| Contract Doc Ref:[ASI 128/26 05 19]<br>Location: Zone[N/A], Level [N/A]<br>Closest Column Line Intersection is [N/A]<br>Add'l Doc's Ref's: N/A<br><br>The contract specification Section 26 05 19 for the 600 Volt wire and cable, under Article 1.3 Quality Assurance; states that wire and cable shall be of the same manufacturer for the project duration. Multiple manufacturers shall not be permitted.<br><br>Based on the listed manufacturers provided within this specification section, the contractor view's Article 1.3 to mean that all cable shall be from one manufacturer for each type of cable listed, not a sole source for the entire list of cable. This would mean that all THHN or THWN shall be from a single manufacturer, all RHH/RHW-2 cable would be form a single manufacturer, as well as all Metal clad cable would be from a single manufacturer. We believe that this is the intent as Division 25 and 27 outline other manufacturers for the various other cables such as CAT 5 and CAT6.<br><br>Based on the specification there is no one single cable manufacturer that can produce all of the specified cable. Therefore the contractor, will be submitting on multiple manufacturers for each type of cable, and once approved the contractor will select a single manufacturer for each type of cable and will only procure and install the selected single manufacturer for each type of cable throughout the project. Fisk standard submittal packages will at a minimum include three manufacturers, who are either listed or an approved equal. We would like to continue with this standard policy in order to avoid having one manufacturer as a sole supply source. Please confirm this as acceptable. |   |                    |                     | Yes - no exceptions taken.  |                      |                    |                          |

George Metzger</p> <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>For standpipe FSP B8 'UP' called out on P1-2203, refer to P1-2303 for location where the sleeve would penetrate the ground level slab. This standpipe sleeve falls within the Stair 301 shaft (no slab, therefore no sleeve provided). There is no clash, A1-2863 does not require any revisions and is correct as is.</p> <p>FSP B7 'UP' on P1-2204 indicates the sleeve location at lower concourse (as on A1-2204); refer to P1-2304 for location where this FSP B7 'DN' penetrates the ground floor slab. The sleeve highlighted in this RFI query does not go up at that point. There is no clash, the required 10" sleeve is already indicated on A1-2864 and this drawing does not require revision, as it is correct as is.</p> |                          |

 UL General Requirements

Per the Fire Protection Matrix and Schedule/Sheet A1-8662, all structural steel columns at the Lower Concourse,

Ground, Second, Bus Deck, and Roof Park Levels are to receive SFRM. Column A1726 is located at the Ground and Second levels and therefore requires SFRM.

Per Specification Section 05 10 00 (3.2) P.3.b Structural Steel and fireproofing manufacture's requirements, the steel is scheduled to be unprimed and unpainted.

As directed by TJPA (see attached email from Steve Cunningham) and agreed upon in the Structural Issues Meeting on 10/23/14, Column A1726 was painted Obstinate Orange for the Steel Erection Event.

Coatings have not been tested for compatibility with SFRM.

Per UL general requirements (see attached) metal lath will need to be applied over the paint, prior to the application of SFRM.

Please confirm the use metal lath, attached with power actuated fasteners, on the painted areas of Column A1726 is acceptable in order to comply with UL and the fire rating.

the alternate system fully complies with a UL tested assembly that is appropriate for this location, please submit additional information for review and a shop drawing submittal.

Contract Doc: A1-2862; P1-2202  
 Location: Zone 1, Ground Level  
 Gridline: D-E/1.4  
 Add'l Doc Ref's: Virtual Building PLMBG-CR #054

Refer to attached sketch for the missing connection on sheet P1-2202. All the other drawings are correct.

See attached Virtual Building PLMBG-CR #054

The A1-2862 Slab Edge Plan shows plumbing penetration (marked with red fill), but there is no vertical plumbing pipe on the P1-2202 Lower Concourse Level Zone 02 Plumbing Plan or P1-2302 Ground Level Zone 02 Plumbing Plan. The FSP system (marked with yellow) has no connection on ASI 128 floor plans only on the Fire Protection Riser Diagram P1-5040 (the connection marked with orange), although the previous ASI P1-2302 contained this connection. The P1-2202 shows a Sprinkler Drain (SPDR) (marked with purple) standpipe which does not appear on the P1-2302 only an FSP standpipe (yellow) which marked both 6 (Combination Standpipe Sprinkler Riser) and 54 (3" Sprinkler Drain). The same systems are marked with the same color. (2015.01.23.)

Modeled the pipes according to the plumbing plan, and the slabs according to the slab edge plan.

Please confirm.

**REQUEST:**

Contract Doc: P1-2102; P1-2110; P1-5020  
 Location: Train Platform Level  
 Gridline: Global  
 Add'l Doc Ref's: Virtual Building PLMBG-CR #022

See attached Virtual Building PLMBG-CR #022

On Train Platform Level Zone 02 Plumbing Plan (P1-2102) and on Train Platform Level Zone 10 Plumbing Plan (P1-2110) it is shown 3" Pump Discharged Sanitary pipes going down to Sump Pumps (SP). Waste Water Piping Diagram (P1-5020) shows 4" Pump Discharged Sanitary pipes going down to Sump Pumps (SP).

Pump Discharged Sanitary pipes will be modeled with 3" diameter according to floor plan P1-2102; P1-2110.

Please confirm.

**From:** Webcor Construction LP      Julia John

**To:** Turner Construction Company Phil Militello

**Answered By:**

**Co-Author:** Webcor Construction LP      Jeff Heath

**REQUEST:**

Contract Doc: P1-3015; P1-2104  
 Location: Zone 2, Lower Concourse Level, Train Platform Level  
 Gridline: D.4-D.8/16-16.9  
 Add'l Doc Ref's: Virtual Building PLMBG-CR #142

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

See attached Virtual Building PLMBG-CR #142

There is a contradiction between the 1/P1-3015 Partial plan and the P1-2104 Plumbing plan because the floor plan shows two pipes flipped compared to the partial plan.

Pipes will be modeled according to the P1-2104 Plumbing plan.

Please confirm.

| Please reject this RFI. The topic of rounded slope values has already been responded to in a number of previous RFIs. A less than 1/10th of 1 percent deviation represents a real-world deviation of less than 1/8" over 10 feet. See responses to RFIs T-2310, T-2306 and T-2296.   |  |   |            |   |            |             |                          |

(2015.01.16.)</p> <p>The penetration will be modeled below the curb and the dimensions shown on the screenshot will be used.</p> <p>Please confirm.</p>  | <p><b>SUGGESTION:</b></p>  | <p><b>ANSWER:</b> Confirmed.</p> | <p><b>Accept Suggestion:</b> <input type="checkbox"/></p> |                          |                          |   |  |
| <p><b>T-2502</b></p> <p><b>From:</b> Webcor Construction LP<br/>           Kamran Azarbal</p> <p><b>Co-Author:</b> Shimmick Construction Company, Inc. Sylvia Hartanto</p> <p><b>REQUEST:</b><br/>           Contract Doc Ref: S1-2207 &amp; S1-7111<br/>           Location: Lower Concourse Level Elevator Pit<br/>           Grid Line: GL 32 - 32.4 &amp; GL E<br/>           Add'l Doc Ref's: Attached</p> <p>See attached documents of elevator pit at grid lines 32-32.4 and cross grid line E. The current elevator pit's 10" wall encroaches columns C247 &amp; C248 by 5". These columns have been poured to bottom of moment frame beam at 32.4. The structural details at this specific location are not provided and the current conflict is in-constructible. Please confirm that decreasing the 10" wall to a 4" wall is acceptable and provide rebar details at this location.</p> | <p><b>BGP - Lower Concourse Elevator Pit Conflict with Column</b></p> <p><b>To:</b> Turner Construction Company Phil Militello</p> <p><b>SUGGESTION:</b></p> | <p><b>Closed</b></p>             | <p><b>03/19/2015</b></p>                                  | <p><b>03/29/2015</b></p> | <p><b>03/26/2015</b></p> | <p><b>Potentially</b> <input type="checkbox"/></p> <p><b>Answered By:</b> Adamson Associates, Inc. George Metzger</p> | <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>It is acceptable to notch the elevator pit slab and exterior wall around the columns. The minimum pit wall thickness shall be 4" and the plan extent of the notch shall be 36" centered on each of the columns. The pit wall shall not contact the columns. THE ELEVATOR PIT INTERIOR WALL FACE SHALL REMAIN PER CONSTRUCTION DOCUMENTS EDGE OF SLAB PLAN. GC shall confirm pit dimensions with the elevator subcontractor.</p> <p>Pit Wall Reinforcing: Inside face vertical and horizontal bars are unaffected. They shall be the sole reinforcing passing through the notched wall section. Exterior face horizontal reinforcing shall terminate with a horizontal hook at each notch reentrant corner. The hook length at each notch may be reduced to 6". Exterior face vertical reinforcing shall terminate at each notch. On both sides of each notch, provide (2) additional exterior face vertical bars located within 16" of the notch reentrant corner.</p> |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**REQUEST:**

Contract Doc: A1-2202 ; 15/A-0035  
 Location: Zone 1, Lower Concourse Level  
 Gridline: D.4-D/2-3  
 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #154

See attached Virtual Building PH3(ASI)-CR #154.

