pipe end at a mitered angle to match the Cast Node.

Since this joint on the Cast Node is already being machined, OIW believes that the more desirable and less expensive option is to machine the nozzle of the Cast Node perpendicular to the axis of the Basket Column Pipe. As the nozzles will each be custom machined regardless, machining them to match the pipe axis should be a relatively low cost change.

OIW requests that the nozzles of each Ground Level Cast Nodes to be machined perpendicular to the axis of the adjoining lower Basket Column Pipe.

A negative response will result in a cost increase and a time increase.

**ANSWER:**

In recent meetings, Webcor/Obayashi has made it clear that the same Ground Level Cast Node geometry will be used at multiple locations even though the angle of the lower Basket Columns changes at each Node. This adds a level of complexity and cost to the joint between the Cast Node and Basket Column Pipe due to the kink imposed on that joint as a result of the following:

T-1093	<b>BGP - Foundation Wall Mix Placed in Shear Wall</b>	Closed	CR	01/09/2014	01/19/2014	01/14/2014
<b>From:</b> Webcor Construction LP                      Jackson Tukuafu						
<b>REQUEST:</b> Please reference TG06.0 technical specs section 033020.2.1 and cast-in-place mix designs submittal numbers: TG0600-203 (Foundation Walls) and TG0600-204 (Slabs, Beams and Shear Walls).  Foundation Wall cast-in-place mix satisfies all requirements prescribed in table 2-1 "Concrete Properties" (033020.2.1) for the Shear Wall cast-in-place mix design. In order to limit site congestion (1 concrete pump vs. 2 concrete pumps) and to aid in logistic coordination between trade subcontractors (BBII Steel offhaul and/or bracing/rebracing work and SCCI concrete placing activities). SCCI is proposing to utilize the Foundation Wall mix when placing the shear walls. Per the project schedule there will be instances in which a foundation wall and shear wall that are in close proximity, are to be poured on the same day. If the same mix is approved to be used for both types of walls, one pump can be utilized vs. two.  Is this proposed mix design variance acceptable?			<b>ANSWER:</b> Please reference TG06.0 technical specs section 033020.2.1 and cast-in-place mix designs submittal numbers: TG0600-203 (Foundation Walls) and TG0600-204 (Slabs, Beams and Shear Walls). From: Webcor Construction LP Stephanie Azzolino

REQUEST:

See attached CD RFI # 264 SK1 to SK4 for items 1 to 8:

- 1.) Supply the slope angle for MFB1.
2.) Confirm the noted information is the correct information to determine the top end of MFB1.
3.) Supply the noted dimension (to be used to locate PL 2 1/2 x 9 x 2'-6).
4.) The braces per 5/S1-5015 as shown on plan (SK1) will cross each other between Grids 19.9 & 20.1 as shown on SK3 & SK4. There is insufficient room on Girders TR19.9 & TR20.1 to accommodate these brace connections without the braces fouling each other. Please work with SK3 & SK4 and provide a solution.
5.) Supply the underside of slab dimension at the location of the brace per item 4.
6.) Supply the underside of slab dimension at the location of the brace per item 4.
7.) Supply the underside of slab dimension at the location of the brace per item 4.
8.) Supply the underside of slab dimension at the location of the brace per item 4.

ANSWER:

See attached CD RFI # 264 SK1 to SK4 for items 1 to 8:

- 1.) Supply the slope angle for MFB1.
2.) Confirm the noted information is the correct information to determine the top end of MFB1.
3.) Supply the noted dimension (to be used to locate PL 2 1/2 x 9 x 2'-6).

T-1116	BSE - Micropile Removal and Relocation in Buttress Area	Closed	01	01/16/2014	01/26/2014	01/31/2014
	<p>From: Webcor Construction LP                      Robert Kjome</p>					
	<p><b>REQUEST:</b></p> <p>WOJV recieved FO T-00008 9/07/2012 which added micropiles within the footprint of the buttress shafts. RFI T-0323.1 returned 10/24/12 directed BBII to install buttress shaft E4, which is in direct conflict with Micropile E520.</p> <p>BBII proposes to:</p> <p>Option 1. Remove Micropile E520                  Option 2. Drill Micropile E520 into the center of the buttress shaft as proposed in RFI T-1115                  Option 3. Relocate Micropile E520 to a location provided by the design team.</p> <p>Also, BBII is requesting that they be permitted to relocate</p>					
	<p>the existing buttress piles as an alternative to drilling adjacent to buttress piles. A micropile dowel could take the place of a micropile as necessary. A dowel would consist of the same #20 Gr. 80 reinforcing bar used for the micropiles. A six- inch diameter, 20 foot long hole would be drilled in the center of the buttress pile. An additional drill rig will be required to perform the drilling. A 25' bar would be set with centralizers and tremie grouted with the same grout used for the micropiles. Based on an assumed minimum Buttress pile concrete and grout strength of 3,000 psi, the developmental length (ld) of a #20 bar is 182.5 inches (15.2 feet). 20 feet embedded would develop the yield strength of the #20 bar (393 kip) and exceed the design micropile load of 308 kips.</p> <p><math>ld = (80,000 \text{ psi} / (20 * \text{sqrt}(3000 \text{ psi})) * 2.5 \text{ in} = 182.5 \text{ in}.</math></p> <p>Accepting this alternative would mitigate delays and extra costs that will result should buttress pile concrete and/or grout be encountered while drilling adjacent to these piles.</p> <p>Please confirm that this alternative micropile procedure is acceptable.</p>

T-1142	<b>BGP - Grounding Rod at Buttress Pile in Zone 4</b>	Closed	CR	01/27/2014	02/06/2014	02/03/2014
<b>From:</b> Webcor Construction LP                      Jackson Tukuafu						
<b>REQUEST:</b> Please refer to drawing E1-2026.  In Zone 4, an overlapping series of concrete buttress piles were poured along the North Wall of the excavation, extending towards the south wall.  In this area, the final grade of the excavation will be the concrete buttress piles. The attached photo shows the buttress pile layout with the grounding ring/ground rods overlayed on it. The ground rods need to be driven 10' deep. Please confirm that the rods which conflict with the buttress piles could be moved away from the north CDSM wall and to the void area of the buttress piles as shown in the attached SCCI sketch SK-SCCI_RFI421.			<b>ANSWER:</b> Please refer to drawing E1-2026. T-1161.1	<b>BSE - Replacement and Removal of Waler Lookouts GL 9.5 West</b>	Closed	01	02/20/2014	03/02/2014	03/04/2014
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b> Due to a revision in the concourse slab elevation, waler lookouts from gridline 9.5 West must be removed to allow for construction of the slab. BBII's EOR for the internal bracing has approved the use of additional 6x6x3/8" angle braces to replace the lookouts in conflict. Reference the attached RFI response, supplemental calculations, and details from PB&A.  See URS comments 1-3 below on RFI T-1161 also see PB & A response and additional drawing to these comments  1. The drawings do not show the sequence of installing new items and removing existing items. The construction sequence is required to ensure proper load transfer from removing elements to new load-carrying elements. Information provided for construction must clearly identify details and sequencing. There should be nothing left to interpretation by field personnel. This includes all detailing as well as full identification of what is to be installed and where, and what is to be removed, with clear identification of what is required prior to removal, and when (relative to installation of new bracing elements). The specific degree of finalization for installation of the new installed bracing elements prior to removal of lookouts is required. This includes identification of the specific inspections required to be complete prior to allowing any removal of existing lookouts to occur.  PB & A response :The replacement WF beam or angle shall be installed and special inspections shall be performed on the welding connections prior to the removal of the existing WF lookouts underneath the waler. As per sketch attached  2. For welding of an angle brace to a waler, please show clarification of welding to provide full compliance AWS prequalified procedures (weld geometry). For the bottom welding, please verify the weld is accessible with waler beam flange being close to welds. Welding is to include detailing that provides access for performance of welding. All welding must have clearly defined geometry allowing calculation of weld capacities. If this is not achieved, the welding provided cannot be relied upon for transmission of loads. If an angle brace needs to move away from waler beam flange for accessibility, the distance shall be			<b>ANSWER:</b> Due to a revision in the concourse slab elevation, waler lookouts from gridline 9.5 West must be removed to allow for construction of the slab. The drawings do not show the sequence of installing new items and removing existing items. The construction sequence is required to ensure proper load transfer from removing elements to new load-carrying elements. Information provided for construction must clearly identify details and sequencing. There should be nothing left to interpretation by field personnel. This includes all detailing as well as full identification of what is to be installed and where, and what is to be removed, with clear identification of what is required prior to removal, and when (relative to installation of new bracing elements). The specific degree of finalization for installation of the new installed bracing elements prior to removal of lookouts is required. This includes identification of the specific inspections required to be complete prior to allowing any removal of existing lookouts to occur.  PB & A response :The replacement WF beam or angle shall be installed and special inspections shall be performed on the welding connections prior to the removal of the existing WF lookouts underneath the waler. As per sketch attached  2. For welding of an angle brace to a waler, please show clarification of welding to provide full compliance AWS prequalified procedures (weld geometry). For the bottom welding, please verify the weld is accessible with waler beam flange being close to welds. Welding is to include detailing that provides access for performance of welding. All welding must have clearly defined geometry allowing calculation of weld

---------------	----------------	---------------	------------------------	---------------------	----------------------	----------------------

indicated.

PB & A response :The replacement WF beams or angles shall be installed on each side of the pipe strut. If an existing angle brace has been installed on the soldier beam on the side of the pipe strut, the replacement WF beam or the angle shall be installed on the adjacent soldier beam away from the pipe strut. The angle brace is move from the waler beam flange for accessibility per sketch SK-1 attached.

3. Either an identical WF beam or an angle brace as proposed for a replacement element of the existing lookouts is to be attached to WF soldier pile beams above a waler according to the RFI. However, a number of soldier piles already connect angle braces, and those soldier piles with an existing brace may have a difficulty to accommodate an additional WF beam or angle. Lookouts were placed at least 4 per waler and one on each side of a strut per the drawings and calculations, and the same number and locations of replacement elements are required. Please verify the existing angle braces are to be used as a part of the lookout replacements or the same number of new angle braces as the existing lookout beams are to be added in addition to the existing angle braces. Please verify the proposed replacement elements can be installed without a conflict of existing angle braces.

PB & A response: At least the same number of replacement WF beams as that of the existing lookouts shall be installed. For the replacement angle option, minimum 4 additional angle braces excluding the existing ones are required.

Please confirm it is acceptable to proceed with removal of the lookouts per PB&A's RFI response. Note that the RFI response provided by PB&A has been amended to address comments from urs in response to RFU T-1161.

capacities. If this is not achieved, the welding provided cannot be relied upon for transmission of loads. If an angle brace needs to move away from waler beam flange for accessibility, the distance shall be indicated.

PB & A response :The replacement WF beams or angles shall be installed on each side of the pipe strut. If an existing angle brace has been installed on the soldier beam on the side of the pipe strut, the replacement WF beam or the angle shall be installed on the adjacent soldier beam away from the pipe strut. The angle brace is move from the waler beam flange for accessibility per sketch SK-1 attached.

3. Either an identical WF beam or an angle brace as proposed for a replacement element of the existing lookouts is to be attached to WF soldier pile beams above a waler according to the RFI. However, a number of soldier piles already connect angle braces, and those soldier piles with an existing brace may have a difficulty to accommodate an additional WF beam or angle. T-1176	SSS - Finish Requirements at BRBs	Closed	CR	02/19/2014	03/01/2014	02/27/2014

From: Webcor Construction LP                      Stephanie Azzolino

**REQUEST:**

Detail B/A1-8662 indicates that BRBs at Ground Level between GL D.4/28 and D.4/31 are to receive IFRM-2 fire protection. All other BRBs are to receive SFRM fire protection. Please refer to SK RFI 397 SK1 attached and clarify the following finish requirements for the BRBs:

- 1) Details 1, 3, and 5 on S1-4206 indicate that bottom gusset plates are to be galvanized. Please confirm that only the bottom gusset plates are to be galvanized.
- 2) For BRBs to receive SFRM fire protection:
  - a. Please confirm the extent of the SFRM at the braces as indicated by the red outline in details 2, 3, and 6. Note that all materials indicated to receive SFRM will be bare steel. Steel will be prepped in accordance with 07 81 00-3.2.B.
  - b. Please confirm the pin, bolts, plates, and top gussets shown in details 2 and 6 are to be bare steel in anticipation of receiving SFRM by others.
- 3) For BRBs to receive IFRM fire protection:
  - a. Please confirm the extent of the IFRM at the braces as indicated by the blue outline in details 2, 3, and 6. Materials indicated to receive IFRM will be prepped and primed in accordance with 07 81 23.
  - b. Detail B/A1-8662 graphically indicates that only the braces and not the gussets are to receive IFRM. Please confirm the final finish of the bottom gusset plates is to be galvanized and provide the finish requirements for the top gussets.
  - c. Please provide the finish requirements for the pins and 1" thick plates indicated on 6/S1-4206.
  - d. Provide the finish requirements for the bolts indicated in detail 6/S1-4206.

**ANSWER:**

<b>T-1192</b>	<b>BSE - Steel Plate at CDSM Piles 450-451</b>	<b>Closed</b>	<b>01</b>	<b>02/24/2014</b>	<b>03/06/2014</b>	<b>03/04/2014</b>
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b>		<b>ANSWER:</b>				
<p>During level 4 and 5 excavation, a high volume leak occurred in zone 4 between CDSM pile 450 and 451. In an effort to stabilize the CDSM panel and repair the leak, BBII installed a steel road plate between soldier piles 167-168 and injected grout behind it.</p> <p>BBII is concerned that removing the plate will likely cause the panel to become destabilized and could reopen the flow of water. BBII survey of the plate indicates that the plate is behind the theoretical face of CDSM wall and does not encroach into the permanent structure - reference the attached drawing.</p> <p>Please confirm is is acceptable to leave this plate in place.</p>		<p>During level 4 and 5 excavation, a high volume leak occurred in zone 4 between CDSM pile 450 and 451. T-1205	<b>BGP - Lower Concourse Blockouts to Pour Train Level Partition Walls</b> From: Webcor Construction LP Claude Titcher	Closed	01	02/26/2014	03/08/2014	03/04/2014
	<b>REQUEST:</b> SCCI is planning on pouring as much of the Train Level Partition Walls in Area 3 and 4 prior to the Lower Concourse Deck being poured (see attached Structural Drawings for reference). However, some of the partition walls conflict with the Rakers used for bracing. Additionally, there are some partition walls in Areas 6-16 that are added in ASI #110 that is now included in TG06 scope.  Since the Rakers will not be removed until after the Lower Concourse Deck is poured, SCCI proposes installing blockouts in the Lower Concourse above the walls in order to complete the concrete pours for the partition walls in Areas 3 and 4. The same blockouts will be installed for the partition walls on the mat slab level in Areas 6-16, added as part of ASI 110. The blockouts will be 6"x 12" for RCS 1 reinforcement and 9"x 12" for RCS8 reinforcement, both at 4' O.C. The blockouts would be positioned in the space between bars as to not affect the reinforcement layout.					<b>ANSWER:</b> SCCI is planning on pouring as much of the Train Level Partition Walls in Area 3 and 4 prior to the Lower Concourse Deck being poured (see attached Structural Drawings for reference). T-1216	<b>BGP - CDSM Soldier Pile Encroachment Area 13</b> From: Webcor Construction LP Claude Titché	Closed	01	03/14/2014	03/24/2014	
	<b>REQUEST:</b> Reference Documents: Exhibits A - H					<b>ANSWER:</b> Reference Documents: Exhibits A - H

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Choice Required</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>
---------------	----------------	---------------	------------------------	---------------------	----------------------	----------------------

This RFI addresses the impact of the encroaching CDSM soldier piles (SP) on the north & south wall in mat slab pour Area 13 as well as all levels of the encroachment into the foundation wall between CDSM piles 265 to 288 on the north elevation and 495 to 517 to on the south elevation for location Plan see exhibit - A

Exhibit - B, & C depict the location and degree in which the SP are encroaching

WOJV proposal North elevation on gridline A: (See Exhibit - B) between CDSM pile 262-263 to 270, 272-273 to 276 WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching SP 266 to 270, 274 & 275. Originally these were WR1 reinforcement areas #11@8"oc EF vertically and would change to #11@6"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.1 (Exhibit - D).

Between CDSM piles 280 to 281-282 & 284 to 290, WOJV is proposing to decrease the specified 36" wall thickness to 33" to clear the encroaching SP 281, 284, 285, 286, 288-290. This foundation wall area was originally a WR1 reinforcement area #11@8"oc EF vertically and would change to #11@6"OC this reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on detail A/Sk.1 (Exhibit -D).

Between CDSM piles 270 to 272-273 & 281-282 to 283-284, WOJV is proposing to decrease the specified 36" wall thickness to 32" & 33" respectively to clear the encroaching SP 271, 272 & 282. This foundation wall area was originally a embedment column with reinforcement in this area was a double layer of #11@6"oc EF vertically and would change to double layer of #11@5"OC this reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.4 option 1 (Exhibit -F).

WOJV proposal on the South elevation: (See Exhibit - B) Between CDSM piles 503 to 506 WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching SP 504, originally this was a WR1 reinforcement areas #11@8"oc EF vertically and would change to #11@6"OC, the reduction in foundation wall

This RFI addresses the impact of the encroaching CDSM soldier piles (SP) on the north & south wall in mat slab pour Area 13 as well as all levels of the encroachment into the foundation wall between CDSM piles 265 to 288 on the north elevation and 495 to 517 to on the south elevation for location Plan see exhibit - A

Exhibit - B, & C depict the location and degree in which the SP are encroaching

WOJV proposal North elevation on gridline A: (See Exhibit - B) between CDSM pile 262-263 to 270, 272-273 to 276 WOJV is proposing to decrease the specified 36" wall thickness to 34" to clear the encroaching SP 266 to 270, 274 & 275. Originally these were WR1 reinforcement areas #11@8"oc EF vertically and would change to #11@6"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.1 (Exhibit - D).

Between CDSM piles 280 to 281-282 & 284 to 290, WOJV is proposing to decrease the specified 36" wall thickness to 33" to clear the encroaching SP 281, 284, 285, 286, 288-290. This foundation wall area was originally a WR1 reinforcement area #11@8"oc EF vertically and would change to #11@6"OC this reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on detail A/Sk.1 (Exhibit -D).

Between CDSM piles 270 to 272-273 & 281-282 to 283-284, WOJV is proposing to decrease the specified 36" wall thickness to 32" & 33" respectively to clear the encroaching SP 271, 272 & 282. This foundation wall area was originally a embedment column with reinforcement in this area was a double layer of #11@6"oc EF vertically and would change to double layer of #11@5"OC this reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.4 option 1 (Exhibit -F).

WOJV proposal on the South elevation: (See Exhibit - B) Between CDSM piles 503 to 506 WOJV is

REQUEST:	Further to response to RFI T-637 please find attached					
ANSWER:	Further to response to RFI T-637 please find attached					

#11@5"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.3 option 2 (Exhibit -E)

WOJV proposal on the South elevation: (See Exhibit i B) Between CDSM piles 438 to 442 & 445-446 to 448 WOJV is proposing to decrease the specified 36" wall thickness to 33" to clear the encroaching SP 441,442,445,446 & 447, originally this was a WR1 reinforcement areas #11@8"oc EF vertically and would change to #11@6"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.1 (Exhibit - D).

Between CDSM piles 441-442 to 445-446, WOJV is proposing to decrease the specified 36" wall thickness to 33" to clear the encroaching SP 442 & 445 Originally this was a WR2 reinforcement areas #11@6"oc EF vertically and would change to #11@5"OC, the reduction in foundation wall thickness would be compensated by reducing the rebar spacing predicated on Detail A/Sk.3 option 2 (Exhibit - E)

In all other areas without CDSM pile encroachment issues the reinforcement will remain unchanged as per the Contract drawings.

See Exhibit - F & G showing details of transition between modified reinforcement to contract reinforcement.

These solutions if approved would be incorporated into the TG06 shop drawings.

Please confirm if these solutions would be acceptable.

T-1221	<b>BGP - 36" Pile Sleeve Joint</b>	Closed	01	03/06/2014	03/16/2014	03/14/2014
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b> Please reference attached sketch, photo, and Contract Drawings SI-3003 and SI-2025. SCCI welded the 36" pile sleeve (see S 1-2025) vertical CJP as depicted in the attached sketch due to a shop fabrication error (see attached photo). Per AWS DI .1, the pre-qualified joint designation B-U2a-GF for FCAW allows a 65 degree groove angle with detail and fit up tolerances. The welded joint is approximately 15 degrees out of tolerance and is on one side of the sleeve only (2 joints per sleeve). Due to the member considered as non-structural, SCCI requests this joint to be acceptable as welded at this location only. SCCI will adhere to Spec Section 05 50 10 - 2.5.C.2 - "Weld mat foundation sleeve components continuously and test their water tightness by filling with water. Monitor water level for 48 hours minimum. Dry and correct faulty welds and re-test until proven watertight." Is this acceptable?		<b>ANSWER:</b> Please reference attached sketch, photo, and Contract Drawings SI-3003 and SI-2025. **REQUEST:**

At SE401 see attached CD RFI # 317 SK1 to SK5 for items 1 to 7:  
 1) It is not clear what is meant by the noted slope designation.  
 Confirm the roof slab slopes and the top of pad slab is EL 56'-11 per A1-2894 (SK3).  
 2) Confirm the noted dimension is 1'-2 3/4 per 8/S1-5004 (SK4).  
 3) This note is pointing to the edge of slab and giving a top of steel elevation. Work with SK5 and clarify.  
 4) Confirm the noted dimensions should read 1'-9 & 9'-2 per 1/S1-7113 & RFI T-0965 (SK251, CD 200). If not, clarify.  
 5) The noted HSS members are not shown on S1-2504 (SK1) or 3/S1-7113 (SK2) but this detail is referenced on both plans noted above.  
 a) Please confirm the HSS members are required.  
 b) If yes, supply the size.  
 c) Supply the horizontal locations on plan  
 d) Supply the elevation  
 e) Supply connection details  
 f) NOTE: the elevator post connections per 1/S1-7600 may foul the HSS members (work with SK5)  
 6) Confirm the slab edge plate terminates below the 10" raised slab as shown.  
 7) Confirm detail 1/S1-7600 with the full depth stiffener and kicker brace applies in the noted cases with no elevator post on top of the beam.

**ANSWER:**

T-1224	BGP - Concourse Top Bars at Column Embedded Plates	Closed	01	03/10/2014	03/20/2014	03/18/2014

From: Webcor Construction LP                      Claude Titche

**REQUEST:**

Reference: SKS-0324 and SKS-0325  
 Per SKS-0324 and SKS-0325, where the top bars for the concourse slab intersect type 1 B and 1 C embedded base plates, the bars are to be trimmed and supplemented with a matching slab dowel in MF beam layer 1. The typical deck top reinforcing consists of a continuous run of #9 bars @ 12" and alternates with a #9 x 28'-0" long bars@ 12". See attached sketch for details. To avoid trimming a 28'-0" bar and splicing it with a 17'-0" bar, please confirm if it is acceptable to relocate the #9 x 28'-0" top bars@ 12" to the MF beam layer 1. The continuous #9 bars@ 12" will remain at 3/4" from the top of concrete and trimmed according to SKS-0324 and SKS-0325.

**ANSWER:**

T-1230.1	<b>SSS - Machined Cap Plate Surface Finish</b>	Closed	CR	03/24/2014	04/03/2014	04/04/2014
<b>From:</b> Webcor Construction LP Gregory Kemerer						
<b>REQUEST:</b> To clarify, the specifications section 05 10 00 - 3.2.P.2 requires finished bearing surfaces to be protected with a rust-inhibiting coating (which is typically a petroleum/grease or wax based product) which is to be removed immediately prior to erection. The Train Box Column Cap Plate is a finished bearing surface.  The Interzinc 315 product referenced in the response to RFI T-1230 is specific to the IFRM Coating System. Skanska/TMF proposed an organic zinc rich primer (Interzinc 315B) as the rust inhibiting coating, which would not need to be removed prior to placement of the TG atop the cap plate. The proposed product meets or exceeds the primer specified in the 05 10 00 - 2.2.A spec section as noted in the attached manufacturer's letter. Please confirm this is acceptable.		<b>ANSWER:</b> To clarify, the specifications section 05 10 00 - 3.2.P.2 requires finished bearing surfaces to be protected with a rust-inhibiting coating (which is typically a petroleum/grease or wax based product) which is to be removed immediately prior to erection. T-1252	<p>appear to be concentric to South spandrel beam B65. However, no dimensions have been provided, i.e. radius, offset etc. Furthermore, CD s1-2211 shows that CB16 and CB&amp;B7 do not follow the same radius. There appears to be an offset between the CB16 and CB/B7 at the MFB at GL 6, and the offset dimensions are not shown. If architectural drawings are used to find the missing radius (reference SKA-3017 and SKA-3026), one can find that the future partition walls at the South corridor have R=647' - 7 1/2" on both East and West side of MFB at GL6. This implies that the partition walls in this area would be off center (non-concentric), and the South corridor would taper (or narrow) Down towards East. SCCI. believes that this was not designer's intent.</p> <p>Please provide accurate and consistent dimensions and offsets for the LCC beams and future partition walls.</p>

	<p>Skanska's scope. Please supply the requested dimensions (4 total).                      3a) W/O agrees that the stringer is to be designed by the stair supplier, however, we anticipate that it is to be connected to the W12x14. Typically the stringer is connected to the bent plate that is part of the W12x14. This member would also include web stiffeners. If a typical detail is not available, please provide stiffener details and leave the stringer connection to be designed by the stair supplier.                      3b) See above, the offset dimension for bent plate should work with 3a.                      3c) Please provide location of stringers as requested.</p>

T-1282	BGP - Lower Concourse - Latest Drawing Request	Closed	01	03/25/2014	04/04/2014	03/28/2014

From: Webcor Construction LP Claude Titcher

**REQUEST:**

Per the meeting between TCCO, WOJV, SCCI, and AAI on Monday 3/24/14, it was made clear that AAI believes that all documents have been issued to WOJV in order for construction of the lower concourse deck. WOJV stated that there are currently drawings out to bidders (for TG 07.2 /TG10 MEPS Series) and in Pre-Construction, but that WOJV has not been provided direction by TJPA/TCCO to proceed with construction in the field, nor to utilize the most current drawing sets. Prior to this meeting, WOJV requested that all IFB drawings be issued as an ASI's in order to coordinate with current and continuing construction. ASI's 112 and 113 drawings were issued, however they are not complete per our initial request. AAI has responded to RFI's and submittals referring to sheets that have yet to be issued for construction. This has caused confusion and frustration for all parties. Therefore, in lieu of continuing to request ASI's to address this specific issue at the lower concourse, WOJV/Turner have agreed to utilize the RFI process to construct the lower concourse deck.

For the list of series of drawings below, please note and/or provide the latest drawings or ASI(s) that should be used to construct the lower concourse deck. We understand that there are drawings issued for pre-construction, that will not be issued for construction for multiple bid packages. For those cases, TJPA/TCCO needs to inform and provide WOJV with the set of the most current and coordinated drawings to be used for construction of the lower concourse, including (but not limited to) blockouts, deck penetrations (such as MEPS), beams, dowel/formsaver locations, and electrical conduit locations.

- Architectural Drawings : A1-2200 Series
- Architectural Drawings : A1-2800 Series
- Architectural Drawings : All sheets providing complete wall dimensions whether floor plan/wall plan/ or enlarged details
- Structural Drawings : S1-2200 Series
- Plumbing Drawings : P1-2200 Series
- Electrical Drawings : E1-2200 Series and E1-3200 Series
- TE Drawings : TE-2200 Series

**ANSWER:**

Per the meeting between TCCO, WOJV, SCCI, and AAI on Monday 3/24/14, it was made clear that AAI believes that all documents have been issued to WOJV in order for construction of the lower concourse deck. WOJV stated that there are currently drawings out to bidders (for TG 07.2 /TG10 MEPS Series) and in Pre-Construction, but that WOJV has not been provided direction by TJPA/TCCO to proceed with construction in the field, nor to utilize the most current drawing sets. Prior to this meeting, WOJV requested that all IFB drawings be issued as an ASI's in order to coordinate with current and continuing construction. ASI's 112 and 113 drawings were issued, however they are not complete per our initial request. AAI has responded to RFI's and submittals referring to sheets that have yet to be issued for construction. This has caused confusion and frustration for all parties. Therefore, in lieu of continuing to request ASI's to address this specific issue at the lower concourse, WOJV/Turner have agreed to utilize the RFI process to construct the lower concourse deck.

T-1320	<b>BGP - Dewatering Sleeve at Mat Slab Depression</b>	Open	01	04/14/2014	04/24/2014	04/16/2014
<b>From:</b> Webcor Construction LP                      Claude Titché						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Grace requires that there be a minimum 8" clear horizontal plane to allow for the waterproofing membrane transition. Dewatering sleeve #38 is located on the edge of a sloped mat slab depression. Please confirm it is acceptable to lower the flat the mud slab to provide a sufficient horizontal plane to accommodate waterproofing. Sides of depressions will be sloped at 45deg.			Grace requires that there be a minimum 8" clear horizontal plane to allow for the waterproofing membrane transition. Dewatering sleeve #38 is located on the edge of a sloped mat slab depression. <b>REQUEST:</b>			<b>ANSWER:</b>			
See attached CD RFI # 383 SK1 to SK3 for items 1 to 3: Drawings A1-2502 (SK1), A1-2892 (SK2), A1-2951 (SK4), and 1/A1-2951 (SK5) show a valley. A valley is not shown			See attached CD RFI # 383 SK1 to SK3 for items 1 to 3: Drawings A1-2502 (SK1), A1-2892 (SK2), A1-2951			

Number	Subject	Status	Choice Required	Date Created	Date Required	Date Answered
T-1322.1	<p><b>SSS - West Zone Bus Level and Roof Level Grade Clarifications</b></p> <p>on S1-2502 and S1-2602 and it is not clear what the intent is for the structural framing:</p> <p>1) In order to keep the diagonal brace framing along Grid H in one plane (shown in blue), it is necessary to introduce a valley as indicated by the red line. If not, twisting will be introduced into the framing and connection details 3/S15025 at Grid 1.4 and 1/S1-5018 at Grid 2. Per Note 6 on S1-2602 the beams are canted to match the slope of TPG1 on Grid 2 but the BU-40 on Grid 1 is horizontal. This will result in the beams having to twist. To avoid this a valley as shown on the architectural drawings is required. Please confirm a valley as indicated by the red line is required or clarify/supply the top of steel elevations between grids 1-2.</p> <p>2) If a valley is introduced, all beams crossing the red valley line will need to be broken-back/bent beams. Please supply a detail showing the splice at the bend lines.</p> <p>3) If the valley is to occur, please clarify the location of the valley as drawings A1-2502 (SK1) and A1-2892 (SK2) show conflicting information. The same condition shown here also occurs between Grids 1-2/B-D, 32.4-33.5/B-D &amp; 32.433.5/F-H. The same condition except opposite shown here occurs between Grids 1-2/F-H on the roof park level.</p> <p>4) It is not clear on S1-2606/S1-2607 where the east-west slopes start east of Grid 31.7. Please clarify the framing.</p>	Closed	CR	05/16/2014	05/26/2014	06/02/2014
	<p>From: Webcor Construction LP Gregory Kemerer</p>					
	<p><b>REQUEST:</b></p> <p>See attached CD RFI # 383.1 SK1 to SK6 for items 1 to 10:</p> <p>The noted (2) skewed W40x277 form part of the bracing system and must remain in the same as the other braces.</p> <p>This means that the noted W40x149 &amp; W36x231 will not align with the top of the W40x297 on Grid 1.</p> <p>1) Please advise how to make the moment weld for the for the W40x149 to the W40x297 with the flanges not aligned.</p>

	<p><b>REQUEST:</b></p> <p>Skanska has incorporated the response to RFI T-1324 into the drawings and made the necessary adjustments, while maintaining the required stiffness factor, at gridlines 28-29/D.4, 29-30/D4 and 30-31/D.4. These adjustments have been submitted under submittal package TG0701-415.4.</p> <p>However, after discussions with Star Seismic, at GL 4-5/F the stiffness factor plays a limiting role into modifying the length of the brace. Please see the attached stiffness and over strength analysis, provided by Star Seismic, and confirm that the brace lengths may stay the same as previously approved in TG0701-415.2.</p>

T-1327	<b>BGP - Lower Concourse Beam Locations</b>	Closed	01	04/16/2014	04/26/2014	04/19/2014
	From: Webcor Construction LP Claude Titcher					
	<b>REQUEST:</b>					
	Please confirm the bellow structural beam updates should be incorporated into the TG06 Scope of work.					
	1. CB24 is required between Grids 4 and 5. Beam centerline to be located 12'-3" south of Grid C.3.					
	2. B1 shown west of Grid 5 at approximately Grid B.6 is not required and can be deleted from scope.					
	3. The pair of B4's shown east of Grid 5 near Grid B are not required (opening has been removed). Beams can be deleted from scope.					
	4. B24 is required between Grids 6 and 7. B23 is required between Grids 7 and 8. South face of both beams shall be located approximately 27" north of Grid E.6 and align with the northern most face of trestle pile blockouts in order that they not be interrupted by the blockouts. The coordinated location of the beam with blockouts will be submitted on the comprehensive layout drawings. RFI T-1040 response is superseded as is RFI T-876. Section 2/S1-3501 does not apply. SKS-0343(attached) will detail the section across drop.					
	5. B25 is required between Grids 7 and 8 near Grid B.6. Beam will align with B29 to the west.					
	6. CB15 is required between Grids 10.1 and 11 near Grid C.7. Beam centerline to be located 10'-4 north of Grid D.					
	7. Beam between Grids 13 and 14 near Grid B.5 will frame escalator opening and be marked B12. Beam will be located at edge of opening shown on A1-2844. To minimize potential congestion at overlapping beams, beam between Grids 12 and 13 near Grid B.6 marked B9 will be located such that the north face of beam aligns with the south face of adjacent beam B12.					
	8. B15 is required between Grids 14 and 15, 5'-10" south of Grid B.					
	9. B53 is required between Grids 20.1 and 21 near Grid C.4 at the north face of the escalator pit. A B53 is also required at the south face of escalator pit. B4A is required at the west face of escalator pit between B53's. Companion B54's between Grids 21 and 22 will align with B53's. Beams will be located per pit dimensions given on A1-2845.					
	10. CB8 is required between Grids 33.2 and 34. Beam centerline will be located 6'-4" south of Grid G.					
	Beam locations will be submitted for review with the comprehensive layouts.