The B1226A door (marked with green) is correctly placed on the A1-2202 Floor plan according to detail number 15/A-0035 but the model does not match with the section A1-9241 because the section shows the door is in the center of the wall.

The door will be modeled according to the A1-2202 and A-0035 plans.

Please confirm.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The Design Team disagrees that there is a conflict. Section D/A1-9241 was revised in ASI-0128.

Potentially

**From:** Webcor Construction LP                      Julia John

**To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Webcor Construction LP                      Jeff Heath

**REQUEST:**

Contract Doc: C/A1-9242; C/A1-9242(SKA-3328); 2/A1-3009  
 Location: Zone 1, Lower Concourse Level  
 Gridline: C.3-D/7-8  
 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #155

See attached Virtual Building PH3(ASI)-CR #155.

There is a contradiction on the newer C/A1-9242 section and the older C/A1-9242 (SKA-3328) section. The position of the gridline D (marked with blue) is changed on the latest plan. The correct position of gridline D is scaled from the 2/A1-3009 as on the screenshot. The good position is marked with green.

The older position of gridline D is followed (marked with green).

Please confirm.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Confirmed, the gridline is misplaced. Follow the gridline per plan 2/A1-3009 and section D/A1-9242.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**Co-Author:** Webcor Construction LP                      Jeff Heath

**REQUEST:**  
 Contract Doc: A/S1-3203; A/A1-7406; 1/S1-2250  
 Location: Zone 1, Ground level  
 Gridline: V-W/2-4  
 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #174

See attached Virtual Building PH3(ASI)-CR #174.

The pier (marked with green) is on the structural section number A/S1-3203 but it is missing from the architecture section number A/A1-7406. The other pier (marked with purple) is missing from the structural section number 1/S1-3203 but it is on the architecture section number A/A1-7406. The structural floor plan number S1-2250 does not match with the sections and the pier marked with yellow is missing. The size and the position of wall openings are also different on the two sections.

All the piers will be modeled according to A/S1-3203 and the openings are modeled according to A/A1-7406.

Please confirm.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Vehicle and Bike Ramps submittals have been reviewed and approved, and the ramp is currently under construction.

**T-2537**                      **SCS - DBA Steel Conections At TG 19.9 and TR 20.1**                      **Closed**                      **03/20/2015**      **03/30/2015**      **03/24/2015**      **Potentially**

**Co-Author:** Shimmick Construction Company, Inc. Henry Chiang

**REQUEST:**  
 Contract Doc Ref: S1-2305, S1-3702, S1-3707  
 Location: Ground Level  
 Grid Line: GL 19, 20  
 Add'l Doc Ref's: Attached

Please reference Contract Drawings S1-2305, S1-3702, and S1-3707 regarding the DBA Steel Connections at TR 19.9 and TR 20.1. Also reference Structural Steel Shop Drawings E4, 609AC, E5, and 701AB.

1. On SI-2305, TR 19.9 and TR 20.1 have Detail 9/SI-3702 is cut showing top of concrete running sloped. However, by cross referencing elevations on S1-2305, the concrete is stepped, not sloped, at the concrete/TR connection. The stepped condition is closest to 6/S1-3707. Please confirm

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Confirmed that the connection of the concrete beam shall be similar to Detail 6/S1-3707.

**REQUEST:**

Contract Doc Ref: S1-2703  
 Location: Roof Park Level  
 Add'l Doc Ref's: CD RFI 767 SK1

See attached CD RFI 767 SK1 for items 1 to 14:

- 1) Confirm the noted connections should be indicated as moment connections at 7 locations.
- 2) Confirm the cantilevered beams are the same size as the back-span beam at 7 locations or supply the missing beam sizes.
- 3) Confirm 90 degrees or supply the angle.
- 4) Supply dimension.
- 5) Supply dimension.
- 6) Clarify what is meant by the noted line.
- 7) Confirm 90 degrees or supply the angles.
- 8) Depending on the response to items 1 & 2, supply a moment connection detail for the non-aligned flanges.
- 9) It is not clear where the cantilevered beams terminate as a detail is not shown. Please clarify the extent of the cantilevered beams at 7 locations.
- 10) Confirm dimension.
- 11) Supply dimension.
- 12) Supply dimension.
- 13) Supply dimension.
- 14) Supply dimension.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1) Highlighted connections are not moment connections. The cantilevered member is an angle, not a WF beam. Edge of slab detail 9/S1-5000 shall apply at the 7 highlighted locations. In lieu of the backspan kicker brace per 9/S1-5000, provide bracing as follows:

a) Where backspan beam is W12 and edge beam is W16, provide a plate brace similar to 6/S1-5015, except that plate thickness shall be 1/2" and fillet welds shall be 3/8".

b) Where backspan beam and the edge beam are same size, provide a flange to flange moment connection between the two beams.

c) Where backspan beam is W21x147 and edge beam is W21x44, provide a full depth shear plate connection per 1/S1-5013.

2) See response to 1).

3) Confirmed.

4) Highlighted dimension is 2' - 4 3/4".

5) Highlighted dimension is 15' - 0".

6) The short line is a graphical error and shall be ignored.

7) Confirmed.

8) See response to 1).

9) See response to 1).

10) Confirmed.

11) Highlighted dimension is 5' - 3 3/4".

12) Highlighted Dimension is 1'-3 1/2". The HSS5x0.375 is centered on the horizontal HSS10x6x3/8 beam shown on S1-2704. See attached sketches SKA-4550 and SKA-4551 for location of

George Metzger |   |                      |                    |                          |  |
| <b>REQUEST:</b><br>Contract Doc Ref: S1-2706, 2/A1-2972<br>Location: Roof Park Restaurant<br>Gridline: 5<br>Add'l Doc Ref's: CD RFI 771 SK1<br><br>See attached CD RFI 771 SK1 for items 1 to 3:<br>1) It appears the edge of slab/curb information is not consistent. Please clarify where the edge of slab/curb is.<br>2) Depending on the response to item 1, please note the close proximity of the beams to each other and clarify their location to avoid fouling each other.<br>3) The W18x50 beams are shown on S1-7103 without giving their TOS Elevation and they are not shown at all on S1-2732. Confirm they are at TOS Elevation 117'-0 1/2 or clarify. |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>1) The 2" dimension between the two steel beams as shown on SK1 in the RFI is incorrect. S1-2732 does not callout the 11'- 5 5/8" dimension as shown on SK1. Distance between the W16 and W18 beams is 8 3/4" which makes the total distance between the west edge of the elevator roof curb and GL 5 to be 12' - 0 3/8" and is consistent with A1-2972. However, with the current locations of the two W18x50 beams (centered on the guide rail HSS posts), the beam flanges project into the hoistway space. To provide required hoistway clearance move the W18x50 posts away from the hoistway space so that centerline distance the two W18x50 beams increases to 9' -9 1/2".<br>2) The two beams do not foul each other. See response to 1).<br>3) As per the Elevator consultants recommended dimension, the datum will be 116'-7". Please note that this datum is subject to change as required by the awarded Elevator Contractor's requirements.<br><br>Reason for RFI (TT): We disagree with reason for request Insufficient Information and Engineering Conflict. We categorize this RFI as no cost clarification. |                      |                    |                          |  |

**REQUEST:**

Contract Doc Ref: C/S1-2708  
 Location: Roof Park Restaurant  
 Gridlines: F and E.6  
 Add'l Doc Ref's: CD RFI 802 SK1

See attached CD RFI 802 SK1 for items 1 to 3:  
 1) The noted dimensions were previously requested but the response in RFI T-1922 (SK 941, CD 698) noted that these dimensions are to be supplied by the Elevator Contractor. Please supply the dimensions on the west and east sides of the future elevator.  
 2) The picture seems to indicate that the elevator posts extend up above the roof steel but S1-2706 indicates that the posts terminate below the roof beams. Confirm the posts terminate below the roof beams or supply more information for the elevation at the top of posts and the top connection.  
 3) The elevator posts for the future elevator are HSS8x4x1/2 per S1-2701. Confirm that information remains correct.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The Design Team has not been officially authorized to work on this elevator by TJPA. We cannot locate elevator elements without a Elevator manufactures design input.