T-1331	<b>SSS - Missing Stair ST301 Information</b>	Closed	CR	04/17/2014	04/27/2014	05/05/2014
<b>From:</b> Webcor Construction LP                      Gregory Kemerer						
<b>REQUEST:</b> See attached CD RFI # 389 SK1 to SK7 for items 1 to 12: 1) The noted W16x26 beams are centered below the concrete wall on S1-2303. Confirm the lower beam may be moved below the stair post or supply an alternate solution. 2) The noted W16x26 beam is centered below the concrete wall on S1-2303. Confirm it may be moved below the stair post or supply an alternate solution. 3) Supply all clouded dimensions on SK2 thru SK7. 4) Confirm equal spacing. 5) It appears the noted stair stringer connects to the HSS post. Please supply the missing connection detail. 6) The plan shows a moment connection but detail 3/S1-5012 does not. Please clarify the intent for the beam to post connections at (8) locations. 7) 9/S1-7601 is not the correct detail because it shows an HSS beam and we have a W21x50 at this location. Please clarify and note that detail 3/S1-7601 will not work as the edge of slab is 7" from beam center. 8) This dimension is 7" per S1-2403. Confirm 7" is correct. 9) Confirm the "CB" notation should be removed. 10) The minimum distance between the center of post and the W10x22 must be 1'-1 3/4 in order to connect per 3/S1-5012 and 1/S1-5010. Supply alternate connection details if the dimension is less. This is a typical occurrence on all stairs. 11) The red dimensions match the dimensions shown in detail 3/S1-7006 (SK3). Please clarify the discrepancy in dimensions. 12) 9/S1-7601 is not the correct detail because it shows an HSS beam and we have a W21x50 at this location. Please clarify and note that detail 3/S1-7601 will not work as the edge of slab is 6" from beam center.		<b>ANSWER:</b> See attached CD RFI # 389 SK1 to SK7 for items 1 to 12: 1) The noted W16x26 beams are centered below the concrete wall on S1-2303. T-1336	<b>SSS - API 5L X65 Pipe to A216 WCC Casting (Field Weld ) PQR</b>	Closed	CR	04/17/2014	04/27/2014	04/29/2014
<b>From:</b> Webcor Construction LP Gregory Kemerer						
<b>REQUEST:</b> Skanska is currently procuring weld test plates for qualifying field welds to API-5L Grade X65 pipe. For this, we propose to use API 2W plate. Whereas API 5L is strictly a pipe specification, API 2W is a plate specification but is commonly rolled and welded to create API 5L pipe. Below is a direct comparison between API 5L Gr. X65 allowable chemical and mechanical properties with our proposed API-2W plate material. Values for the plate are taken directly from the MTR for the plate we propose to use (attached and highlighted). All values for the API 2W plate we propose to use meet the requirements of the API 5L Grade X65 specification. Please confirm it is acceptable to use the API 2W plate for our PQRs.			<b>ANSWER:</b> Skanska is currently procuring weld test plates for qualifying field welds to API-5L Grade X65 pipe. T-1339.2	<b>SSS - Deck Support Steel at Step in Slab</b>	Closed	CR	06/18/2014	06/28/2014	07/09/2014
<p><b>From:</b> Webcor Construction LP Gregory Kemerer</p> <p><b>REQUEST:</b></p> <p>The response to RFI T-1399.1 indicated the zee closure was incorrectly shown on SK-3 and shall be supported on the lower beam, not on top of the deck. We agree the closure would be best supported on the lower beam, however the closure was placed on top of the deck so that the lower deck could bear 3" on the beam as is required for a type 3 deck as per 2/S1-5000.</p> <p>SSK-0355 revises the closure so that the bottom leg is underneath the lower deck and the top leg is above the upper deck. This creates several problems for installation. The most significant being that the closure now needs to be installed before the deck. Typically closures are installed after the deck so that the deck can be used as a working platform. SSK-0355 would require the installation of the closure on open iron, which while possible is not a safe working practice.</p> <p>Option 1: As a proposed solution to the issues indicated above, we propose to increase the beam size at the step from a W12x14 to W12x26 which has a 6-1/2" wide flange. We would also revise the zee shaped closure to a cee shaped closure with the top leg placed underneath the upper deck (see detail A SK-1). Also at locations where a WT will be added, a W12x14 will only be left with about 1-3/4" of exposed beam flange for bearing, instead of the required 3", increasing this to W14x26 will provide the required bearing (see detail B SK-1).</p> <p>Option 2: As an alternative, at locations where the top deck spans less than 3' the top deck load will be primarily supported by the upper WF beam. As detailed in SK-2 the zee plate will only act as a closure with minimal deck support and can be installed after the deck if allowed to bear on top of the lower deck. Note: this alternative does not provide a solution of the 1-3/4" bearing issue on detail B SK-1.</p> <p>Please confirm if option 1 or 2 is acceptable.</p>		<p><b>ANSWER:</b></p> <p>The response to RFI T-1399.1 indicated the zee closure was incorrectly shown on SK-3 and shall be supported on the lower beam, not on top of the deck. <b>REQUEST:</b> Structural detail 10/S1-4202 shows a yellow paint marking to be applied to mask the protected zone. The attached products, J.P. Nissan Co & Brite Mark, are representative of what Skanska feels should be applied to satisfy this requirement.  Skanska's experience with these paint coatings or marking systems is such that it retains its color and adherence to the structural steel well beyond the erection activity and is not detrimental to fireproofing systems. Please confirm that the aforementioned products are acceptable to be applied as the yellow paint marking.  *NOTE - the attached photo does not have the signage displayed; final product will include the signage as shown on 10/S1-4202. In addition, Skanska has spoken to technical representatives from both Carboline (Pyrocrete-40) & Isolatek (Cafco M-II) and they do not foresee any compatibility issues (See SK1 & SK2).		<b>ANSWER:</b> Structural detail 10/S1-4202 shows a yellow paint marking to be applied to mask the protected zone. T-1362	BGP - Lower Concourse Confirmation	Closed	01	05/02/2014	05/12/2014	05/13/2014

From: Webcor Construction LP                      Claude Titcher

**REQUEST:**

See attached submittal sheet D2.28 and sheet E1-2204. Response comment to Submittal Package TG0600-121.1 on sheet D2.28 between gridlines 12-13 B-C, calls out "conduits are now embedded in the lower concourse slab". Per the TG0600-121.1 submittal review comment meeting held on 4/30/14, please confirm that embedded conduits FE045,FE051,FE052,FE058 incorporated on sheet E1-2204 dated 03/31/14 will continue to be surface mounted and blockout will be left in place for penetrating the slab.

Please confirm attached sketch SKA-3148 showing the coupler setting out dimensions for the future corridor wall at B1 level, GL 10, B-C as reviewed with AAI in our slab edge workshop held April 30, 2014

Please confirm rebar for Lower Concourse Floor drains marked "Future" are to be trimmed as detailed on 1/S1-3501 but not blocked out.

For door openings not dimensioned on architectural slab, floor or wall plans, please confirm it is acceptable to size door rough openings in the lower concourse partition walls to be 4.5" larger than doors scheduled on sheets A1-9700, A1-9701, A1-9702. If not please provide a door jamb detail for these openings.

Please confirm that Lower Concourse telecom penetrations shown on slab edge plans A1-2841 through A1-2851 to be 4" x 90 GRS elbows with a factory 30" radius as shown on 6/TE1-8014.

**ANSWER:**

following table, please confirm that the direction provided in the aforementioned RFI response is to install framing channels per 12/S1-5003. In some cases, the slab openings are only between 8"-12" wide. Otherwise, please indicate that it is acceptable to provide rebar as shown in SKS-0354 per RFI T1366 instead.

<b>T-1367</b>	<b>SSS - IFRM Prime Coat Requirement</b>	<b>Closed</b>	<b>CR</b>	<b>05/06/2014</b>	<b>05/16/2014</b>	<b>05/12/2014</b>
<b>From:</b> Webcor Construction LP Gregory Kemerer						

**REQUEST:**

Specification section 07 81 23 (Intumescent Fire Resistive Materials), issued with Field Order 00027, lists three acceptable basis of design manufacturers for IFRM systems. Additionally, specification section 07 81 23, 1.7.C.2 states that the intumescent fire protection system is to be from a single source, indicating that the prime coat Skanska shop applies must be from the same manufacturer as the subsequent coats that are field applied.

Per the monthly schedule delivered to TJPA, the IFRM contractor is not to be selected until 10/16/14.

Skanska requires direction as to which of the three approved basis of design manufacturers will be used on subsequent coats in order to obtain a recommendation from that intumescent coating manufacturer as to the appropriate primer to be utilized.

Alternatively, priming of IFRM steel can be removed from Skanska's scope and added to the scope of the IFRM contractor. This will result in a cost increase.

Please provide direction.

**ANSWER:**

Specification section 07 81 23 (Intumescent Fire Resistive Materials), issued with Field Order 00027, lists three acceptable basis of design manufacturers for IFRM systems. Additionally, specification section 07 81 23, 1.7.C.2 states that the intumescent fire protection system is to be from a single source, indicating that the prime coat Skanska shop applies must be from the same manufacturer as the subsequent coats that are field applied.

T-1369	<p><b>SSS - Weld Electrode Subcomponents</b></p> <p>From: Webcor Construction LP                      Gregory Kemerer</p> <p><b>REQUEST:</b></p> <p>During a Quality Control review, performed by Thompson Metal Fab for compliance with the "Buy America" clause of the Contract, a question was noted regarding the proposed use of ESAB Spoolarc F9A4-ENi4 Submerged Arc Welding (SAW) Electrode for the welding of the HPS70W steel in the Train Box Columns. The attached letter from ESAB, dated April 22, 2014, describes the process that ESAB employs in the manufacture of the referenced product. It notes the fact that the tensile and yield properties of the specific filler metal alloy required to meet the Contract specifications of 90XX are not offered or produced by any mills within the United States. The alloy is provided as a "Greenrod" and is acquired outside of the States. The cold drawing, proprietary processing and packaging of the product is done, by ESAB, wholly within the United States and uses, other than the alloy itself, domestically produced and acquired materials. The Certificate of Conformance from ESAB states that the product is manufactured in the United States (attached).</p> <p>An inquiry was made, by Skanska, to Lincoln Electric regarding a similar product classification that met the Contract requirement (F9A4-ENi5). Lincoln Electric advised Skanska that they also receive "Greenrod" and strip from sources outside of the United States for this product.</p> <p>A subsequent Quality Control review by The Herrick Corporation revealed a similar condition for the use of the Lincoln Electric product Outershield XLH-70, AWS</p>	Closed	CR	05/07/2014	05/17/2014	05/21/2014
	<p>Due to the construction sequence, where the moment frame beams intersect a column support, the single-piece moment frame beam perimeter stirrups cannot be installed as shown in 2/S1-3600. Please confirm that it is acceptable to use an alternate 3-piece perimeter stirrup configuration where the moment frame beams intersect a column support. See the attached sketch for details</p>					
	<p>Due to the construction sequence, where the moment frame beams intersect a column support, the single-piece moment frame beam perimeter stirrups cannot be installed as shown in 2/S1-3600. ---------------	----------------	---------------	------------------------	---------------------	----------------------	----------------------

classification E70T-1C-H8, FCAW process weld electrode. Once again, Lincoln has indicated that "Greenrod" for weld electrode products may not be domestically available and may be sourced from throughout the world. However, the manufacturing process, like ESAB, is done wholly within the United States. The Certificate of Conformance from Lincoln also states that the product is manufactured in the United States (see attached certificate and letter dated 04/28/2014).

The CFR Part 661.5 of the Clause gives the following definitions:

c) The steel and iron requirements apply to all construction materials made primarily of steel or iron and used in infrastructure projects such as transit or maintenance facilities, rail lines and bridges. These items include, but are not limited to, structural steel or iron beams and columns, running rail and contact rail. These requirements do not apply to steel or iron used as components or subcomponents of other manufactured products or rolling stock, or to bimetallic power rail incorporating steel or iron components.

d) For a manufactured product to be considered produced in the United States:

- (1) All of the manufacturing process for the product must take place in the United States; and
- (2) All of the components of the product must be of U.S. origin. A component is considered of U.S. origin if it is manufactured in the United States, regardless of the origin of its subcomponents.

Skanska has interpreted this clause to indicate that both ESAB and Lincoln supply welding electrodes for this Project that are wholly manufactured within the United States and that they satisfy the requirement of the "Buy America" clause.

Please confirm that the use of manufactured weld electrodes on the Project for which the manufacturer is providing a Certificate of Conformance indicating that the entire manufacturing process is performed in the United States, but may contain alloy material produced elsewhere, meet the intent of the Contract "Buy America" clause.

Corporation revealed a similar condition for the use of the Lincoln Electric product Outershield XLH-70, AWS classification E70T-1C-H8, FCAW process weld electrode. Once again, Lincoln has indicated that "Greenrod" for weld electrode products may not be domestically available and may be sourced from throughout the world. However, the manufacturing process, like ESAB, is done wholly within the United States. The Certificate of Conformance from Lincoln also states that the product is manufactured in the United States (see attached certificate and letter dated 04/28/2014).

The CFR Part 661.5 of the Clause gives the following definitions:

The pile located within this specific pit (see marked up S1-2026 is a 36" pile as detailed. Please provide new dimensions for the pit incorporating the 36" pile.					<b>ANSWER:</b>  Please reference attached contract drawings sheet S1-2026.  The mat slab pit located at Gridline 27 and E has a width of 2'-6". The pile located within this specific pit (see marked up S1-2026 is a 36" pile as detailed. Please provide new dimensions for the pit incorporating the 36" pile.
T-1379.1	<b>BGP - Pit and Pile Discrepancy at GL 27-E</b>  From: Webcor Construction LP                      Claude Titcher	Void	01	05/21/2014	05/31/2014	
	<b>REQUEST:</b>  SCCI is in receipt of RFI T-1379. SCCI disagrees with the response provided in the aforementioned RFI.  S1-2026 illustrates a 30" wide pile in a 30" wide pit at gridline 27/E. However, Submittal #TG0300- 284.4, which was reviewed and approved by the design team, shows the previously mentioned trestle pile as a 36" wide pile. It has also been confirmed in the field this pile is 36" wide pile.  Please provide applicable details (similar to D4 on SI-3009 & D2 on SI-3007) for permanent elements in the mat slab construction, including but not limited to galvanized sleeves and structural steel reinforcing, for the pit at GL 27/E which contains a 36" wide pile, not 30" as shown on the design drawing S 1-2026.					<b>ANSWER:</b>  SCCI is in receipt of RFI T-1379. T-1380.1	SSS - Field Weld Access at Deck Support Angles	Closed	CR	06/10/2014	06/20/2014	06/24/2014
<p><b>From:</b> Webcor Construction LP Gregory Kemerer</p> <p><b>REQUEST:</b></p> <p>After reviewing the response to T-1380 there are several items of concern:</p> <p>A.                      Access from the underside will not always be possible. At certain locations the perimeter wall bracing and rebracing that will remain in place during the deck installation on operation at Ground Level is in close proximity to the transfer girder and will restrict the mobility of a scissor or lift required for a welder to reach the work point from the lower concourse slab, approximately 30' below.</p> <p>B.                      To provide an effective weld from the underside, the deck lower flute is required to overhang the toe of the angle. In order to achieve this, shifting the deck may result in the loss of bearing at other locations. If the deck can't be shifted a 12ga minimum flashing plate will be required, see details 3 &amp; 4 on SK1.</p> <p>C.                      Effective concrete placement will be an issue if adequate clearance from the top of deck flute to bottom of girder flange is not established.</p> <p>To move forward we propose the following:</p> <p>1.                      Where <math>d &lt; 7"</math> we will use stock angle sizes up to 8x4x1/2" (LLV) welded to the toe of the flange, see detail 1.</p> <p>2.                      Where <math>d &gt; 7"</math> but <math>&lt; 15"</math> we will use an overhead 1/8" fillet from the underside as per the response to T-1380 (where accessible), see detail 2. This will allow a minimum of 4" clearance from top of deck flute to underside of flange for placement of concrete.</p> <p>Where the bottom flute does not overhang the toe of the angle and shifting the deck creates a loss of bearing at another location, a 12ga min flashing will be welded to the angle and deck bottom flute, see detail 3 &amp; 4.</p> <p>Please confirm items 1 &amp; 2 are acceptable.</p>		<p><b>ANSWER:</b></p> <p>After reviewing the response to T-1380 there are several items of concern:</p> <p>A. See attached CD RFI # 427 SK1: Confirm the noted dimensions are correct for PE403 & PE404 at 2nd level and Bus deck level.		See attached CD RFI # 427 SK1: Confirm the noted dimensions are correct for PE403 & PE404 at 2nd level and Bus deck level.				
T-1412	<b>SSS - Pipe Wall Thickness Tolerance</b>	Closed	CR	05/23/2014	06/02/2014	05/28/2014
<b>From:</b> Webcor Construction LP                      Gregory Kemerer						
<b>REQUEST:</b>		<b>ANSWER:</b>				
Per conversation during "Transbay structural issues review" meeting on 5-20-2014, the wall thickness tolerance of spec 05 15 22 was discussed. Per design team, this tolerance is intended to apply to the ends where the pipe would be welded, and a less restrictive tolerance would be acceptable throughout the length of the pipe, provided that the wall thickness is greater than nominal, not less.  The manufacturer of the spun-cast pipe has produced all product to date with dimensions that meet the 05 15 22 spec for 12" at each end. Throughout the remainder of the pipe, the wall thickness is greater than nominal (typically by about 0.090"), and in all cases falling within the tolerance of API-5L.  See attached depiction of the pipe tolerances.  Please confirm that wall thickness tolerance noted in spec 05 15 22 is intended to apply to the ends only, and that the wall thickness throughout the remainder of the pipe may be greater by as much as is allowed by API5L, but shall be no less than the nominal wall thickness. <b>REQUEST:</b> See attached CD RFI # 428 SK1:  Supply a connection detail for the flat MC10 to HSS posts.		<b>ANSWER:</b> See attached CD RFI # 428 SK1:  Supply a connection detail for the flat MC10 to HSS posts.				
T-1419	<b>SSS - Bus Deck Cast Node Dimension Confirmation</b>	Closed	CR	05/23/2014	06/02/2014	06/04/2014
<b>From:</b> Webcor Construction LP                      Gregory Kemerer						
<b>REQUEST:</b> The structural issues meeting on 5/15/2014 reviewed potential changes to the cast node machine shop drawings. Due to the sand inclusions in the 35A and 35B cast nodes, further machining of the pad surfaces is required. This will result in a dimension of 16" from the W0 work point in lieu of the initial dimension of 17" (see attached sketch). Cast Connex has proceeded to make the 16" revision to the cast node machine shop drawings.  Please confirm this is acceptable, and update the structural drawings to match.		<b>ANSWER:</b> The structural issues meeting on 5/15/2014 reviewed potential changes to the cast node machine shop drawings. T-1443	Re-Install Dewatering Well Pump #34 per Field Coordination	Closed	CR	06/06/2014	06/16/2014	06/12/2014
From: Webcor Construction LP Jackson Tukuafu						

**REQUEST:**

On Thursday, May 22, 2014, there was slurry intrusion through dewatering well #34, from the Transbay Tower Project. After the Transbay Tower Project placed a lean mix to plug the slurry intrusion, only water has come out of the well at a pressurized rate, not yet experienced on this project prior to the event.

The water in this well has been confirmed acceptable by the SFPUC to discharge into the City's combined sewer system, on 6/5/14. A plug has been placed in this well in order to keep the jobsite from flooding due to the volume of water pushing through the well. We want to replace the dewatering pump in this well, but are concerned that we may end up dewatering the Transbay Tower Project and possibly draw the water table on their project outside of the requirements of our specification.

- 1) Please confirm that it is acceptable to re-install the dewatering pump in well #34.
- 2) Please let us know if there are certain steps or durations that you want us to pump in an effort for ARUP to monitor the water table on Transbay Tower's Project and/or other adjacent properties.
- 3) Please confirm that in performing this activity, we are not held to the requirement of Spec Section 31 56 13-13.F.1. in regards to "The performance of the shoring wall shall be such that the groundwater levels around the excavation are maintained within 3 feet from the pre-excavation levels" since there is the potential of us drawing their groundwater through our well.

**ANSWER:**

<b>From:</b> Webcor Construction LP Gregory Kemerer						
<b>REQUEST:</b>			<b>ANSWER:</b>			
<p>As a follow-up to the review comment on drawing 1202 within Submittal Package TG0701-73.1, the elevation of the grout/vent holes on the pipe basket columns is called out to be 6'-0" above finished floor per S1-4003 (SK1). Skanska's modeler has taken the finished floor to be the top of steel dimension provided in the structural drawings (EL 56'-4") plus the slab thickness provided on S1-5000 (SK2). Based on this, the model currently reflects the grout/vent holes at EL 63'-6", 6'-0" above the structural slab high point. (TOS EL 56'-4" + 1'-2" [S8 slab] + 6'-0" = EL 63'-6") (SK3).</p> <p>Please confirm a grout/vent hole elevation of 63'-6" at the Bust Deck Level is acceptable. Note that shop drawings packages CS1 through CS7 have been released for fabrication based on the current model.</p>			<p>As a follow-up to the review comment on drawing 1202 within Submittal Package TG0701-73.1, the elevation of the grout/vent holes on the pipe basket columns is called out to be 6'-0" above finished floor per S1-4003 (SK1). <b>T-1473</b>	<b>BGP - Lower Concourse Service Corridor Dimensions on West Wall</b>	<b>Closed</b>	<b>01</b>	<b>06/25/2014</b>	<b>07/05/2014</b>	<b>07/02/2014</b>
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b>			<b>ANSWER:</b>			
<p>Please reference RFI T-0576 regarding the offset of the West Foundation Walls to account for the CDSM Encroachment. The west wall (GL 1) was offset 3 1/8" to the east while the southwest wall (GL XI-1) was offset 1 7/8" to the northeast. Currently there are no dimensions explicitly shown in the contract drawings for the width of the service corridor that runs along the very western edge of the Lower Concourse in Area 1 and 3. However there is a dimension shown on A1-3006 &amp; A1-7004 that shows the eastern face of the service corridor at 5' to the west of GL 1.4 which translates into a service corridor width of 9' -8 7/8". Is it the designers intent to offset the service corridor walls similar to the foundation walls to maintain the 10' corridor width, or is it the designers intent to shrink the width of the service corridor and keep the interior walls in place? Please provide dimensions for the service corridor width.</p>			<p>Please reference RFI T-0576 regarding the offset of the West Foundation Walls to account for the CDSM Encroachment. <b>REQUEST:</b>			<b>ANSWER:</b>			
<p>With the response from RFI T-1473 and the contract drawings, SCCI has enough dimensions to model the service corridor running north-south in Area 3. However there is not enough information to model the alignment of the service corridor running northwest-southeast. Please provide a work point with dimensions somewhere along the east face of the service corridor (preferably at the southernmost point of the service corridor at Shear Wall 390A) or provide an angle at which the service corridor changes direction above Gridline K.</p>			<p>With the response from RFI T-1473 and the contract drawings, SCCI has enough dimensions to model the service corridor running north-south in Area 3. <b>REQUEST:</b>		<b>ANSWER:</b>				
<p>Shimmick is planning to use a similar form system for the fourth lift of the foundation wall to that used on the second wall lift. However, the second wall lift form system is a cantilever system and is supported by 1 row of anchors, excerpting significant force on the wall lift below. Shimmick proposes to add a tie to the top of the forms and connect to the CDSM soldier piles in addition to using the third lift anchor to provide better support. The soldier piles extend above the ground level and this added tie would not affect the waterproofing (installed by others). See the attached marked up drawings for reference</p> <p>Please confirm it is acceptable for the fourth lift form system to tie to the CDSM soldier piles.</p>		<p>Shimmick is planning to use a similar form system for the fourth lift of the foundation wall to that used on the second wall lift. See attached CD RFI # 470 SK1 to SK3: CD RFI # 257 was issued to confirm that detail 8/S1-5015 would be referenced for all information not shown in detail 4/S1-8003 and the response in RFI SK 330 referred us to revised ASI 109 drawing S1-8003. The revised detail added (1) bolt at the bottom end of the brace connection but did not give any additional information for the connection at the top end of the brace to the beam. The connections for the braces per detail 4/S1-8003 were therefore applied per the information in detail 8/S1-5015 and RFI's T-0919, T-0919.1 & T-0919.2 (SK 173, 173.1 & 173.2, CD 127, 127.1 & 127.2). Please confirm the connection as submitted and shown on SK3 is typically acceptable. **From:** Webcor Construction LP                      Claude Titche

**REQUEST:**

Per the breakout meeting held after the TTC progress meeting on 7/9 @10:30, and email correspondence between Adib Sassine and Walter Melville (Attached). Please confirm the following items regarding the grounding mesh in electrical room B1441 at Grid Lines 15/G.5.

- Due to constructability issues please confirm that the attached PUC approved alternate detail is acceptable and will be incorporated into lower concourse electrical room B1441 at GL15/G.5
- The attached alternate detail incorporates a 4/0 field fabricated grid in lieu of the original #6 mesh and 4/0 ground ring. Please confirm that the alternate detail 4/0 grid will suffice to also act as the ground ring, and all pigtailed can be attached to the grid.
- Please confirm the grounding grid spacing is 4' on center with connections to mat rebar at 8' on center.
- Please confirm that cadweld or use listed irreversible compression connections to cross-grid and ground mat at 8' on center minimum is acceptable.
- Please confirm ground potential rise study at each switch gear room is not required.
- Please confirm which specification governs, IEEE142 per Transbay Transit Center contract documents or per PUC referenced specification IEEE80, which will require "Ground Grid Test". (See attached email).
- Please confirm the layout of grid does not extend past the walls in South Electrical room B1441.
- Please confirm that exothermic or irreversible compression connections listed for concrete encasement are required for all pigtailed main grid connections, (outside edge to cross members, corners, and main cross connectors), and connections to building ground wires (shown with "G" on plan).
- Please confirm that SFPUC and DBI will be the only entities inspecting the grounding grid.

T-1532	<b>SSS - Deck Support Angle at Column Base Plate</b> From: Webcor Construction LP Gregory Kemerer	Closed	CR	07/19/2014	07/29/2014	07/24/2014
	<b>REQUEST:</b> Per detail 1/S1-5052 when the column base plate and the transfer girder flange is the same width, there is no deck support for the length of the column base plate when the deck sits at the same level as the girder.  Please confirm it is acceptable to provide a gage angle to support the deck around the column base plate. The gauge angle will be welded after the column to girder connection is made to avoid the angle and weld interfering with the connection. See attached SK1 & 2 for clarification.					<b>ANSWER:</b> Per detail 1/S1-5052 when the column base plate and the transfer girder flange is the same width, there is no deck support for the length of the column base plate when the deck sits at the same level as the girder.  Please confirm it is acceptable to provide a gage angle to support the deck around the column base plate. The gauge angle will be welded after the column to girder connection is made to avoid the angle and weld interfering with the connection. See attached SK1 & 2 for clarification.
T-1532.1	<b>SSS - Deck Support Angle at Column Base Plate</b> From: Webcor Construction LP Gregory Kemerer	Closed	CR	07/31/2014	08/10/2014	08/18/2014
	<b>REQUEST:</b> This is a follow-up to the response of RFI T-1532.  As per the response, restricting welding to only the girder flange creates several issues: 1. See detail 17 on SK1 - an additional 4" would be required on the vertical leg of the angle to allow welding to the girder flange. This creates a 12" vertical leg, welded at the bottom toe to the girder and supporting a 13" concrete slab. Our decker does not believe this is adequate support. This occurs at 9 locations.  2. See detail 5 & 17 on SK1 - overhead welding will be required from the underside to weld to the girder flange. Detail 5 occurs at 67 locations and 17 occurs at 9 locations. Our decker will incur additional labor and equipment costs for this work.  If welding to the base plate is prohibited, an alternative solution which will have lower additional cost impact is to use Hilti pins to attach the gauge angle to base plate or girder flange. See attached product data and application details. See attached SK2 for clarification.  Please confirm if welding to the column base plate is prohibited, Skanska can use Hilti pins as per SK2.					<b>ANSWER:</b> This is a follow-up to the response of RFI T-1532. T-1532.2	<b>SSS - Deck Support Angle at Column Base Plate</b>	Closed	CR	08/25/2014	09/04/2014	09/15/2014
<b>From:</b> Webcor Construction LP Gregory Kemerer						
<b>REQUEST:</b> This is a follow-up to the response of RFI T-1532.1  As per the response to the above RFI, direction to drawing A1-9317 (which was provided as part of FO 27) indicates a deck closure/support angle separated 1" from the column base plate, with no structural information provided. As a detail for deck support around the column base plate is not provided in the structural drawings and Skanska's proposals have been rejected in previous RFI responses, this remains an open issue. We require a detail in order to proceed with the detailing of shop drawings. Please note this condition occurs at CS1 and throughout the central zone and is currently holding up the resubmittal of the metal deck shop drawings for the central zone.  Additionally, the RFI response identified a "no weld zone" that was not shown on the design documents. As this was not called out on the contract drawings, this zone is not being identified with paint strips as per the protected zone requirements. This may lead to trade workers accidentally welding in the field. Please provide direction for the identification requirements for the base plate "no weld zone".			<b>ANSWER:</b> This is a follow-up to the response of RFI T-1532.1  As per the response to the above RFI, direction to drawing A1-9317 (which was provided as part of FO 27) indicates a deck closure/support angle separated 1" from the column base plate, with no structural information provided. T-1536	<b>SCS - Concrete Cover &amp; Tolerance on Foundation Wall Terminator Rebar</b>	Closed	01	07/24/2014	08/03/2014	08/04/2014
<b>From:</b> Webcor Construction LP                      Claude Titche						
<b>REQUEST:</b> Drawing SI-3201 and other similar foundation wall sections call out a 2" concrete cover on the terminators of the foundation wall vertical rebar. These vertical bars have no adjustability because one end is a terminator and the other end is a male coupler end. The elevation of the top of terminator will be dependent on the coupler elevation above the Lift 3 Foundation Wall. The ground floor slab is 10" thick and sloped along the top of foundation wall.  To allow for maximum deviation to accommodate for the slope of the slab, tolerances in rebar fabrication and location from the previous wall lifts and the final wall lift: 1. Shimmick proposes to change the concrete cover from 2" to 5" and increase the tolerance to 2.5". Please confirm this is acceptable. 2. If the proposal is not acceptable, please provide a concrete cover and tolerance that is acceptable.		<b>ANSWER:</b> Drawing SI-3201 and other similar foundation wall sections call out a 2" concrete cover on the terminators of the foundation wall vertical rebar. T-1547	<b>BGP - Seismic Joint Deformed Bar Anchor Variance</b>	Closed	01	07/25/2014	08/04/2014	07/25/2014
<b>From:</b> Webcor Construction LP Claude Titcher						
<b>REQUEST:</b> Please reference Detail 2, Sheet S 1-3205.  Please clarify the following deformed bar questions:  1. 1" diameter deformed bar is a non-standard diameter for deformed bar. This will require the bar to be specially manufactured which could take up to 4 weeks to procure. 3/4" diameter deformed bar is the largest standard size readily available. Is it acceptable to use 3/4" diameter in lieu of 1" diameter deformed bar?  2. The detail depicts a head on the end of the deformed bar. Headed deformed bar is also non-standard (see attached Nelson Stud Deformed Bar Product Data) and currently found to be unattainable. Is it the intent of the engineer to include a headed deformed bar anchor? Is it acceptable to use a standard A 108 bar per ASTM A496 as detailed in the attached product data?			<b>ANSWER:</b> Please reference Detail 2, Sheet S 1-3205. T-1548	<b>BGP - Protection Slab at Seismic Joint</b>  From: Webcor Construction LP                      Claude Titche	Closed	01	07/25/2014	08/04/2014	07/29/2014
	<b>REQUEST:</b>  Please reference Detail 3 of A1-8881, S1-2027, and the attached Drawings.  Please confirm the protection slab is to stop 5" east of GL 35 as scaled on attached Detail 3 of Sheet AI - 8881.  Please confirm it is acceptable to eliminate the 12" section of protection slab against the east CDSM wall.  Please reference attached drawing S1-2027. If the protection slab is required to end 5" east of GL 35, the slab will be poured halfway up the slope on the center and north pits as depicted in S1-2027. Is it the engineer's intent to end the slab halfway up the pit? If not, please provide details of protection slab location at the seismic joint at the center and north pits.					
	<b>ANSWER:</b>  Please reference Detail 3 of A1-8881, S1-2027, and the attached Drawings. <b>T-1549</b>	<b>BGP - 3rd Wall Lift Vertical Unistrut Spacing Tolerance</b>	<b>Closed</b>	<b>01</b>	<b>07/25/2014</b>	<b>08/04/2014</b>	<b>07/29/2014</b>
<b>From:</b> Webcor Construction LP                      Claude Titché						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Vertical Unistrut embedded in the 3rd wall lift is spaced at 10' O.C. per plan drawing AI -6231. Due to locations of wall bulkheads, form work panel ribs, and other embedded items, the contractor requests a tolerance of plus/minus 4" off the 10' O.C. spacing. Please confirm if this is acceptable and if not, please provide an acceptable lateral tolerance.			Vertical Unistrut embedded in the 3rd wall lift is spaced at 10' O.C. per plan drawing AI -6231. <b>REQUEST:</b>			<b>ANSWER:</b>			
<p>There is a 3 7/16" gap between the flanges of the TPG1 and W40x264. The north end of the W40x264 is connected to the W40x297 per 1/S1-5010 and the south end is connected to the BU-40x28 per 1/S1-8001 including a field moment weld at the top and bottom flange of the W40x264. Please review and supply any changes that are required for erection access.</p> <p>Alternatively, please confirm that it is acceptable to move CP1D (shown on S1-4002) 6-inches away from TPG01.</p>			<p>There is a 3 7/16" gap between the flanges of the TPG1 and W40x264. T-1568.2	BGP - Pile Location Discrepancy at GL E/34.5 in Zone 4	Closed	CR	09/15/2014	09/25/2014	09/25/2014
<p><b>From:</b> Webcor Construction LP                      Claude Titcher</p> <p><b>REQUEST:</b></p> <p>SCCI is in receipt of RFI response T-1568.1. Please see attached sketch for reference.</p> <p>SCCI offers this response for Item #2.</p> <p>1. Galvanizing will be removed from surface of the installed sleeve in order to weld a new identical flange centered 19" down from the top of sleeve. Weld will be a ¼" fillet weld, both top and bottom of flange all the way around the sleeve. The sleeve will then be repaired with approved cold galv spray.</p>		<p>Please reference RFI response T-1568, attached photo of bridge pier/sleeve at Grid Lines 34.5/E and attached sketch.</p> <p>SCCI is in receipt of RFI response T-1568. The bridge pier in question is not fully contained within the sumps pits referenced in RFI response T-1568 (see photo attached). The galvanized pile sleeve encroaches into the Eastern most sump pit approximately 5/8".</p> <p>In order to facilitate the installation of this sump pit the provided contract details will need to be modified. The pile will need to be cut off at a lower elevation than the typical detail, which will require a larger block-out. The typical contract rebar details will need to be altered, as well as the typical waterproofing details.</p> <p>1. Please confirm the attached sketch showing revised rebar and formwork details is acceptable.                  2. In order to install a deeper blockout, the galvanized sleeve will be cut down to 4" above bottom Of blockout. This cut will remove the sleeve flange. Please confirm this is acceptable.</p> <p>All waterproofing detail revisions will be performed per Grace's recommendation and referenced mat slab "Ready-to-Pour" sign-off document for Mat Slab 16</p>

<b>REQUEST:</b>			<b>ANSWER:</b>			
<p>See attached diagram of a wall lift construction joint overlay on the ground floor plan. Per Specification Section 03 30 02 - 3.2, Foundation wall and ground floor construction joints shall align with the location of joint below in TG06 and will not impair the strength of the structure. A conflict occurs at the noted areas of the attached diagram, where the wall joint placed according to specification, will intersect at a moment frame beam. SCCI proposes to move wall construction joints in order to avoid conflicting with the moment frame beams.</p> <p>Please confirm shifting construction joints to not align with the construction joints below is acceptable and provide permissible parameters to assign new construction joints for SCCI to reflect upon and modify the construction joint layout. A conceptual sketch is attached reflecting the proposed shift in vertical construction joint.</p>			<p>See attached diagram of a wall lift construction joint overlay on the ground floor plan. <b>T-1590</b>	<b>SCS - Concrete Form Support Kicked To Temp Bridge</b>	<b>Closed</b>	<b>CR</b>	<b>08/04/2014</b>	<b>08/14/2014</b>	<b>08/09/2014</b>
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b>		<b>ANSWER:</b>				
<p>A unique support system is necessary for the foundation wall under the temporary bridges (First, Fremont, Beale). Shimmick proposes that in these areas, the form work will kick to support brackets mounted to the underside of the bridges to provide better support. Without this, the form system will be a cantilever system supported by 1 row of anchors which will exert a significant force on the wall lift below.</p> <p>Please confirm it is acceptable for the fourth lift form system to be supported by the bridge underside.</p>		<p>A unique support system is necessary for the foundation wall under the temporary bridges (First, Fremont, Beale). <b>REQUEST:</b>		<b>ANSWER:</b>				
<p>Per Specification Section 03 20 02-1.4-A-7, "test results for [pendulum] bearings with similar size" are to be submitted for approval. Per Mageba, they have test data on pendulum bearings (isolators) with similar sizes which they believe have been tested under more severe conditions than the ones required for this project. See attached email correspondence with Mageba for further explanation and more specific details in regards to their test and how the results apply to satisfy the requirements in the specifications. The referenced Annex documents in the email are also attached. Only a sample of the data has been included for preliminary approval; full test data will be submitted once this data is confirmed acceptable.</p> <p>Please confirm that the mentioned test reports could serve as evidence of the proper functioning of mageba pendulum bearings, as well as the fulfillment for the requirements in the specifications.</p>		<p>Per Specification Section 03 20 02-1.4-A-7, "test results for [pendulum] bearings with similar size" are to be submitted for approval. T-1597	SSS - Transfer Girder Top Flange Stiffeners at GL3	Closed	CR	08/11/2014	08/21/2014	09/16/2014

From: Webcor Construction LP Gregory Kemerer

**REQUEST:**

At either side of transfer girder TR3, the lower slab elevation requires the deck to be cut around each of the girder stiffeners compromising the rigidity of the deck, see attached SK1 for clarification.

Please confirm it is acceptable to shorten the short stiffeners under both of the center columns to 1" above the top flange of the deck.

**ANSWER:**

At either side of transfer girder TR3, the lower slab elevation requires the deck to be cut around each of the girder stiffeners compromising the rigidity of the deck, see attached SK1 for clarification.

Please confirm it is acceptable to shorten the short stiffeners under both of the center columns to 1" above the top flute of the deck.