**REQUEST:**

Contract Doc: A1-2843; S1-2203  
 Location: Zone 1, Lower Concourse Level  
 Gridline: A-B/8-9  
 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #175

See attached Virtual Building PH3(ASI)-CR #175.

There is a clash between telecommunications opening and moment frame on the Lower Concourse Level. The sheet A1-2843 shows that the distance is 0'-7" between the telecommunications openings and the grid line A but the sheet S1-2203 shows a moment frame at the same place.

The clash remains until further qualification.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

George Metzger</p> |                     |  |                      |                    |                          |
| <p><b>REQUEST:</b></p> <p>Contract Doc Ref: M1-5000-Detail 6 / Spec 23-05 29-3<br/>                 Location: Zone: N/A<br/>                 Closest Column Line Intersection is: N/A<br/>                 Add'l Doc Ref's: N/A</p> <p>There is a conflict between spec. 23 05 29-3 and drawing detail 6/M1-5000. The detail shows 2 rod roller hanger for pipe sizes 6" and a larger. Spec calls for 2 rod roller hanger for 8" and above. Although specifications trump drawing details please confirm that rollers for 8" mechanical pipe and larger is acceptable.</p> |   | <p><b>SUGGESTION:</b></p>  |                     | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Specifications do not trump the drawings. When there is a conflict in the Contract Documents, the Design Team/TJPA Representative will determine the correct item. Drawings and specs are both Contract Documents and "where requirements differ, apply the more stringent" (per Mechanical General Provisions 23 05 01-1.2D), unless otherwise approved by the TJPA Representative. In this specific case only, rollers for 8 inch and larger pipe are acceptable.</p> |                      |                    |                          |

George Metzger</p>   |                      |                    |                          |
| <p><b>REQUEST:</b></p> <p>Contract Doc Ref: S1-2604, 7 &amp; 8/ S1-5020<br/>                 Location: Zone 4, Roof Level<br/>                 Gridline: 14<br/>                 Add'l Doc Ref's: LS-RFI 37 Sketch #1 and #2</p> <p>Please reference the Roof Park Level sheet S1-2604. At grid 14/F is the call out for a 3"x18"x53' drag plate. The plate is shown butting into the flange of the column. With a 53' length the plate would extend all the way to perimeter gridline H. The metal decking abuts to each side of the plate per detail 7/S1-5020.</p> <p>The drag plate is installed over the column per detail 8/S1-5020. With the 53' length the end of the drag plate stops 3' short of the perimeter beam and terminates over the row of W24 beams. This is typical at all drag plate ends.</p> <p>In that 3' region there is an approximate 19" square hole between the deck, the drag plate, and the beams. Please confirm it is acceptable to close the hole by adding a 12 gauge flat plate as per the attached details or supply an alternate solution.</p> |   | <p><b>SUGGESTION:</b></p> |                     | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Confirmed.<br/>                 Reason for RFI (TT): We agree with reason for request Verification. We categorize this RFI as clarification on means and methods.</p> |                      |                    |                          |

**From:** Webcor Construction LP      Julia John      **To:** Turner Construction Company Phil Militello

**Answered By:**

**Co-Author:** Webcor Construction LP      Jeff Heath

**REQUEST:**

Contract Doc: A1-4304  
 Location: Zone 2, Ground level  
 Gridline: C.3-G/15-16  
 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #567

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

See attached Virtual Building PH3(ASI)-CR #567

There are no dimensions about the compound ceilings (marked with yellow fill) on the A1-4304 Ground level zone 04 reflected ceiling plan.

The missing dimensions are scaled from the reflected ceiling plan. See resulting dimensions on the screenshots above.

Please confirm.

**REQUEST:**

Contract Doc Ref: [ASI 0128/E1-2303,2/E1-3301]  
 Location: Zone[03 ], Level [Ground ]  
 Closest Column Line Intersection is [D,11]  
 Add'l Doc's Ref's: SK# FEC0022

Per the response given in RFI T-2216 , the electrical room layout was revised. This includes the addition of a new partition wall. However, the dimensional layout for these changes were not provided. Please provide a dimensional layout of electrical room 01324.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Refer to enclosed sketch SKA-4447 for new partition type and location within Electrical Room 01324. Also, refer to response to RFI T-2216.

**REQUEST:**

Contract Doc Ref: [ASI 128/  
 Location: Zone[N/A], Level [N/A]  
 Closest Column Line Intersection is [N/A]  
 Add'l Doc's Ref's: N/A

Per specification section 250500 Paragraph 2.9 "conduit and fittings" subparagraph C 1, 3, 5, D1, all relate to fittings by manufacturers and model number. Paragraph G.2 Rigid Steel and Intermediate Metal Conduit Fittings list the following acceptable fittings manufacturers: Appleton, Crouse-Hinds, Efcor, Midwest, O.Z/Gedney, Raco, Spring City and Thomas and Betts. In carefully reviewing the specification for the Buy America requirements, none of the above listed manufacturers comply with the Buy America. Therefore, Fisk has carefully reviewed the Buy America requirements, and wishes to identify that this is a sub-component of a larger system. The fittings are a small and minor sub-component of larger systems consisting of: Switchgear, Electrical Panels, Fire Alarm System, Intrusion System, Conduit, Wire, Cable, and Lighting System. The sub-components include, clamps, conduit fittings, connectors, junction boxes, anchors, clamps, washers, screws, nuts, bolts, fire seal, and concrete pads just to name a few. The complete manufacturing end products, including all components and sub-components, systems will take place in the United

| <p>States, in the City of San Francisco, California, by Local International Brotherhood of Electrical Workers (IBEW). Fisk Electric has reviewed three (3) FTA ruling regarding sub-components: one for the Charlotte Area Transit System, one for the Los Angeles County Metropolitan Transportation Authority, and the last one for the Southern California Edison.</p> <p>Fisk Electric is following the FTA's conclusions in preparing this RFI. Enclosed please find copies of all three (3) FTA rulings outlined above. Please note that Fisk Electric intends to utilize fittings manufactured by the O.Z./Gedney Company, one of the acceptable manufacturers specified in the contract specifications. Please review and approve our use of the O.Z. Gedney fittings for various conduit systems requirements.</p> |                                    | <p><b>From:</b> Webcor Construction LP      Aseem Goyal<br/> <b>To:</b> Turner Construction Company Phil Militello</p> <p><b>Co-Author:</b> Transbay Fire Protection      Kevin Malone</p> |                     | <p><b>ANSWERED BY:</b> Adamson Associates, Inc. George Metzger</p> |                      | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>As discussed in the meeting with the SFFD, the pressure reducing type fire hose valves will be used for levels B2 and B1 only. Level 1 through 4 will have standard fire hose valves. Fire Sprinkler Subcontractor is the engineer of record for this system and shall be responsible for confirming all final Regulatory Agency requirements for the system.</p> |                          |
| <p><b>REQUEST:</b></p> <p>Ref: 21 13 19<br/>                 Location: N/A<br/>                 Closest Column Line: N/A<br/>                 Add'l Doc Ref's : Fire Sprinkler Permit Submission Meeting #1 ĳ Item 1.05</p> <p>Low Rise buildings in San Francisco are normally provided with Manual Wet Class 1 Standpipe systems which are pressurized by Fire Trucks through the FDCs. SFFD confirmed this is the approach they expect and would prefer not to have to deal with PRVs. Since we have combined standpipe/sprinkler systems under pump pressure, PRVs will be required where pressures exceed 150 psi. This occurs only in the below grade levels of the building. TFP requests acknowledgement that PRVs will only be provided on levels where pressures require them.</p>                                |                                    | <p><b>SUGGESTION:</b></p>  |                     |  |                      |  |                          |

| <p>Please see attached Virtual Building ARCH (ASI 128)-CR #003</p> <p>There is a missing dimension about an interior door (marked with yellow fill). The A1-2403, the 3/A1-7301 and the 2/A1-7006 plans show the door, but none of these plans show the position of this 02301A door. In addition, the A1-2883 plan shows the curb (marked with green fill) under the door, but the dimension of the curb is also missing.</p> <p>The dimension of the door was scaled from plan. The door should be 3'-5 3/8" from GL 6 according to the A1-2403.</p> <p>Please provide missing dimensions.</p> |   |                    |                     |                      |                      |  |                          |

|  | <p><b>REQUEST:</b><br/>                     Contract Doc Ref: A1-8550 through A1-8532<br/>                     Location: Zone 4, Second Level<br/>                     Gridlines: 27 and C.3<br/>                     Add'l Doc Ref's: SK1, SK2, SK3, SK4</p> <p>The response to RFI T-2663, refers us to a 3D model file provided to Webcor. From this we have taken rough dimensions for the vertical sides of the OCS plate. The model does not provide sufficient information for steel detailing.</p> <ol style="list-style-type: none"> <li>Please confirm dimensions taken from the 3D model (Ref SK RFI 1075.1 SK01).</li> <li>Please provide vertical plate thickness and grade (Ref SK RFI 1075.1 SK02).</li> <li>Please provide vertical plate to horizontal plate weld detail (Ref SK RFI 1075.1 SK03).</li> <li>What is plate configuration at corners (Ref SK RFI 1075.1 SK04).</li> </ol> | <p><b>SUGGESTION:</b></p>                                    |                     |                      | <p><b>ANSWER:</b>     <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>It appears that the image in red is the rhino model (outside surface model) which a part of the construction documents. The blue plate appears to be offset from the red image and might be a result of the 2D shop drawing mis-coordination. The design intent is to have the 1/2" vertical plates (same thickness as horizontal plate) flush at the end of the horizontal plate on three sides. It is acceptable to have small tolerance of geometrical difference on the north and south sides. However, the east and west sides must match the rhino 3D model. The plate vertical walls per the 3D model shall be 1'-1" in height. 12'-9 1/2" for the lower dimension is confirmed. Upper dimension of walls to match the plate edge is confirmed. The vertical plates shall be welded to the horizontal plate with a 3" long, 1/4" fillet weld spaced at 12" on center on both sides.</p> <p>We suggest that the DB Ceiling contractor be copied on RFI's such as this for future coordination.</p> <p>Date Answered by Design Team: 4/27/15<br/>                     Date closed by WOJV: 4/27/15</p> |                    |                          |

| <p><b>REQUEST:</b></p> <p>Contract Doc Ref: 08 88 53<br/>                 Location: Zone 3 Ground Level and Roof Park Level</p> <p>Specification Section 088853, article 2.3.K provides some guidance on the temperature design criteria. However, we need more accurate temperatures for the interior and exterior surfaces of W-12 and W-13 skylight glazing.</p> <p>Due to limitations on the fire-rated glass provided by manufacturer VETROTECH, the maximum in-service temperature of the fire rated glazing cannot exceed 122 degrees Fahrenheit (F) (50 degrees Celsius). We have methods to control the temperature include adding various solar control low-e layers to the laminated glazing or adding some limited air conditioning to the interiors (under-side of fire rated glazing). However we have run initial modeling and the current design temperatures are too high on the one day of the year.</p> <p>Therefore, we need the design team to review whether the current design criteria regarding temperature can be lowered to reflect actual temperature considering the fact the roof is covered primarily with a green roof which will help reduce and delay the effect of solar radiation. And that the interior spaces have been engineered to promote natural ventilation.</p> <p>We are looking for 10 year high temperatures for exterior and interior glass surfaces on W-12 and W-13.</p> <p>Current Specification states Maximum exterior ambient temperature of 100 degrees F. Note that this corresponds approximately to ASHRAE's 10-year return period temperature for San Francisco, CA. The 10-year return period means that this temperature can be exceeded once during a ten year period (10% probability of being exceeded in any</p> |   | <p><b>SUGGESTION:</b></p> |  | <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>We cannot provide exterior and interior glass surface temperatures as requested. The surface temperature of the cladding material is a result of sun exposure, duration, and ambient temperature on the specific properties of the material, material temperature absorption and retention properties, mass of the material, etc., which are not fully known by the design team and can vary and spike with natural climate conditions. We can provide guidance from thermal comfort analysis conducted for the natural ventilation and radiant floor system performance in the Grand Hall during the design phase. The results of the computer modeling predicted a maximum interior air temperature of 92.5 degrees F at the ground floor when the outdoor air temperature is 95 degrees F. We expect to see higher temperatures (3-5degF) at the underside of the W-12 system as the heat rises through the space to the exhaust discharge points in the glass box and light column skylight. If exterior air temperatures exceed 100 degrees F then interior air temperatures are expected to track closely similar to the results from the analysis described above.</p> <p>At discussion in 4/16/2015 meeting, AAI stated that the RFI would be amended to state that the maximum ambient interior design temperature should be 100degrees Fahrenheit. After further review, the Design Team prefers Option 2 proposed by Greenlite's 4/15/2015 email - ASHRAE's 50-year return period temperature for San Francisco, CA (2% probability of being exceeded in any given year). [AAI]</p> <p>RFI Answered by Design Team: 04/20/2015<br/>                 RFI Closed by WOJV: 04/28/2015</p> |                      |                    |                          |

given year).

Maximum interior ambient temperature (under the W-12) of 100 degrees F. We interpret this to mean that even with the natural ventilation design and green roofs, we should assume that the interior temperature will be the same as the exterior temperature. Please confirm if the interior ambient design temperature can be reduced below the exterior ambient of 100 degrees F, and if so by how much?

The W-13 system has naturally ventilated spaces above and below and is covered by the skylight system above. Please confirm what design maximum temperatures we should assume above and below the W-13 system.

**Co-Author:**

**REQUEST:**

Contract Doc Ref:  
 (ASI 128 dated 12/16/14)  
 Specification Section 07 81 23  
 Details 1, A, & B/A1-8662  
 Sheet S1-2505  
 Detail 5/S1-5017  
 Detail 1/S1-6008  
 Detail 1/S1-4206

Location:  
 Light Column and Bus Deck Level

Closest Column Line Intersection:  
 Bus Deck Level GL 21 & GL 22  
 GL D.4/28 to GL D.4/38

Add'l Doc Ref's:  
 Letter from International Paint

Specification Section 07 81 23 Intumescent Fire Resistive Material has the following IFRM-1 and IFRM-2 performance requirements:  
 (2.3) A.1 - Listed by UL, ITS/WH, FM Global, or ICC-ES, and bearing their label.  
 (2.3) A.2 - Formulated and applied to achieve required UL fire resistive ratings.  
 (2.3) A.3 - The use of factory precast components with precast bolt heads.

Per Detail 1/A1-8662 IFRM-1 is to be applied to the beams on the Bus Deck Level at GL 21 and GL 22. Sheet S1-2505 calls for a Type 2 (P) Drag Connection. Detail 5/S1-5017 depicts a Type 2 (P) Drag Connection and connection pins requiring pre-cast bolt covers.

Per Detail A/A1-8662 IFRM-2 is to be applied at the base of the light column and references the structural drawings. Detail 1/S1-6008 depicts bolts and protection caps at the base of the light column.

Per Detail B/A1-8662 IFRM-2 is to be applied on the brace frame at GL D.4/28 to GL D.4/38 and references structural drawings. Detail 1/S1-4206 depicts Typ. Brace Conn. at MF Col. at Ground Floor and connection pins at the BRB plates requiring pre-cast bolt covers.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The design intent is to not install IFRM-2 at any connections or areas with bolts; thus neither bolts, nor pins require fireproof bolt covers. Detail 5/S1-5017 does not require IFRM-2, thus it does not need bolt covers. At detail 1/S1-6008 there are not fireproof bolt covers, they are bolt protection caps, apply IFRM-1 at this location.