T-1598	<b>SSS - Supplemental Pin Testing</b>	Void	CR	08/11/2014	08/21/2014	
<b>From:</b> Webcor Construction LP                      Gregory Kemerer						
<b>REQUEST:</b> Based on review of structural and referenced specification section it appears that Supplemental destructive testing of galvanized pins is not required after pins are galvanized per para 2.3.J. As per our previous QAQC meeting of June 17, 2014, it was requested by the TJPA representative that additional galvanized steel pin samples (ASTM A668 Class M) with associated nuts for each pin size be provided for destructive testing by TJPA representative testing lab and as follow: 1. 7" dia. X 2'-1" (A1551 as shown on 1551 of Pin shop drawings) 2. 7" dia. X 1'-2 3/16" (A1553 as shown on 1553 of Pin shop drawings). 3. 7" dia. X 1'-6 7/8" (A1554 as shown on 1554 of Pin shop drawings). 4. 8" dia. X 2'-7" (A1555 as shown on 1555 of Pin shop drawings). 5. 6" dia. X 1'- 8 13/16" (A13001 as shown on 13001 of Pin shop drawings).  Please provide the following: 1. Provide testing criteria to the testing lab agency after pins have been galvanized and in addition to the specified forged steel pins ASTM 668 Class M testing requirements.  2. Provide WOJV with a CR to supply and ship these additional pins and nuts to the testing lab. 3. If additional samples of other pins on the project are required, please specify. 4. BRB pins are not included in this RFI to be tested. Please confirm.			<b>ANSWER:</b> Based on review of structural and referenced specification section it appears that Supplemental destructive testing of galvanized pins is not required after pins are galvanized per para 2.3.J. <b>T-1625</b>	<b>SCS - Embedded Column Inner Vertical Bars at Foundation Walls</b>	<b>Closed</b>	<b>01</b>	<b>08/19/2014</b>	<b>08/29/2014</b>	<b>08/22/2014</b>
<b>From:</b>	Webcor Construction LP                      Claude Titché					
<b>REQUEST:</b>	See attached marked up contract drawings.  The TG0600 rebar subcontractor is using HRC 420 friction welded standard couplers at the top end of the 3rd lift foundation walls and embedded columns C21, C33, C34 vertical bars. The inner set of embedded column vertical bars are indicated in sections as having a 90 degree SH tail at the top of bar. It isn't possible to install the bar with the 90 tail into the 3rd lift HRC 420 standard coupler as the tail of the bar needs to spin circular to engage the threads into the coupler with the final tail orientation dictated by torquing of the bar into the coupler. A possible solution to this issue is to utilize the HRC 555 Forged head in lieu of the 90 degree tail. The top of the inner vertical bar 555 head could be held 4" below the top of the outer vertical bar 555 head for concrete encapsulation.  Please confirm that the proposed solution is acceptable for the typical embedded column in foundation walls.					<b>ANSWER:</b> See attached marked up contract drawings. <b>From:</b> Webcor Construction LP                      Claude Titche						
<b>REQUEST:</b> Partition walls taller than 24'-0", as indicated in Section 3/S1-9050, have vertical reinforcing of #7 bars @12" centers. Section 4/S -9051 indicates that the vertical bars will have a 90 degree tail at the top end of the bar. The standard tail length for #7 bars is 14" and will not fit within the 12" thick walls. Rotating the #7 bar tails to clear the concrete face by 1 1/2" clash with one another. Harris Rebar requests permission to utilize #7 straight vertical bars with a #5 'U' shaped cap with 30" lap@ 6" centers at the top of walls. Is this acceptable?  In order to minimize multiple varying lengths of the #7 vertical wall bars, the #7 threaded vertical dowel bar length will be increased from 49" to 56". The #7 wall vertical bar will be held up to the top of wall elevation, less clear cover, and maintain a minimum 49" lap splice at the Concourse Level. Is this acceptable?			<b>ANSWER:</b> Partition walls taller than 24'-0", as indicated in Section 3/S1-9050, have vertical reinforcing of #7 bars @12" centers. T-1650	<b>SCS - Requesting Approval for Precast Panels in Lieu of Cast-In-Place</b>	Closed	01	08/27/2014	09/06/2014	09/15/2014
<b>From:</b> Webcor Construction LP Claude Titcher						
<b>REQUEST:</b> See attached Exhibits A through D as a possible means of precast installation method. Using a precast yard facility in lieu of concrete cast in place will reduce the construction duration for the scallop, perimeter, and sky light elliptical wall operations since production can start prior to the construction start date. Precasting concrete elements also results in a better final product. Quality advantages of using a precast yard facility over cast in place methods are improved formwork design, curing procedures, temperature control, and form stripping methods since work space, formwork weight, formwork relocation and reassembly, and hoisting equipment restrictions are greatly reduced if not eliminated.  shimmick requests approval from the engineer to allow precast manufactured panels in lieu of the cast in place walls shown on S1-2752 & S1-3282 scallop walls, S1-2602 stair well, S1-2603 elliptical skylight, S1-2604 light column opening, S1-2606 stair shaft, and S1-2607 elevator shaft.			<b>ANSWER:</b> See attached Exhibits A through D as a possible means of precast installation method. T-1657	<b>SCS - Lower Concourse MEP Room Construction Joints</b>	Closed	01	09/03/2014	09/13/2014	09/12/2014
<b>From:</b> Webcor Construction LP Claude Titcher						
<b>REQUEST:</b> ASI 121 issued new wall CJ locations. Reference sheet AI-2203, Detail I/AI-3008 and B/AI-9240.  A. On the south wall of the room at GL 13-B.2 there is a construction joint (see plan attached indicated as location "A") running through one of the MEP blocks outs. That creates a cantilever section below the beams cutout and above the MEP block out. Is that acceptable? If not, where should the CJ be relocated?  B. On the same wall there is a construction joint ( see plan attached indicated as location "B"), the distance between the MEP block and the construction joint is 5' 5/8", which is not enough to place diagonal trim bars on the comers of the MEP block out that are closer to the construction joint. Please provide detail for this location.  C. In the same wall, the construction joints are not shown in the area cover by the spall plate, do the CJ's start at the top of the wall plates? Please confirm intent and provide further direction.			<b>ANSWER:</b> ASI 121 issued new wall CJ locations. Reference sheet AI-2203, Detail I/AI-3008 and B/AI-9240.  A. T-1665	BGP - B20 Spandrel Beam at Knock-Out Walls	Closed	01	09/08/2014	09/18/2014	09/09/2014

From: Webcor Construction LP Claude Titcher

**REQUEST:**

Please see attached S1-2210 and S1-3204 D4.

SCCI inadvertently poured the Shear Wall against the Knock-out Wall without any blockout for West Spandrel Beam B20, as shown in S1-2210 and S1-3204.

Please confirm the following remedy is acceptable:

1. The affected #7 bars are drilled and bonded to supports (Shear Walls) with standard embedment per approved epoxy manufacturers recommendation.
2. Tie spacing, which is presently at 12". Will be reduced to 8"; Tie size will remain #4 rebar.
3. Contact surface not to receive 1/4" X 8" continuous neoprene pad, will be roughened to 1/4" amplitude.

**ANSWER:**

Please see attached S1-2210 and S1-3204 D4.

SCCI inadvertently poured the Shear Wall against the Knock-out Wall without any blockout for West Spandrel Beam B20, as shown in S1-2210 and S1-3204.

T-1666	SCS - Wall Opening Detail Conflicts	Closed	CR	09/08/2014	09/18/2014	09/15/2014
<p><b>From:</b> Webcor Construction LP                      Claude Titcher</p> <p><b>REQUEST:</b></p> <p>Please reference drawing S1-3001.</p> <p>See attached marked up drawing 4/S1-3207 details typical wall opening reinforcement, noting to use additional bars for 10" to 30" wall openings with lengths LTS + W. The typical vertical bars used for the foundation walls are #11 rebar and the added bar length is 19'-6" (LTS + W + W + LTS + W = 102" + 1 0" + 10 + 102" + 10"). Depending on the location of the penetration, the added bar would have to extend LTS + W beyond the opening, which in the 10" opening case is 9'-4" (102" + 10"). This is not possible considering the foundation walls under TG07.2 scope of work are between 8' to 12'.</p> <p>Additionally these additional vertical bars will potentially conflict with moment frame beam rebar at ground level by adding to the rebar congestion. See attached marked up drawings for example conflict.</p> <p>1. Please provide an alternative to the current wall opening detail for the foundation wall.                  2. Please provide an alternative detail for cases where additional vertical bars conflicting with moment frame beam rebar.</p>		<p><b>ANSWER:</b></p> <p>Please reference drawing S1-3001.</p> <p>See attached marked up drawing 4/S1-3207 details typical wall opening reinforcement, noting to use additional bars for 10" to 30" wall openings with lengths LTS + W. T-1667	<b>SCS - Foundation Wall Conduit Penetration Locations</b>	Closed	CR	09/08/2014	09/18/2014	09/08/2014
	From: Webcor Construction LP                      Claude Titcher					
	<b>REQUEST:</b> Reference drawings: A1-2862 to A1-2871, E1-2862 to E1-2871 and E1-3208 to E1-3210.  Please see attached marked up drawings noting atypical set of conduit penetrations. A1-2862 provides a lateral distance relative to a grid line to set of conduits; however 3/E1-3208 details the set of conduits as not aligned. On top of this, the referenced drawings do not provide an elevation for the conduit penetrations. SCCO requires the locations of these penetrations to proceed with foundation wall rebar detailing.  Please provide information on the location of the electrical conduit foundation wall penetrations.					
	<b>ANSWER:</b> Reference drawings: A1-2862 to A1-2871, E1-2862 to E1-2871 and E1-3208 to E1-3210.  Please see attached marked up drawings noting atypical set of conduit penetrations. T-1668	<b>SSS - Weld Access Hole at Transfer Girder</b>	Closed	CR	09/08/2014	09/18/2014	09/15/2014
	From: Webcor Construction LP                      Gregory Kemerer					
	<b>REQUEST:</b> Please confirm it is acceptable to provide weld access holes as indicated on 628BC per AWS D1.1 to adequately terminate the CJP weld to cast node. For plates not fabricated, confirm it is acceptable to omit the hole closest to the proposed access hole to maintain AISC min edge distance. This typically occurs at all cast node to girder connections.					
	<b>ANSWER:</b> Please confirm it is acceptable to provide weld access holes as indicated on 628BC per AWS D1.1 to adequately terminate the CJP weld to cast node. For plates not fabricated, confirm it is acceptable to omit the hole closest to the proposed access hole to maintain AISC min edge distance. This typically occurs at all cast node to girder connections.					
T-1669	<b>SSS - Insufficient Cope for Erection Clearance</b>	Closed	CR	09/09/2014	09/19/2014	09/15/2014
	From: Webcor Construction LP                      Gregory Kemerer					
	<b>REQUEST:</b> Please refer to beams highlighted in S1-2503 (attached) and work with this RFI.  The 7" cope shown in 2/S1-5017 is not sufficient for erection clearance. The connections on the other end of these beams dictate that the beams cannot be dropped vertically into position during erection (Please refer to attached SK RFI 813 SK1 and SK RFI 813 SK2). Beams					
	<b>ANSWER:</b> Please refer to beams highlighted in S1-2503 (attached) and work with this RFI.  The 7" cope shown in 2/S1-5017 is not sufficient for erection clearance. The connections on the other end of these beams dictate that the beams cannot be dropped vertically into position during erection (Please refer to attached SK RFI 813 SK1 and SK RFI 813

<p>Please reference detail 4/S1-3207 and RFI T-1666 about foundation wall opening conflicts. Since submitting RFI T-1666, more concerns regarding 4/SI-3207 have been brought to our attention.</p> <p>One of the concerns mentioned in RFI T-1666 was the case of additional vertical bars potentially conflicting with moment frame beam rebar. This issue can also occur with the diagonal cross bars and additional horizontal rebar.</p> <p>1. Please provide an alternative detail for cases where either additional horizontal bars and diagonal cross bars conflict with moment frame beam rebar.</p> <p>Due to the length of additional horizontal bars, wall openings near foundation wall CJs will cause the constructability issue of requiring rebar to be built out further to proceed with concrete pours.</p> <p>2. Please confirm that the alternate wall opening detail (requested in RFI T-1666) for additional vertical bar lengths can also be applied to additional horizontal bars.</p>			<p>Please reference detail 4/S1-3207 and RFI T-1666 about foundation wall opening conflicts. T-1702	SSS - Weld Terminations on Moment Frame Column Shafts	Closed	CR	09/15/2014	09/25/2014	09/26/2014
<p><b>From:</b> Webcor Construction LP                      Gregory Kemerer</p>						
<p><b>REQUEST:</b></p> <p>Please see Section 5.17.1- Figure 5.2 from the AWS D1.1 Structural Welding Code (See SK1). In the sketch, proper terminations are shown for both a CJP weld and fillet weld as they approach an access hole.</p> <p>The moment frame column shafts have been designed with a varying thickness of web. These web splice locations require an access hole to account for the different weld details between the web and flange, with generally a CJP weld being performed on one side and a fillet on the other (See SK2).</p> <p>The shaft drawings that have been detailed show an access hole that conforms to 5.17.1 - Figure 5.2. Note, however the shaft drawings do not show the weld termination detail. It is industry standard for the modeler to exclude these details as it is up to the fabricator/inspector to understand that welds should always be terminated as per the section of the AWS code they fall under, unless the design engineer specifies otherwise.</p> <p>Currently, the TJPA shop inspection staff has directed our fabricator to terminate both the CJP &amp; fillet welds similarly - as shown for a fillet weld (See SK3). Please confirm that this is acceptable as currently shown.</p> <p>Please also confirm that the weld terminations should be completed as per AWS D1.1 - Section 5.17.1- Figure 5.2 for all columns fabricated in the future. Terminating CJP welds, as currently directed by the inspection staff to be flush with the end of the access hole will result in additional costs to our fabricator.</p>			<p><b>ANSWER:</b></p> <p>Please see Section 5.17.1- Figure 5.2 from the AWS D1.1 Structural Welding Code (See SK1). <b>REQUEST:</b>			<b>ANSWER:</b>			
<p>As a follow-up to SK RFI 821 (T-1702.1), please note the following:</p> <p>It is unclear on how to exactly fix the weld terminations that currently do not conform with Section 5.17.1- Figure 5.2 from the AWS D1.1 Structural Welding Code.</p> <p>Skanska proposes two options that would allow the transitions to be permissible as per AWS code.                      Option 1: Remove material from the web/CJP that would allow for a proper transition down to the flange. See SK1.                      Option 2: Add additional weld metal to the CJP that would allow for a proper transition down to the flange. See SK2.</p> <p>Please confirm that both options are acceptable &amp; it is at the fabricators discretion to choose which method.</p>			<p>As a follow-up to SK RFI 821 (T-1702.1), please note the following:</p> <p>It is unclear on how to exactly fix the weld terminations that currently do not conform with Section 5.17.1- Figure 5.2 from the AWS D1.1 Structural Welding Code.</p> <p>Skanska proposes two options that would allow the transitions to be permissible as per AWS code. <b>REQUEST:</b> Spec section 03 30 20-16-3.2 states that the maximum spacing for interior walls and ramp slab is 60 feet. In the response to the Area 1-4 and Area 5 Comprehensive Drawings, TT indicated that no movement joints were required in the Vehicle and Bicycle Ramps below the ramp.  To facilitate construction, please confirm:  1) The bicycle ramp and associated ramp walls can be poured monolithically from the start of the walls to the wall perpendicular to the ramp walls under the slab(See attached). Due to access issues, SCCI has to use lost formwork (styrofoam) for the underside of ramp formwork. SCCI will use this same form work for the inside of wall form.  2) The maximum joint spacing for the Ramp and Ramp Walls can be increased to 90 feet as no movement joints are required below the vehicle or bike ramps.		<b>ANSWER:</b> Spec section 03 30 20-16-3.2 states that the maximum spacing for interior walls and ramp slab is 60 feet. T-1711	<b>SCS - Roof Shear Key and Pylon Rebar Epoxy Connection</b>	Closed	CR	09/19/2014	09/29/2014	09/29/2014
	<p>From: Webcor Construction LP                      Stephanie Azzolino</p> <p><b>REQUEST:</b></p> <p>Per S1-3282 detail 9 "SHEAR KEY AT ROOF" calls for vertical #4 rebar dowels to be cast with the structural deck. Per S1-3281 detail 7 "SIGNAGE PYLON FOOTING DETAIL" calls for vertical #5 rebar dowels to be cast with structural deck. For constructability reasons it is essential that Shimmick's operations maintain open access for roof top small cranes and man lifts for all trades. Per specification section 03 20 02 Part 2.3 F. 3. Adhesive for dowels in existing concrete b. HIT-RE 500_SD injectable adhesive by HIL TI, Inc., is an approved method. The minimum embedment depth requirement for #4 rebar is 2.75 inches and the concrete thickness requirement is 4 inches at the shear keys. The minimum embedment depth requirement for #5 rebar is 3.125 inches and the concrete thickness requirement is 4.375 inches for the signage pylon. The roof deck is 7" with 3" tall flutes leaving a clear space of 4 inches. Shimmick's solution for the 4.375 inch concrete thickness requirement is to pour an additional .5 inches of concrete at the concrete deck where the pylons will be installed. See drawing attachment "A" and product data attachment "B" on page 4 for rebar drill and epoxy requirements.</p> <p>Shimmick requests approval for the shear keys and the pylons be drill and epoxy rebar doweled connections after the roof top deck has been poured and larger operations have been completed.</p>

<b>REQUEST:</b> Upper basket column pipes located at gridline 1/G and 1/C are shown to be concrete filled to top of pipe in S1-4018 Rev 4. Details shown in B/S1-4018 require a 2" diameter vent hole in the roof level cast nodes. Roof level cast nodes at these locations are 72-36 and 72-37 and according to machining drawing CN-0127 Rev 4 (issued 12/19/13), neither of these cast nodes have vent or grout holes.  Currently, pipes are detailed with (2) - 5/8" vent holes approx. 7" from the top of the pipe so the pipes could be filled to this point. Please confirm currently detailed pipe vent holes can remain as is or provide new vent hole details for the pipe and/or cast nodes.  Please note cast nodes 72-36 and 72-37 have already been released to Oregon Iron Works by Bradken.			<b>ANSWER:</b> Upper basket column pipes located at gridline 1/G and 1/C are shown to be concrete filled to top of pipe in S1-4018 Rev 4. <p>Two train box column cap plates (MK p395) have been cut undersize and are out of AISC tolerance as follows:                      (1) - p395 104"long - Cut to 103.8125"                      (1) - p395 104" long - Cut to 103.75"</p> <p>Skanska proposes to proceed with fabrication as is, by laying out the holes and machined channel from the center of the cap plate, see SK1 for reference.                      Please confirm this is acceptable.</p>			<p>Two train box column cap plates (MK p395) have been cut undersize and are out of AISC tolerance as follows:                      (1) - p395 104"long - Cut to 103.8125"                      (1) - p395 104" long - Cut to 103.75"</p> <p>Skanska proposes to proceed with fabrication as is, by laying out the holes and machined channel from the center of the cap plate, see SK1 for reference.                      Please confirm this is acceptable.</p>			
<b>T-1765</b>	<b>SSS - Tapered Slab at Bus Deck Perimeter</b>	<b>Closed</b>	<b>CR</b>	<b>10/01/2014</b>	<b>10/11/2014</b>	<b>10/13/2014</b>
<b>From:</b> Webcor Construction LP Gregory Kemerer						
<b>REQUEST:</b>			<b>ANSWER:</b>			
<p>1)The perimeter Bus Level slab tapers from a 14" slab to 10" at the edge of slab, with the perimeter beam requiring 9" studs as per 9/S1-5004. Please confirm it is acceptable to provide two 9" studs on the framing steel to account for the sloping slab, see attached SK1 &amp; 2 for clarification.                      2)At the Bus Deck level node the slab tapers from a 14" slab to 6" at the edge of slab. Please confirm it is acceptable to provide 6" studs on the framing steel to account for the sloping slab, see attached SK1 for clarification.</p>			<p>1)The perimeter Bus Level slab tapers from a 14" slab to 10" at the edge of slab, with the perimeter beam requiring 9" studs as per 9/S1-5004. T-1767	<p>SSS - Weld Clearance Hole Size at Moment Frame Column Cruciform</p> <p>From: Webcor Construction LP                      Gregory Kemerer</p> <p><b>REQUEST:</b></p> <p>Several Moment Frame Columns have cruciform sections that weld over column web splice joints. The splice joint provides a transition from thick web to thin web. In a majority of these cases, the cruciform web as detailed has a 1" radius cutout to clear the column web splice joint. The 1" radius cutout is insufficient to adequately clear the tapered double bevel splice joint and provide space for runoff tabs necessary for the CJP weld.</p> <p>Please confirm it is acceptable to provide a weld clearance hole in the cruciform section wide enough to clear the bevels of the column web splice joint plus 1" on each side of the bevel for weld runoff tabs. See attached sketch. If confirmed, this information needs to be shown on detail drawings.</p>	Closed	CR	10/01/2014	10/11/2014	10/13/2014
	<p>C show two continuity plates that are with-in approx. 2 1/2" of each other with a CJP DCW marked as the weld detail. In these conditions there is insufficient access to provide a continuous weld along the backside of the backing bar.</p> <p>Please confirm that in situations where there is insufficient access between the two continuity plates, the backing bar can be tac welded within the weld zone and left in place on one of the plates. The other plate will have the backing bar attached as per the aforementioned specification.</p> <p>However, on CS1 columns A1723, A1731, A1759 and A1760 the backing bar was tact welded within the weld zone in cases where the continuity plates were in close proximity. Please confirm these columns are acceptable. *Note - the typical continuity plates that are spaced properly have a double bevel prep and therefore will not be affected.</p>

wall below the TG0600 scope line going from the top of the Vehicle Ramp slab to the bottom of the beams on the Ground Level. Please confirm which drawing set shows the correct scope line.

**ANSWER:**

See attached CD RFI # 586 SK1 & SK2 for items 1 & 2:  
 1) These braces extend up to the underside of the W27x84 on S1-2604 as shown in snapshot from the model. Confirm no further action is required.  
 2) Confirm the red approval dimensions shown on E51 (SK1) are intended to be a revision to the information supplied previously as noted.

**ANSWER:**

XKT Engineering requests that the weld clearance holes located at column flange to web, weld transition points (full penetration to fillet welds), be eliminated (see attached drawing P1022).

There is no code requirement for these holes. Welds would be detailed and welded in accordance with AWS D1.1, Section 2.8.2.

Please confirm this is acceptable.

T-1796	SCS - Sky Light Embed Layout Dimensions	Closed	01	10/07/2014	10/17/2014	10/07/2014
<p><b>From:</b> Shimmick Construction Company, Inc. Henry Chiang</p> <p><b>REQUEST:</b></p> <p>After searching through sky light drawings AI-8401 through AI-8479 and SI-8000 through SI-8020 Shimmick was not able find information providing the sky light attachment to top of wall embed sizes, anchor bolt length, and spacing of embeds. For the central sky light from grid line 19.1 to 22 on page A 1-8451 which shows the structural truss frames for the sky light, which determines the embed layout, the truss frames are called out as equally spaced between each grid line. This does not give you the complete perimeter and requires too many assumptions. Also on AI-8401Note2. Dimensional control sub part A. "Dimensional control shall be derived from the three dimensional (3D) computer model and the two dimensional (2d) drawings." Sub part B. "See sheet AI-0009 for an index of 3D models". The 3D models referenced on AI-0009 are models that Shimmick TG07 Superstructure currently does not have access to. Shimmick would prefer to have the embed information on a drawing sheet equivalent to what is provided for the roof park railing details on sheets AI-8680 to AI-8685.</p> <p>Shimmick is requesting the engineer to provide sky light attachment to top of wall embed sizes, anchor bolt lengths, and spacing of embeds for the top of concrete skylight support walls?</p>						
<p><b>ANSWER:</b></p> <p>After searching through sky light drawings AI-8401 through AI-8479 and SI-8000 through SI-8020 Shimmick was not able find information providing the sky light attachment to top of wall embed sizes, anchor bolt length, and spacing of embeds. For the central sky light from grid line 19.1 to 22 on page A 1-8451 which shows the structural truss frames for the sky light, which determines the embed layout, the truss frames are called out as equally spaced between each grid line. This does not give you the complete perimeter and requires too many assumptions. Also on AI-8401Note2. Dimensional control sub part A. "Dimensional control shall be derived from the three dimensional (3D) computer model and the two dimensional (2d) drawings." Sub part B. "See sheet AI-0009 for an index of 3D models". The 3D models referenced on AI-0009 are models that Shimmick TG07 Superstructure currently does not have access to. Shimmick would prefer to have the embed information on a drawing sheet equivalent to what is provided for the roof park railing details on sheets AI-8680 to AI-8685.</p> <p>Shimmick is requesting the engineer to provide sky light attachment to top of wall embed sizes, anchor bolt lengths, and spacing of embeds for the top of concrete skylight support walls?</p>

T-1835	BGP - Removal Sequence of Internal Bracing System Within Zone 4	Closed	01	10/21/2014	10/31/2014	10/23/2014

From: Webcor Construction LP                      Claude Titcher

**REQUEST:**

Further to last Monday's (10/13/14) meeting with TJPA, Arup, Turner and WOJV where the removal sequence of the internal bracing system within the Zone 4 East end Diaphragm was discussed, please confirm the following is acceptable:

Remove the walers which are connected together in a sequence referred to as the observation method where one waler on the north and one on the south as well as the two cross lot struts attached to the walers would be de-stressed and removed at any one time. Once the first pair of cross lot struts have been de-stressed and removed and little or no movement has been recorded on the WOJV installed survey points or the Arup inclinometer's over the following 24 hours after de-stressing, the contractor can then proceed and begin de-stressing and removing the next pair of walers and struts to the east. This removal method would then be repeated until only four cross lot struts at that particular level remain; which are numbers ST-65 to 68.

If acceptable, please specify 1) the movement tolerance for a given waler removed, 2) the observation period for analyzing movement, and 3) the acceptable means for monitoring for movement (survey, inclinometer, or both).

**ANSWER:**

the Lowest Anticipated Service Temperature (L.A.S.T.) plus 20 degrees F (AWS D1.8 Section 6.3.6).

Bradken has made repairs to the ground node casting 5-02 utilizing Hobart Brothers weld electrode in TM-771 (data and test reports attached). The weld repair(s) were not considered DCW welds, and were made in accordance with an approved repair procedure in conformance to the contract specifications.

The attachment of the Ground Node to the Transfer Girder is specified in the drawing at the girder flange/web to casting interface to be a DCW. The required weld will intersect with this previously repaired weld metal. The Fabricator has qualified a welding procedure for the specified base metal combination (ASTM A572-50 to ASTM A216WCC). It is the understanding of the Code that this additional weld filler metal of the casting repair to be included in the final girder to casting weld must comply with the AWS D1.8 Seismic requirements in order to be in conformance to the Code provisions.

The manufacturer has lot tested three (3) individual lots of TM-771 in accordance with the AWS D1.8 requirements. (documents attached). In addition to the test results provided at 70 degrees F, Hobart has provided additional test data from three (3) lots at 0 degrees F. These additional test results exceed the contract required L.A.S.T. of 25 degrees F plus 20 degrees F (45 degrees F).

Please confirm that the three (3) ASW D1.8 Lot Tests for the TM-771 weld electrode performed at a L.A.S.T. temperature of 0 degrees F for the weld repair are acceptable:

- 1) Specifically to Ground Cast Node 5-02  
And
- 2) To any future repairs in the DCW weld zone of the ground cast nodes

Note: Additional test results for Fabco RXR weld electrodes will be provided when they are available.

Additionally, the testing specified shall be not more than the Lowest Anticipated Service Temperature (L.A.S.T.) plus 20 degrees F (AWS D1.8 Section 6.3.6).

Bradken has made repairs to the ground node casting 5-02 utilizing Hobart Brothers weld electrode in TM-771 (data and test reports attached). T-1838	<b>SCS - 4th Lift Foundation Wall - Moment Frame Beam Alignment</b>	Closed	01	10/22/2014	11/01/2014	10/31/2014
<b>From:</b> Webcor Construction LP                      Claude Titché						
<b>REQUEST:</b> See attached sketch. This RFI is related to RFI T-1467.  Ground level moment frame beams tie into the foundation wall. Due to level shoring towers, the moment frame beams will be step in elevation. The level moment frame beams will be interfacing with the sloped 4th lift foundation wall causing issues in alignment and constructability in the remaining foundation wall. SCCI proposes to have the top of 4th lift be 3'-11" below top of slab. This method will clear the alignment issues, provide a starter wall edge and will result in a 1" ± 1/4" encroachment of 4th lift wall into the moment frame beam.  Please confirm it is acceptable for the 4th lift encroach into the moment frame beam by 1" ± ¼"		<b>ANSWER:</b> See attached sketch. This RFI is related to RFI T-1467. **REQUEST:**

- 1) There does not appear to be any specific detailing that allows for transverse drift to occur, without inducing loads in the stairs themselves. Is there an expectation that the stairs can handle this displacement-induced load demand?
- 2) We would like to modify the base detail of the typical stairs in order to add a second base plate with a horizontal slot in the transverse direction, in order to accommodate transverse drift without inducing load on the stairs. Do you have any issues or concerns with that?
- 3) We would like to ensure that there are adequate seismic gaps at the perimeter of the stair framing, in order to avoid inducing any horizontal seismic loading on the building framing members at the stair perimeter. In the process of accomplishing this, we may need to reduce slightly the overall widths or lengths of the stairs themselves, possibly by one or several inches. Are there any specific reasons that this could not be done? Would this be acceptable to the design team?
- 4) We will list the vertical and horizontal stair reactions at the perimeter of the stair framing. Do you have any specific format that we should attempt to use for this effort?
- 5) We understand that the review of the stair drawings and calculations will not proceed through the City and County of San Francisco, but instead has been delegated to the design team. Is this correct? Please elaborate.
- 6) Please let us know the best persons to coordinate our efforts with, both at Thornton Tomasetti and at Pelli Clarke Pelli Architects.

**ANSWER:**

- 2) We would like to modify the base detail of the typical stairs in order to add a second base plate with a horizontal slot in the transverse direction, in order to accommodate transverse drift without inducing load on the stairs. Do you have any issues or concerns with that?
- 3) We would like to ensure that there are adequate seismic gaps at the perimeter of the stair framing, in order to avoid inducing any horizontal seismic loading on the building framing members at the stair perimeter. In the process of accomplishing this, we may need to reduce slightly the overall widths or lengths of the stairs themselves, possibly by one or several inches. Are there any specific reasons that this could not be done? Would this be acceptable to the design team?
- 4) We will list the vertical and horizontal stair reactions at the perimeter of the stair framing. Do you have any specific format that we should attempt to use for this effort?
- 5) We understand that the review of the stair drawings and calculations will not proceed through the City and County of San Francisco, but instead has been delegated to the design team. Is this correct? Please elaborate.
- 6) Please let us know the best persons to coordinate our efforts with, both at Thornton Tomasetti and at Pelli Clarke Pelli Architects.

T-1849.1	SST - Coffman Engineers Stair Design Questions for SEOR	Closed	CR	11/17/2014	11/27/2014	12/01/2014
From: Webcor Construction LP		Gregory Kemerer				

**REQUEST:**

The response to item #5 on RFI T-1849 is incomplete. As the TJPA is the Authority Having Jurisdiction (AHJ) for the remaining code permissions, please confirm they will be providing the required permits and reviews for the stair package shop drawings (TG07.5). If this is not the case, please confirm that no permit is required.

T-1858	<b>SCS - Opening blockouts through Ground Level</b>	Closed	01	10/30/2014	11/09/2014	11/12/2014
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b> Due to the North to South shoring along the Lower Concourse Level, the concrete partition walls cannot be built until the Ground Level is poured and struts have been removed. Since the Ground Level will be completed before the partition walls are built, SCCI proposes installing blockouts in the Ground Level above the walls in order to complete the concrete pours and vibrate for the partition walls in GL 10 to GL 13. The blockouts will be 8" diameter circle, the rebar detail will be the one shown at 9/S1-5003. The blockouts will not be farther than 5' O.C. or closer than 2' 6" O.C. See the attached drawing for blockouts layout. Please confirm this is acceptable.		<b>ANSWER:</b> Due to the North to South shoring along the Lower Concourse Level, the concrete partition walls cannot be built until the Ground Level is poured and struts have been removed. T-1859	<b>SCS - Vertical Trim Bar Termination</b>	Closed	01	10/30/2014	11/09/2014	11/05/2014
<b>From:</b> Webcor Construction LP                      Claude Titcher						
<b>REQUEST:</b> Please reference drawing 4/S1-3207, RFI T-1666, RFI T-1698 and see attached spreadsheet listing out the length of trim bar to be embedded into poured spans of 3rd lift for relevant openings.  The foundation wall penetration detail 4/S1-3207 requires vertical trim bar of LTS + W above and below the opening. RFI T-1666 and RFI T-1695 responses have noted that a hook or head may be used to terminate trim bars where bar length exceeds height of wall. However the third lift will require embedded trim bars for all foundation wall openings where this detail is applied. seer proposes to terminate trim bars with hooks at the bottom of the 4th lift, similar to RFI T- 1666's response for the top of wall.  Please confirm if terminating trim bars with hooks at the bottom of the 4th lift is acceptable or provide parameters for cases where this would be acceptable.		<b>ANSWER:</b> Please reference drawing 4/S1-3207, RFI T-1666, RFI T-1698 and see attached spreadsheet listing out the length of trim bar to be embedded into poured spans of 3rd lift for relevant openings. T-1870	SCS - Horizontal CJ for Upturned Beams at GL 18, 26, 34, and 35	Open	01	10/31/2014	11/10/2014	
<p><b>From:</b> Webcor Construction LP                      Claude Titcher</p> <p><b>REQUEST:</b></p> <p>Please reference S1-3660 through 3663, and TG03 Balfour Beatty Bridge submittal TG0300-201. Some challenges to pouring the upturn beam monolithic with the slab pour are:</p> <p>(1) Worker access is less than 5' from top of slab to underside of roadway and less than 3' to the underside of the steel framing.                      (2) The slab and beam must be finished per spec 033002 3 .6.C to receive waterproofing in A1-8717.                      (3) There is minimal to no access at the upturn beam and under the temporary duct bank.                      (4) Large quantity of concrete to pour with difficult access.                      (5) The available road closure time for 1st/Fremont/Beale may not provide enough time to perform all the above. Given these restrictions, Shimmick requests approval to pour the upturned beam separate from the slab:</p> <p>Option 1: by placing a horizontal construction joint along the length of the upturned beam with top of keyway flush with top of slab.</p> <p>Option 2: by placing 2 vertical construction joints on either side of the upturn beam. (preferred)                      Please confirm if either of these CJ proposals are acceptable. (WOJV: this option will not work due to internal bracing removal sequencing, refer to option 1)</p>		<p><b>ANSWER:</b></p> <p>Please reference S1-3660 through 3663, and TG03 Balfour Beatty Bridge submittal TG0300-201. Some challenges to pouring the upturn beam monolithic with the slab pour are:</p> <p>(1) Worker access is less than 5' from top of slab to underside of roadway and less than 3' to the underside of the steel framing.                      (2) The slab and beam must be finished per spec 033002 3 .6.C to receive waterproofing in A1-8717.                      (3) There is minimal to no access at the upturn beam and under the temporary duct bank.                      (4) Large quantity of concrete to pour with difficult access.                      (5) The available road closure time for 1st/Fremont/Beale may not provide enough time to perform all the above. Given these restrictions, Shimmick requests approval to pour the upturned beam separate from the slab:</p> <p>Option 1: by placing a horizontal construction joint along the length of the upturned beam with top of keyway flush with top of slab.</p> <p>Option 2: by placing 2 vertical construction joints on either side of the upturn beam. <b>REQUEST:</b>			<b>ANSWER:</b>			
Per drawing S1-3282 detail 3 the roof top concrete deck overhangs the 10.1 beam line by 2 feet. Delaying the installation of placing the overhang portion of the concrete deck would allow Shimmick to place the roof top concrete deck sooner. This construction joint would be in addition to the current construction joint in the seismic wall per RFI T-1738. Please see attached drawing for further explanation. Shimmick requests approval to add a construction joint in the deck on the 10.1 beam line.			Per drawing S1-3282 detail 3 the roof top concrete deck overhangs the 10.1 beam line by 2 feet. **REQUEST:**

See attached CD RFI # 686 SK1 & SK2 for items 1 to 6: The design intent in this revised connection for the W40 beams east of Grid 26 is not clear as it contradict various other details as listed below. The noted beams are currently connected to the perimeter beams per S1-8003. Please review and confirm for items 1 to 5:

- 1) Indicates W40 beam supported by perimeter beam and W30 at the opposite end.
  - a) Confirm the connection to the perimeter beam is per 1/S1-8003 at the CP5 location.
  - b) Confirm the other end of the W40 may be connected to the W30 per 1/S1-5011 except with a full depth shear plate and 7 bolts as there is insufficient room for a double angle connection per S1-5010. See enlarged typical detail on SK1
- 2) Confirm the connection for the W40 to the perimeter beam is per 1 & 1B/S1-8003 at the CP5 location.
- 3) Indicates W40 beam supported by perimeter beam and BU-40 at the opposite end.
  - a) Confirm the connection to the perimeter beam is per 1/S1-8003 at the CP5 location.
  - b) Confirm the other end of the W40 may be connected to the BU-40 per 1/S1-5011 except with a full depth shear plate and 11 bolts.
- 4) Indicates W40 beam supported by perimeter beam and W24 at the opposite end.
  - a) Confirm the connection to the perimeter beam is per 1/S1-8003 at the CP5 location.
  - b) Confirm the other end of the W40 may be connected to the W24 per 1/S1-5011 except with a full depth shear plate and 6 bolts.

<b>REQUEST:</b>			<b>ANSWER:</b>			
<p>Attached are drawings A1-7511 and A1-7512 regarding the details for the stainless steel risers at the terrazzo stair treads (affected stairs are 205, 307, 308 and 309). Need clarification on the following items:</p> <p>Stair 307 specifies etched risers, while stairs 205, 308 and 309 are to be perforated. Please clarify the desired "etch". Do the risers on stair 307 have the same hole-pattern as stairs 205, 308 and 309? Is the etch an alternate finish? Please clarify design intent.</p> <p>With regard to the hole pattern, there is not enough information for the desired stagger or border (if required). Please clarify design intent.</p> <p>Olson Steel priced all of the risers as grade 304 stainless steel. Please confirm this is the desired grade versus grade 304L, 316,316L etc.</p> <p>Olson Steel priced all of the risers with a mill finish. Please confirm the risers do not receive any alternate finish (#4 brush, etc.).</p>			<p>Attached are drawings A1-7511 and A1-7512 regarding the details for the stainless steel risers at the terrazzo stair treads (affected stairs are 205, 307, 308 and 309). <b>T-1900</b>	<b>SST - Middle Handrail Location Clarification</b>	<b>Closed</b>	<b>CR</b>	<b>11/08/2014</b>	<b>11/18/2014</b>	<b>11/12/2014</b>
<b>From:</b> Webcor Construction LP Gregory Kemerer						
<b>REQUEST:</b>			<b>ANSWER:</b>			
<p>Please see attached for a handrail location question. Olson has located the center stringers so that the handrail clearances are equal-equal. This creates uneven stringer to stringer clearances. Olson has done middle stringer centered between stringers and centered between handrail and it seems both meet code. Please note the architectural drawings have not located them correctly. Please advise.</p>			<p>Please see attached for a handrail location question. Olson has located the center stringers so that the handrail clearances are equal-equal. <b>REQUEST:</b> Q1. From the General Structural Notes note CD-13 on sheet S-0006, it is our understanding that the stair structure should not impose torsion on the superstructure members. However, for Stair 401 sheet A1-7111 shows the stair columns located eccentrically from the centerlines of the superstructure beams. In addition, Structural sheet S1-2404 calls out detail 9/S1-5027 which shows the superstructure beam supporting the stair column eccentrically. Is it acceptable to detail this connection as shown in 9/S1-5027 even though it applies torsion to the beam?  Q2. Should the 3/8" side plate shown in detail 9/S1-5027 be installed for the full length of the beam?		<b>ANSWER:</b> Q1. T-1911	BGP - Foundation Wall/Corbel Below Vehicle and Bike Ramp	Closed	01	11/14/2014	11/24/2014	11/24/2014

From: Webcor Construction LP                      Claude Titcher

**REQUEST:**

Please confirm the following items related to the Foundation Wall/Corbel below the Vehicle and Bike Ramp and the response to RFI T-1850:

1. The corbel supporting the slab for the Communication Vault Room between the Vehicle and Bike Ramp is level and the top of the corbel remains at EL+ 14.0' per Detail 5 on AI-7413 even though it is not indicated on SKA-4289 (A1-7401).
2. The corbels below the Vehicle and Bike Ramps extend to the outside faces of the walls for each ramp and the corbel supporting the slab for the Communication Vault Room spans the entire distance between the corbels under the Vehicle and Bike Ramp.
3. S1-2251 shows the extent of the 4th Lift Foundation Walls that is included in TG06's scope in order to support the Vehicle and Bike Ramp. The western extent of the 4th Lift Foundation Wall is shown where the inside face of the foundation wall intersects with the outside face of the Vehicle Ramp Wall. The eastern extent of the 4th Lift Foundation Wall is shown to extend roughly 9 feet past the outside face of the Bike Ramp Wall to Gridline W. Additionally, the only elevation information for the portion of TG06's 4th Lift Foundation Wall is "TG0600 Foundation Wall=3/4" Below Bike Ramp (Varies)." Please confirm the eastern extent of the 4th Lift Foundation Wall as described above (per S1-2251) is correct. If it is correct, please provide a top elevation for the foundation wall that extends out past the Bike Ramp to Gridline W.
4. SCCI intends to pour the section of TG06's 4th Lift Foundation Wall in 3 different pours (see attached markup of S1-2251 for SCCI's proposed construction joint layout). Please note that these construction joints do not match up with the construction joints below in the 3rd Lift Foundation Walls. However, SCCI assumes that a similar condition to the 3 rd Lift Foundation Walls above the Knockout Walls (see RFI T-1569) exists due to the West Throat Slab separating the 3rd and 4th Lift Foundation Walls below the ramp.

**ANSWER:**

Please confirm the following items related to the Foundation Wall/Corbel below the Vehicle and Bike Ramp and the response to RFI T-1850:

1. The corbel supporting the slab for the Communication Vault Room between the Vehicle and Bike Ramp is level and the top of the corbel remains at EL+ 14.0' per Detail 5 on AI-7413 even though it is not indicated on SKA-4289 (A1-7401).
2. The corbels below the Vehicle and Bike Ramps extend to the outside faces of the walls for each ramp and the corbel supporting the slab for the Communication Vault Room spans the entire distance between the corbels under the Vehicle and Bike Ramp.
3. S1-2251 shows the extent of the 4th Lift Foundation Walls that is included in TG06's scope in order to support the Vehicle and Bike Ramp. The western extent of the 4th Lift Foundation Wall is shown where the inside face of the foundation wall intersects with the outside face of the Vehicle Ramp Wall. The eastern extent of the 4th Lift Foundation Wall is shown to extend roughly 9 feet past the outside face of the Bike Ramp Wall to Gridline W. Additionally, the only elevation information for the portion of TG06's 4th Lift Foundation Wall is "TG0600 Foundation Wall=3/4" Below Bike Ramp (Varies)." Please confirm the eastern extent of the 4th Lift Foundation Wall as described above (per S1-2251) is correct. If it is correct, please provide a top elevation for the foundation wall that extends out past the Bike Ramp to Gridline W.
4. SCCI intends to pour the section of TG06's 4th Lift Foundation Wall in 3 different pours (see attached markup of S1-2251 for SCCI's proposed construction joint layout). Please note that these construction joints do not match up with the construction joints below in the 3rd Lift Foundation Walls. However, SCCI assumes that a similar condition to the 3 rd Lift Foundation Walls above the Knockout Walls (see RFI T-1569) exists due to the West Throat Slab separating the 3rd and 4th Lift Foundation Walls below the ramp.

T-1912	SST - Stair 403 Clarifications	Closed	CR	11/14/2014	11/24/2014	11/24/2014
<b>From:</b> Webcor Construction LP                      Gregory Kemerer						
<b>REQUEST:</b> This question impacts stair 403 between concourse and ground level.  1. Per the attached comments onSK-RFI-12A, the stair is currently setup to agree with 5/A1A7011and the structural steel locations noted by ASI-027. The new dimensions noted in ASI-127 will revise the edge of slab, thus revising the width of the stair well and the widths of the stairs inside it. Please furnish a revised detail.  2. Per the attached comments on SK-RFI 12B,new stair width dimensions have been determined to be5'-4 and 5'-6 ½". Please verify these dimensions are correct. These new dimensions create uneven ascending and descending stair widths. Does the stair need to be re-centered to 5'-5 ¼" equal widths on each side or is it allowed to be uneven?  3. Per the attached comments on SK-RFI-12C. the stair support columns would need to shift with the stairs and this creates a problem near the grid D.8 adjustment. The 2" shift south puts it too far off the edge of the concrete beam below and 11/S1-7600 will no longer work. Please advise on a revised detail. *Please furnish revised details 2, 4, 5/A1-7011 to reflect changes on ASI-127 and furnish revised column edge detail to replace 11/S1-7600		<b>ANSWER:</b> This question impacts stair 403 between concourse and ground level.  1. T-1913	SST - Checker Plate Mid Landings at Detail 10S1-7601	Closed	CR	11/14/2014	11/24/2014	12/10/2014
<b>From:</b> Webcor Construction LP                      Gregory Kemerer						
<b>REQUEST:</b> This question impacts all checkered plate mid-landings at detail 10/S1-7601  Q1: At detail 10/S1-7601 there will be a checkred kicker plate butting up against the end of the stringer at the soudside stringer connections. The long slot and bolted connection that allows the stringer to float will not be able to float in the direction of the kicker plate that stops it. This is typical at midlandings. Please see included sketches and advise.		<b>ANSWER:</b> This question impacts all checkered plate mid-landings at detail 10/S1-7601  Q1: At detail 10/S1-7601 there will be a checkred kicker plate butting up against the end of the stringer at the soudside stringer connections. From: Webcor Construction LP Gregory Kemerer

**REQUEST:**

See attached CD RFI # 684.1 SK1 to SK2 for follow up on items 1, 2, 5, 6 and 9 :

- 1) The response to item 1 in T-1929 SKA-4323 has provided dimensions to locate the stair posts on the Second Level (4/S1-7012) but it remains unclear where the post locations are in details 5 & 6/S1-7012. Where do the dimensions in 4/SKA-4323 apply? Note dimensions of nearest HSS 12x6x5/8" from GL 30 in detail 2 and 4 are not consistent (13'-5" from Detail 4 and 13'-10 1/4" from detail 2. Please clarify.
- 2) Braces are indicated on plan (orange lines) but connection details are missing. Supply connection details for each end of each brace.
- 3) Previous response is complete
- 4) Previous response is complete
- 5) SKA-4324 provides revised east/west locations for the hangers below the second level. Confirm the north/south dimensions in 3/S1-7012 are correct.
- 6) The post to beam connection per 1/S1-7600 does not work at the double posts. Supply a new connection detail.
- 7) Previous response is complete
- 8) Previous response is complete
- 9) The response is not clear please provide a revised structural plan
- 10) Previous response is complete

T-1930	SSS - Stud Spacing Detail	Closed	CR	11/18/2014	11/28/2014	12/01/2014
<p><b>From:</b> Webcor Construction LP                      Gregory Kemerer</p>						
<p><b>REQUEST:</b></p> <p>Please reference detail 1/S1-5000, Typical Headed Stud Spacing Detail. Note #4 indicates the maximum number of studs permitted per individual metal deck rib is 3. Also provided in this detail is a plan view titled "Beams Perpendicular to Deck" where the plan shows a three stud per rib condition. Skanska note the three studs are spaced 2-5/8" in one direction and 3" in the other which nets a diagonal spacing of 3". Skanska is running into conditions where the number of studs versus the number of available ribs will exceed 3 studs per rib, particularly at the bus deck level. See below for 2 examples:</p> <ol style="list-style-type: none"> <li>1. Sheet S1-2507, near the south east corner a W30x99 beam with 68 studs. The bay width is 16' wide and when you subtract the width of the support girders and the ribs lost by the drag plates we only have 11 available ribs. This results in 6 to 7 studs per rib.</li> <li>2. In the same general area are diagonal beams with 10 studs noted. Again due to the relatively short length of beam and long drag plates we may only have one full rib and a partial rib in which to fit 10 studs. Net result is 6 to 7 studs per flute.</li> </ol> <p>Please confirm the following is acceptable: Where the beam is wide enough, allow up to 6 studs per rib maintaining a repeating pattern of the aforementioned 2-5/8"x3" pattern. Where the quantity of studs would exceed 6 or is limited by the width of the beam to 4 or 5, eliminate the excess studs. See SK1 for clarification.</p>			<p><b>ANSWER:</b></p> <p>Please reference detail 1/S1-5000, Typical Headed Stud Spacing Detail. <b>T-1998</b>	<b>SCS - Wall Opening Detail Conflicts for Horizontal and Diagonal Bars</b>	<b>Void</b>	<b>01</b>	<b>09/15/2014</b>	<b>09/25/2014</b>	
<b>From:</b> Webcor Construction LP Claude Titcher						
<b>REQUEST:</b>			<b>ANSWER:</b>			
<p>Please reference detail 4/S1-3207 and RFI T-1666 about foundation wall opening conflicts. Since submitting RFI T-1666, more concerns regarding 4/SI-3207 have been brought to our attention.</p> <p>One of the concerns mentioned in RFI T-1666 was the case of additional vertical bars potentially conflicting with moment frame beam rebar. This issue can also occur with the diagonal cross bars and additional horizontal rebar.</p> <p>1. Please provide an alternative detail for cases where either additional horizontal bars and diagonal cross bars conflict with moment frame beam rebar.</p> <p>Due to the length of additional horizontal bars, wall openings near foundation wall CJs will cause the constructability issue of requiring rebar to be built out further to proceed with concrete pours.</p> <p>2. Please confirm that the alternate wall opening detail (requested in RFI T-1666) for additional vertical bar lengths can also be applied to additional horizontal bars.</p>			<p>Please reference detail 4/S1-3207 and RFI T-1666 about foundation wall opening conflicts. T-2013	FRP - UL Listing Reference for Intumescent Fire Resistive Material (IFRM-2)	Open	CR	12/12/2014	12/12/2014	

From: Webcor Construction LP                      Tram Nguyen

**REQUEST:**

Contract Doc Ref:  
 Sheet A1-8662 (ASI 127 dated 9/12/14)  
 Detail A/A1-8662 (ASI 127 dated 9/12/14)  
 Detail A/S1-6005 (IFC Drawings for Main Package dated 3/31/14)

Location:  
 Light Column - Train Plaform through Roof Park Level

Grid Line:  
 22-24 & D-F

Add'l Doc Ref's:  
 UL Design Listings (Design No. X674)

Per the Fire Protection Matrix & Schedule/A1-8662, the UL Design Listing referenced for IFRM-2 is X674.

Per Detail A/A1-8662, IFRM-2 is to be applied to the light column cast pipe members.

Per Detail A/S1-6005, the light column cast pipe sizes are 32"x2.36", 30"x2", 28"x1.57", and 30"x1.57".

The specific member sizes required by the contract documents are not identified within UL Design Listing X674 as tested assemblies.

Please provide direction as to how UL Listing X674 is to be applied to the light column members, or provide a standard to be used for installation of IFRM-2 at the members not listed within UL X674.

**ANSWER:**

Contract Doc Ref:

However, Table 2.1 shows that only the demand critical welds and butt joints in the column splices should receive the aforementioned testing and that in general, the welds on the moment frame columns should be subject to MT on 25% of the joints and UT on 100% of the joints. Further, testing on the moment frame columns can be reduced as per AISC 341, Appendix Q5.2. Please see attached SK1 that highlights the testing requirements, as understood by Skanska, for the moment frame columns and confirm this is correct.</p> <p>If this is not accurate, please supply the NDT</p>					
					<p><b>ANSWER:</b></p> <p>Contract Doc Ref: Spec Section 05 12 10-8                      Location: Moment Frames                      Grid Line: N/A                      Add'l Doc Ref's: SK1</p> <p>Spec Section 05 12 10-8, Table 2.1 outlines the nondestructive testing requirements.</p> <p>Please review the following, and confirm:</p> <p>1) The moment frame columns that are being fabricated are currently being subjected to 100% UT and 100% MT on all weld configurations. However, Table 2.1 shows that only the demand critical welds and butt joints in the column splices should receive the aforementioned testing and that in general, the welds on the moment frame columns should be subject to MT on 25% of the joints and UT on 100% of the joints. Further, testing on the moment frame columns can be reduced as per AISC 341, Appendix Q5.2. Please see attached SK1 that highlights the testing requirements, as understood by Skanska, for the moment frame columns and confirm this is correct.</p>

requirements for the Moment Frame Columns.

2) Please clarify the Table 2-1 remark under welds not described below, "MT 25% of joints, full length". It is our understanding that 1 out of every 4 joints will receive full length MT inspection and the next 3 joints will not receive MT. Please confirm.

If this is not accurate, please supply the NDT requirements for the Moment Frame Columns.

2) Please clarify the Table 2-1 remark under welds not described below, "MT 25% of joints, full length". It is our understanding that 1 out of every 4 joints will receive full length MT inspection and the next 3 joints will not receive MT. Please confirm.

T-2017	BGP - Foundation Wall - 3rd Lift - West Wall Rebar Cover	Closed	01	12/16/2014	12/26/2014	12/19/2014

From: Webcor Construction LP                      Claude Titcher

**REQUEST:**

Contract Doc Ref: N/A  
 Location: West Foundation Wall. W379. W380  
 Grid Line: N/A  
 Add' Doc Ref: Field Report SS10-073, attached sketches.

Please see attached sketches and field report #SS8510-073, sections 073.3.2 and 073.3.3, authored by Sean McNeill.

Due to a variance in concrete cover at foundation walls W379 and W380 SCCI proposesthe following solutions.

073.3.2: Where the 4 instances occur, SCCI proposes to excavate behind the vertical dowel approximately 6"down to allow for field bending of thee dowel in order to achieve specified cover. Vertical will be identified, concrete will be excavated and dowel will be field bent away from face of wall. (Please reference attached sketch referencing issue #073.3.2)  
 Please confirm this is acceptable.

073.3.3: Where condition occurs at wall W80, a 12"x 12"grid of #4 temperature steel will be added. This grid of temperature steel will be dobieed off of existing contract bars in order to achieve specified cover. The approximate height of the grid will be 3'to 6'and approximately 15'to 20'in length. At the top of the wall clear cover will be set to specified amount. (Please reference attached sketch referencing issue #073.3.3)  
 Please confirm this is acceptable.

---------------	----------------	---------------	------------------------	---------------------	----------------------	----------------------

**REQUEST:**

Contract Doc: S1-2607, S1-8002  
 Location: Zone 4, Roof Park  
 Gridline: E/33.5  
 Add'l Doc Ref's: RFI T-2034, CD RFI 740.1 SK1

Per RFI T-2034, detail 1/S1-8002 was supplied for the W33x118 to the BU-40x22 connection at GL E/33.5.

The connection per 1/S1-8002 will not work at the noted location:  
 > 1/S1-8002 calls for 11 bolts but only 9 bolts will fit inside the W33.  
 > the bottom flange of the W33 cannot be moment welded.

Please see the proposed connection in the attached CD RFI 740.1 SK1.

Confirm the connection is acceptable as shown or supply a new detail.

**ANSWER:**

Contract Doc: S1-2607, S1-8002  
 Location: Zone 4, Roof Park  
 Gridline: E/33.5  
 Add'l Doc Ref's: RFI T-2034, CD RFI 740.1 SK1

T-2049	PFB - Single Booth Panel Board Requirements per Specification Section 13 34 24	Closed	CR	12/29/2014	01/08/2015	01/08/2015

From: Webcor Construction LP                      Tram Nguyen

**REQUEST:**

Contract Doc Ref: (ASI 128 dated 12/16/14)  
 Specification Section 13 34 24  
 Sheet E1-2310  
 Sheet E1-2306  
 Sheet E1-2502

Location: N/A

Closest Column Line Intersection: N/A

Add'l Doc Ref's: N/A

Specification Section 13 34 24 (2.3) N Prefabricated Guard Booths indicates that Sheets E1-2310, E1-2306, and E1-2502 are to be used for installation of electrical within the prefabricated guard booths.

Sheets E1-2310, E1-2306, and E1-2502 show the electrical for prefabricated guard booths as home runs to electrical panels within electrical rooms not integrated with the booths.

Specification Section 13 34 24 (3.2) C indicates that there is to be a single booth panel board.

Please revise the electrical drawings to show a single booth panel board which feeds all electrical to the booth, or revise the specification to agree with the drawings.

**ANSWER:**

T-2059	SCS - DBA's at Bus Level Seismic Joint	Closed	01	01/07/2015	01/17/2015	01/16/2015

From: Webcor Construction LP                      Claude Titche

**REQUEST:**

Contract Doc Ref: S1-2503, S1-5005  
 Location: Bus Deck Level  
 Grid Line: 10  
 Add'l Doc Ref's: N/A

Please reference S1-5005 regarding the seismic joint detail at bus level. Drawing states "5/8" DEFORMED BAR ANCHOR (TYP AS SHOWN)@ 10" OC BETWEEN JOIST BOX". The joist box locations/dimensions and further DBA spacing/dimensions are required to detail the DBAs.

1. What is the north-south spacing between these joist boxes?
2. What are the plan dimensions for the joist boxes?
3. Please confirm the 10" OC DBA spacing is in the north-south direction between joist boxes.
4. What is the east-west spacing between the two DBAs shown in S1-5005?
5. Are the DBAs noted above (#5 at 10" o/c between joist boxes) required in the region where 2/S 1-5005 is valid (IE: at Bus Level Seismic Joints roughly between GLD and F)?
6. Detail 1/S1-5005 shows 3 of the 4 DBAs penetrating the joist box. Please confirm or revise the detail.

**ANSWER:**

T-2060	<b>SSS - SE201 &amp; SE202 FO 34 Missing Information</b>	Closed	CR	01/07/2015	01/17/2015	01/16/2015
<b>From:</b> Webcor Construction LP                      Gregory Kemerer						
<b>REQUEST:</b> Contract Doc Ref: S1-2701 Location: Zone 1, Roof Park Gridline: F/5 Add'l Doc Ref's: SK1  Drawing S1-2701 shows a beam supporting elevator posts near gridline F/5. This beam was initially aligned with the W12x14 beams on either side, but was moved below the future elevator post in FO 34.  The location of the moved W16x36 beam was requested in RFI T-1922, but the dimensions were not supplied and the issue was deferred to the elevator contractor.  To avoid holding up the fabrication of the beams and supporting steel, confirm it is acceptable to locate the beam aligned with the W12's and extend the new W12x19 as shown in current model.		<b>ANSWER:</b> Contract Doc Ref: S1-2701 Location: Zone 1, Roof Park Gridline: F/5 Add'l Doc Ref's: SK1  Drawing S1-2701 shows a beam supporting elevator posts near gridline F/5. <b>REQUEST:</b>		<b>ANSWER:</b>				
<p>Please refer to the beam elevations shown on drawings S1-3660 and S1-3661.</p> <p>Both beams, at 2 locations on each beam, show #14 bar lapping with #11 bar using a standard top splice. General Note RE-9 (also see notes RE-7 &amp; 8) on sheet S-0007 indicates Lenton mechanical coupler splices are required. S1-3001 does not provide a splice length for bars larger than #11. Please confirm no coupler is required, and provide the required standard top splice length.</p>		<p>Please refer to the beam elevations shown on drawings S1-3660 and S1-3661.</p> <p>Both beams, at 2 locations on each beam, show #14 bar lapping with #11 bar using a standard top splice. **From:** Webcor Construction LP                      Claude Titcher

**REQUEST:**

Contract Doc Ref: S1-5022  
 Location: Ground Level  
 Grid Line: C and G  
 Add'l Doc Ref's: Attached

Please reference Sheet S 1-5022 showing the typical steel to concrete connection at the ground level. Note the 1:1 slope from bottom of beam to bottom of flange in Detail 1B and 4A. Insufficient rebar details are available in this 1:1 slope in SI-5022. The details direct to the SI-37XX series for further rebar details. Sections are taken at various GLs at N/S Transfer Girders, but not between GLs at the E/W perimeter steel. The bottom bar embedment varies: 90 degree, 45 degree, and terminator ends are all used.

Shimmick requires further rebar details in the 1:1 sloped region of the MFBs between GLs at the E/W perimeter steel along GL C and G to produce shop drawings. This RFI affects Submittal TG0702-076 for Ground Level 13-19 Rebar and has potential changes for Submittal TG0702-075 for Ground Level 10-13.

1. Please provide a new rebar detail applicable to all MFB between grid lines, one each for GL C and GL G. Please include bent bottom bar requirements and stirrup requirements as applicable.

2. Are bent bars, similar to those shown in the SI-37XX markups, required in the 1:1 sloped region of the MFBs between TRs along GL C and G?

3. If bent bars are required per #2, please provide criteria on when to apply each of the following bottom bar end conditions: 90 degree, 45 degree, and terminator ends. Shimmick would propose the criteria as the size of the 1:1 slope region.

4. If bent bars are required per #2, Shimmick proposes that the bottom bent bars are added with a splice to facilitate placing the bar. Propose (a) splice length per splice schedule on S1-3001, to extend from start of 1:1 toward foundation wall, (b) to reduce bent bar size from matching MFB to a #5, (c) splice length per larger bar size.

5. Please provide a distance from the GL G and C at

T-2099	SCS - Welded Bars at Cast Node/TRs Near Roadway Slab 2	Closed	01	01/16/2015	01/26/2015	01/27/2015

From: Webcor Construction LP                      Claude Titcher

**REQUEST:**

Contract Doc Ref: S1-2305, S1-4109, S1-4304, S1-4354, 1/S1-4354  
 Location: Ground Level  
 Grid Line: N/A  
 Add'l Doc Ref's: Attached.

Please reference the following sheet path to reference welded bar conflicts at the Cast Node/TR connections: S1-2305 ->B/S1-4109 -> B/S1-4304 -> S1-4354. The below applies to 6 locations: C/16.9, G/16.9, C/19.1, G/19.1, C/24.9, G/24.9. Sheets from Skanska's Submittal TG0701-079 are attached as an example for C/16.9.

In detail 1/S1-4354, 2 of the bottom bars sit on the outside of the 2" stiffener plates. All bottom bars are welded to bottom of flange. In cross referencing the Structural Steel Shop Drawings, the bottom flange extends no further than the edge of the 2" stiffener plate. There is no bottom flange on which to weld the 2 outermost bottom bars as shown in detail 1/S-4354. Propose either (a-preferred) fit all 26 bottom bars within both 2" stiffener plates by reducing spacing from 5" OC to 3" OC minimum, with bars field adjusted to avoid plates, or (b) weld the north bar to the north face of the 2" stiffener plate. Please confirm which proposal is acceptable. Rebar shops will reflect detailing change if acceptable.

**ANSWER:**

The below applies to 6 locations: C/16.9, G/16.9, C/19.1, G/19.1, C/24.9, G/24.9. Sheets from Skanska's Submittal TG0701-079 are attached as an example for C/16.9.

In detail 1/S1-4354, 2 of the bottom bars sit on the outside of the 2" stiffener plates. All bottom bars are welded to bottom of flange. In cross referencing the Structural Steel Shop Drawings, the bottom flange extends no further than the edge of the 2" stiffener plate. There is no bottom flange on which to weld the 2 outermost bottom bars as shown in detail 1/S-4354. Propose either (a-preferred) fit all 26 bottom bars within both 2" stiffener plates by reducing spacing from 5" OC to 3" OC minimum, with bars field adjusted to avoid plates, or (b) weld the north bar to the north face of the 2" stiffener plate. Please confirm which proposal is acceptable. Rebar shops will reflect detailing change if acceptable.

T-2106	SCS - Conflict Between TR Girder Stirrup Holes and Concrete Beams	Closed	01	01/16/2015	01/26/2015	01/27/2015
<p><b>From:</b> Webcor Construction LP                      Claude Titcher</p> <p><b>REQUEST:</b></p> <p>Contract Doc Ref: S1-3705                      Location: Ground Level                      Grid Line: N/A                      Add'l Doc Ref's: Attached.</p> <p>Please reference SI-3705, Sheet 631AC from SSS TG0701-074, and Sheet GN02F from SCS TG0702-075. All sheets are in reference to the concrete MFB framing into TR 12 at GL C as an example.</p> <p>SI-3705 shows 2" holes penetrating TR 12 at top and bottom of web for placement of stirrups. The steel shop drawing for TR 12 shows the hole layout. However, when detailing the MFB/TR connection at C/12, the stirrup holes fall outside the concrete beam bottom due to the 1:1 sloped region of the concrete beam (shown in SI-3705). The conflict is reflected in the rebar shop drawing. This results in exposed stirrups.</p> <p>Shimmick proposes that stirrups be eliminated when transfer girder stirrup holes fall outside the concrete limits. Please confirm this is acceptable. If this is not acceptable, Shimmick proposes to provide hanger bars through only the top holes in the web, with size to match original stirrups and fit concrete limits.</p>		<p><b>ANSWER:</b></p> <p>Contract Doc Ref: S1-3705                      Location: Ground Level                      Grid Line: N/A                      Add'l Doc Ref's: Attached.</p> <p>Please reference SI-3705, Sheet 631AC from SSS TG0701-074, and Sheet GN02F from SCS TG0702-075. tight fitting backing ring required to complete a CJP.

For demonstration please refer to attached SK RFI 1015 SK 1 and SK 2 which shows actual dimensions for the first pipe section cut by our fabricator (p16056) and corresponding measurements from cast nodes 702-01 and 702-02

machined backing ring (see attached sketches). The sketches compare the measured pipe ID to the cast node backing ring OD. This piece does not fit against either of the cast nodes

To resolve these issues we see the following options / solutions:

1. Grind internal bores of pipe ends to allow fit against castings. This option would not permit the completion of complete joint penetration welds so the CJP weld designation requirement would have to be modified to a PJP by the design team. Gaps exceeding PJP allowances would have to be built up with weld metal. Please note; however, that this option does not ensure a correct alignment between the vertical pipe and cast nodes.
2. Machine internal bores of pipe ends to ensure a tight fit against the castings and correct alignment between the pipe and castings. The actual machining work to achieve this would be minimal; however, building machining fixtures and set up time for each pipe end would be significant.
3. For pipe to pipe welds in the ring sections, we suggest removing the CJP weld designation.

Please advise or provide a solution as the above options have cost and schedule impacts.

varying and unmatched IDs again inhibiting the installation of a tight fitting backing ring required to complete a CJP.

For demonstration please refer to attached SK RFI 1015 SK 1 and SK 2 which shows actual dimensions for the first pipe section cut by our fabricator (p16056) and corresponding measurements from cast nodes 702-01 and 702-02

<b>T-2167</b>	<b>FSP - Required Spacing between Sprinkler Heads</b>	<b>Open</b>	<b>CR</b>	<b>02/03/2015</b>	<b>02/13/2015</b>	
<b>From:</b> Webcor Construction LP      Aseem Goyal						
<b>REQUEST:</b>						
Contract Doc Ref: A1-4506 & A1-4507/ Spec 21 13 19 1.3/B/7						
Location: Bus Deck Level (Between Grids 27 & 33.5)						
Closest Column Line : N/A						
Add'l Doc Ref's : N/A						
Per Spec 211319 1.3/B/7.a closely spaced sprinklers (6' on centers) are required between 27 & 33.5. A1-4507 shows these closely spaced sprinklers at less than 6' on center. This is less than the minimum spacing between sprinklers allowed per NFPA #13 unless baffles are placed between the heads to prevent cold soldering. Baffles are not shown on sheets A1-4506 & A1-4507. Please confirm the closely spaced sprinklers will be spaced at 6' on center per specifications?

T-2168	SSS - Light Column Pipe to Cast Node Joints	Void	01	02/03/2015	02/13/2015	
<p><b>From:</b> Webcor Construction LP                      Andrew Kitchen</p>						
<p><b>REQUEST:</b></p> <p>Contract Doc Ref: S1-6005, S1-6006                  Location: GL 23                  Add'l Doc Ref: AWS D1.1</p> <p>Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. Pipe has been ordered and delivered in conformance with this specification. Detail 6/S1-6006 shows the intended fit between the vertical pipe legs and the cast nodes. The castings have a machined feature on each nozzle end that is intended to slide into the pipe ends and act as a backing ring. The corresponding weld between these two components is called out as a complete joint penetration weld in the same detail. In accordance with AWS D1.1 Section 5.22.1.1, the separation between faying surfaces of butt joints landing on a backing shall not exceed 1/16". The allowable tolerances for API 5L Grade X52 pipe do not require concentricity (between internal and external bores) or even a constant wall thickness that would be required by AWS D1.1 to provide a complete joint penetration weld. Further, there is no requirement in the contract documents for additional machining to the internal bores of the pipe ends as would be required by AISC Code of Standard Practice.</p> <p>As a result our fabricator has encountered the following conditions;</p> <ol style="list-style-type: none"> <li>1. Pipe does not fit over the machined backing ring at the cast node nozzle end as intended without additional grinding and/or machining</li> <li>2. Pipe fits over cast node backing ring; however, pipe ID is not circular or concentric, resulting in excessive gaps that exceed fit tolerance requirements for a complete joint penetration weld. Further, the lack of concentricity may result in misalignment of the pipe and cast nodes in the vertical legs.</li> <li>3. Ring pipe segments will be made from different pipe sections. Pipe ends from such sections will have varying and unmatched IDs again inhibiting the installation of a tight fitting backing ring required to complete a CJP.</li> </ol> <p>For demonstration please refer to attached SK RFI 1015 SK 1 and SK 2 which shows actual dimensions for the first pipe section cut by our fabricator (p16056) and corresponding measurements from cast nodes 702-01 and 702-02 machined backing ring (see attached sketches).</p>			<p><b>ANSWER:</b></p> <p>Contract Doc Ref: S1-6005, S1-6006                  Location: GL 23                  Add'l Doc Ref: AWS D1.1</p> <p>Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. 	<p>The sketches compare the measured pipe ID to the cast node backing ring OD. This piece does not fit against either of the cast nodes.</p> <p>To resolve these issues we see the following options / solutions;</p> <ol style="list-style-type: none"> <li>1. Grind internal bores of pipe ends to allow fit against castings. This option would not permit the completion of complete joint penetration welds so the CJP weld designation requirement would have to be modified to a PJP by the design team. Gaps exceeding PJP allowances would have to be built up with weld metal. Please note; however, that this option does not ensure a correct alignment between the vertical pipe and cast nodes.</li> <li>2. Machine internal bores of pipe ends to ensure a tight fit against the castings and correct alignment between the pipe and castings. The actual machining work to achieve this would be minimal; however, building machining fixtures and set up time for each pipe end would be significant</li> <li>3. For pipe to pipe welds in the ring sections, we suggest removing the CJP weld designation.</li> </ol> <p>Please advise or provide a solution as the above options have cost and schedule impacts.</p>

T-777.1	BGP - Lower Concourse Concrete Finishes	Closed	01	06/05/2014	06/15/2014	06/13/2014

From: Webcor Construction LP                      Claude Titcher

**REQUEST:**

Reference specification sections  
 - 03 30 20 (Dated August 30, 2012)  
 - 09 67 24 (Dated March 31, 2014)  
 Reference Drawings  
 - A1-2202 thru A1-2211 (Dated March 31, 2014)  
 - A1-9523, A1-9524, A1-9525 (Dated March 31, 2014)  
 - A1-9602 (Dated March 31, 2014)

Per specification 03 30 20-3.6, B.1 Concrete Finishes:  
 Scratch finish is specified with FF/FL and is clarified in RFI T-777. (see attached)

New Lower Concourse drawings A1-9523, A1-9524 & A1-9525 issued in IFC set dated 3.31.14 delineate certain areas of structural concrete slab to remain as exposed and will not receive topping slab. These sheets do not show any reference for concrete surface finish other than what is specified under specification 03 30 20 and RFI T-777. The contractor has stated that this finish will be provided using a Fine Broom.

Please confirm this understanding is in alignment with the designer's intent for the areas of structural slab that will remain exposed.

Also, please confirm for all Concourse floor areas (topping slab, interim topping slab or no topping slab) that are to receive floor coating FC-3 the specified scratch finish is the designer's intent for concrete finish. FC-3 Spec section 09 67 24 located per floor finish plans A1-22\_\_ Series drawings and Floor finish schedule A1-9602.

	<p>Reference Geotechnical Drawings</p> <p>A. Both the Architectural and Structural drawings show the west end of the train box curve continuing to the south west to an extent greater than that shown on the Geotechnical drawings. The structural drawings indicate a line showing the "extent of shoring wall in the bid package". Please confirm that the shoring wall's final design will follow the geometry shown in the architectural and structural drawings.</p> <p>B. Both the Architectural and Structural drawings show the south east of the train box curving once Beale street is reached. The Geotechnical drawings show the wall continuing straight along line J until it intersects the end wall. Please confirm that the shoring wall's final design will follow the geometry shown in the architectural and structural drawings.</p> <p>C. Please provide new workpoints &amp; centerline dimensions of CDSM Wall based on the correct end conditions at both the east and west ends.</p> <p>Submitted by Charles M. Gardner                      Kiewit Infrastructure West Co.                      08/03/2010</p>

TG03.00-0032	TG03 Question 0032 - Extend Bid Date	Closed	06	08/10/2010	08/17/2010	08/13/2010
<p><b>From:</b> Webcor/Obayashi Joint Venture      Manuel Saldana</p>						
<p><b>REQUEST:</b></p> <p>Exhibit A, II, "Key Dates for Bidding Process" of the Project Bidding Manual establishes the Bid Due Date as Sept. 14, 2010, 6 weeks from the date of bid package issuance.</p> <p>Six weeks is an insufficient amount of time to adequately prepare a \$200M estimate and bid. We therefore request that the Bid Due Date be extended an additional 8 weeks for the following reasons</p> <p>Design-Build                      The SBE package includes major design-build elements. The extent of the design work related to shoring, bracing, trestle, cross-street bridging and dewatering that the BSE Trade Subcontractor will be responsible for performing became fully apparent to the prequalified contractors only when the bid package was issued. Developing these required Trade Contractor designs far enough to allow accurate pricing to begin will take time.</p> <p>Considering the magnitude and location of the construction work, the risk accompanying the design is also extremely high. A memorandum of understanding that adequately addresses this risk must be negotiated with the Trade Subcontractor's Professional Engineer before design can even begin. This will take time.</p> <p>Similarly, the Trade Subcontractor will likely enlist the services of an independent Professional Engineer to act as a peer reviewer to check the work of the Trade Subcontractor's principal engineer. Reconciliation of any differences identified during this review will take time.</p> <p>Liquidated Damages                      Liquidated damages associated with not meeting the CM/GC's schedule for Substantial Completion are extraordinarily high. It appears to us that the BSE Trade Subcontractor's time for substantial completion, i.e. 1,825 days following Notice to Proceed with pre-construction services, is highly interconnected with the work of other trade subcontractors and also contingent on their performance. If this is the case, it becomes very difficult to accurately assess risk of exposure to liquidated damages. The Joint Venture will need time to clarify with the CM/GC the relationship between the other trade subcontractors' work and the BSE Trade Subcontractor's</p>			<p><b>ANSWER:</b></p> <p>Exhibit A, II, "Key Dates for Bidding Process" of the Project Bidding Manual establishes the Bid Due Date as Sept. 14, 2010, 6 weeks from the date of bid package issuance.</p> <p>Six weeks is an insufficient amount of time to adequately prepare a \$200M estimate and bid. <b>REQUEST:</b> Reference Exhibit A Section 5 last paragraph references Specification 00 05 20 for responsibilities for liquidated damages.  Q - The liquidated damages described in 00 05 20 are based on a requirement for the completion of Trade package No. 1 in 1,825 calendar days beginning with Notice to Proceed with Pre-Construction Services. 1) Please provide the Notice to Proceed date for Pre-Construction Services. 2) Please advise how liquidated damages will be assessed for late completion of Zone 1, Zone 2, Zone 3, and Zone 4. Since any of these zones could potentially be late, it is not clear how the CM/GC will assess potential LD's.  Submitted by Kelly Turner Granite / CJA / NCC Joint Venture 08/11/2010		<b>ANSWER:</b> Reference Exhibit A Section 5 last paragraph references Specification 00 05 20 for responsibilities for liquidated damages. **REQUEST:**

Reference Transbay Terminal Center Bid Package TG03 Shoring, Buttress and Excavation (Cont.)