At the braced frame details referred to in this RFI, install IFRM-2 only on straight pipe runs and install IFRM-1 elsewhere. Submit shop drawing to confirm all demarcation lines between the two fireproofing types.

| <b>REQUEST:</b><br>Contract Doc Ref: S1-2250, S1-3301, S1-3303<br>Location: West Throat Slab<br>Gridline: 1-4<br>Add'l Doc Ref: Attached<br><br>Please refer to S1-2250, S1-3301, and S1-3303. Columns C19 that frame into beams B118 on the west throat slab shown on S1-2250 are shown in section as having 1-1/2" clear cover to the ties. Detail 5/S 1-3301 indicates the same amount of cover for beam ties. The applicable column elevation, Detail 3/S 1-3303 indicates that the column cage is to nest within the beam support below as well as above. C19 columns cannot nest within intersecting beams at the clear cover given without reinforcing clashing. Further, the tie configuration indicated for Type 020 column on S1-3306 presents constructability and congestion issues given the tie size (#6's) at 4" spacing. Please confirm the following or provide another solution:<br>1. Per the attached sketch, confirm the proposed tie layout |   |        | <b>SUGGESTION:</b>  |            | <b>ANSWER:</b> Accept Suggestion: <input type="checkbox"/><br>1. Confirmed.<br><br>2. **Co-Author:** Webcor Construction LP                      Jeff Heath

**REQUEST:**  
 Contract Doc: 3/M1-3103; M1-2202  
 Location: Zone 1, Lower Concourse Level  
 Gridline: F/5  
 Add'l Doc Ref's: Virtual Building MECH (ASI 128)-CR #012

Please see attached Virtual Building MECH (ASI 128)-CR #012.

There is a contradiction between Mechanical Floor Plan (M1-2202) and Mechanical Section (3/M1-3103 marked red line). The Floor Plan shows there are a 28x22 EA duct (marked yellow) and a 22x28 QA duct (marked green). The Mechanical Section (3/M1-3103) shows both ducts with 22x28 size.

The two plans should match.

Please confirm.

**SUGGESTION:**

**ANSWER:**                      **Accept Suggestion:**

**T-2785**                      **TTC - Different Equalizer Line dimension**                      **Open**                      **04/08/2015**                      **05/06/2015**                      **Potentially**

**From:** Webcor Construction LP                      Michelle Collanton                      **To:** Turner Construction Company Phil Militello

**Co-Author:** Webcor Construction LP                      Jeff Heath

**REQUEST:**  
 Contract Doc: 1/M1-3004; A/M1-3004; B/M1-3004;  
 Location: Zone 1, Lower Concourse Level  
 Gridline: L/4  
 Add'l Doc Ref's: Virtual Building MECH (ASI 128)-CR #013

Please see attached Virtual Building MECH (ASI 128)-CR #013.

There is a contradiction between the 1/M1-3004 Enlarged Mechanical Plan; B/M1-3004 Mechanical section and A/M1-3003. The cooling Tower Plant Enlarged Plan (1/M1-3004)(and (A/M1-3004 )(these marked green)Plan section shows one Equalizer Line with 10" but the but the other Plant Section (B-/M13004) (marked orange) shows this Equalizer Line with 8" size.

These plans should contain a same size.

**SUGGESTION:**

**ANSWER:**                      **Accept Suggestion:**

|               | <b>REQUEST:</b><br>Contract Doc: P1-5031; 4/P1-3010<br>Location: Zone 2, Second Level; Bus Deck Level<br>Gridline: D-E/14-15<br>Add'l Doc Ref's: Virtual Building PLMBG (ASI 128)-CR #011   | <b>SUGGESTION:</b>                                    | <b>ANSWER:</b>      | <b>Accept Suggestion:</b> | <input type="checkbox"/> |                    |                          |
|               | Please see attached Virtual Building PLMBG (ASI 128)-CR #011.   |   |                     |                           |                          |                    |                          |
|               | There is a contradiction between the riser diagram P1-5031 and the enlarged plan 4/P1-3010. Waste And Vent Piping Diagram (P1-5031) shows sanitary branch pipe under 03481 Men's Restroom (shown with purple) connecting to the blue main branch. 4/P1-3010 shows same pipe connecting to SAN pipe, which comes below 03482 Women's Restroom (shown with yellow) first and than to the main branch (shown with blue). On piping diagram, there is a red dashed line showing the connection according to floor plan. Unnecessary connection is shown by red arrow. |   |                     |                           |                          |                    |                          |
|               | Enlarged plan should match riser diagram.   |   |                     |                           |                          |                    |                          |
|               | Please confirm.   |   |                     |                           |                          |                    |                          |

**Co-Author:** Webcor Construction LP                      Jeff Heath

**REQUEST:**  
 Contract Doc: P1-3008; P1-5053; P1-2406  
 Location: Zone 4, Second Level  
 Gridline: D.4-E.6/30  
 Add'l Doc Ref's: Virtual Building PLMBG (ASI 128)-CR #040

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Please see attached Virtual Building PLMBG (ASI 128)-CR #040.

There is a contradiction between the enlarged plan (P1-3008), the Second Level Zone 06 Plumbing Plan (P1-2406) and the water piping diagram (P1-5053). According to the riser diagram (P1-5053) the CW D3 riser (pipe marked with pink) has to continue straight up to Bus Deck Level (pipe marked with green) but the symbol at CW D3 (yellow rectangle) on floor plan (P1-2406) indicates that the riser does not go up to Bus Deck Level. Enlarged plan (P1-3008) shows a downgoing pipe from Bus Deck Level (red rectangle), but no continuation is shown on P1-2406. Position of this downgoing pipe has an offset from CW D3. (marked with red and yellow rectangle).

The enlarged plan (P1-3008), the plumbing floor plan (P1-2406) and the water piping diagram (P1-5053) should match.

Please confirm.

(marked with red fill).

The plumbing floor plan (P1-2305) (P1.2205) and the water piping diagram (P1-5052) should match.

Please confirm.

**From:** Webcor Construction LP Michelle Collanton **To:** Turner Construction Company Phil Militello

**Answered By:**

**Co-Author:** Webcor Construction LP Jeff Heath

**REQUEST:**

Contract Doc: P1-5052; P1-2205  
 Location: Zone 3, Ground Level  
 Gridline: C/21  
 Add'l Doc Ref's: Virtual Building PLMBG (ASI 128)-CR #063

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Please see attached Virtual Building PLMBG (ASI 128)-CR #063.

There is a contradiction between the plumbing floor plan (P1-2205) and the water piping diagram (P1-5052). According to the water piping diagram (P1-5052) there are pipes which had capped future connection (marked with red) connected to the CW pipe (marked with cyan). But there are no pipes connected to the CW pipe (marked with cyan and clouded) on the plumbing floor plan (P1-2205).

The plumbing floor plan (P1-2205) and the water piping diagram (P1-5052) should match.

Please confirm.

3) Per RFI T-2537 response, please confirm Skanska is to implement detail 6/S1-3707 in lieu of 9/S1-3702. Please note that TR 19.1 and 20.1 are in fabrication. Please confirm if an alternate detail could be proposed to Shimmick that does not alter stud locations in 9/S1-3702.

**From:** Webcor Construction LP                      Michelle Collanton                      **To:** Turner Construction Company Phil Militello

**Answered By:**

**Co-Author:** Webcor Construction LP                      Jeff Heath

**REQUEST:**

Contract Doc: P1-5050; P1-2602; P1-3013  
 Location: Zone 1, Park Level  
 Gridline: C.3-D/4  
 Add'l Doc Ref's: Virtual Building PLMBG (ASI 128)-CR #071

Please see attached Virtual Building PLMBG (ASI 128)-CR #071.

There is an annotation error on Water Piping Diagram (P1-5050), Park Level Zone 02 Plumbing Plan (P1-2602) and on Riser Bank Detail (P1-3013). The Piping Diagram shows that the riser has a GWT/A1 tag (marked with green) but on the Plumbing Plan and on the Riser Bank Detail the riser has a GWT/A4 tag (marked with red).

Water Piping Diagram, Park Level Zone 02 Plumbing Plan and Riser Bank Detail should match.

Please confirm.

**SUGGESTION:**

**ANSWER:**                      **Accept Suggestion:**

George Metzger |  |
|               | <p><b>REQUEST:</b></p> <p>Contract Doc Ref: E1-2102 and E12204<br/>                 Location: Zone 2&amp;4 Level B1&amp;B2<br/>                 Closest Column Line Intersection is GL2-D and GL15-C<br/>                 Add'l Doc Ref's: N/A</p> <p>Drawing E1-2102, Note 6 classifies the electrical race ways and equipment in Room B2261 (aboveground storage tank room) as NEC Division1, Class 1 and that all electrical race ways and equipment should be installed per this Classification.</p> <p>Similarly drawing E1-2204, Note 5 classifies the electrical race ways and Equipment in Room B1485 (aboveground storage tank room) as NEC Division 2, Class 2 and that all electrical race ways and equipment should be installed per this classification.</p> <p>Both storage tanks will contain Diesel No. 2. Diesel No. 2 is classified as a Class II combustible by the NFPA having a flash point higher than 100 degrees F. Per the NEC the proper classification of the electrical installation in these two rooms is "non-hazardous" since Diesel No. 2 is a not a flammable liquid. Please revise these notes to reflect the correct NEC classification for these two tank rooms as "non-hazardous". There is no cost impact to the project, since Becker Electric priced the electrical installation for this portion of the install based on a non-hazardous classification.</p> |               |                     |                      |                      | <p><b>SUGGESTION:</b></p>                                   | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Liquid is Class 2 flammable, but the room is NEC 500 Class 1, Division 2. Sheet E1-2102 is correct as is. Refer to attached sketch, SKE-RFI-T-2896-1, for correction.</p> <p>Answered by Design Team : 04/27/2015<br/>                 Closed by Webcor: 04/28/2015</p> |

**From:** Webcor Construction LP Michelle Collanton

**To:** Turner Construction Company Phil Militello

**Answered By:**

**Co-Author:** Webcor Construction LP Jeff Heath

**REQUEST:**

Contract Doc: P1-2203; P1-2303  
 Location: Zone 1, Lower Concourse Level, Ground Level  
 Gridline: E.6-F/8  
 Add'l Doc Ref's: Virtual Building PLMBG (ASI 128)-CR #132

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Please see attached Virtual Building PLMBG (ASI 128)-CR #132.

The Lower Concourse Level Zone 03 Plumbing Plan (P1-2203) shows SAN-A8 riser (marked yellow, red arrow) but the Ground Level Zone 03 Plumbing Plan (P1-2303) shows SAN-A6 riser at the same place.

The yellow marked riser tag should be SAN - A8 on both plans.

Please confirm.

| <p>On architectural plan sheet AI -2864, the air vent slab opening (South of GL G, at GL 22) interferes with the moment frame concrete beam. Reference RFI T-1010.1 for concrete beam spacing &amp; RFI T-2103 for direction to center air vent slab opening location between beams. The opening cannot be centered similar to RFI T-2103's direction due to a small span between beams. Please revise contract documents to resolve this conflict by either adjusting air vent slab opening location or moment frame concrete beam location.</p> |   |               |  |                      |  |                    |                          |  |

location of shear keys and specifics of what the shear key is and how we can secure the embed plate to it. We would anticipate a steel shear key allowing us to weld or mechanically attach the embed. It is our assumption that the shear key will be provided for steel embed attachments, and will NOT be by GREENLITE. Reactions can be provided. It is our assumption that the shear key will allow for the transfer of lateral and transverse shear forces into the structure, and NOT transferring the shear forces directly into the concrete through the embedded threaded rods. Please confirm.

| Contract Doc Ref: 08 88 53  |                                       |  |                   |                     |                           |                    |                          |
| 1.Specification 08 88 53 Section 1.2.A.1: This section describes basic system configuration calling for primary girders (trusses) with a tension rod suspension system. What does the design team expect from the tension rods in a fire condition?   |                                       |  |                   |                     |                           |                    |                          |
| ie (A) Do we ignore the tension rods when designing the primary steel members which traverse the opening for dead load and applied design live load? - in which case the truss becomes irrelevant in a fire condition. But we may have larger truss members to span the opening.  |                                       |  |                   |                     |                           |                    |                          |
| Or (B) is the design intent to design for the tension rods to assist the primary steel members and assist with carrying the dead load and applied design live load? - in which case the performance of the composite structure in fire conditions is a much more complicated issue and probably impossible to test for in the furnace to ASTM-E119. Please note: Even if a portion of the truss structure was to be replicated inside the furnace under the primary steel members, testing this would not replicate the performance |                                       |  |                   |                     |                           |                    |                          |

| <p><b>REQUEST:</b></p> <p>Contract Doc Ref: 08 88 53<br/>                     Add'l Doc Ref's: S-0005<br/>                     1. Specification 08 88 53 Section 2.3.D.6: This section is providing criteria for seismic loading. Section is calling for system to meet the performance requirements of AAMA 501.4 and 501.6 and submit test reports of similar assemblies demonstrating compliance.</p> <p>W-12 &amp; W-13 are unique framing systems that will NOT have initial test reports to demonstrate compliance. Design intent is to prove framing systems can resist seismic loading through analysis as opposed to testing. Please confirm if acceptable.</p>  |                                    | <p><b>SUGGESTION:</b></p>  |                     | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>1. The testing reports were requested to determine the viability of a similar system that has been tested. Since no specific testing for these systems is required as a value engineering measure, TJPA should be clearly informed that W-12 &amp; W-13 are unique framing systems that will NOT have initial test reports to demonstrate compliance and that the Design Build Contractor will prove that the proposed framing system can resist the required seismic loading through analysis as opposed to testing.</p> <p>2. The Design Team does not take exception to the DB Contractor's interpretation of the seismic loading. It should be noted that concurrence from the SSRC</p> |                      |  |                          |

2. Specification 08 88 53 Section 2.3.E: This section is providing criteria for seismic loading per ACSE 7-05 Chapter 13 and note CD-6 of structural sheet S-0005.

committee may be ultimate necessary for the final seismic analysis/approval.

Below is our intent for determination of applied seismic loading:  
 - Utilizing the greater of the following lateral accelerations for determination of Fp (Seismic Design Force)  
 1. Determine A (Lateral Acceleration) per CD-6 sheet S-0005  
 - A = 0.45g  
 - A = 0.6 (ap/Rp)(1 + 2 \*z/h)  
 a. ap = 1.0 (wall element and body of wall connections)  
 b. Rp = 2.5 (wall element and body of wall connections)  
 c. ap = 1.25 (fasteners of the connecting system)  
 d. Rp = 1.0 (fasteners of the connecting system)  
 - A = Sa/Rp  
 a. Rp = 2.5 (wall element and body/fasteners of wall connections)  
 - Sa for W12 is taken from East Building Floor Acceleration Spectra Chart Roof Level GSL2. Please confirm  
 - Sa for W13 is taken from Trainbox Floor Acceleration Spectra Chart Ground Level GSL2. Please confirm  
 - Once A is determined we will use the following equation:  
 Fp = A\*Wp (Importance Factor of 1.5 is assumed to be included and will NOT be applied to the equation). Please confirm.  
 2. Determine Fp per ASCE 7-05 Chapter 13 Section 13.3 utilizing SDS = 1.0g  
 - Consider a vertical acceleration utilizing 0.2g  
 - Consider item (5) of CD-6 for ceiling design  
 Please confirm if above interpretation of seismic load determination utilizing design limits from section CD-6 of S-0005 is correct.

Entire assembly (10" tall duct, 1" grease trap, 4.5' of fire-wrap on all sides) is 20" deep. Access panels in architectural ceiling are required at</p> |                      |                    |                          |

prime stair assemblies as specified in Section 05 50 00 and Section 05 05 12." Specification section 05 50 00-2.8 Cleaning and Shop Painting states "Shop prime steel, including galvanized steel, with one coat of primer to dry film thickness of one mil for a single coat." Shop primer as indicated per the specification 05 05 00 is Tnemec 90-97, however per attached letter from Tnemec, 90-97 is not recommended to be used as a primer coat over galvanized metal, as it is to be used in lieu of galvanizing or to touch up galvanizing. It is not used as a full coat over galvanized metal. Tnemec recommends using Tnemec series 69 expoxoline as a full coating over the galvanized metal, however this material is already specified to be used as an intermediate coat per 09 97 15 - High Performance Coatings Galvanized Metal, and should be applied immediately prior the finish coat per manufacture suggestions.