Q - We have started into our second week of intensive review of bid documents and drawings in which to grasp what is prescriptive work and what requires additional contractor design and scheduling in our bid proposal preparation. Having been involved in not only pre-bid contractor designed support-of-excavations but final design and construction of numerous deep supported excavations in urban environments in numerous cities in California, we look forward to working on this unique and challenging project. This project brings additional elements to be considered during design of support-of-excavation and traffic supported trestles that would not normally be considered in below street level construction. One, the width of the supported excavation at approximately one hundred and eighty L.F., will require at least two intermediate vertical piles to support the horizontal bracing levels. Second, the need to incorporate both longitudinal and transverse traffic trestle decking whose vertical support locations will add to the constraints and interference with the location of the horizontal bracing levels. Third, the phasing of the shoring and excavation will require various locations of bracing levels of the CDSM cut-off walls. Fourth, the tie-down anchors will have to be designed to meet project specifications. Fifth, the volume of information including as-builts and the myriad of geotechnical information provided will consume considerable time which our designers can ill afford not to digest the pertinent information. And lastly, the tremendous coordination and evaluation of the various key subcontractors scopes and proposals will be itself a considerable effort since various proprietary information will be provided to them for pricing Tutor-Saliba's in-house designs. For these various reasons, we strongly urge a postponement of at least four weeks to the current scheduled bid date of September 14th in which we can properly develop the most complete and competitive design concepts and pricing proposal to Webcor/Obayashi. It is very important that you evaluate this request in a timely manner in which we can allocate the limited time available to our engineering and estimating forces. Your timely written response is appreciated.

<b>TG03.00-0056</b>	<b>TG03 Question 0056 - Access Trestle Permanent Structure</b>	<b>Closed</b>	<b>06</b>	<b>08/16/2010</b>	<b>08/22/2010</b>	<b>08/20/2010</b>
<p><b>From:</b> Webcor/Obayashi Joint Venture      Manuel Saldana</p> <p><b>REQUEST:</b>                      Reference Exhibit A, Attachment 3 A.</p> <p>Q - We note that the access trestle is to be coordinated with permanent construction, not conflict with the permanent structure except for penetrations, and is to be at the same level of the temporary bridges at the connections. This would appear to require that the trestle deck be below the bottom of the ground floor permanent structure section, with built-up ramps to match the street bridges. We also note that the permanent ground level structure is lower at the street crossings than elsewhere. This would push the trestle deck further down, conflicting with the limits of placement of the top level bracing strut. No guidance is given regarding how the future Trade Subcontractor will want to use the trestle to construct the ground floor or the superstructure. Please clarify where the top of trestle deck is intended to be located, and whether it is acceptable to locate the trestle deck at ground floor level, such that it could be used for sequential construction of the ground floor and superstructure. Is there an upturned longitudinal beam down the middle of the street crossings? . Schedule A on S1-3201 only indicates a 30" slab.</p> <p>Submitted by Charles M. Gardner Kiewit Infrastructure West Co. 08/13/2010</p>

<b>REQUEST:</b>						
Reference drawing sheet GT-1111 Legend. A.						
Q - Please help to clarify the strut and waler system stiffness requirements. Our initial interpretation and the associated analyses indicate that strut and waler sizes increase very significantly over what would be required by strength considerations alone. Please provide a sample calculation or procedure for determining stiffness for comparison with the values given in kip per foot, per foot of wall. B. Pre-loading will take out a portion of the axial shortening of the struts. We assume that it is appropriate to subtract out that deflection from the stiffness calculation. Please confirm.

**REQUEST:**

Reference specification 39 09 13

The plans show geotechnical instrumentation including inclinometers, MPBXs, piezometers and settlement points. Specification Section 39 09 13 states that "... Geotechnical instrumentation consists of inclinometers, settlement casings, settlement monitoring points, survey reference points, piezometers and multiple point borehole extensometers." The plans state that the geotechnical instruments for monitoring the TBT excavation and shoring work are to be drilled and installed by the TJPA representative. However, the specifications call for "...furnishing, installing, monitoring, reading, recording, maintaining, protecting ..... geotechnical instrumentation." The specifications go on to state that "...where shown on the drawings, the Contractor will procure and install the specified instrumentation." We find no notes on the plans calling for the Contractor to procure and install the specified instrumentation nor notes as to who is responsible for monitoring the shoring performance. The plans appear to be inconsistent with local practice in that it is customary in Northern California for the Contractor to furnish, install and monitor appropriate geotechnical instrumentation when the Contractor is responsible for constructing works involving deep excavations and shoring. We recognize the Internal Bracing Specification requires a monitoring program for struts, but is silent on exterior monitoring.

1. What is the Owner's intent in this regard?
2. Will the TJPA be responsible for the exterior monitoring

**ANSWER:**

<b>TG03.00-0159</b>	<b>TG03 Question 0159 - Temporary Bridge</b>	<b>Closed</b>	<b>06</b>	<b>09/03/2010</b>	<b>09/10/2010</b>	<b>09/13/2010</b>
<b>From:</b> Webcor/Obayashi Joint Venture	Manuel Saldana					
<b>REQUEST:</b>	<p>Schedule A on S1-3201 identifies top of structure elevations. When these elevations are cross referenced against the elevations of the cross streets the temporary bridges that tie into it will be several feet above grade, unless there is a provision for a concrete "leave out" Drawing A 5206 shows First Street Elevation at 14.94. The top of structure at this zone is from 12.79' to 13.47', this allows less than 2' for the temporary bridge installation. Depending on the final Temp. bridge design and clearance necessary to construct box structure below the bridge deck may be as much as 6' above the city street. Is it the owners intent to ramp up on the city street to the temp bridge elevation? If so what is the max grade allowed for the approach ramp?</p> <p>Also, please comment on the intent for side sloping, access for business, support of fill, etc. This condition applies to Beale street as well.</p> <p>Submitted by Charles M. Gardner Kiewit Infrastructure West Co. 09/02/2010</p>

TG03.00-0164	TG03 Question 0164 - Internal Bracing	Closed	CR	09/07/2010	09/13/2010	09/22/2010
<p><b>From:</b> Webcor/Obayashi Joint Venture      Manuel Saldana</p> <p><b>REQUEST:</b></p> <p>Information Requested                      Reviewing Drawings GT-1110, GT-1111, GT-1112 and GT-5101, and our In-house Design, there seems to be a conflict in the TJPA Design of the CDSM wall. Drawings GT-1111 and GT-1112 note that the Max Cantilever to ground surface is 10' max (install) and 13' max (removal), but with the West, East, and Buttress Earth pressures from GT-1110 and Strut Elevation called out at + Elevation 11, + Elevation 6, and + Elevation 4 and the Top of Pile beams form GT-5101, produce cases where the install Cantilever exceed the 10' Max.</p> <p>A/1-5 +22.0 -11 = 11' that exceeds 10'                      1-1 +24.0-11 = 13' that exceeds 10'                      X1-1 +25.0 -11 = 14' that exceeds 10'                      X1-2 +24.0 -11 = 13' that exceeds 10'                      J/13-19 +18.0 -6 = 12' that exceeds 10'                      J/19-25 +17.0 -6 = 11' that exceeds 10'                      J/25-27 +15.0 +4 =11' that exceeds 10'</p> <p>Does the note on Stage 2 on Drawing GT-1111 infer that the Owners Design of the CDSM wall can take the "Over Cantilever" because we can dig to a specific Elevation of +8 west of Grid Line 17 and to Elevation + 7 east of Grid Line 17? Or does the Owners Design need to be Revised to add an additional Strut/Waler Level to the Owners Wall Design? Can we get a clarification on the 10' max shown on Drawing GT-1111 and the west end walls? Can we use 14', 13', 12', 11' cantilever to the first strut level elevation shown at +11, +6, and +4 vs the 10' max shown on GT-1111 Drawings?</p> <p>Submitted by Charles M. Gardner                      Kiewit Infrastructure                      09/03/2010</p>		<p><b>ANSWER:</b></p> <p>Information Requested                      Reviewing Drawings GT-1110, GT-1111, GT-1112 and GT-5101, and our In-house Design, there seems to be a conflict in the TJPA Design of the CDSM wall. TG03.00-0165	TG03 Question 0165 - Excavation	Closed	CR	09/07/2010	09/13/2010	09/08/2010

From: Webcor/Obayashi Joint Venture      Manuel Saldana

**REQUEST:**

Reference Earthwork 31.00.00, 3.19.B.2 which states "Protect newly excavated areas from traffic and erosion...Barricades shall be installed at the tops of the sloped embankments to prevent vehicles and storage loads within seven feet of the tops of the slopes."

a. Does this specification apply to the top edge of the vertical face main excavation? (i.e. perimeter shoring wall)

b. If seven foot distance is required (at the top edge of the main excavation), then can it be assumed to start at the inside face of CDSM wall and stop at the outside toe of barrier? If not, then please define start and stop of the seven foot distance.

c. CDSM wall and excavation occurring on Minna and Natoma streets exist in close proximity to numerous private garages, driveways, and pedestrian entryways. With a further 7 ft setback restriction, this will virtually take the remaining portion of Minna and Natoma street, relegating any traffic along these alleys to existing sidewalks. A specific example would be on Natoma between column lines 14 to 17. Is it the Owner's intent to maintain these setbacks and demolish the existing sidewalks and planter areas by pushing vehicular access closer to the buildings?

TG03.00-0175	TG03 Question 0175 - Shoring Wall	Closed	CR	09/07/2010	09/13/2010	09/17/2010

From: Webcor/Obayashi Joint Venture      Manuel Saldana

**REQUEST:**

The response to previous question TG0300-0054 states that the rebracing loads can be determined based on the information provided on GT-1110. Please identify the specific information on GT-1110 that is to be used to determine these loads. We note that the computation of these loads will depend upon the assumed degree of CDSM wall fixity at the base slab, the assumed distribution of seismic loads, as well as, other inherent assumptions. The CDSM wall analysis and design computations (which we assume must have included an analysis of the bracing removal/rebracing stages) have not been made available to the bidders so it is not possible to ascertain the basic loading and support conditions assumed by the CDSM wall designer for the bracing removal/rebracing conditions. We recommend that the static and seismic components of the rebracing design loads be provided so that all bidders are designing the rebracing for bracing demands that are consistent with the CDSM wall designer's computations.

<b>TG03.00-0199</b>	<b>TG03 Question 0199 - Retention</b>	<b>Closed</b>	<b>CR</b>	<b>09/13/2010</b>	<b>09/19/2010</b>	<b>09/14/2010</b>
<b>From:</b> Webcor/Obayashi Joint Venture      Manuel Saldana						
<b>REQUEST:</b> Reference Answers to Pre-Bid Meeting Questions.  The answer to Question 13 says that retention is withheld for the duration of each subcontractor's scope of work rather than the entire project. Most of the SBE Subcontractor's scope of work will be complete with the placing of the rat slabs. However, the contract will continue until the SBE Subcontractor's responsibility for shoring/bracing removal and trestle/bridge removal is complete. The schedule for this work is contingent on other Trade Subcontractors and the completion date for the entire scope of the SBE Trade Subcontract Package is unknown. Will Webcor/Obayashi release retention attributable to all work completed up until the placing of the rat slabs when the placing of the rat slabs is complete?

TG03.00-0202	TG03 Question 0202 - Bid Due Date	Closed	CR	09/13/2010	09/19/2010	09/13/2010

From: Webcor/Obayashi Joint Venture      Manuel Saldana

**REQUEST:**

Our QBD sent on 9/02/10 expressed our serious concern with the SBE Trade Package schedule, liquidated damages and other contract terms. We requested that Webcor/Obayashi meet with the SBE Trade Package bidders, as soon as possible, in order to clarify and resolve the major issues of concern. We also requested that the bid due date be postponed by 6 weeks.

We have not yet received a response to our 9/02/10 QBD. We cannot continue to expend resources on this bid without Webcor/Obayashi acknowledging our concerns and committing to act timely to help resolve them.

We ask that Webcor/Obayashi provide us with a response to our 9/02/10 QBD by Friday 9/17/10, otherwise we will have to suspend our estimating effort on Bid Package TG03.

<b>From:</b> Webcor Construction LP                      David Hungerford						
<b>REQUEST:</b> The bid form is far too complex. We can possibly understand the need for the data indicated by the bid form from the subcontractor awarded the project, but we can see no need for each and every bidder to fill out every space in a ten page bid form. In addition the bid form requires us to fill in the quantities. As every subcontractor will have different quantities, this seems somewhat odd. A typical SF PUC style bid form, with quantities provided, would result in bids that could be confidently compared with each other- Apples to Apples, not Oranges to Apples. We request that such a bid form be provided. If the bid form is not simplified greatly, we will not be able to bid this project, since it will take more time to complete the form than actually estimate the project.  W/O to provide answer.		<b>ANSWER:</b> The bid form is far too complex. <b>TG043-0010</b>	<b>Bid Package Drawing Clarification</b>	<b>Closed</b>	<b>CR</b>	<b>11/02/2010</b>	<b>11/16/2010</b>	<b>11/02/2010</b>
<b>From:</b> Webcor Construction LP	David Hungerford					
<b>REQUEST:</b>	Exhibit A.IV, Clarification of Bid Package. It states that The issued for construction drawings and the Field Order revisions are for construction of Bid Package TG04.5.1 ONLY. However the Delta 1- Field Order-revisions state that the revisions (are) for TG04.3 and TG 04.4. So if they are for construction of Bid Package TG04.5.1 ONLY, why are they revisions for TG04.3 and TG04.4? Are you trying to say- Use all the drawings as provided, and then when we give you a contract we will reissue the drawings, without changes, other than stating that they are now issued for construction? Please clarify exactly what you mean.					<b>ANSWER:</b> Exhibit A.IV, Clarification of Bid Package. It states that The issued for construction drawings and the Field Order revisions are for construction of Bid Package TG04.5.1 ONLY. However the Delta 1- Field Order- revisions state that the revisions (are) for TG04.3 and TG 04.4. So if they are for construction of Bid Package TG04.5.1 ONLY, why are they revisions for TG04.3 and TG04.4? Are you trying to say- Use all the drawings as provided, and then when we give you a contract we will reissue the drawings, without changes, other than stating that they are now issued for construction? Please clarify exactly what you mean.

<b>REQUEST:</b>						
<p>Sheet U1110 and all the other demo sheets. On sheet U1110 note 5 does not specifically state that the gas is to be demolished by PG&amp;E, note 7 does not say duct bank to be removed by AT&amp;T (other notes are similar), but the notes also do not specifically state that ¿Trade contractor is to demolish¿ or something similar. Exhibit A.IV.D.2 (page 7), third bullet, states: ¿Unless noted otherwise on the drawings, Electrical, Gas &amp; Telecommunication lines will be abandon and all feeders removed by the respective utility owners prior to demolition by this contract.¿ Thus there is an ambiguity. Are we, or are we not to include demolition of the Electrical, Gas &amp; Telecommunication lines? In either case, who removes the boxes, vaults etc.? Please clarify. Exactly what is required at all locations on the plans?</p> <p>W/O to provide answer.</p>

<b>From:</b> Webcor Construction LP      David Hungerford						
<b>REQUEST:</b>			<b>ANSWER:</b>			
<p>Specs. 000700.6.06.C.2 states that markup on labor is direct cost plus Caltrans surcharge plus 15%, or is it direct</p>			<p>Specs. 000700.6.06.C.2 states that markup on labor is direct cost plus Caltrans surcharge plus 15%, or is it</p>			

<u>Number</u>	<u>Subject</u>	<u>Status</u>	<u>Choice Required</u>	<u>Date Created</u>	<u>Date Required</u>	<u>Date Answered</u>
	<p>cost including bonds and insurance plus 15%? As the current Caltrans surcharge is approximately 11% and our liability insurance and WC insurance total 16.21% and adding the approximately 6.20% FICA, 1.45% medicare, 1.5% SF payroll tax, 7.1% unemployment &amp; training taxes equals approximately 32.5% which exceeds the sum of the 11% surcharge and 15% markup, this is a very important point. As currently written, we would do any extra work at a loss. Note that Caltrans uses the surcharge plus 33% for labor, which allows a profit. Please explain why we should bid a project that guarantees that all extra work would be performed at a loss, or change or clarify the specification.</p>

<b>REQUEST:</b> Specs. 321217.3.4.A.  This section states that Contractor shall mill and fill AC pavement as directed by TJPA representative. Prior to bid we must be told exactly which areas are to be milled & filled. If you cannot provide exact and complete parameters (such as a drawing showing the exact limits of the mill and fill required), we will have to assume that absolutely no mill and fill is required. We cannot be expected to know what the TJPA representative will require.			<b>ANSWER:</b> Specs. 321217.3.4.A.  This section states that Contractor shall mill and fill AC pavement as directed by TJPA representative. Prior to bid we must be told exactly which areas are to be milled & filled. If you cannot provide exact and complete parameters (such as a drawing showing the exact limits of the mill and fill required), we will have to assume that absolutely no mill and fill is required. We cannot be expected to know what the TJPA representative will require.

<b>From:</b> Transworld Construction, Inc. Erik Liu						
<b>REQUEST:</b> ---- detail required for concrete sleeve installation The existing condition of the manhole covers is not consistent with our contract documents. Detail 1/C- 5001 indicates that the existing manhole sits on existing concrete slabs to which we are to drill 1 inch embedment. However, if you refer to the attached photograph indicated as picture one, you can clearly see that the manhole cover is actually a part of a concrete ring assembly. Please provide a new detail and instructions for the installation of the required concrete sleeve.

Field verified measurements and layout for the location of the structural steel does not coordinate with the stucco inset locations as shown on detail C/S-5000. In addition framing around the perimeter of the wall (aluminum panel locations) had to be modified due to assembly and installation methods. (See attached pictures and sketches. This RFI addresses three framing issues. All issues have been discussed in the weekly 301 Mission Wall subcontractor meeting with URS, Turner, Transworld, TJPA and Webcor-Obayashi.

1.) In two of the four stucco slot locations, field conditions show that a portion of the base plate conflicts with the stucco slot. This base plate encroaches into the stucco panel per dimensions shown on the attached sketch. Please advise.

2.) The structural steel had been relocated to CL of the wall (per RFI T-0098) and therefore studs around the steel per B/A-6000 could not be set per plan. Transworld has installed hat channel metal framing to the face of the structural steel tube using fasteners into the structural steel as per RFI T-0106 as well as modified the boxed framing per attached sketches around the perimeter of the wall. Sizes of metal framing were used to align with adjacent framing per plan. This work is currently installed, please confirm framing modifications per attached marked up details are acceptable.

3.) Blocking at the top of the wall at the north side (between the framing and 8"x 8" tube steel) was not installed, as there was no room between the framing and steel. Framing was attached directly to the tube steel. See attached.

Please confirm that the framing modifications in item 2 and 3 are acceptable and provide direction at the base plate conflict per item 1.

U-0023	MOP 1 for de-energizing PG&E at Minna St. between 1st and 2nd St	Closed	03	12/01/2010	12/02/2010	12/02/2010

From: Webcor Construction LP Jeffrey Negley

**REQUEST:**

There is a live PG&E cable in conduit (see RFI U-0021) in First Street at intersection of Minna Street.

Per spec section 01.01.42 / AT2-1 MOP for the Utility Shutdown Template, MOP 1 was created and sent via email on 11/29/10 requesting signatures from TJPA and PG&E for verification the conduit is de-energized. Copy enclosed.

Also per spec section 02 41 00-3 (Vol. 20 Contract # CMCG 08-04 Existing Utilities)  
 Item A - "Coordinate the shut off or disconnect of existing utilities affecting demolition work with the utility owner at least (7) seven calendar days prior to commencing with the work. The TJPA Representative will coordinate with the utility owner to open/close valves on piping, perform piping disconnects required and perform electric and telecommunication disconnects required. Do not proceed with this phase of work before getting the approval from the TJPA Representative".

Please provide approval.

In addition, per item B of spec section 02 41 00-3, "Prior to removal of any non-governmental (privately owned) ductbank, conduit or gas lines, obtain in writing a Utility Severance Certificate that all connections have been disconnected and the utility is not active".

Please provide a Utility Severance Certificate per item B above.

Sewer work on First Street is scheduled to start 12/1/10. Work cannot proceed until the conduit is de-energized.

Thank you.

**ANSWER:**

There is a live PG&E cable in conduit (see RFI U-0021) in First Street at intersection of Minna Street.

U-0035	Installlation Depth of Storm Drain New Catch Basins	Closed	03	12/09/2010	12/13/2010	12/13/2010

From: Webcor Construction LP                      David Hungerford

**REQUEST:**

Reference: Sheet U-3023, U-3033 (Detail B), Attached detail from Department of Public Works Buearu of Engineering

Trinet is concerned that the installation depth for many of the new catch basin does not comply with SFDPW Sewer Departent guidelines, specifically regarding access to the traps for the maintenance department. The DPW sewer maintenance crews need to have ready access to the p-trap during flooding emergencies. DPW crews need to be able to reach the p-trap to, either remove the cleanout cap and release the flow to the culvert pipe (if the trap bottom is plugged), or rod the culvert line through the trap (if the culvert is plugged). To get some clarification of the installation guidelines, Trinet had informally talked to one of the design engineers at the SF Bureau of Engineerring, Hydraulics Department. He advised Trinet that new catch basins should be installed with center of trap and discharge piping grade located between 3 and 4 feet below the culvert runs to cross under existing utilities that are in conflict with a direct run to the discharge manhole. Bends should be 22 1/2 degrees where possible as required, and if 45 degree bends must be used we should limit the number to two (2).

Please provide the depth of CB#603 on Fremont Street. To expedite the work in the field, we require an answer by 12/13/10.

U-0063	Unmarked service lateral on Minna St. at Station 3+08	Closed	03	12/22/2010	01/01/2011	12/27/2010
<b>From:</b> Webcor Construction LP                      David Hungerford						
<b>REQUEST:</b> Reference: Sheet U-3107 (dated 2010.09.29)  During excavation for the 8" water main along Minna Street, Trinet encountered a 1" Polyethylene service lateral at station 3+08, that extended into the vacant lot on the south side of the street. The service was broken during construction and Trinet has temporarily capped it. The utility was not shown on any utility plans. There is also no new service lateral, or reconnection of an existing, depicted on the new water main drawings at or adjacent to this location. Please advise on what should be done with the service. The repair is only temporary and a permanent reconnection will need to be performed by the SFWD if the service is to be maintained active. If the service is to be de-activated, then Trinet recommends that it be shut off at the connection to the old main.			<b>ANSWER:</b> Reference: Sheet U-3107 (dated 2010.09.29)  During excavation for the 8" water main along Minna Street, Trinet encountered a 1" Polyethylene service lateral at station 3+08, that extended into the vacant lot on the south side of the street. <b>From:</b> Webcor Construction LP                      Jason Dunne						
<b>REQUEST:</b> Reference Sheet U-3107 and Trinet RFI 059.1  This is a follow up to the engineer's response to Trinet RFI #59 (RFI#U-0066). Upon further evaluation of the 4" fire service connection at 83 Minna by Tom Farhnam (SFWD Senior Inspector), the water department proposed the attached installation detail for an 8"x4" tee in the 8" main, to be performed by Trinet, and the connection detail to the existing 4" service, to be performed later by the SFWD crew. This change was proposed to avoid conflicting utilities running along the south side of the new 8" main. AECOM's Design Engineer, Eric Zagol, was advised of the changed design plan proposed by SFWD in the field on 12/28/2010. Please confirm if the attached plan is acceptable and approved for construction.		<b>ANSWER:</b> Reference Sheet U-3107 and Trinet RFI 059.1  This is a follow up to the engineer's response to Trinet RFI #59 (RFI#U-0066). <b>U-0080</b>	<b>Proposed Design Change for MH #501</b>	<b>Closed</b>	<b>03</b>	<b>01/17/2011</b>	<b>01/27/2011</b>	<b>01/28/2011</b>
	<b>From:</b> Webcor Construction LP                      Nhi Tran					
	<b>REQUEST:</b> Reference Sheet U-2021 and attached drawings  Trinet proposes to change the design of sewer manhole #501 from a Modified Box Manhole (per SF Standard Plan #87,184) to a Precast Concrete Manhole (per SF Standard Plan #87,181 - see attached drawing). The proposal includes the installation of a temporary 24" PVC pipe stub, extending south from the manhole and connected to the brick sewer per SF Standard Plan #87,197.  The proposed manhole design will facilitate construction around the many utilities identified in the excavation - see RFI # U-0021 (Trinet RFI 04). It is also the preferred manhole design for 24in pipe per the SF Standard Drawings, especially since the brick sewer on the south side will later be abandoned and plugged (in the manhole) by the owner. This plan will also facilitate the later abandonment of the outlet to the south, as the owner will just have to plug the 24in outlet pipe and not a 3x5 brick sewer.  Please consider. An expedited response is requested.					<b>ANSWER:</b> Reference Sheet U-2021 and attached drawings  Trinet proposes to change the design of sewer manhole #501 from a Modified Box Manhole (per SF Standard Plan #87,184) to a Precast Concrete Manhole (per SF Standard Plan #87,181 - see attached drawing). <b>From:</b> Webcor Construction LP                      Nhi Tran  <b>REQUEST:</b> Reference Sheet U-2021, RFI #U-0080, and attached drawings  In response to the Engineer's concerns with the number and size of pipes in Trinet's original revised detail for MH 501 (RFI#U-0080), Trinet has changed their proposed installation drawing to include a 5' I.D. cast-in-place MH base. The lower precast section of the MH will be 5' I.D., with a precast reducer section transitioning from 60" to 48" I.D. placed above. Attached is the revised drawing for MH 501 and shop drawings for the precast MH sections. The design was discussed with Cliff Wong from the SF Bureau of Engineering, Hydraulics Department, and he did not have a problem with a 5' I.D. manhole.  Trinet requests an expedited response.		<b>ANSWER:</b> Reference Sheet U-2021, RFI #U-0080, and attached drawings  In response to the Engineer's concerns with the number and size of pipes in Trinet's original revised detail for MH 501 (RFI#U-0080), Trinet has changed their proposed installation drawing to include a 5' I.D. cast-in-place MH base. 	<p><b>REQUEST:</b></p> <p>Reference Sheet U-3125 and attached sketch</p> <p>The existing 4no. 4in AT&amp;T lines on Beale Street at Sta 6+10 are not as shown on the contract drawings. See attached sketch. Contract drawings show the conduit crossing M Squared's trench for 6 or 7 feet, however the duct bank is in the trench for 37 feet due to the alignment and width of the duct bank. The conduits are covered with a 2 foot wide concrete cap and appear in the trench for the new 12in water main at Sta 6+12 before leaving the trench at Sta 5+75. M Squared cannot lay the pipe on top of the concrete cap as the pipe will not have the required coverage. Due to this M Squared is unable to install the new 12in water as shown. Juan with AT&amp;T advised that M Squared remove the concrete cap from the conduits to allow for excavation of this portion of trench. With the cap removed it is more likely that the pipe will have the necessary minimum coverage.</p> <p>Please confirm that this is how M Squared is to proceed. An expedited reponse is requested.</p>

U-0088	Minna St 18in Sewer Conflict with PG&E MH#1355 at STA 1+77	Closed	03	01/28/2011	02/07/2011	03/24/2011
<b>From:</b> Webcor Construction LP                      Nhi Tran						
<b>REQUEST:</b> Reference Sheet U-2007 and attached drawings  During layout for the installation of the new 18in Sewer Main on Minna St., Trinet observed that the alignment of the 18in Sewer Main is in conflict with existing PG&E MH #1355 at STA 1+77.50, which is to remain in place. The center line of the new sewer main is 0.10ft north of the outside edge of the manhole wall, as depicted in the attached drawing. The north side wall of the manhole is constructed on top of the existing 3ft x 5ft brick sewer. The brick sewer structure extends approximately 16in into the vault along its entire length. The brick sewer therefore cannot be demolished without undermining the north wall of the electric vault. Eric Z. of AECOM was notified of this issue via phone call on 01/21/2011.  Please advise: 1. How should Trinet proceed with the installation of the new 18in VCP Sewer at this location? 2. How should Trinet proceed with the demolition of the existing 3ft x 5ft brick sewer?		<b>ANSWER:</b> Reference Sheet U-2007 and attached drawings  During layout for the installation of the new 18in Sewer Main on Minna St., Trinet observed that the alignment of the 18in Sewer Main is in conflict with existing PG&E MH #1355 at STA 1+77.50, which is to remain in place. U-0090	<b>46 Minna St 6in Fire Service Connection</b>	Closed	03	02/01/2011	02/11/2011	02/03/2011
<b>From:</b> Webcor Construction LP                      Nhi Tran						
<b>REQUEST:</b> Reference Sheet U-3108 and attached sketch and photos  The original plan for connection of the 6in Fire Service Lateral @ 46 Minna St. was to leave the existing 6in gate valve (which is located at FOC) in place and connect the new 6in fire line to the downstream side of the old valve (See attached photo and sketch). This plan was proposed by SFWD inspectors, Tom Farhnam and Dan Helminiak, at a field meeting on 12/28/10. On Friday 1/28/11 the SFWD, plumbers when taking measurements for the tie-in, proposed a different plan. They want to extend the new 6in fire line beyond the curb and into the basement, and connect to the homeowners fire line inside the basement (under the sidewalk).  Note: This will require coordination with building owner to put a hole through their foundation. Layout and a detail would need to be provided for the wall penetration, as well a detail to plug the hole where the existing water line is entering the basement.  Please provide direction on how to proceed.		<b>ANSWER:</b> Reference Sheet U-3108 and attached sketch and photos  The original plan for connection of the 6in Fire Service Lateral @ 46 Minna St. was to leave the existing 6in gate valve (which is located at FOC) in place and connect the new 6in fire line to the downstream side of the old valve (See attached photo and sketch). On Friday 1/28/11 the SFWD, plumbers when taking measurements for the tie-in, proposed a different plan. They want to extend the new 6in fire line beyond the curb and into the basement, and connect to the homeowners fire line inside the basement (under the sidewalk).  Note: This will require coordination with building owner to put a hole through their foundation. Layout and a detail would need to be provided for the wall penetration, as well a detail to plug the hole where the existing water line is entering the basement.  Please provide direction on how to proceed.

U-0102.1	<b>Catch Basin #206 redesign</b> From: Webcor Construction LP      Colin Azevedo	Closed	03	04/01/2011	04/11/2011	04/13/2011
	<b>REQUEST:</b> Please clarify the following items relating to the re-design of CB#206:  1) The only specification section addressing mortar coating is in 33 31 10 Paragraph 2.1.I, which specifies a "Wet Spray Mortar" application. This process would be cost prohibitive for coating only one catch basin. Trinet proposes the use of "SikaTop 123 Plus" mortar - product data sheets are attached. Please advise if this product is acceptable or specify an alternate material.  2) The RFI response directs Trinet to use ductile iron pipe for culvert runs with less that 3' of cover. If 22.5% DI bends are required to construct the culverts Trinet would prefer to use Mechanical Joint Fittings. Please advise if these are acceptable.					<b>ANSWER:</b> Please clarify the following items relating to the re-design of CB#206:  1) The only specification section addressing mortar coating is in 33 31 10 Paragraph 2.1.I, which specifies a "Wet Spray Mortar" application. U-0105	Natoma St Duct Bank Conflict at Sta 12+92	Closed	03	02/24/2011	03/06/2011	03/01/2011
<p><b>REQUEST:</b></p> <p>Reference Sheets U-1112, U-1120, U-3012, and RFI#U-0096</p> <p>In order for M Squared to install the new water main on Natoma Street between Sta 6+40 to Sta 10+00, the existing 3'x5' sewer must first be demolished. The 3'x5' sewer cannot be demolished until the new 24-inch VCP has been installed and connected to the existing sewer on First Street at Sta 9+59. Per sheets U-1112 and U-1120, the new 24-inch sewer is to be constructed after the demolition of the PG&amp;E ducts. However, demolition of the PG&amp;E ducts cannot be completed because PG&amp;E has not completed their relocation work</p> <p>Per RFI#U-0096 (M Squared RFI #009), as confirmed by PG&amp;E in the field on 02/09/2011, there is a live PG&amp;E duct bank in conflict with MH#305 and the new 24-inch VCP between MH#305 and MH#306, and not due to be decommissioned for at least three months.</p> <p>M Squared proposes to install a 12-inch HDPE pipe from Sta 9+25 to Sta 9+59, and perform a temporary connection to the existing 3'x5' sewer on First Street. Surveys carried out on the electric duct bank at Sta 9+30 on 02/08/11 shows that the bottom of the Duct Bank is approx. 10.8, meaning a 12-inch pipe will fit. In addition, M Squared proposes to perform a temporary connection (also 12-inch HDPE) at Sta 7+20 from the new MH#303 to the existing 3'x5' sewer. This would allow M Squared to demolish the 3'x5' sewer from Sta 7+02 to Sta 9+59, and allow M Squared to install the water from Sta 6+40 to Sta 10+00.</p> <p>M Squared estimates the cost for both of these connections is \$20,000.</p> <p>An expedited response is required to avoid impact to the installation of the water line</p>		<p><b>ANSWER:</b></p> <p>Reference Sheets U-1112, U-1120, U-3012, and RFI#U-0096</p> <p>In order for M Squared to install the new water main on Natoma Street between Sta 6+40 to Sta 10+00, the existing 3'x5' sewer must first be demolished. The 3'x5' sewer cannot be demolished until the new 24-inch VCP has been installed and connected to the existing sewer on First Street at Sta 9+59. Per sheets U-1112 and U-1120, the new 24-inch sewer is to be constructed after the demolition of the PG&amp;E ducts. U-0109	First St Sewer Grade Change To Conform to Existing 3'x5' Brick Sewer	Closed	03	03/02/2011	03/14/2011	03/03/2011
<p><b>From:</b> Webcor Construction LP                      Nhi Tran</p> <p><b>REQUEST:</b></p> <p>Reference Sheet U-3021, U-3009, and attached sketch</p> <p>This RFI confirms modification discussed in the field by Trinet and discussed with the Design Engineer, SFDPW, and W/O personnel. Trinet's field survey shows the existing 3'x5' brick sewer on First Street to be approximately 11-inches lower than the grade depicted on the drawings. Trinet also checked the elevation of the existing SSMH (10-feet north of MH#501) and confirmed that it is approximately 11-inches lower than what is shown on the drawings. Trinet installed MH#502 with invert elevation at 6.77 to match the existing brick sewer at the connection point. The new 24-inch VCP is being installed 11-inches lower than what is shown on the drawings maintaining the design slope of 0.0062. MH#501 will be installed with the invert elevation of 7.58, as shown in the attached sketch.</p> <p>Please confirm that this design is acceptable. Also, please provide a revised grade for the 24-inch VCP run from MH#207 (Minna St.) to MH#501.</p>		<p><b>ANSWER:</b></p> <p>Reference Sheet U-3021, U-3009, and attached sketch</p> <p>This RFI confirms modification discussed in the field by Trinet and discussed with the Design Engineer, SFDPW, and W/O personnel. U-0111	<b>Minna St. Joint Trench Conflict with (E) 8" elbow and thrust block</b>	Closed	CR	03/04/2011	03/14/2011	03/09/2011
<b>From:</b> Webcor Construction LP                      Nhi Tran						
<b>REQUEST:</b>		<b>ANSWER:</b>				
<p>Reference drawing sheet U-3409 and attached sketch.</p> <p>During our excavation for the joint trench on the east end of Minna St. (STA 9+29) Trinet encountered the (E) 8" water main in Trinet's trench line, approximately 1 foot from our termination point. The existing alignment is different from what is shown in the contract drawings. The drawings do not show the water line crossing the joint trench. The alignment and grade of the water main changed in Trinet's excavation to avoid the adjacent catch basin. A 22.5 degree elbow is located in the center of the joint trench excavation. The elbow is rolled up to accommodate the grade change and there is a thrust block under the footing. Trinet does not believe that it would be safe to excavate under the water main for Trinet's duct bank without having the line shutoff. Extending the PG&amp;E ducts to FOC will also place the connection point for PG&amp;E's extension of the duct bank directly under the water main fittings and elbows. There is adequate clearance to install the 4" gas line above the water main and extend it out to FOC per contract. The top of the water main is 49" below FG at the south side of the joint trench, at the location of the ags line.</p> <p>Trinet proposes to terminate the concrete encased duct bank approximately 5 ft. back from FOC. This would allow adequate room for Trinet to mandrel the ducts after the joint trench is installed without undermining the water main. PG&amp;E could then extend their duct bank under the water main to connect to Trinet's water main. Please advise.</p>		<p>Reference drawing sheet U-3409 and attached sketch.</p> <p>During our excavation for the joint trench on the east end of Minna St. (STA 9+29) Trinet encountered the (E) 8" water main in Trinet's trench line, approximately 1 foot from our termination point. U-0119	Minna St. JT_ AT&T Reconfiguration and impact on (E) trees From: Webcor Construction LP      Colin Azevedo	Closed	03	03/25/2011	04/04/2011	03/30/2011
	<p><b>REQUEST:</b>            The revised drawings for the Joint Trench alignment dated 3/16/2011 show the reconfigured AT&amp;T ducts running through an existing tree well on the east side of the AT&amp;T vault at Stn. 3+71. RFI U-0112 (Minna St, Joint Trench, AT&amp;T Vault and Conduit Configuration) also shows the reconfigured AT&amp;T ducts running through an existing tree well on the east side of the vault. This conduit layout in consistent with discussions with the AT&amp;T inspector in the field was reflected in the shop drawings. The revised drawings do not address relocation and/or removal of the impacted trees and the related irrigation changes. Please review and advise.</p>					
						<p><b>ANSWER:</b>            The revised drawings for the Joint Trench alignment dated 3/16/2011 show the reconfigured AT&amp;T ducts running through an existing tree well on the east side of the AT&amp;T vault at Stn. 3+71. U-0122	M Squared Submittals for TG04 Bid Packages	Closed	CR	04/01/2011	04/11/2011	04/11/2011

From: Webcor Construction LP                      Colin Azevedo

**REQUEST:**

Please confirm the following:

Per previous discussions it has been agreed between the TJPA, AECOM, Turner Webcor/Obayashi and M Squared that material submittals approved for use by M Squared in individual bid packages will be considered acceptable for all bid packages M Squared is working on (TG04.1, TG04.3, TG04.4, & TG04.6).