As the permanent steel stairs will be used for an extended period of time as construction stairs, and per conversation with AAI, please confirm it is acceptable to field install the galvanized stairs, spot prime any exposed surfaces with Tnemec 90-97 and allow the stairs to be used for construction activities. Once the schedule permits the final painting to commence, TG7.05 contractor will clean the stairs and spot prime any damaged locations immediately prior handing over the stairs to the painting contractor, whom will place the intermediate coat of Series 69 expoxoline and then the finish coat of paint.

Contract documents call for custom "Security Screen w/ Gate" at IDF and MDF rooms (see Sheet A1-2203 for example).

Per negotiations with TJPA (see attached e-mail correspondence), TG07.3 shall furnish and install standard product fencing in lieu of custom fencing at locations called out in the contract documents.

Please confirm the following for IDF and MDF rooms:  
 1. Where custom fencing is specified by the contract documents, standard product fencing (see attached sketch SK-1 for agreed upon materials and details) shall be furnished and installed.

2. Fence dimensions and other requirements within the contract documents will remain unchanged.

Please reference Detail 6/S 1-5003 regarding the plate supporting the deformed bar anchors for high curbs on metal deck. Harris Rebar would like to propose an alternate to detail 6/S 1-5003. The original detail calls for welded DBA's attaching to a plate screwed into the metal deck. We would like to propose to replace the DBA bars and supporting plate with a rebar hat bar. This bar would be at the same size and spacing as the DBA bars, matching the schedule. The difference is that the bar would tie into the deck reinforcing rather than being welded to a deck plate. The bars would be supplied in sections with the ties fusion welded with bracing wire to the project site. Please confirm if this is acceptable.

**REQUEST:**  
 Contract Doc Ref: S1-6005 to S1-6007  
 Location: Light columns at all levels.  
 Gridlines: 22-24  
 Add'l Doc Ref: n/a

**SUGGESTION:**

To maintain project schedule requirements, our subcontractor Oregon Iron Works (OIW) will be taking back a portion of the light column fabrication scope from their subcontractor, XKT Engineering. The scope of this work will involve welding API 5L Gr. X52 pipe and A572 Gr. 50 plate to ASTM A958 castings. In accordance with the project specifications, XKT performed the required Procedure Qualification Record (PQR) testing for casting to pipe and for casting to plate material welds. The tests were witnessed and the mechanical testing was performed by the TJPA's third party inspection firm (ISI). The PQR documentation was submitted and approved as Submittal TG0701-105B. Skanska is requesting that OIW be allowed to utilize the PQR tests and data performed by XKT to develop their own Welding Procedure Specifications (WPSs) for their use in welding light column components

**ANSWER:**      **Accept Suggestion:**   
 TT and sbp have no objections to this alternate proposal.

| <p><b>From:</b> Webcor Construction LP      Quang Le</p> <p><b>To:</b> Turner Construction Company Phil Militello</p> <p><b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton</p>  |  |   |                     | <b>Answered By:</b>   |                      |                    |                          |
| <p><b>REQUEST:</b></p> <p>Contract Doc Ref: 1/S1-2252, 4/S1-5032, and 10/S1-9001<br/>                 Location: North Mezzanine Exit<br/>                 Gridlines: 21-22<br/>                 Add'l Doc Ref: SK1, SK2, and SK3</p> <p>1) Please confirm the rebar dowels tying into the slab wall shown in SK3 will be placed after the deck as the deck cannot be installed after the dowels. A similar condition occurs at the South Exit Mezzanine.</p> <p>2) To the north-west of grid 22/C a S11 slab is shown. The deck for the S11 slab spans between two W12x40 beams and rests on the top side of the bottom flange. To clear the top flange the deck must be shortened by about 5". The net result is 1½" of bearing at each end of the sheet. The minimum requirement for bearing is 2". Furthermore, the maximum un-shored span for this deck is 10'-0". The beam to beam dimension is 10'-8 1/16" with a clear dimension of 10'-0 1/16". The max un-shored span is based on 2" of bearing. With the reduced bearing and maximum span reached we recommend the deck be shored prior to placing concrete. Please confirm 1 ½" of bearing is acceptable and shoring will be required.</p> |  | <p><b>SUGGESTION:</b></p> <p>Item 1:<br/>                 WOJV: A coupler installed at the CMU wall is a possible solution.</p> |                     | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> |                      |                    |                          |

Co-Author:

**REQUEST:**

Contract Doc Ref: TG0701-92A Sht. 2, S1-2303  
 Location: Ground Level, Zone 2  
 Gridlines: 10-14  
 Add'l Doc Ref's: WOJV 1, 2, and 3

There are voids around the columns at the ground level with no detail. Highlighted are the locations with similar shape and size openings. Please provide a response that could be implemented in zones 1, 3, and 4.

- 1) Please provide a general detail to close the L-shaped openings.
- 2) Please confirm sheet metal gauge size is to remain the same as deck per spec 05 30 00 (2.3A, 2.4C, and 2.4D) if opening is larger than 3"x3".
- 3) Please provide a general detail to close the line gap openings between top of flange to TR.
- 4) Please confirm sheet metal gauge size is to remain the same as deck per spec 05 30 00 (2.3A, 2.4C, and 2.4D) if gap is larger than 2".
- 5) Please provide a general detail to close the square opening.
- 6) Please confirm sheet metal gauge size is to remain the same as deck per spec 05 30 00 (2.3A, 2.4C, and 2.4D) if opening is larger than 3"x3".

For Reference only: Spec 05 30 00- Steel Deck

2.3A) Galvanized Steel: roof steel deck, floor galvanized steel deck and all closures and flashing shall be formed from steel sheets conforming to ASTM A653, SS Grade 33 (min) with minimum yield strength of 38ksi. Before forming, steel sheet shall be coated with a zinc coating conforming to ASTM A653 Zinc coated per ASTM A653 G90.

2.4C) Pour Stops and Girder Fillers: Steel sheet, of same material as deck panels, and of thickness and profile indicated, but not less than deck gauge.

2.4D) Column Closures, End Closures, Z-Closures, and Cover Plates: Steel sheet, of same material and thickness as deck panels, unless otherwise indicated.

| Contract Doc Ref: S1-5003, S1-3001<br>Location: N/A<br>Gridline: N/A<br>Add'l Doc Ref: TG0702-075.2   |  |               |                     |                      |                      |   |                          |
| <p>Please reference Detail 6/S1-5003 regarding the deformed bar anchors for high curbs on metal deck. The detail calls out "5/8" DIA DEFORMED BAR ANCHOR@ 12" OC EA FACE" for curbs of 8"- 23" width. Per Detail 4/S1-3001, the standard hook length for these #5 bars will be 9 3/8", requiring the std. hook to be turned skew relative to the curb face. This was proposed in all welded bar curb details submitted (ex: TG0702-075.2 attached) and no exceptions were noted. No required angle is noted in the contract drawings or the submittal.</p> <p>Shimmick proposes to rotate all DBA standard hooks parallel to face of curb as a typical installation detail to simplify DBA welding. This request would be typical for all 8"-23" wide curbs on metal deck with DBA's on each face, particularly those in Detail 6/S 1-5003. Please confirm this proposal is acceptable.</p> |  |               |                     |                      |                      |   |                          |

|               | <p><b>REQUEST:</b><br/>                     Reference Specification: 07 12 10 - 3.2.D</p> <p>This section states "Install Protection board on vertical surfaces with long dimension vertical and the polyethylene film side facing the soil/cement surfaces." Per the manufacturer's installation instructions, "the protection board will be installed length wise for easier handling during the fastening procedure." SCCI suggests installing the protection board length wise per the manufacturer's instructions. Is this acceptable?</p>  |               |                     |                      |                      |                    |                          |
|               | <p><b>SUGGESTION:</b></p>  |               |                     |                      |                      |                    |                          |
|               | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Install the protection board as specified. It is not intended for protection, but to serve as a substrate for the waterproofing assembly.</p> <p>Protection board is 4' x 8'. When installed vertically, the edges of the boards will be butted and fastened at each pile. This will provide a line of fasteners on the edge of each board and help accommodate the board to pile misalignment. When installed horizontally, the board will be fastened on the intermediate pile which will complicate the installation if the piles are twisted or misaligned.</p> <p>The board should not be fastened to the CDSM. It should only be fastened to the steel soldier piles.</p> |               |                     |                      |                      |                    |                          |

Co-Author:

**REQUEST:**

Further to the response to RFI-860, Please find attached information (see exhibit A) on the proposed class 2 barlocks which are intended to be used at the noted partition walls in Area 3 as outlined in original RFI T-0860 see exhibit B.