These submittal include:

- TG0434-002 - Excavation & Backfill Samples
- TG0434-003 - Excavation & Backfill Test Reports
- TG0434-004 - Excavation & Backfill Compaction & Warning Tape
- TG0434-005 - Shoring Plan
- TG0434-006 - Backfill Material
- TG0434-007 - Water Utilities Distribution Piping & Valves
- TG0434-010 - Asphalt Mix Design
- TG0434-013 - Noise Mitigation Plan
- TG0434-015 - CQC Plan
- TG0434-016 - Health and Safety Plan and MSDS
- TG0434-017 - SWPPP
- TG0434-018 - Debris Management Plan
- TG0434-025 - Cast in Place Concrete
- TG0434-030 - Labor Rates
- TG0404-001 - Sewer Package
- TG0404-002 - Filter Fabric
- TG0404-003 - Concrete Forming
- TG0404-004 - Precast Concrete
- TG0404-005 - Precast Concrete Catch Basin Base

**ANSWER:**

Please confirm the following:

	<b>REQUEST:</b> M Squared is unable to excavate/shore/install the 18" VCP from the existing manhole at Sta 0+45 to MH#301 at Sta 0+81 as shown on sheet U-3010. While excavating for the sewer installation M Squared encountered several unknown utilities which were unmarked and not shown on the contract drawings. Also, some of the known utilities are at different locations and elevations than indicated on the drawings. Due to the quantity and proximity of these utilities it is not possible to excavate and shore between MH#301 and the existing MH at Sta 0+45. Additionally PGE have yet to relocate their gas and electric utilities out of the area of the proposed MH#301. See attached drawings illustrating M Squared's pothole findings. Please advise on how to proceed.

	<p><b>From:</b> Webcor Construction LP                      Colin Azevedo</p> <p><b>REQUEST:</b></p> <p>Trinet has been advised by Mission Clay (the VCP manufacture) that the hydrostatic test described in the SF Standard Specification Section 319.02 is primarily for cast iron or ductile iron pipe and is not recommended for clay pipe. The National Institute of Clay Pipe and Mission Clay recommend a low pressure air test in accordance with ASTM C 828. See attached copy of ASTM C 828. Trinet proposes using this low pressure air test in lieu of the 10psi hydrostatic test called for in the standard specifications. The low pressure air test will allow test on pipe runs with no service laterals ie: MH501-502, 206-207, 203-204, 202-201. Please advise if this is acceptable.</p> <p>With regards to the three remaining pipe runs that have lateral connections, please provide direction of how to plug the laterals if required to test the main lines.</p>					
	<p><b>ANSWER:</b></p> <p>Trinet has been advised by Mission Clay (the VCP manufacture) that the hydrostatic test described in the SF Standard Specification Section 319.02 is primarily for cast iron or ductile iron pipe and is not recommended for clay pipe. The National Institute of Clay Pipe and Mission Clay recommend a low pressure air test in accordance with ASTM C 828. See attached copy of ASTM C 828. Trinet proposes using this low pressure air test in lieu of the 10psi hydrostatic test called for in the standard specifications. The low pressure air test will allow test on pipe runs with no service laterals ie: MH501-502, 206-207, 203-204, 202-201. Please advise if this is acceptable.</p> <p>With regards to the three remaining pipe runs that have lateral connections, please provide direction of how to plug the laterals if required to test the main lines.</p>

U-0143.1	(E) PG&E Duct Bank from EMH #1320 to Demolished EMH #1355	Closed	03	06/14/2011	06/24/2011	06/14/2011
From: Webcor Construction LP                      Colin Azevedo						
<b>REQUEST:</b>		<b>ANSWER:</b>				
<p>After further investigation of the existing PG&amp;E duct bank between EMH #1320 and demolished EMH # 1355 (@ Anchor &amp; Hope), Trinet found that there is only one unobstructed conduit between the two manholes. The unobstructed conduit is the one that already had a pull rope in place. Trinet had demolished a section of this conduit during excavation for sewer MH # 201 because it was in conflict with the shoring. Trinet replaced the damaged section (approx. 8 LF) on Saturday 6/1, and reconnected the pull rope in the conduit run. A sketch of the conduit run, depicting the section replaced, is attached. Please review and advise if one 4" conduit will be adequate from EMH #1320 to the west end of demolished EMH #1355.</p>		<p>After further investigation of the existing PG&amp;E duct bank between EMH #1320 and demolished EMH # 1355 (@ Anchor &amp; Hope), Trinet found that there is only one unobstructed conduit between the two manholes. U-0147	Existing Top-Of-Curb Grades @ Minna Driveways for 575 Mission Building	Closed	03	05/27/2011	06/06/2011	06/01/2011

From: Webcor Construction LP                      Colin Azevedo

**REQUEST:**

The existing driveways entering the 575 Mission St building, are depressed between 2 ½" to 3" below the adjacent top-of-curb and sidewalk grades - see attached drawing depicting the driveways. This condition seems to be a consequence of repeated overlaying of Minna street, which has resulted in a curb height in many areas far less than the City standard of 6 inches. The street grade along the north side of Minna along the 575 Mission building ranges from 3 ½ to 4 ½ inches below top-of-curb grade.

Trinet has been directed in the field by Jason Chin, and by the Engineer in RFI #U-0146, to construct the new roadway with finish grade at curb line 6" below top-of-curb grade. This is consistent with City standard plan # 87,169. The new roadway grades will result in 3" to 3 ½" of exposed curb height at the driveways to 575 Mission, which is considerably deeper than the 1" called for in the San Francisco standard plans for driveway construction (plan # 87,171). It will also not be possible to raise the street grade at the driveways without impeding road runoff drainage and causing ponding.

Please review and advise.

**ANSWER:**

U-0148	Pavement Reconstruction Plan for West End of Minna Street - Stn 2+15 to 2nd St	Closed	03	05/27/2011	06/06/2011	06/07/2011
--------	--	--------	----	------------	------------	------------

From: Webcor Construction LP                      Colin Azevedo

**REQUEST:**

Please provide a pavement reconstruction drawing, or typical cross section detail, for the west end of Minna St from Stn 2+15 to 2nd St. Trinet had planned to reconstruct the street in this area from curb to curb. We find however, that there is a grade difference of approximately 6 inches between top-of-curb on the north side of the street and the south side, with the south side being at the higher grade. The construction detail approved in RFI #U-0146 (Trinet #094) cannot be utilized in this area, because the street already has a cross slope of approx. 2% from south to north.

**ANSWER:**

Please provide a pavement reconstruction drawing, or typical cross section detail, for the west end of Minna St from Stn 2+15 to 2nd St. Trinet had planned to reconstruct the street in this area from curb to curb. We find however, that there is a grade difference of approximately 6 inches between top-of-curb on the north side of the street and the south side, with the south side being at the higher grade. U-0149	MH#701 Conflicts with existing utilities	Closed	03	05/27/2011	06/06/2011	06/09/2011
<b>From:</b> Webcor Construction LP                      Colin Azevedo						
<b>REQUEST:</b> The 14" AWSS line west of MH#701 was found to be constructed thru the roof of the existing 3x5 sewer. Several bends were used in the AWSS line construction and these bends included lugs and tie rods. As a result of the presence of these tie rods and fittings we can now not move MH#701 any further west. To install the new 24" VCP in a straight line (perpendicular to MH wall), and in order to get by the existing PGE MH we will have to pour the pipe wall and 2" of the internal diameter of the pipe into the west wall of MH 701. Please advise on how to proceed.		<b>ANSWER:</b> The 14" AWSS line west of MH#701 was found to be constructed thru the roof of the existing 3x5 sewer. U-0157	Pressure Testing for Sewer Manhole #'s 501 & 502 on 1st St.	Closed	CR	06/28/2011	07/08/2011	07/08/2011
From: Webcor Construction LP                      Jonathan Flaming						
<b>REQUEST:</b> This RFI is a follow-up to discussions in the field with AECOM and the SFDPW Inspector and Trinet, regarding Trinet's inability to perform a pressure test on sewer manholes 501 & 502 on 1st St. due to field conditions. MH #502 is constructed around the existing 3x5 brick sewer on one side (per SF Standard Plan #87,184) and Trinet has no means of plugging the brick sewer effectively to withstand a pressure test.  In the case of sewer MH #501, the original design was similar to MH #502 and a pressure test would not have been possible. The revised design (see attached drawing) includes a temporary 24" corrugated PVC pipe stub extending south from the manhole and connecting to the existing 3x5 brick sewer. The inside of the temporary 24" pipe stub is also corrugated, and therefore cannot be sealed with an inflatable pipe plug, as would be required to perform a pressure test of the manhole structure.  Please confirm that a pressure test will not be required for sewer manholes 501 & 502 on 1st St.

M Squared received direction to perform additional potholes further west of First St on Howard St. Please see attached pothole findings. Please advise how you would like to proceed.

**ANSWER:**

Per response to RFI#U-0176.1 M Squared performed additional potholing at Location 7.

Please see the attached pothole findings.

Please advise how you would like to proceed.

Note: The 4" Unknown Utility was confirmed to be an abandoned PG&E gas main. On 1/10/12 PG&E drilled the line and confirmed it to be abandoned.

**ANSWER:**

See attached sketch. The duct bank shown on Fremont Street to be demolished is in fact underneath the curb and gutter and portion of the sidewalk on Fremont St. In order for M Squared to remove this duct bank it will require us to close the west sidewalk on Fremont St, demo and remove the sidewalk, remove the ductbank and then replace the sidewalk. Currently the east sidewalk is closed also due to BBI activity. Please advise how you would like to proceed.

By proceeding with this alignment M Squared will again return the AWSS pipe through the structure of an AT&T vault and a PG&E Vault. It does not appear from our field work that there are other options for a workaround.  Based on information M Squared currently have attained from the trenching; restraining each joint, per the original contract will require the following: - 4 additional 16-inch 45deg bends

work.

It is not possible to locate the fire hydrant in this area due to the presence of the basement. The existing hydrant has a column poured into the structure of the basement (see attached).

Please advise on how you would like to proceed.

**ANSWER:**

On 1/24/2012 M Squared began repairing the basement roof per the response to RFI U-0190. SFDPW engineer William Liang came out and review the progress that day and provided alternate direction in the field. Please provide this direction in writing so work may resume.

**ANSWER:**

Please refer to drawing MA-15 and response to RFI U-0190.

As a result of differing site conditions between Sta 8+50 and 9+00, the new location of the HP fire hydrant shown on drawing MA-15 is to remain in the existing location per response to RFI U-0190.

Please provide a detail drawing showing the new hydrant lateral with all SFDPW requirements for HP hydrants in an areaway.

U-0202	SLUDGE LINE - Unknown Subsurface Structure at 301 Mission	Closed	CR	06/07/2012	06/17/2012	06/12/2012

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

Please refer to attached detail 3/U-5001.

Detail 3 on sheet U-5001 which shows the connection detail for 12" HDPE to existing 10" steel, uses a 10" steel to 12" sleet reducer and then using a 12" steel to 12" HDPE Coupling in order to connect new sludge main to existing sludge main.

Our preference is to use a 10" steel to 10" HDPE coupling and then install a 10" HDPE to 12" HDPE Reducer. As the O.D of the existing sludge is unknown it will cause significant delay in the ordering of the 10" steel to 12" steel reducer as we will have to get the OD at the connection point and then order the material. Even with this piece of material, it will be extremely difficult to get a welder into the trench to weld the reducer on to the exiting pipe as a result of the amount of utilities which were discovered in potholing.

The use of the 12" HDPE to 10" HDPE reducer eliminates the need for a welder in the trench.

U-0203	AWSS - Compaction Method for Trade Package TG04.2	Closed	CR	06/08/2012	06/18/2012	06/11/2012

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

Specification section 02225 Section 3.7 C forbids the use of flooding or jetting in order to gain the necessary levels of compaction in the AWSS pipe trench.

However due to the amount of utilities and duct packages in the trenches it will not be possible to gain the necessary levels of compaction under and around these utilities by utilizing the methods referenced in the specifications. By not gaining the necessary compaction around utilities it is possible that voids will occur over time causing the utility to be come unsupported and the street surface to sink.

We are requesting the use of jetting (as described in Section 703.08 of the City and County of San Francisco Standard Specifications) as a method to gain the necessary levels of compaction for the AWSS trenches. Jetting has previously been utilized as a successful method of gaining compaction levels on several other Transit Center Utility Relocation packages.

Please confirm that this proposed method is acceptable for use on this trade package. If not, please provide an alternative method for gaining the necessary compaction.

**ANSWER:**

U-0205	SLUDGE LINE - HDPE Hydrostatic Testing	Closed	CR	06/22/2012	07/02/2012	07/05/2012
From: Webcor Construction LP Jackson Tukuafu						
<b>REQUEST:</b> Please refer to spec section 33 34 10-3.1 H  The method of HDPE pipe testing listed in the contract documents differ from the testing methods provided by the pipe manufacturer: The specifications call for the pipe to be filled 24hrs in advance and then the pipe pressurized to 115psi for a duration of 4hrs, The manufacturer's method involved filling the line with pressure for 3 hrs to allow expansion etc. in the pipe and then adding additional water, per Table 2 of the attached document. Once this additional water has been added the pressure can hold for the duration listed. Or alternatively allowing a 5%fluctuation in the pressure target for the test over 1 hour.  Please see attached pipe manufacturer's data attached and provide direction. M Squared believe that the testing method in the specifications is not suitable for HDPE due to its flexibility and would be more suited to steel pipe.			<b>ANSWER:</b> Please refer to spec section 33 34 10-3.1 H  The method of HDPE pipe testing listed in the contract documents differ from the testing methods provided by the pipe manufacturer: The specifications call for the pipe to be filled 24hrs in advance and then the pipe pressurized to 115psi for a duration of 4hrs, The manufacturer's method involved filling the line with pressure for 3 hrs to allow expansion etc. in the pipe and then adding additional water, per Table 2 of the attached document. <b>REQUEST:</b> Please refer to that attached photo and schematic of current condition.  M Squared has identified the space at Sta 9+05 as the only viable location for the gate valve in that area. However several utilities remain in conflict with this location:  - The MCI lines are plastic and the correspondence has already began with MCI to move these lines 2' south during AWSS Main installation - The 3 x 2" Steel Electrical lines have been confirmed active by PGE representatives - All remaining lines are unknown.  Please advise on how you would like M Squared to proceed.		<b>ANSWER:</b> Please refer to that attached photo and schematic of current condition.  M Squared has identified the space at Sta 9+05 as the only viable location for the gate valve in that area. However several utilities remain in conflict with this location:  - The MCI lines are plastic and the correspondence has already began with MCI to move these lines 2' south during AWSS Main installation - The 3 x 2" Steel Electrical lines have been confirmed active by PGE representatives - All remaining lines are unknown. U-0227	AWSS - 2nd Street AWSS Gate Valve Vault	Closed	CR	04/16/2013	04/26/2013	04/22/2013

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

Refer to drawing MA-13, MA-3, MA-10

Due to the presence of several PGE duct banks and the steam line that runs along 2nd Street M Squared feels it will be significantly difficult to modify a precast valve vault to fit into the area designated for the vault. As a result, M Squared proposes to construct a cast in place valve vault as has previously installed and approved on Market Street.

1. Please confirm it is acceptable to install a cast in place vault at this location.
2. Please advise if rebar detail attached is acceptable for use.

**ANSWER:**

U-0228	AWSS - Sidewalk Expansion Evaluation between First Street and Beale Street	Closed	CR	05/31/2013	06/10/2013	10/18/2013

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

Per the attached email it appears that the City's intent to is to move the curb lines south between First St & Fremont by 3' and also between Fremont & Beale Street by 4'.

First to Fremont St - In moving out the curb line by 3' the AWSS Line on this block will be pretty close to being under the new curb line, therefore making any maintenance of the AWSS line in the future very difficult. There would also be an impact to the gate valve location on the east side of the 1st and Mission intersection and the west side of Fremont & Mission due to the new curb coming south. It is possible a modified roof to the vault would be required as half of the vault would be in the street and another half would be in the sidewalk (judging from rough field measurements). The AWSS Fire hydrant would also need to be relocated as it would now be in the middle of a widened sidewalk, whereas the distance acceptable is 24" to 26" from FOC.

Fremont to Beale Street - The current alignment for the AWSS along Mission between Fremont & Beale is close to the curb on the north side (in order to avoid 3 PG&E utility vaults). By moving the curb 4' south the AWSS line will now be underneath the sidewalk on this block. Similar to above the gate valve vaults would be partially under the sidewalk here and modifications/relocations may be required.

Please advise if M Squared is to continue with the AWSS install per plan. Alternatively please provide direction on the conflicts that moving the sidewalk creates for the main.

U-0231	AWSS - Concrete Sampling for Kickers	Closed	01	07/25/2013	08/04/2013	08/02/2013

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

The contract specifications require concrete sampling of all cast in place concrete on the AWSS project. However in the pre-construction QC meeting the City confirmed that the SFWD Inspector - Dan Helminiak is permitted to inspect all concrete thrust blocks.

Due to the small size of the thrust blocks it is not practical for concrete samples to be provided to an inspection agency.

Please confirm that per the agreement SFWD inspector can inspect all concrete used in the AWSS thrust blocks and that no concrete sampling is required.

U-0232	AWSS - Schedule Change of AWSS Install	Closed	01	07/30/2013	08/09/2013	08/14/2013

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

Per our recent AWSS meetings M Squared had been directed by the owners' representative to complete the AWSS install at 1st & Mission intersection and then mobilize to Main Street intersection to begin work down there.

IF M Squared is to begin work at Main St then there will be no connection made on the east side of 1st and Mission. The new 16" line will be installed up to the 16"X10" tee and the 10" connection will be done heading North on 1st.

We can see 3 options that would allow us to proceed to Main Street.

1. Cap the new 16" Tee on the east side of the tee. This would allow the AWSS system to be in service from 2nd Street all the way to the east side of 1st Street, including 1st Street heading towards Market.

2. Perform a connection from the new 16" Tee to the existing 12" AWSS main on Mission east of 1st Street. This would allow the AWSS system to be fully operational from 2nd all the way to Main. This would be temporary as M Squared would presumably return to complete the 16" install here.

3. Leave the new and existing pipe as is. The AWSS main would be operational from 2nd Street all the way to the gate valve on Mission west of 1st Street. The main would remain shut off on the 1st and Mission intersection, and also 1st Street heading towards Market as the new 16" AWSS line would be open at the tee (not capped/connected) and the existing 12" would not be connected to anything.

Please provide an option to M Squared to allow us to proceed.

Where possible M Squared removed the street base and excavated as much as we could. The remainder of the trench was tunneled under duct banks and under the street, with the street base remaining in place.</p> <p>Now that all the AWSS main has been installed M Squared will shortly be faced with backfilling this intersection. There is currently only a small portion of trench that can be backfilled using conventional methods i.e ram compactor etc. The remainder of the trench will also not be suitable for backfilling using the jetting method as there will be no way to compact the area directly underneath the street base.</p> <p>M Squared is requesting permission to create several small holes (approx. 6" dia) in the street base, between some of the utilities and backfill the AWSS trench</p>

	Bode Mix 604CC (attached).					
	MUNI's busiest route. SFMTA have asked that M Squared minimize lane closures where possible.					
	Please confirm that this 8inch slump is acceptable on Bode Mix 604CC (attached).					
<b>U-0241</b>	<b>AWSS - Proposed Fire Hydrant Re-Location on Mission and Fremont Street</b>	<b>Closed</b>	<b>CR</b>	<b>01/21/2014</b>	<b>01/31/2014</b>	<b>02/13/2014</b>
	<b>From:</b> Webcor Construction LP      Jackson Tukuafu					
	<b>REQUEST:</b> As per AWSS Coordination Meeting on 01/17/2014, the location of this fire hydrant near the intersection of Fremont and Mission is potentially going to need to be moved to accommodate the new sidewalk expansion. The purpose of the RFI is for Michael Smith with SFWD to analyze, consider and direct the feasibility of relocating the fire hydrant further north.  If the hydrant is to be located somewhere other than is shown on the drawing please provide a detail for this work as additional fittings may need to be ordered.

	<b>From:</b> Webcor Construction LP      Jackson Tukuafu					
	<b>REQUEST:</b> Sheet MA-16 shows that the hydrant tee is to be rolled down 45-degrees in order to tie in to the lateral piping. However, when M Squared excavated this section, they discovered that the hydrant lateral piping is shallow and the main is approx. 2-feet deeper.  In order to install the piping, the hydrant tee will need to be rolled UP 45 degrees. In addition to this M Squared will need to order a customized 8-inch DIP flanged spool to join the tee to the flanged 45-degree elbow.  Please confirm it is acceptable to proceed with the customized flange or provide direction.

<b>From:</b> Webcor Construction LP                      Jackson Tukuafu						
<b>REQUEST:</b>			<b>ANSWER:</b>			
Please refer to attached drawing MA-16 and attached photos.			Please refer to attached drawing MA-16 and attached photos.			
After trenching to remove the AWSS, M Squared exposed the 12-inch VCP sewer culvert on the NW corner of Beale & Mission street spanning from the catch basin to the sewer main. The joint was open by 4-inches and was covered in cardboard and duct tape. There was also a reverse flow on the pipe by 15 degrees. U-0244	AWSS - Gate Valve Vault at Sta 16+40 (West of Beale Street)	Closed	CR	02/07/2014	02/17/2014	02/10/2014

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

See attached photos of conflicts with gate valve vault at Sta 16+40.

Due to the unforeseen utilities in place, M Squared cannot install the concrete vault around the gate valve at STA 16+40. In order to avoid delays to the project M Squared reached out to the engineer of record to bring this issue to his attention. See attached email chain.

As it appears M Squared is directed to return to 1st Street and work east again; M Squared will be unable to build any structure around the gate valve at Sta 16+40. Due to the flip flop of the schedule we will not be able to tie in at this point for several months so we suggest the following:

- Install the gate valve at Sta 16+40 and direct bury the valve, leaving access to the gates with ductile risers and valve caps. FYI - these gates should not be opened anyway as the line will be out of commission during construction.
- Re-excavate this gate valve when M Squared installs the pipe from Fremont St heading east and tie in the pipe to it then. In the interim M Squared will drive a sheet pile behind the gate valve and support it with a 1.5ton concrete block. This will prevent any gate valve movement.
- As M Squared will be working their way from 1st St towards Beale Street, they should have several weeks in which to design some sort of modified manhole, custom sized vault in which to encase the valve.

Please advise if this is acceptable.

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

Please refer to drawing MA-15 and attached M Squared sketch SK-TG04.2-069.

According to the plans the tee is to be rolled down, however the existing tee is rolled out flat and there are 2 x 45 degree elbows installed to raise the line over the existing brick sewer.

1. Due to existing utilities, the area is congested and has very minimal access. M Squared will need SFWD to determine which water line is live and allow M Squared to remove the abandoned water main to provide more space here.

M Squared is also unable to find a lead joint to connect the new pipe. M Squared has found, what appears to be some form of a repair coupling or sleeve on the existing line. There is one either side of the existing brick sewer main.

2. Please advise how you would like M Squared to proceed. M Squared has already trenched 7-feet further south than is shown on the drawings.

**ANSWER:**

U-0246	AWSS - Gate Valve Vault Locations at 1st Street and Fremont Street	Closed	CR	03/27/2014	04/06/2014	04/01/2014

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

Please refer to drawing MA-15, MA-16 and attached M Squared sketch SK-TG04.2-070.

First Street:

1. M Squared is able to install the gate valve and gate valve vault at the west side of 1st Street on Mission Street without impacting the new sidewalk expansion. The valve vault will be in the street and outside any sidewalk limits. The vault can be constructed once the street light conduit has been relocated. This work has already been coordinated with the City Street Lighting Division. Please advise on when the City will remove the conflict to install the gate valve/vault.

Fremont Street (east side):

2. See attached sketch. Due to the amount and location of existing utilities M Squared will be unable to install a gate valve vault of any kind at this location. It is also looking highly unlikely that M Squared will be able to install any gate valve at this location due to the utilities in the area. Please advise as to how M Squared will proceed.

**ANSWER:**

U-0247	AWSS - PG&E Utility Conflicts at Fremont Intersection	Closed	CR	03/27/2014	04/06/2014	04/18/2014

From: Webcor Construction LP Jackson Tukuafu

**REQUEST:**

Please refer to drawing MA-16 and attached M Squared sketch SK-TG04.2-071.

There are 3 duct banks exiting out of PG&E Vault #1669:

1. PG&E Duct bank #1 runs from 1st Street down Mission to Fremont Street and has been in our trench all that time. It has not encroached on the AWSS Main alignment and there is enough clearance from AWSS main most of that time. It has impacted excavation but should not pose too much of a problem for pipe installation.
2. PG&E Duct bank #2 sits on top of the existing 12" AWSS Main and runs directly on top of the AWSS Main for a large portion of the intersection. Due to this duct bank we are unable to excavate down to the AWSS Main, unable to remove pipe and will be unable to install new 16-inch AWSS.
3. PG&E Duct bank #3 runs underneath the existing 12" AWSS main, it is concrete encased and part of the concrete encasement encroaches onto the existing 12" AWSS Main. This duct bank appears to leave our trench after 10ft or so.

Where duct bank #2 and duct bank #3 cross each other there is only 11-inch between the two duct banks. Not enough space to install a 16inch pipe with tie rods and stop collars. The AWSS is pinched between these 2 duct banks for approx. 10ft with one duct bank on top of the 12-inch main and one touching the main from underneath. While all duct banks impede us it seems there is a higher chance of making this work with the removal of duct bank #2.

Please provide direction on how to proceed or advise when PG&E will begin to remove their duct banks.

U-0248	<b>AWSS - Restraints at the Intersection of Mission and Fremont St.</b>	Open	CR	06/04/2014	06/14/2014	
<b>From:</b> Webcor Construction LP                      Lynn Kowallis						
<b>REQUEST:</b> Please refer to drawing MA-16 and M Squared Sketch-TG04.2-072.1 and TG04.2-072.2.  Question #1 - Does every joint between the new GV west of Fremont Street, and the new 16"x10" tee in Fremont Street intersection need to be restrained with bell & stop collars? This distance is approx. 50ft. Question #2 - Currently there does not appear to be enough space to install the new 16" pipe WITH bell & stop collars through the utilities in the Fremont St intersection. There does appear to be space to install 16" pipe without the stop/bell collars on.  - Our suggestion would be to install the 16"x10" tee and restrain that tee on one joint heading east. Install piping across the Fremont St intersection without stop/bell collars, delete the 16" GV at that location (we believe we will not be able to fit one anyway), and tie off the last piece of pipe coming into the hydrant tee east of Fremont Street.  Please clarify if this is acceptable.			<b>ANSWER:</b> Please refer to drawing MA-16 and M Squared Sketch-TG04.2-072.1 and TG04.2-072.2. **Transbay Transit Center – San Francisco, CA**

**Noise and Vibration Mitigation Management Plan**

Webcor/Obayashi

**September 07, 2012**

## **GENERAL:**

The Webcor/Obayashi (W/O or CM/GC) Noise and Vibration Mitigation Management policy that will be implemented on the Transbay Transportation Center Project will be an overall project policy, with each Trade Subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to comply with Specification Section 00 08 13, 00 08 13/APB, the San Francisco Noise Control Ordinance, regulations and requirements and section 01 35 65, Specific Project mitigation measures and monitoring requirements as applicable to the various phases of work.

When required by the specifications, W/O will ensure its Trade Subcontractors comply with this plan as well as the San Francisco Noise Control Ordinance.

To expedite the project or minimize impacts, W/O will ensure that its Trade Subcontractors apply for written waivers of some of the noise requirements by application to the TJPA in accordance with Section 00 08 13 Specific Project Requirements when required by the specifications or contract. Written waivers shall be uploaded to Constructware by CM/GC. It is anticipated that some Work may require multiple shifts or for other reasons need to be performed outside of typical weekday daytime construction hours. Trade Subcontractors shall minimize construction activities during evening, nighttime, weekend, and holiday periods and shall obtain specific permits before performing construction in noise sensitive areas during these periods.

Night noise permits requests shall be submitted to the TJPA at least 7 days in advance of work. Noise permit request shall include:

1. Name of person in charge of work and phone number
2. Hours to be worked
3. Narrative of scope of work including necessity of doing work at night, maps, and truck routes
4. List of noise/vibration/light making equipment including make and model
5. Mitigation and monitoring methods being used

W/O will ensure that its Trade Subcontractors provide noise inspections and testing of equipment to ensure that all equipment onsite is in good condition and effectively muffled per manufacturer's recommendation. If inspection or testing documents are requested by the TJPA, or any of its representatives, W/O will require its Trade Subcontractors to provide requested documentation in a timely manner. Trade Subcontractors shall provide inspection and testing documents to CM/GC prior to start of work and as the equipment is replaced. CM/GC shall upload documents to a file location within Constructware.

W/O will ensure that its Trade Subcontractors minimize use of vehicle backup alarms and demonstrate how backup alarms will be minimized by using mitigation measures such as designing the construction site with a circular flow pattern that minimizes backing up of trucks and other heavy equipment. Trade Subcontractors shall submit quarterly reports of measures to reduce back up alarms. W/O shall upload these reports to a specific location within Constructware.

W/O will ensure that all its Trade Subcontractors' equipment onsite is equipped with broadband back-up alarms that will automatically adjust based on the ambient noise during nighttime hours (between 8 p.m. and 7 a.m.) when ambient noise is low. If safety considerations and applicable regulations will not allow use of broadband back-up alarms, Contractor shall request an exemption in writing to the TJPA

Representative including the applicable safety regulations (Cal/OSHA, OSHA). Trade Subcontractors shall comply with the TJPA's request for broadband back-up alarms for all work between 8 p.m. and 7 a.m. If requested by the TJPA or its representative, Trade Subcontractors shall provide W/O with equipment specifications showing broadband back-up alarms for submission via Constructware.

Through W/O's requirement of the submittals outlined in this noise and vibration plan, W/O will verify Trade Subcontractors' construction operations are performed in such a manner to minimize noise.

W/O will verify that its Trade Subcontractors perform noise monitoring to demonstrate compliance with noise limits and endeavor to minimize construction activities during off hours except for those required and deemed acceptable per the Contract Documents. Trade Subcontractors shall submit monthly monitoring reports to W/O for submission via Constructware.

W/O will verify Trade Subcontractors haul routes to ensure that they minimize noise intrusion into residential areas, and control noise during nighttime hours.

W/O will require all Trade Subcontractors to use procedures and equipment, when it would be effective, that produce lower noise levels than normal when required by the specifications or contract. W/O will require the Trade Subcontractor to submit manufacturer special noise control kit information. If none is available, then the Trade Subcontractor needs to submit a statement of this. Upon receipt and review of the information, W/O and the Trade Subcontractor will identify the events when the noise control measures should be used based on the specifications.

W/O will require all Trade Subcontractors plans to include use of temporary barriers near noisy activities as required by the specifications or contract. Such barriers shall be located close enough to the noise source to achieve noise attenuation. As necessary and when it is shown it would be effective, Trade Subcontractors shall construct shed-like structures or complete buildings to contain the noise from nighttime activities.

W/O shall require haul route map, plan and storage location to be part of Trade Subcontractor's plan and included within its submittal.

#### VIBRATION CONTROL

Vibration limits are based upon the Federal Transit Administration's Planning and Environment Transit Noise and Vibration Impact Assessment guidelines. W/O will require all Trade Subcontractors' to limit or prohibit use of construction techniques that create high vibration levels when it affects adjacent properties.

If construction techniques that create high vibration levels are used, W/O will require all Trade Subcontractors' to comply with the following additional restrictions:

1. Provide advance notice to TJPA of any vibration intensive activities. Perform vibration intensive activities only during daytime hours between 7 a.m. and 8 p.m. unless otherwise allowed by special permit or variance, as required by the specifications or contract. Perform vibration monitoring during vibration intensive activities during daytime hours between 7 a.m. and 8 p.m. unless otherwise allowed by special permit or variance, as required by the specifications or contract. Recorded data should be part of the Trade Subcontractor Daily report. A summary shall be submitted monthly and uploaded to Constructware.

2. Investigate alternative construction methods and practices to reduce the impacts if present and implement alternative methods and practices as reasonable.
3. Provide a plan to measure vibration levels including but not limited to measurement locations, times and metrics. Plan shall also include contingency plan if operations exceed the limits. This plan shall be uploaded into Constructware by W/O.
4. Limit or prohibit use of construction techniques that create high vibration levels.

Trade Subcontractors shall be responsible for providing technical information, as required by the specifications, in their plan. Trade Subcontractor's plan shall be submitted via Constructware for Record Only.

**Transbay Transit Center – San Francisco, CA**

**Air Quality Plan**

Webcor/Obayashi

January 16, 2012

## GENERAL PLAN:

The Webcor/Obayashi (W/O) Air Quality Plan that will be implemented on the Transbay Transit Center Project will be an overall policy with each subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to comply with the Bay Area Air Quality Management District regulations and requirements.

W/O will require its Trade Subcontractors to establish a plan that complies with all requirements set for in specification sections 00 08 13, and 01 35 65 prior to starting Work onsite. W/O shall check and verify trade subcontractor's compliance with air quality requirements on a daily basis. Any non-compliant trade subcontractors will receive both verbal and written notice through Safe Site One (W/O internal program). Additional, W/O will require trade subcontractors to demonstrate they are actively monitoring air quality by providing checklists or documentation on each Trade Subcontractors daily report. W/O shall verify its Trade Subcontractors Air Quality plan includes the following but not necessary limited to:

1. Specific measures to minimize impacts to sensitive receptors associated with exposure to respirable nuisance dust (PM10) and achieve a goal of No Visible Emissions.
2. W/O shall verify Trade Subcontractors comply with City Dust Control Order (DPW Order No. 171,378. Water active construction areas at least twice daily to control dust using non-potable water in accordance with San Francisco Ordinance 175-91
3. Identify specific measures to minimize dust generation; to reduce health risks to workers and the public.
4. Mist the immediate excavation area with a water spray to prevent airborne dust particles. Perform continuous water spraying during dust-generating activities. Mist or spray in such a way as to prevent puddling or generation of runoff, which could potentially reach storm drains or catch basins.
5. Minimize the amount of excavated material or demolished debris stored at the Site. Remove excavated material and demolished debris, with the exception of hazardous materials or suspected hazardous materials, from the Site no later than the end of each workday. If hazardous materials or suspected hazardous materials are stored on site, store such materials in accordance with all applicable California Environmental Protection Agency regulations, including providing storage in proper containers and protection from exposure to the elements. Remove such materials from the Site as soon as possible for disposal or recycling in accordance with applicable laws and regulations.
6. Wet all exposed soil surfaces at least 3 times daily during dry weather or more frequently if dust is blowing or if required by the TJPA. Immediately wet sweep serpentine residuals from the street.
7. Keep the Site and adjacent areas clean and perform wet sweeping at the end of each shift. Sweep daily (with water sweepers) all paved access roads, parking areas and staging areas at construction sites. Sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public streets.
8. Load haul trucks carrying excavated material so that the material does not extend above the walls or back of the truck bed. Wet before covering and tightly cover the surface of each load before the haul truck leaves the loading area. Cover trucks hauling soil, sand, and other loose materials or require trucks to maintain at least 2 feet of freeboard
9. Clean up spillage on City streets, whether directly or indirectly caused by Contractor's operations.

10. Minimize use of on-site diesel construction equipment, particularly unnecessary idling. Shut off construction equipment to reduce idling when not in direct use. Where feasible, replace diesel equipment with electrically powered machinery.
11. Retain receipts of ultra-low sulphur fuel (ULSF) purchase and equipment tuning and repair and make these available to the TJPA Representative or to the Federal Transit Administration (FTA) designee upon request.
12. Locate diesel engines, motors, or equipment as far away as possible from existing residential areas.
13. Properly tune and maintain diesel power equipment. To manufacturer's specification and frequency.
14. Suspend grading operations during first and second stage smog alerts, and during high winds (i.e., winds greater than 25 miles per hour).
15. Upon completion of the construction phase, buildings with visible signs of dirt and debris from the construction site shall be power-washed and/or painted (provided that permission is obtained from the property owner to access and wash the property with no fee charged by the owner). Trade Contractor shall request CMGC to contact Singer and Associates to notify property owners for access. If permission from property owners for access is not granted, Trade Contractor is not responsible for power-washing or painting.
16. Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites.
17. If applicable, replant vegetation in disturbed areas as quickly as possible.

W/O will verify Trade Subcontractors comply with the requirements of the Bay Area Air Quality Management District (BAAQMD) Regulation 6 (for particulate matter and visible emissions), Regulation 7 "Odorous Substances," Regulation 11 "Hazardous Pollutants," and the California Health and Safety Code Division 26 "Air Resource", Chapter 3 "Emission Limitations," Section 41700 "Prohibited Conduct," and related regulations. Trade Subcontractors shall notify the BAAQMD 10 working days prior to commencing demolition or hazardous materials abatement work.

1. Such notification shall include the names and addresses of operations and persons responsible; description and location of the structure to be demolished or altered including size, age and prior use, and the approximate amount of friable asbestos; scheduled starting and completion dates of demolition or abatement; nature of planned work and methods to be employed; procedures to be employed to meet BAAQMD requirements; and the name and location of the disposal site.
2. The BAAQMD randomly inspects removal operations and will respond to any complaints received. Contractor shall cooperate with and facilitate all BAAQMD authorized inspections.\
3. Notifications shall be documented and provided to CM/GC for submission to the TJPA via ConstructWare.

Trade Subcontractors shall be responsible for providing technical information, as required by the specifications, in their plan. All trade subcontractors plans shall be submitted for Record Only via ConstructWare.

**Transbay Transit Center – San Francisco, CA**

**Waste Management and Construction Debris Plan Revision 6**

Webcor/Obayashi  
November 7, 2013

## **GENERAL PLAN:**

Webcor/Obayashi Joint Venture (Webcor/Obayashi) understands that the building contractor plays a critical role in the management of jobsite produced construction waste. Webcor/Obayashi has adopted a waste reduction and recycling policy that will be implemented on the Transbay Transportation Center Project. This policy will be an overall policy with each subcontractor contributing their specific plan as they come on board to the project.

The primary goal of the plan is to divert as much construction generated debris & unused material from landfills as possible. At a minimum, Webcor/Obayashi and its trade subcontractors will divert 75% of the waste generated on the construction project from landfills. Trade subcontractors Construction Waste Management Plan shall be prepared and submitted in compliance with the Owner's LEED project requirements and the requirements of the City and County of San Francisco.

The Trade Subcontractors are required to comply with Specification Sections 00 08 15, 01 74 00, and 01 81 13 as well as any or all of the procedures listed below. If a conflict in percentages exists between this section and Section 01 81 13, General LEED Building Design and Construction Requirements, the most stringent section shall govern.

- Use of approved debris haulers with documented recycling levels.
- Source separated debris boxes will be provided onsite for mixed debris and recyclable items such as lumber and wood related products, dirt, concrete and asphalt, cardboard & metals.
- Trade Subcontractors are required to handle and dispose of any generated hazardous waste.
- Requesting Trade Subcontractors and vendors to utilize reusable packaging when possible.
- Trade Subcontractor shall provide a Construction Waste Management Plan.

All Trade Subcontractors shall develop their own Waste Management and Construction Debris Plan that complies with the Contract Documents and this plan. Trade Subcontractors shall submit this plan in accordance with the specifications and it shall become part of Webcor/Obayashi's overall project plan. All technical requirements defined in the contract documents shall be fulfilled by Trade Subcontractors and submitted to the Construction Management Oversight (CMO) For Record Only through ConstructWare

Webcor/Obayashi will ensure the Trade Subcontractors are effectively implementing the procedures and are in compliance with Specifications.

Webcor/Obayashi will verify that after Award of Contract and before commencement of the Work at the site, the Trade Subcontractor conducts a Reuse/Recycle Assessment as part of their Solid Waste Management Plan (SWMP): Trade Subcontractor's assessment shall

estimate the types and quantities of materials for the Project that are anticipated to be feasible for source separation for recycling or reuse, either onsite or offsite, and note the procedures intended for a recycling, reuse, and salvage program. Documentation of the trade subcontractor's plan shall consist of the following:

- Trade subcontractor and vendor waste management strategies.
- Trade subcontractor required to provide a monthly summary of the total waste material with backup documentation (weight tickets) if processed offsite.
- The amount recycled (in tons), material types, recycling procedures, and processing facility locations to which materials were diverted if processed offsite.

Trade Subcontractor's Construction Waste Management Plan shall also include estimated wastes, disposal, and handling with the following:

A. List of materials that comprise source separated materials include, but are not limited to:

- Concrete, Wood, Mud, Mixed Aggregates, Yard waste, Metals, and Cardboard.
- Yard waste is not included in our overall diversion rate calculation on the template or corresponding spreadsheet per the requirements from the LEED BD&C v3.0 Reference Guide.

B. List of materials that comprise Miscellaneous Construction Debris include, but are not limited to:

- Wood, Scrap Metal, Drywall, Plastics, Film Plastics, Wire, Cable, Glass.
- The total quantity estimated, inception to completion Disposal.
- Total Project Generation, Diversion + Disposal.
- Project Diversion Rate.

Webcor/Obayashi will verify that Construction and Demolition Waste; Non-hazardous solid resources resulting from Trade Subcontractor's construction, remodeling, repair, and demolition operations for the Project are properly transferred to a C&D Recycling Facility. The C&D Recycling Facility shall be a facility that receives only C&D (construction and demolition) material. Trade Subcontractors shall provide Webcor/Obayashi a summary sheet, including all receipts for transport materials each month with the progress billing if any materials are processed offsite.

Webcor/Obayashi will verify that of the inevitable waste generated, Trade Subcontractor's reuse, salvage, or recycle as many of the waste materials as economically feasible.

Webcor/Obayashi will participate/attend a meeting with Trade Subcontractor, the TJPA Representative and representatives of the City's Solid Waste Management and recycling programs prior to commencement of work. Webcor/Obayashi will

ensure all Trade Subcontractors are made aware of the LEED requirements for C&D diversion before being allowed to work on the site.

Webcor/Obayashi will verify that Trade Subcontractors submit a Monthly Disposal and Recycling Summary Report; quantifying the construction and demolition waste generated and recycled, reused or disposed of at Class 3 Landfill. Contractor shall also send a copy of this report to the TJPA Representative and the SWMP to the City Government Recycling Coordinator. The Comprehensive Disposal and Recycling Summary Report shall be submitted quantifying the construction and demolition waste generated and recycled, reused or disposed of at Class 3 Landfill, on a monthly basis. This report is a condition of progress payment and failure to submit this information shall render the Applications for Payment incomplete. The Trade Subcontractors/trades are also responsible for contracting with a regional facility to haul any hazardous materials from the site. The Trade Subcontractor shall calculate the C&D diversion rate for both LEED requirements (excluding yard waste) and the requirements set by the City (including yard waste) for all materials processed offsite. The W/O LEED representative will screen every C&D Submittal and review Trade Subcontractor and lower-tier subcontractors C&D Plans for clarity, completeness, and compliance with City/LEED requirements.

Webcor/Obayashi will verify that Trade Subcontractors develop and implement procedures for source separation to the greatest extent feasible.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for transporting commingled (mixed) construction and demolition waste that cannot be feasibly source-separated if the intent is to process it offsite instead of using debris boxes provided onsite.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for Salvage and Reuse.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement practices for this project that will reduce waste at the source.

Webcor/Obayashi will verify the Trade Subcontractors plans develop and implement procedures for materials that are recycled and/or reused onsite

Webcor/Obayashi will verify that Trade Subcontractors participate in reuse programs by reviewing each Trade Subcontractors Monthly Disposal report for any material processed offsite. For such reuse programs, Trade Subcontractor shall refer to the City's construction and demolition recycling program.

Webcor/Obayashi shall review the environmental goals of this Project with all Trade Subcontractors during the preconstruction meeting. Webcor/Obayashi shall make a proactive effort to increase awareness of these goals among the job site workers. Webcor/Obayashi will make a proactive effort to increase awareness of these goals among the site workers by requiring that each Subcontractor take Click Safety training prior to stepping on the jobsite. As part of this Click Safety training, there is a module dedicated to teaching and reviewing the Exhibit P

LEED requirements of the project during construction activity.

Webcor/Obayashi will verify that Trade Subcontractors are using registered transporters and registered facilities. Only registered transporters can remove mixed construction and demolition debris from the construction site, and they must take this material to a registered facility. NOTE: A Registered facility: is any facility that accepts mixed construction and demolition debris for processing and recycling must be registered with the City and County of San Francisco and must demonstrate an overall minimum recycling rate of 65% for mixed construction and demolition debris. A registered facility must have applied for and received a registration from the San Francisco Department of the Environment. Webcor/Obayashi will ensure that Waste Management Companies that service San Francisco and retained by the Trade Subcontractors are registered transporters and meet the City/LEED requirements. Trade Subcontractors shall refer to SFEnvironment.org for the City's most current list of registered transporters.

Webcor/Obayashi will verify that Trade Subcontractors are implementing the following:

1. Eliminate the procurement of unneeded supplies.
2. Reduce waste by printing and copying double-sided.
3. Submit all submittals, reports, and forms in electronic format (PDF) unless otherwise noted.
4. Fully participate in available and required recycling and composting programs.
5. Purchase products made with recycled content such as paper and recycled aggregate.

Webcor/Obayashi will verify that Trade Subcontractors shall submit:

1. Construction and Demolition Debris Management Plan.
2. Construction and Demolition Debris Recovery Monthly Summary Report and supporting documentation for any materials processed offsite.
3. Construction and Demolition Debris Recovery Final Report for all materials processed offsite.

Trade Subcontractor's plan shall comply with specification section 02 41 00. All Trade Subcontractors will remove and dispose of all waste materials from the site for off-site disposal in compliance with all applicable laws, ordinances, rules, and regulations. Webcor/Obayashi and all Trade Subcontractors will work with the TJPA representative so that the representative may characterize the waste materials as required by law to the extent required by Webcor/Obayashi's selected disposal facilities.

Trade Subcontractor's plan shall comply with specification section 01 15 00. Trade Subcontractor's shall perform work in a manner to minimize generation of dust, dirt, rubbish, and other debris, to prevent dust and debris from interfering with the progress of the work, and to keep dust and debris from accumulating at the work site or adjacent areas. Trade Subcontractor's shall remove debris and rubbish from the site on a daily basis.

Trade Subcontractor's plan shall comply with specification section 01 13 50, by preventing the mixing of hazardous and non-hazardous materials.

Trade Subcontractor's shall be required to provide technical information, as required by the specifications including compliance with the City and County of San Francisco Ordinance 27-Exhibit P  
Construction Waste Management Plan

06, in their plan which will be submitted For Record Only to the CMO.

Mr. Rick Buellesbach  
Senior Project Manager - Transbay Transit Center  
Webcor/Obayashi Joint Venture  
175 Beale Street  
San Francisco, CA 94105

Re: Transbay Transit Center Quality Control Surveys  
Subject: December 2011 Control Verification Survey Results

Dear Mr. Buellesbach:

The field work for subject surveys was conducted by Chaudhary & Associates December 5 - 8, 2011. The surveys included verification of Chaudhary & Associates control (as shown on the Survey Control Plan dated 11-10-2011), with the exception of control point 217 which was destroyed sometime between the November 2011 and December 2011 control verification surveys.

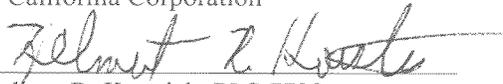

Horizontal control values for point numbers 54, 208, 209, 213, 101, 105, 215, and 227 were constrained in this control network horizontal adjustment. The elevation values remain unchanged from the November 2011 surveys. The table below shows both the 11-10-2011 and the 12-21-2011 values for the remaining control points. Because data values can be impacted by environmental factors (temperature and humidity), seismic activity, and the various combinations of back sight and foresight data available on any given day, only the values which differ by 0.01' or more are adjusted and shown on the following table (and updated on the 12/2011 control map to be sent to you tomorrow). Field note copies and Star Net Reports have been mailed to you.

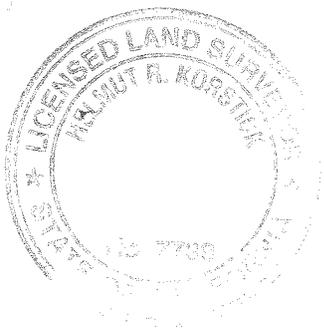

### Horizontal Values

Point #	November 10, 2011		December 2011		Description
	Northing	Easting	Northing	Easting	
79	2115835.42	6013588.51	2115835.43	6013588.49	Fnd Mag+Shnr on TC
205	2115091.66	6013145.43	2115091.66	6013145.42	Mag Nail

Sincerely,  
**CHAUDHARY & ASSOCIATES, INC.**  
A California Corporation

  
Helmut R. Korstick, PLS 7739  
Project Surveyor

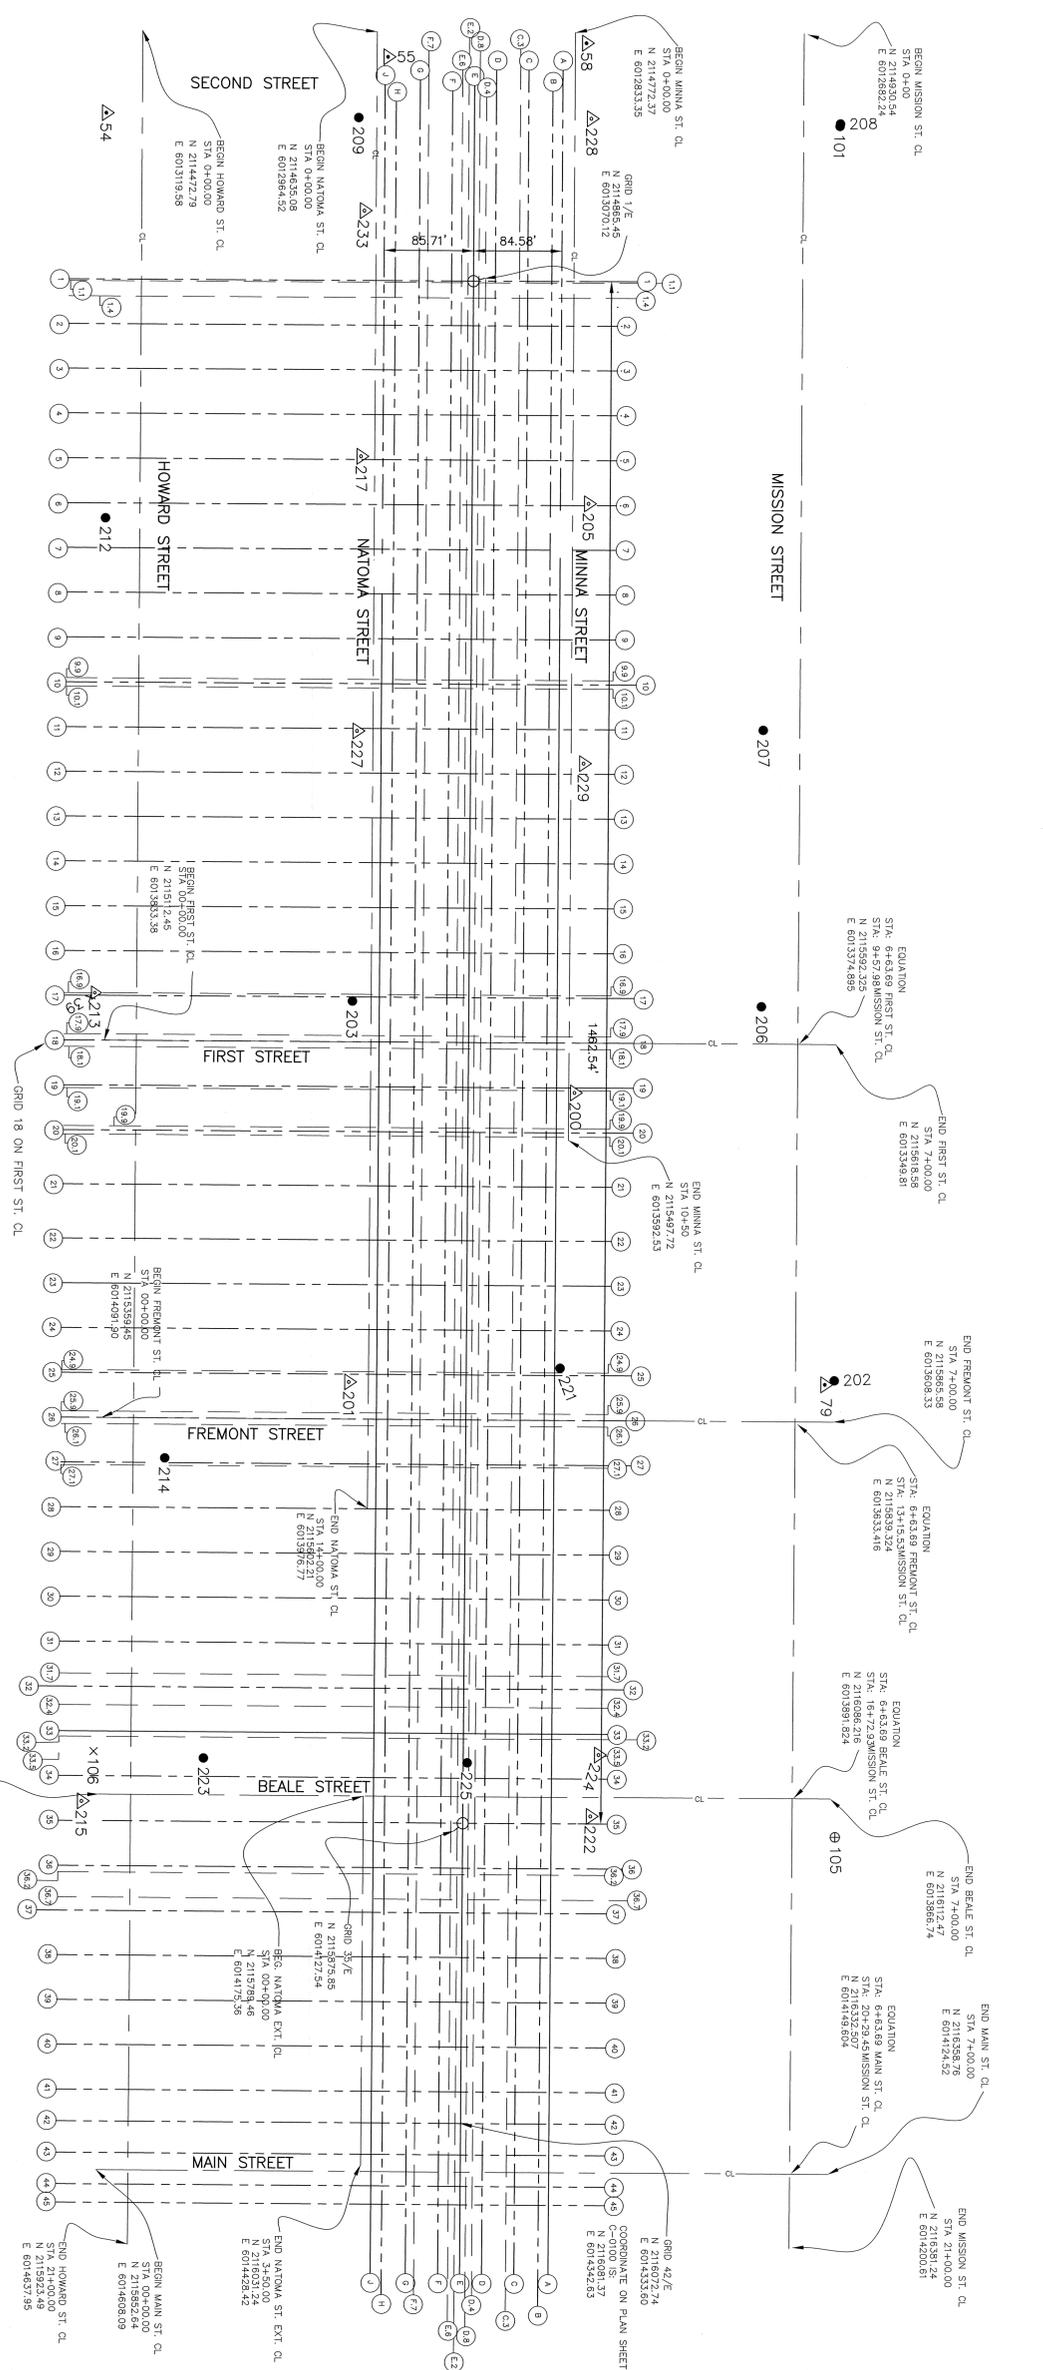

**SURVEY PROCEDURES**

1) CHAUDHARY AND ASSOCIATES FIELD CREW LOCATED AND TIED OUT CONTROL BETWEEN APRIL 22-MAY 13, 2011. DIGITAL LEVELS WERE UTILIZED FOR THE VERTICAL COMPONENT, AND A TRIMBLE S8 WAS USED FOR THE HORIZONTAL COMPONENT. CONTROL WAS ADJUSTED UTILIZING STAFF-NET SOFTWARE. OF THE 4 MAIN CONTROL POINTS SHOWN ON SHEET 01-000 OF PLANS (BEING PLS. 54, 101, 105, AND 106), PLS. 101 AND 105 WERE FOUND TO BE UNRELIABLE. THE OTHER TWO WERE FOUND TO BE RELIABLE. THE STAFF NET ADJUSTMENT A TYPICAL 100' DIGITAL LEVEL WAS UTILIZED FOR THE VERTICAL COMPONENT. NOTE: CONTROL POINTS 220-226 WERE FIELD SURVEYED BETWEEN SEPTEMBER 9-14, 2011.

2) CENTERLINES AS SHOWN ON PLAN SHEET C-0100 TO BE FIELD VERIFIED.

3) GRID LINES TO BE SET BY PLACING A CUT X OR OTHER APPROPRIATE SURVEY MARKER ON THE EXTENSION OF SAID GRID LINES WHERE PRACTICAL OR PER MEMBER AUTHORIZATION.

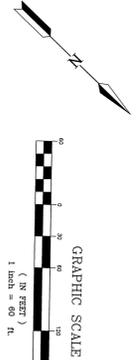

Note: Coordinates are ground coordinates (see note 6)  
 Note: Scale Factor = 1.000000

TRANSBAY JOINT POWERS AUTHORITY

# EXHIBIT “S”

## Transbay Transit Center – San Francisco, CA

### Traffic Control Plan

Webcor/Obayashi

WO-TCP0001

**REVISION 2**

**8/22/2012**

## **GENERAL**

The Webcor/Obayashi Joint Venture (W/O) Traffic Control Plan that will be implemented on the Transbay Transportation Center Project is an overall project policy, with each trade subcontractor contributing their specific plan as they come on board to the project. The primary function of this plan is to provide a framework to insure compliance with Specification Section 01 15 70. To assist in this effort, W/O has enlisted the services of a traffic control consultant (TCC) – Sandis Engineering. Award of this contract between Sandis Engineering and W/O was based on a competitive request for proposal (RFP) process referred to as TG05.4.

TCC is responsible for participating in all aspects of traffic control planning and implementation including, but not limited to:

- Traffic control design oversight;
- Coordination between trade subcontractor traffic control designs;
- Interface with City of San Francisco and other agencies as necessary;
- Participate in coordination efforts of the TJPA Representative;
- Oversight of implementation of approved traffic plans;
- Provide daily reports regarding status of traffic control measures;
- On call traffic control services as requested.

## **TRAFFIC PLAN REVIEW AND COORDINATION**

TCC shall prepare a detailed “as built” traffic plan for approximately four blocks in all directions from the jobsite. This map will be based on SFMTA maps and will be augmented as appropriate per field review of existing conditions. This map will include all striping, signage, curb lines, curb cuts, curb painting, buildings and any other feature of the street layout and traffic control. Beyond the four block distance, the map will include street layout and striping configuration.

Once a trade subcontractor is under contract, W/O shall provide the trade subcontractor with the as-built plan in CADD format. The trade subcontractor will then be required to use this base map for preparation of all their traffic control plans. A summary of the below criteria can be found in the attached Traffic Control Plan Preparation Packet.

The trade subcontractor is required to prepare and submit a complete traffic plan consistent with requirements of the project specification and all requirements per the City of San Francisco. The submittal must be made in a timely fashion to allow for the review timeframe prescribed in the specifications plus an additional four weeks for review by the TCC.

Upon receipt of the submittal from trade subcontractor, W/O will forward it to the TCC for review. The plan will be reviewed for adherence to specifications and for compatibility with previously submitted plans. Comments will be returned to the trade subcontractor who will make modifications as is appropriate.

When the trade subcontractor’s traffic control plan is reviewed and coordinated with the TCC, it will be submitted to the TJPA Representative for approval. Submittal will be in compliance with Specification Section 01 15 70, paragraph 1.4B.

Upon approval by the TJPA Representative and SFMTA, the TCC will update the baseline traffic

control plan as appropriate. The baseline plan will be updated only when a change to the traffic pattern will be in place for three or more months. If the traffic control plan will be in place for less than three months, the plan will be superimposed over the base map for coordination but the baseline drawing will not be modified.

#### **FIELD IMPLEMENTATION**

It is intended that the TCC will maintain a regular, but not full time, presence on site. Similar to the traffic control design review, their scope of work is to review the trade subcontractor's adherence to city standards, project specifications and approved traffic control plans.

TCC review and assistance in field coordination includes but is not necessarily limited to:

- Perform site review of traffic control;
- Note traffic control deficiencies;
- Coordinate correction of site deficiencies with W/O and trade subcontractor;
- Provide daily report of traffic control observations and corrective measures;
- Attend site meetings as necessary to review short term Special Traffic Permit and coordinate between subcontractors and SFMTA;
- Miscellaneous coordination with SFMTA as necessary;
- Review of pedestrian protection as it relates to vehicle traffic;
- Provide traffic control devices and personnel as required to augment traffic control efforts;
- Confirm proper training of subcontractor flagging personnel;
- Provide continuous oversight of traffic control for major construction operations as determined by CM/GC.

#### **TASKS NOT CURRENTLY ANTICIPATED BY TCC**

Training of flaggers for the trade subcontractors although it is an option should it become apparent that subcontractor employees need additional training.

Coordination of the 10b police officers between subcontractors will be the responsibility of the CMO.

Pedestrian control unless it is specifically impacted by vehicle traffic.

## **TRANSBAY TRANSIT CENTER – TRAFFIC CONTROL PLAN PREPARATION PACKET**

### ***Overview***

The purpose of this packet is to provide the contractor with the information necessary to prepare a Traffic Control Plan (TCP) for their work in accordance with the requirements of the Project Specifications and the City and County of San Francisco (CCSF). It includes procedures, timing, a base map, plan sheet template and examples for use when preparing and submitting Traffic Control Plans (TCPs) for review and approval. The documents included in the TCP Packet are described below.

### ***Flow Diagram***

The flow diagram included within the TCP packet identifies the specific components and required time intervals for TCP submittal, review and approval. Please note time requirements for Plan review and approval. No work will be allowed without an approved plan. It is the contractor's responsibility to anticipate and allow for required lead times.

### ***Base Map File***

The AutoCAD drawing of the Base Map file included in this packet represents the City of San Francisco street layout as of the date indicated on the Base Map file title block. ALL proposed TCPs shall be created using this Base Map file as a starting point. It is crucial that proposed TCPs be provided on the same coordinate system as the Base Map file so multiple approved TCPs can be overlain in a composite exhibit. TCPs prepared using a different base or plan template will be rejected.

### ***TCP Standards***

#### ***Design Standards***

The Traffic Control Plans shall be prepared and submitted in accordance with the following documents:

1. Transbay Transit Center Project Specification Section 011570 – Traffic Routing Work, dated September 23, 2010. A copy of this specification is included in the TCP Packet.
2. City and County of San Francisco Regulations for Working in San Francisco Streets (Bluebook), 7<sup>th</sup> Edition dated October 2006. Refer to the following link for a copy of this document: <http://www.sfmta.com/bluebook>

#### ***CAD Standards***

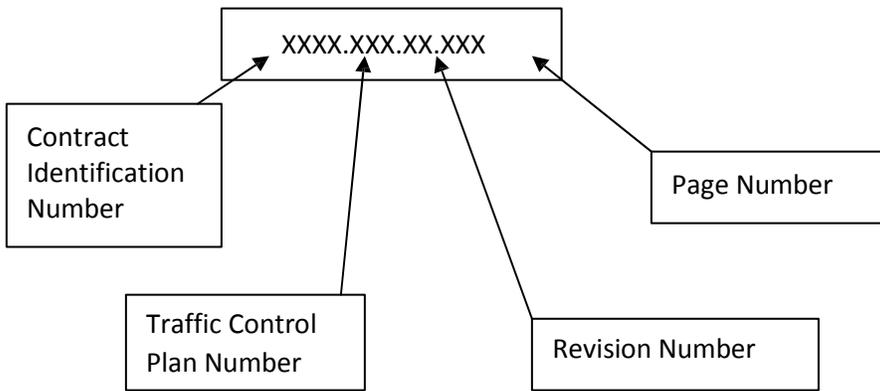

The sheet TCP-001 provides a template with title block, symbols, and specific details pertaining to the presentation and setup of drawings to be used when preparing a TCP. The CAD standards identified under the Vendor Submittal Instructions, including layering configuration, title block, and symbols, shall be referenced and followed when creating all TCP AutoCAD drawings. The contractor shall include additional signs in the form of blocks, notes, and details as needed.

**TCP Samples**

There are three sample Traffic Control Plans included in this packet. These samples provide an example of how the TCPs shall be set up and configured.

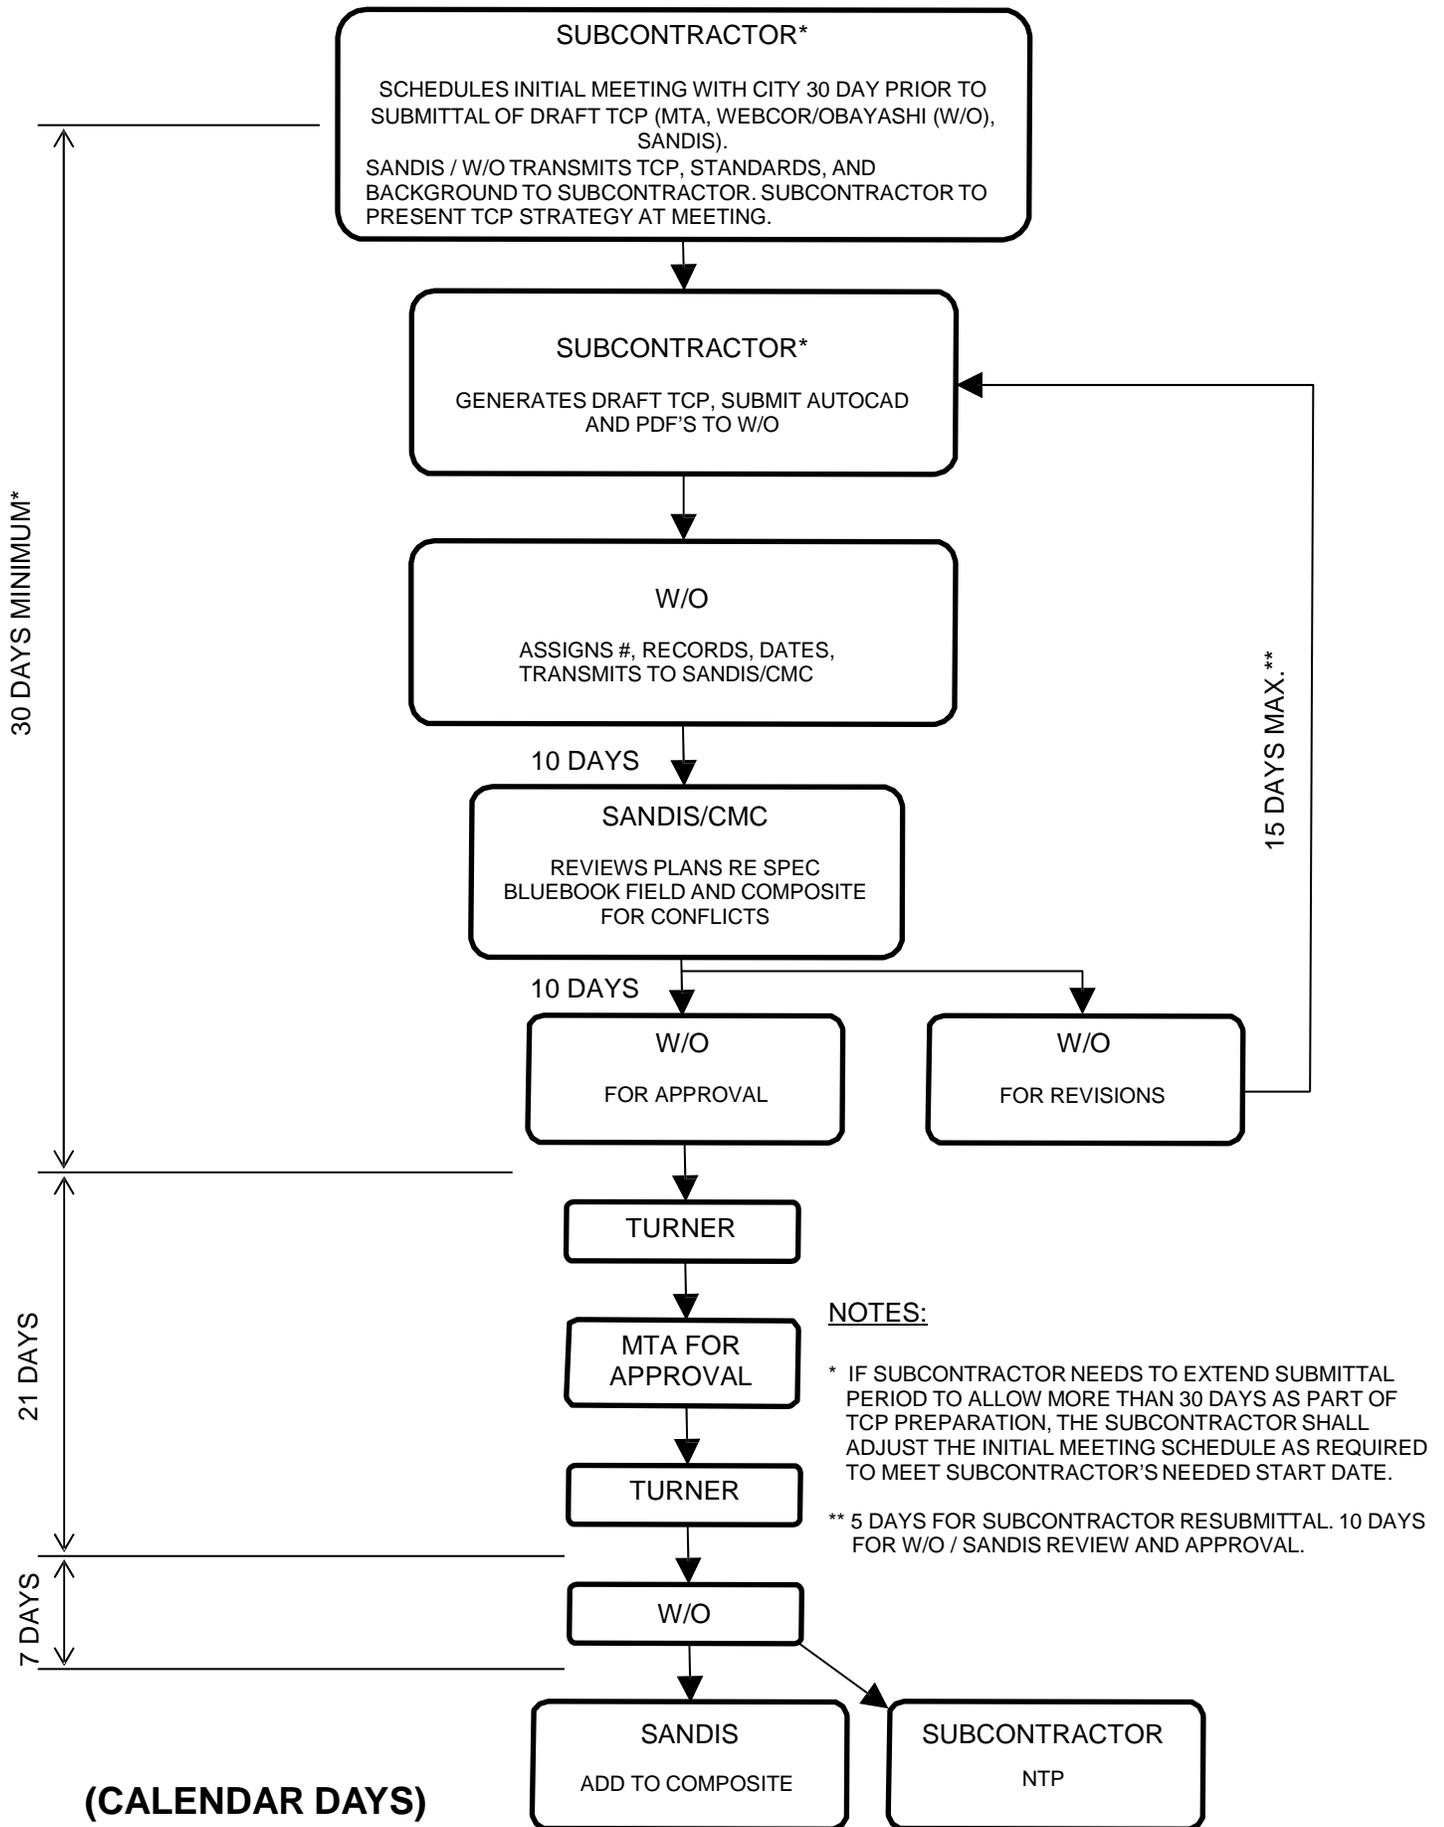

**TCP Submittals**

All proposed Traffic Control Plans shall be submitted at 1"=80' scale on 22"x34" sheet size in both pdf and AutoCAD 2007 formats. They are to be submitted electronically to Webcor-Obayashi's trade package project manager. An important item to be included on all TCP sheets is the submittal tracking number. The tracking number consists of four segments separated by a period. The first segment is the 4-digit contract identification number, the second segment the 3-digit TCP number (provided by Webcor), the third segment is the 2-digit revision number, and the fourth the 3-digit page number. Refer to the Submittal Tracking Number Diagram below for additional direction.

Submittal Tracking Number Diagram

# TRAFFIC CONTROL PLAN SUBMITTAL REVIEW AND APPROVAL PROCESS

# VENDOR SUBMITTAL INSTRUCTIONS

TRAFFIC CONTROL PLANS SHALL BE SUBMITTED AS FOLLOWS:

- 1) FIVE (5) HARD COPIES
- 2) ELECTRONIC COPY IN PDF AND AUTOCAD 2007 FORMATS
- 3) 11"x17" SHEET SIZE
- 4) 1"=80' SCALE
- 5) SHEET NUMBERING "TCP-###"
- 6) ELECTRONIC FORMAT PER TEMPLATE PROVIDED: SINGLE CAD FILE CONTAINING MULTIPLE LAYOUT TABS WITH A SINGLE TCP PER TAB. THE TCP SHALL BE DRAFTED IN MODEL SPACE ON TOP OF THE STREET BASE FILE WITH NOTES/LEGEND IN PAPER SPACE. MODEL SPACE SHALL BE DRAFTED AS FOLLOWS:

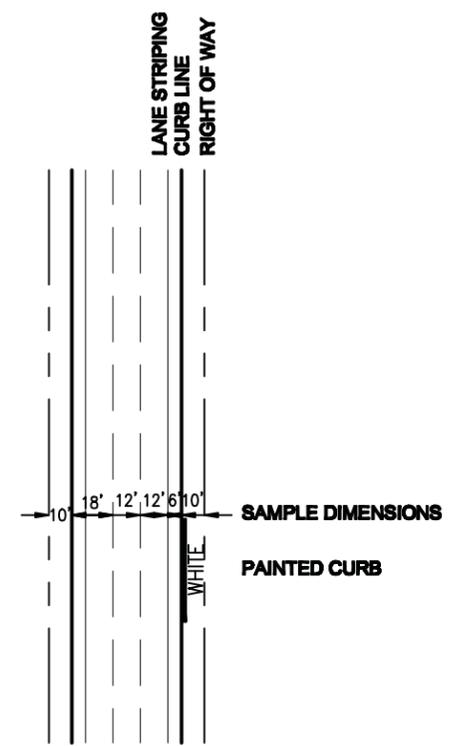

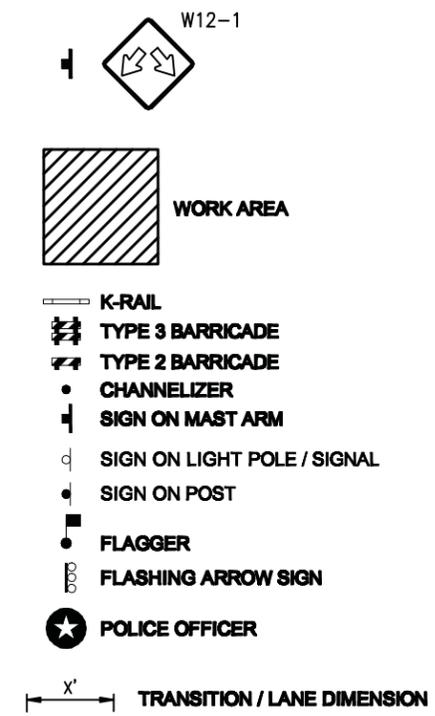

- a) EACH TCP PAGE SHALL CONSIST OF FIVE LAYERS WITH A PREFIX FOR THAT PAGE NUMBER. FOR EXAMPLE, PAGE 001 WOULD CONTAIN THE FOLLOWING LAYERS:
  - 001-TC-DIM
  - 001-TC-NOTES
  - 001-TC-SIGN
  - 001-TC-SIGNTEXT
  - 001-TC-STRIPELINE
  - 001-TC-WORKAREA

- b) ALL SYMBOLS, BLOCKS AND DIMENSIONS SHALL MATCH THOSE ON THIS SHEET IN SIZE, COLOR, AND LAYER. CREATE NEW BLOCKS USING SIMILAR COLOR AND SIZE FOR SIGNS/DEVICES NOT SHOWN HERE.
- c) INSERT STANDARD TITLE BLOCK PER SHEET. USE ATTRIBUTE EDITOR TO FILL IN TITLE BLOCK WITH APPLICABLE INFORMATION.
- d) TABLES, NOTES, AND LEGENDS SHALL BE IN PAPER SPACE PER SHEET ON LAYER XXX-TC-GENERAL, WHERE XXX IS THE PAGE NUMBER
- e) STANDARD TEXT STYLES, SIZES, DIM STYLES PER TEMPLATE
- f) STANDARD LAYER COLORS AND NAMES; AND CTB/PEN SETTINGS PER TEMPLATE
- g) FREEZE LAYERS IN VIEWPORTS AS NECESSARY TO ONLY SHOW THOSE NEEDED FOR THAT INDIVIDUAL SHEET.

7) REFER TO PROVIDED SAMPLE TCP PLAN FOR AN EXAMPLE OF THE FORMAT BEING IMPLEMENTED.

NOTE:  
SAMPLE TEXT FOR  
FREESTANDING NOTES.

## **Exhibit U      Submittal Schedule**

Trade Subcontractor's Schedule submission shall include a full submittal schedule per Specification Section 01 13 00 1.4 – Submittal Schedule.

1. All submittals are to be submitted to Webcor/Obayashi Joint Venture within 60 days of Award.
2. The Submittal Schedule shall contain additional data fields to indicate: 1) the duration in work days for procurement of the item starting from the date that the submittal is approved until the item is available for construction, and 2) the Activity ID of the earliest construction activity for which the item will be required (the submittal/procurement item's successor).
3. The Trade Subcontractor should use the attached data format, Submittal Schedule Excel Template, for the submission of Submittal Schedule as Microsoft Excel File. Contact Webcor/Obayashi Joint Venture to obtain the blank excel file of the Submittal Schedule.
4. The Trade Subcontractor shall show critical submittals in the Exhibit I Construction Schedule in addition to providing the comprehensive submittal schedule required herein. Critical submittals are those submittals considered vital to the timely progression of the project schedule. These items may include, but are not limited to, engineering submissions; long lead items; items required within the first 25% of Subcontractor's performance period; and items that are required for construction or installation of a task with less than 20 working days of total float in the overall project schedule. The last group of items may not be determined until after acceptance of the Trade Subcontractor Construction Schedule submission and its full incorporation into the project schedule. Therefore, the Subcontractor may be required to add items to its Primavera schedule file subsequent to approval of its Construction Schedule submission.

## QUALITY COMMISSIONING PROCEDURES AND GUIDELINES

### Exterior Skin and Waterproofing Systems

- ✓ Roofs
- ✓ Decks
- ✓ Windows
- ✓ Curtain Walls
- ✓ Exterior Wall Systems (Precast, Stucco, EIFS, GFRC)
- ✓ Water Shedding Systems
- ✓ Flashings
- ✓ Expansion Joints
- ✓ Caulking, Sealants
- ✓ Primary and Secondary Water Barrier Systems
- ✓ Above & Below Grade Waterproofing
- ✓ General Waterproofing Systems

#### 1.0 Purpose

The purpose of this procedure and guideline is to set forth a commissioning process, which will ensure that the building's exterior envelop and waterproofing systems perform and function in conformity with design intent and to provide a means of verifying the implementation of these systems based on the project specifications, design and applicable industry standards.

#### 2.0 Definition of Commissioning

The term "Commission" refers to a Quality Assurance process by which the building's exterior envelop and waterproofing systems (i.e., below and above-grade waterproofing, decks, roofs, caulking, plaster, precast concrete and GFRC, curtain-wall, flashing, expansion joints, etc.) are provided, installed and tested in order to verify the systems perform in accordance with the contract documents and the design intent.

Commissioning entails the development of a clear and complete process that verifies the systems design and operational intent. It also is to verify that the exterior envelop and waterproofing systems and its components are installed according to the contract documents, manufacturer's recommendations and published industry standards and that the system receives adequate installation and performance inspections by the installing contractor.

The process must include verifying and documenting the installation steps, phases, and system performance with respect to the design intent and the contract documents. Commissioning is a team effort that requires cooperation by all parties to succeed.

#### 3.0 Description of the Commissioning Process

Commissioning is a "**systematic**" process for achieving, validating and documenting the performance of building systems as so that it meets the design intent and requirements.

The process extends through all phases from design to occupancy, and extending through the warranty period. Numerous checks and inspections shall be performed at each stage of the process to ensure that established procedures are followed. The process also includes training of facility operational personnel to ensure continued efficient use of the exterior envelop and waterproofing systems as originally designed and installed.

This guideline provides a uniform, integrated and consistent approach for the commissioning of all waterproofing systems as well as assisting in insuring product and design compatibility. Since many building waterproofing systems are integrated, a deficiency in one system or component may result in sub-optimal performance and failure among others.

#### 4.0 Commissioning Plan

Commissioning is a “**Quality Process**” for validating the system and component design performance.

The reports from the commissioning process are not just test reports, but reports that document design, installation, inspections, and particular tests and or evaluation procedures. The commissioning plan is continually updated to reflect changes in program and design of the waterproofing system(s). Commissioning reports shall document and record the results of the commissioning process.

Each Trade Subcontractor’s specific commissioning plan must be neatly organized in a consistent manner that reflects the nature of the building systems and their performance. The commissioning plan shall include schedules, requirements and procedures.

Trade Subcontractor(s) shall be responsible for the timely and efficient completion of all commissioning in accordance with the Subcontract Agreement.

**At no time shall any work be permitted to commence without a WEBCOR/OBAYASHI’ approved Trade Subcontractor Waterproofing Commissioning Program.**

Failure to do so may require Trade Subcontractor to assume all related costs and expenses in accordance with the Subcontract Agreement.

In addition, Trade Subcontractor may also be required to assume all related cost should WEBCOR/OBAYASHI find it necessary to develop, manage and or perform any Trade Subcontractor commissioning work.

#### 5.0 Objectives

The fundamental objectives of the commissioning process are:

- 5.1 Create a procedure to verify and provide documentation that the waterproofing performance of the facility meet the design requirements.

- 5.2 Enhance communication by documenting data and decisions throughout all phases of the project.
- 5.3 Validate and report that the performance of waterproofing systems meets design intent.
- 5.4 Provide a means of Quality Control and Quality Assurance (QA/QC) throughout all phases of the waterproofing system(s) installation, inspection, and testing process.

## **6.0 Contractors Normally Participating in the Commissioning Process**

- ✓ Waterproofing Consultant
- ✓ Architect
- ✓ Structural Engineer
- ✓ Mechanical
- ✓ Plumbing
- ✓ Electrical
- ✓ Fire Sprinkler
- ✓ Glass Systems
- ✓ Caulking
- ✓ Brick, Tile, Precast, GFRC, and Stone
- ✓ Fountains and Ponds
- ✓ Swimming Pools & Spas
- ✓ Roofing
- ✓ Insulation
- ✓ Flashing & Sheetmetal
- ✓ Waterproofing Contractors
- ✓ Concrete (If waterproofing admixtures are included by design)
- ✓ Stucco, EIFS, DEFS systems
- ✓ Elastomeric Painting
- ✓ Rough Carpentry (Wood cladding)
- ✓ Architectural Metal Cladding
- ✓ Expansion Joint Systems
- ✓ Water Tanks
- ✓ Special Systems or Components

## **7.0 Commissioning Team**

The commissioning team members may consist of the following:

- ✓ WEBCOR/OBAYASHI - Project Team as required

- ✓ Owner - Designated representative of the owner, building operator/engineer, and/or the owner's construction management firm
- ✓ Engineers - Architect and Designers
- ✓ Waterproofing Contractor
- ✓ Waterproofing Consultant
- ✓ Flashing / Sheet Metal Contractor
- ✓ Exterior Skin Contractor
- ✓ Roof Contractor
- ✓ Glass and Curtain Contractor
- ✓ Caulking and Sealants Contractor
- ✓ Commissioning Agent (CA)
- ✓ Mechanical Contractor
- ✓ Plumbing Contractor
- ✓ Fire Sprinkler Contractor
- ✓ Electrical Contractor
- ✓ Testing Contractor
- ✓ Other as necessary

## 8.0 Meetings

Regularly scheduled commissioning meetings of **the entire team** shall be conducted for site coordination, communicating issues of concern, resolving conflicts, reporting on system process and status, identifying urgent work and all deficiencies.

Commissioning meetings are critical to the **Quality** of the commissioning process as well as timely completion of the project.

## 9.0 Trade Subcontractor Performance Requirements

- 9.1 Designation of the primary person who will be responsible, accountable, and act as the main contact person for all commissioning communications. Provide organizational chart indicating personnel who will be involved in the project. The chart should indicate factory, office, and on-site field personnel.
- 9.2 Review of drawings and specifications for completeness, appropriateness of details, and acceptance by Trade Subcontractor thereof.
- 9.3 Review WEBCOR/OBAYASHI standard details.
- 9.4 Preparing and submitting documentation of Trade Subcontractor's respective materials and systems to be integrated into the overall Commissioning Plan.
- 9.5 Submitting information on the intended commissioning protocol used on materials, and the integration into the system as a whole.
- 9.6 Provide a presentation of the commissioning process to WEBCOR/OBAYASHI, the Owner and or the owner's representatives. Demonstration shall indicate compliance with the Trade Subcontractor Commissioning requirements as outlined in this document.
- 9.7 Submitting shop drawings detailing waterproofing system layout as outlined in the contract documents. Shop drawings shall reflect all conditions present in the building, including but not limited to the following:
  - a. Conditions where different materials meet (i.e. windows to plaster or stone to plaster).
  - b. Corner conditions.
  - c. Conditions where vertical planes meet horizontal planes (i.e. soffits and sills).
  - d. Expansion joints and control joints.
  - e. Flashing.
  - f. Penetrations (i.e. Z-ducts, electrical outlets, louvers).
  - g. Conditions typically utilized by Trade Subcontractor's common practices.

Shop drawings shall include installation drawings indicating the planned sequence of installation of all components.
- 9.8 Providing means and method for preliminary testing of the exterior envelop and waterproofing systems with manufacturer's representative present as required:
  - a. Caulking: Include complete coordination with the caulking manufacturer's representative to assure compatibility of the caulking system with the

surrounding substrate and finishes. Trade Subcontractor shall submit caulking samples including manufacturer's specifications for materials, color, cleaning procedure, required primers, proper backer rod, installation procedures, testing requirements and results. Testing of caulking samples between all combinations of materials shall be performed by qualified testing agencies in direct accordance with A.S.T.M. Standard Test Method C794 (75), including seven (7) day immersion. A letter from the Caulking Manufacturer shall be submitted approving all testing procedures, the installation procedure and the use of the specified materials for the intended application. Any materials installed without such approval that may be in conflict with the approved procedures or of unacceptable color and appearance will be removed and replaced at the Trade Subcontractor's expense.

- b. Windows and Sliding Glass Doors: Assemblies shall be field tested in accordance with American Architectural Manufacturers Association (AAMA) 502-02 Voluntary Specification for Field Testing of Windows and Sliding Glass Doors using Test Methods A and B, testing a minimum of 1% of the products for air leakage resistance and water penetration resistance as specified for various stages of the product installation.
- 9.9 Reviewing all required testing under the witnessing of WEBCOR/OBAYASHI, Building Owner, and or the Owners representatives.
  - 9.10 Correcting all system deficiencies at Trade Subcontractor expense.
  - 9.11 Obtaining all required permits, code required inspections and final certifications.
  - 9.12 Preparing complete as-built record drawings made from an original set that has been marked up throughout the duration of the project. Drawings must indicate all work as it was actually installed showing change order revisions, field changes required to meet the working conditions, and any other items that will affect or reflected in the operation and maintenance of the facility.
  - 9.13 Obtaining all manufacturer's warranties and guarantees.
  - 9.14 Organizing the O&M manuals, if any, from suppliers and manufacturers.
  - 9.15 Performing any specified training for the facility's operational staff.

## 10.0 Information Management

The management and continued organization of the commissioning information shall be the sole responsibility of the Trade Subcontractor.

WEBCOR/OBAYASHI and the Trade Subcontractor shall mutually agree on the location where all the commissioning information and documentation shall be stored.

The Trade Subcontractor shall make every effort to continually update and manage the information throughout the commissioning process. WEBCOR/OBAYASHI and the Building Owner may review the commissioning information provided by the Trade Subcontractor at any time for updates, accuracy and completeness.

WEBCOR/OBAYASHI may elect to withhold or make appropriate adjustments to the Trade Subcontractor's monthly progress billing in the event the commissioning information or performance requirements as described in the Waterproofing Quality Commissioning Procedures & Guidelines are not being performed, managed and updated by the Trade Subcontractor.

## 11.0 Trade Subcontractor Commissioning Submittal Requirement

Each Trade Subcontractor has a responsibility to WEBCOR/OBAYASHI and the Building Owner to comply with the terms of the contract and to verify that the design intent of the waterproofing systems for the project is achieved.

Each Trade Subcontractor is required to provide two completed commissioning manuals containing the information outlined in Section 19 - Commissioning Binder Tab Index of this guideline. Each proposed formatted "3-ring" binder containing all information, including blank forms shall be provided to WEBCOR/OBAYASHI and the Owner for "**review and comment**" before the commissioning process begins, or by an agreed upon date.

WEBCOR/OBAYASHI, the Owner and the owner representative shall review the information and return it to the Trade Subcontractor within **two-week** time with all comments.

Each Trade Subcontractor shall make all required changes as agreed, to the commissioning manuals and resubmit them to WEBCOR/OBAYASHI within **two-weeks**.

Each Trade Subcontractor shall schedule and provide a formal demonstration of their commissioning process to WEBCOR/OBAYASHI, the Owner and the Owners representative after all required changes to the manuals have been satisfactory completed. Demonstration shall indicate compliance with the Trade Subcontractor Waterproofing Commissioning requirements as outlined in this document.

Each Commissioning Manual **shall be neatly organized** using appropriate tabs, dividers, table of content, index, etc. as required for easy referencing. Refer to Section 19 Commissioning Binder Tab Index for a standard binder organization. All Commissioning Manual(s) **must be user friendly**.

## 12.0 Commissioning Binder Tab Index

- Tab 1. Project design criteria specifications** – Provide information that describes the overall design criteria and performance requirements for the waterproofing system(s).
- Tab 2. Manufacture products and components** – Provide complete submittal list of all components that shall be contractually provided and installed.
- Tab 3. Manufacture installation instructions** – Provide manufacture documentation insuring that the system and components installation complies with all Manufacture requirements to maintain performance and guarantee obligations.
- Tab 4. Manufacture details** – Provide manufacture details or published industry standards for penetrations and terminations interfacing with other installed systems.
- Tab 5. Design transition review** – Provide design review comments and concerns on transition interfaces to other s or other compatibility issues.
- Tab 6. Quality Assurance / Quality Control Program** – Provide QAQC program with complete field inspections and checklists.
- Tab 7. Documentation** – Trade Subcontractor shall maintain a separate field binder documenting the QAQC inspections and field-testing for all installed work.
- Tab 8. Field mock-up and testing** – Provide information on mock-up or field performance tests that shall be preformed for all installed system(s). Provide manufacture recommendations or published testing standards used. If no performance testing is preformed, Trade Subcontractor shall provide documentation on how each system is performing in accordance to the documented design intent and contract warranty requirements.
- Tab 9. Schedule** – Provide schedule for, shop drawing devolvement, submittals fabrication, delivery and installation.
- Tab 10. Agency and factory test reports** – Provide all factory, agency, and field performance-testing reports on installed systems.
- Tab 11. Factory and Trade Subcontractor guarantee information** – Provide warranty responsibilities and durations for all systems and components installed.
- Tab 12. Owner Training** – Provide (O&M) and training for all required service and maintenance requirements as it extends throughout each system to maintain warranty. Include owner sign-off sheets verifying training.

- Tab 13. Attic Stock** – Provide list of spare material that shall be supplied by Trade Subcontractor to owner – Paint, applied materials, gaskets, handles, glazing, or patching products.
- Tab 14. As-Built Drawings** – Provide completed set of drawing and details accurately reflecting all installed and completed work.
- Tab 15. Material Safety Data Sheets** – Provide all Material and Data Safety Sheets (MSDS).

### 13.0 Identifying the Defects

It is the intent of the commissioning process to avoid defects in waterproofing systems. A standard of care exhibited during the commissioning process should anticipate potential defects and determine appropriate solutions prior to the installation of these systems. In the event that defects do occur, proper defect identification will help determine the repair needed and assist in selecting the appropriate method and materials.

It is important to acknowledge which factors have caused deficiencies in the waterproofing system and its components, and how a deficiency in one system may influence or amplify another. Careful and thorough defect identification is critical to obtain long-lasting, quality repairs. It is critical and necessary to eliminate the cause of the defect and not solely treat the symptom.

Each Trade Subcontractor shall be responsible for determining the cause and origin of various problems as it pertains to their contractual scope of work. Failure to do so may require Trade Subcontractor to assume all related costs and expenses for damages, repairs performed by others, testing, special inspections, and consultant fees.

### 14.0 Applicable Industry Standards

Unless the Contract Documents include more stringent requirements, applicable published construction industry standards shall be utilized. Where compliance with two or more standards is specified for quality or quantity levels, comply with the most stringent requirement.

Where sections of the specifications require that a product, material, installation, or test complies with a specified industry standard, the Trade Subcontractor shall obtain copies directly from the publication(s) source and include the information in the submitted commissioning information.

Each Trade Subcontractor engaged in construction on the project must be familiar with published industry standards applicable to their construction activity.

### 15.0 Schedules

An initial schedule shall be developed by the Trade Subcontractor identifying dates, times, and durations for shop drawings, approval of submittals, material fabrication, product delivery, acceptance, installation, testing and completion.

The schedule shall also include any commissioning task that shall be performed on waterproofing systems that may involve or affect other related building systems.

Each Trade Subcontractor shall update schedules, daily, weekly, monthly, or as required to keep WEBCOR/OBAYASHI and the Owner informed of the activities performed. This schedule will indicate appropriate milestones during the installation to allow WEBCOR/OBAYASHI and or the Owner the ability to observe and witness system installations prior to being covered up by subsequent s. The schedule will indicate milestone dates for Trade Subcontractor inspection and testing.

#### **16.0 Execution of Inspections and Checklists**

Trade Subcontractor and or vendors shall schedule initial inspections and checklist review with the commissioning team. The inspections and reviews shall be directed, executed, and documented by the Trade Subcontractor or vendor.

To document the process, the Trade Subcontractor performing the task shall provide and complete all documentation forms and checklists. (See attached sample checklist)

#### **17.0 Field Inspections**

One of the most important commissioning activities for waterproofing systems is field inspections. The field inspection process shall serve as a method and means of documenting the installation process as well as indicate variations between contractual design and construction.

Each Trade Subcontractor shall identify in detail the scope of their field inspections, and the types of field procedures that will be required to obtain the necessary information to provide a complete waterproofing quality control evaluation at the completion of the job.

#### **18.0 Field Witnessing of Trade Subcontractor's Quality Control**

WEBCOR/OBAYASHI, the Owner, consultants and the Architect reserve the right to witness the waterproofing system installation at any time. Spot checks shall be conducted on a random basis. If inconsistencies are discovered in quality, performance, or if commissioning information differs from those submitted, the Trade Subcontractor may be required to completely remove and remedy all conditions where the inconsistencies occurred at no additional cost or impact to the schedule.

Witnessing shall include all or part of, but not limited to the following:

- 14.1 Mock ups
- 14.2 Waterproofing component and system installation
- 14.3 System inspection and checks
- 14.4 Performance tests

## 14.5 Special Inspections

## 19.0 Documentation

Trade Subcontractor shall maintain a separate field binder documenting quality control inspections and field-testing for all installed work. Documentation shall include dates, quality control field checklist, reports with inspected locations defined by grid lines and elevations. Provide a dated photo log, documenting inspected areas and general sequence of installed work for the duration of the project.

## 20.0 Testing and Methods

The objective of field-testing is to correlate paths of moisture infiltration and to observe the source of damages. Moisture entering a building during extreme weather may be obvious, but the most reliable method to discover the infiltrating path is to recreate the leakage condition in a controlled manner. Testing also allows verification of the theory for the cause of leakage.

As all system and component tests are unique to some degree, there may not be one standard or method for testing that can be applied to all. There are several methods, standards, governing requirements, and manufacture recommendations, etc., which should be applied.

There are three types of acceptable testing methods that can be used during the investigation. All of which must be approved by WEBCOR/OBAYASHI. These testing categories include:

- ✓ Non-Destructive Testing
- ✓ Destructive Testing
- ✓ Laboratory Testing

### 20.1 Non-Destructive Testing

Non-destructive testing uses a variety of non-invasive tools. This type of testing causes little or no damage or interference to the building envelope. The various methods of non-destructive testing include:

- a. *Rilem Tube* - This calibrated device is adhered to exterior masonry walls to determine the porosity and condition of brick masonry units, mortar joints, head joints, and embedment joints.
- b. *Water Spray Rack (ASTM E1105)* - This test simulates a wind-driven rain condition on a facility. It can assist in determining the specific cause and origin of moisture infiltration when it is used to test independent components of the envelope. Spraying water over a large area in an uncontrolled fashion will not reveal specific causes of water infiltration.
- c. *Hose Spray Test (AAMA 501.2)* - This test method also simulates wind-driven rain in small segmented areas using a standard garden hose in which a calibrated nozzle is attached with a pressure gauge. The spray is

directed at a specific joint, crack, or defect to reveal potential moisture intrusion.

- d. *Differential Pressure Test (ASTM E1105)* - A pressure chamber is constructed on the interior of the facility at a specific location to test moisture driven through an assembly or component. The assembly or component is subjected to a negative force while simultaneously a spray rack is directed at the assembly to draw the moisture into the facility to simulate a negative pressure under a wind-driven rain condition.
- e. *Infra-Red Thermography* - Infra-red Thermography photographs the building exterior to determine the locations of wet components. Components, such as insulation and sheathing, etc., will act as heat sinks if they contain high levels of moisture. During the day, moist and dry components absorb heat. At night, the moist areas release the heat much slower than the dry areas. By reading the heat signature, Infrared Thermography will help expose the problem areas. Small test cuts may be required to verify moisture areas.
- f. *Soundings (ASTM D4580)* - There are different ways to perform sounding tests including the hammer tap test. In this test, a 16 oz. hammer is tapped against concrete for sound. A hollow sound indicates areas where the concrete has separated from the reinforcing steel, typically due to exfoliation or corrosion of the steel. Another method of sounding is to chain drag a heavy 15 ft. link chain along a concrete surface to listen for hollow sounds, indicating defective concrete. This method can cover larger areas effectively and is commonly used on parking garages and loading docks.
- g. *Pachometer Survey* - This test uses a magnetic device used to locate embedded steel reinforcement and help determine the concrete cover over the reinforcement. Generally, the Pachometer is fairly accurate when measuring ¼ inch to 3-inch thick concrete cover and when reinforcing placement is not too congested.
- h. *Poly-sheet Tape-down* - This test determines the presence of moisture coming through a concrete surface, typically a slab-on-grade type of assembly where the typical problem is tile or membrane separation from the floor. A 2' x 2' section of polyethylene is sealed to the concrete with duct tape and removed 24 hours later. If there is moisture beneath the polyethylene, it is a good indication that there is a vapor drive through the concrete section.
- i. *Glass-Slide Epoxy or Crack-o-meter* - This device is sealed in place over a crack and periodically checked to determine if any movement has occurred. If movement has occurred, the glass will crack or the meter will record movement.
- j. *Optical Illuminated Boroscope* - A boroscope is inserted into a 5/8-in. diameter pilot hole through an exterior wall system and allows the cavity walls of brick veneer, stud wall backup of exterior insulated finish systems (EIFS), or other types of constructions to be observed without large-scale destructive testing.

- k. *Smoke/Dust Tracer* - The smoke/dust tracer helps to find air infiltration. It is moved across the interior face of a window to observe the smoke and dust particles coming through the assembly.
- l. *Moisture Meter* - A Delmhorst meter is a digital device that detects the presence of moisture in various building components. This test is typically accompanied by a gravimetric analysis (oven drying of samples), which is used to confirm the results of the Delmhorst meter.
- m. *Flashlight and mirror* - These simple tools can be very useful to detect problem areas. Placing the mirror into the plenum or behind difficult-to-access areas with the flashlight will allow observation of concealed conditions.

## 20.2 Destructive Testing

When the main objective is to determine the existing composition and configuration of concealed assembly conditions, destructive testing may be warranted. The most common methods of destructive testing are test cuts and borings.

Any type of destructive testing must be reviewed and approved by WEBCOR/OBAYASHI.

- a. *Roof Testing* - Test cuts in the roof assembly may be necessary to determine the condition of the underlying insulation and substrate. Cutting into the system may help verify whether roofing problems are causing corrosion of the steel deck, or a spalled and cracked concrete deck, etc. Test cuts may also expose the as-built configurations of the flashing components at roof-to-wall locations, curb locations, etc. This information is critical to the appropriate remedial design and/or repairs.
- b. *Exterior Wall/Skin Testing* - Test cuts on exterior walls may be required to identify the origin of moisture infiltration. For masonry walls, it is most effective to make test cuts at window heads and sills, and at any through-wall flashing locations that may be suspected of allowing moisture intrusion. Masonry test cuts may expose defective through-wall flashing that is allowing moisture intrusion. Test cuts may also help determine the underlying conditions of the steel components in wall systems, including wall ties, reinforcing steel, sub-steel columns, etc.

## 20.3 Laboratory Testing

Destructive testing is also used to obtain samples for lab analysis. Samples of sealants, coatings, painted finishes, roofing materials, etc. can be sent to a laboratory to determine the presence of lead or asbestos. Samples of masonry or concrete can also be tested to help identify causes of moisture/air infiltration (descriptions of these analyses follow).

Laboratory testing may help obtain a better understanding of existing material types, presence of contaminants, and the possibility of hazardous components.

This type of testing can also provide valuable information concerning proper surface preparation, material selection, and implementation of repairs.

The following laboratory tests are some of the more useful when performing building envelope evaluations:

- a. *Gravimetric Analysis* - This test will determine moisture content. After weighing and recording the in-situ existing sample, completely dry the sample in an oven and re-weigh it. The weight difference indicates moisture content and is particularly useful for insulating materials. Testing moisture contents of samples is critical to verify results from non-destructive moisture scans.
- b. *Petrography* - Petrography determines the “make-up” of concrete. This test will indicate the size and type of aggregate, air/void ratio, type of cement, and general mix design data of the concrete. Most materials testing lab can perform this test.
- c. *Air Entrainment* - Provides an indication of the existing concrete’s durability and freeze-thaw resistance. Air entrainment is generally indicated by petrography.
- d. *Presence of Carbonization* - Accomplished by spraying a solution of phenothelene on the concrete substrate and recording the depth of the solution’s color change. This will indicate to what depth carbon dioxide has progressed into the concrete. Carbon dioxide will degrade the cement matrix of the concrete and lower the pH level of it. The layer surrounding the reinforcement is then destroyed, allowing corrosion of the reinforcing steel. Corrosion by carbonization usually occurs over a broad area.
- e. *Chloride Ion Content* - Chlorides from marine atmospheres or mists from road salts entering the concrete substrate, and salts originally introduced to the concrete via admixtures or aggregates can promote accelerated corrosion of reinforcing steel, usually at concentrated or specific locations. The chlorides are not consumed in the corrosion process but rather act as catalysts in the process. The corrosion will progress along the reinforcing bars causing concrete de-bonding, cracking, and spalling.
- f. *Reinforcement Placement, Depth, Quantity, and Type* - This information may be established with the use of a Pachometer or similar electronic metal detector. It is useful in determining required steel replacement and structural capacities during engineering analysis phases.

## 21.0 Engineering Analysis

Using information obtained from the field, laboratory results, and collected data, a comprehensive engineering analysis may be required. The engineering analysis should include an assessment of field and laboratory data, structural analysis as well as the following:

- ✓ Thermal Analysis
- ✓ Drainage Analysis

- ✓ Vapor Drive Analysis
- ✓ Fire Rating Requirements
- ✓ Cost Estimations

## **22.0 Deficiencies and Non-Conformance**

The Trade Subcontractor shall identify and list any outstanding deficiencies or procedures that were not completed successfully during any final testing. Documented deficiencies shall be submitted to WEBCOR/OBAYASHI within 48 hours of each test completion.

The Trade Subcontractor shall also provide in writing, the corrective action for each deficiency as required within 48 hours. The installing Trade Subcontractor and or vendor shall correct all outstanding issues or deficiencies in the materials or the installation of the materials and provide the commissioning team with dates and times for the required corrections and any re-testing.

## **23.0 Remedial Work**

General considerations for the repair of defects and replacement of components should include the following:

- 23.1 Determine the effect, if any; the repairs have on the structure, surroundings, and operations of the building.
- 23.2 Ensure proper preparation of surfaces to be repaired and provide chemical and mechanical bonds for new materials.
- 23.3 Material selection should include an understanding of performance limitations and should rely on the products past acceptable performance. Material selections should include consideration of the following:
  - ✓ Compatibility
  - ✓ Maintenance
  - ✓ Life cycle

## **24.0 Project Commissioning Closeout**

WEBCOR/OBAYASHI, the Owner, and/or the Owner's representative shall determine when the Trade Subcontractor commissioning process has been satisfactorily completed and when to submit the final report information and all other documentation to Webcor.

As part of the project turnover, the quality of all work will be reviewed to determine whether it is within specific and manufacturers' guidelines, industry standards, and code compliance.

WEBCOR/OBAYASHI, the Owner, and/or the Owner's representative consultant must be completely satisfied that the commissioning procedures have been performed accurately and professionally.

In the event the commissioning information or performance requirements outlined in the Waterproofing Quality Commissioning Procedure & Guidelines have not been met, WEBCOR/OBAYASHI may elect to withhold or make appropriate adjustments to the Trade Subcontractor's final billing.