Due to the overall diameter of these Type-2 bar locks, please confirm that it is acceptable to have reduced concrete clear cover to the barlocks which will be approximately 3/4". This reduced clear cover will only be applicable for the length of the barlocks itself, which at worst case is approximately 12".

Please confirm that this is acceptable

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

George Metzger  
 11/18/2013  
 RESPONSE:  
 Acceptable

**REQUEST:**

Reference Exhibit A, 2.A & 4.F

A. Confirm \$25,000 dollar policy is required. Conflicts w/ 16.4 (page 11) of the LONG FORM SUBCONTRACT document. However, 16.9 says more stringent of requirements apply.

B. Confirm duration of E & O insurance. EXB-A Section 4.F states insurance shall be maintained "...10 years beyond the Contract Final Completion Date..." Considering the internal bracing, trestle, and bridges are temporary shouldn't the policy only apply when the system is in use. Once removed (street level construction complete), the liability should shift to the permanent structure's design team as the station superstructure is erected. Taken literally, this could require the E & O maintained 17 years (7 years of construction + 10 years beyond).

Submitted by Charles M. Gardner  
 Kiewit Infrastructure West Co.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

A. The insurance requirements for this scope of work are as described in Exhibit A, Section VI. Insurance Requirements.

B. 4.F of Exhibit A, Section VI. Insurance Requirements was revised in Addendum 2 stating the professional liability insurance maintenance period will be for a period of 3 years beyond the Contract Final Completion.

**From:** Webcor/Obayashi Joint Venture    Manuel Saldana    **To:** Turner Construction Company Daphne Faulkner

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:**

**REQUEST:**

Ref: Structural Drawings

Question:  
 Concourse level and street level structural plans were not provided. Can these plans be made available so we can more accurately plan for bracing and trestle installation and removal?

Submitted by: Charles Gardner  
 Kiewit Infrastructure West Co.  
 8/3/10.

**SUGGESTION:**

**ANSWER:**    **Accept Suggestion:**

For information on the Concourse level and street level plans and section information see the following documents:

section A/S1-3201,

plans A1-2000 through A1-2002 and A1-2005,

sections A1-5000, A1-6000, A1-6102, A1-6118, A1-6231,

sections GT-1111, GT-1112

| <b>REQUEST:</b><br>Reference Exhibit A, VI.2.B. and spec. 00 08 05, 1.3.B<br><br>Specification 08 05 1.3.B requires Professional Liability Insurance in the amount of \$10,000,000 each claim with a deductible not to exceed \$50,00 each claim. Exhibit A VI.2.b requires \$25,000 with a deductible not to exceed \$250,000.<br><br>Q. Can you clarify why the Trade Subcontractor would be held to an amount higher than the CM/GC?<br><br>Submitted by Charles M. Gardner<br>Kiewit Infrastructure West Co.<br>08/04/2010 |   | <b>SUGGESTION:</b> |  | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>The Professional Liability and Commercial Liability requirements included in the TG03 BSE package are the same as those required during prequalification for this scope of work. All five prequalified Trade Subcontractors responded in the affirmative that they have ¿or can obtain a liability insurance policy issued by an insurance company licensed in the state of California¿ for these limits. These insurance requirements are higher than those required of the CM/GC under the prime contract due to the risk associated with the design-build aspects of the BSE work, and because the work will be performed by parties other than Webcor/Obayashi Joint Venture. |                      |                    |                          |

requires:

submission by a responsible party. In this case, the contractor would prepare the application form and provide it to TJPA to submit to DPW. the following information is needed for the permit: project description and address/location, including map and/or drawing compelling reasons for work at night rather than during the day description of night work to be accomplished description of all equipment used for night work, including associated noise level days/time of proposed night work contractor doing the night work contact phone for 24/7 response by both the contractor and project sponsor demonstration that those within a 150¿ radius have been notified at least 5 days in advance of the night noise work

| Reference: Exhibit A Section IV Scope Section D<br><br>Exhibit A Section IV Scope Section D SBE Program states that "Trade Subcontractor shall obtain a minimum SBE participation of 24% of the total value of Trade Subcontractors bid value". Volume 1 section 00 08 21 1.3B states that the SBE goal for this contract is 17%. Please clarify what the SBE requirements are for the Trade Subcontractor for the BSE package. Also clarify how the % is calculated. Is the SBE participation % based on the total value of the Trade Subcontractors bid price or is it based on the amount of the bid that has been subcontracted to others?<br><br>Submitted by Kelly Turner<br>Granite / CJA / NCC Joint Venture |                                  |                    |   | <b>Accept Suggestion:</b> <input type="checkbox"/><br>17% is the overall SBE goal for the entire CM/GC contract. The CM/GC will set varying percentage goals for each individual package. The goal for the BSE package is 24%. SBE percentages are calculated by determining the ratio of firms in the nine-county Bay Area for a particular NAICS code to the number of SBE firms in the same area for that same NAICS code. SBE participation is calculated based on the total value of the Trade Subcontractor's bid price. For example, if the total bid is \$1,000,000, and the SBE goal is 24%, the Trade Subcontractor (if not an SBE itself) must make good faith efforts to subcontract out at least \$240,000 to SBE subcontractors. |            |             |                          |

**Co-Author:**

**REQUEST:**  
 Reference Project Bidding Manual (20/44) and specification 01 14 10/APA 1

Please clarify the definition of "ancillary permits". Request specific differentiation of responsibilities between Contractor/Trade Subcontractor/ TJPA. Perhaps a new responsibility matrix with a column for the Trade Subcontractor would help.

Submitted by Charles M. Gardner  
 Kiewit Infrastructure West Co.  
 08/06/2010

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Revised Specification 01 14 10 / APA 1 will be provided in an upcoming Addendum. Trade Subcontractor is responsible to obtain all permits identified in the matrix as Contractor's responsibility, that are required for Trade Subcontractor's work.

Concept drawing for the access trestle shows a width of 48' in Zone 4 and 32' wide everywhere else. Are there minimum width requirements for the access trestle? If so, please provide details. Are there maximum width constraints? If so, please provide details.

Submitted by Kelly Turner  
 Granite / CJA / NCC Joint Venture  
 08/06/2010

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

The access trestle shown in the drawing is conceptual only. Since there is minimal access at the perimeter of the site the intent of the trestle is to allow for access for excavation, shoring, structural concrete and steel erection. See Exhibit A, Attachment 3 for minimum requirements. There are no maximum requirements.

**Co-Author:**

**REQUEST:**

Exhibit A, II, "Key Dates for Bidding Process" of the Project Bidding Manual establishes the Bid Due Date as Sept. 14, 2010, 6 weeks from the date of bid package issuance.

Six weeks is an insufficient amount of time to adequately prepare a \$200M estimate and bid. We therefore request that the Bid Due Date be extended an additional 8 weeks for the following reasons

**Design-Build**

The SBE package includes major design-build elements. The extent of the design work related to shoring, bracing, trestle, cross-street bridging and dewatering that the BSE Trade Subcontractor will be responsible for performing became fully apparent to the prequalified contractors only when the bid package was issued. Developing these required Trade Contractor designs far enough to allow accurate pricing to begin will take time.

Considering the magnitude and location of the construction work, the risk accompanying the design is also extremely high. A memorandum of understanding that adequately addresses this risk must be negotiated with the Trade Subcontractor's Professional Engineer before design can even begin. This will take time.

Similarly, the Trade Subcontractor will likely enlist the services of an independent Professional Engineer to act as a peer reviewer to check the work of the Trade Subcontractor's principal engineer. Reconciliation of any differences identified during this review will take time.

**Liquidated Damages**

Liquidated damages associated with not meeting the CM/GC's schedule for Substantial Completion are extraordinarily high. It appears to us that the BSE Trade Subcontractor's time for substantial completion, i.e. 1,825 days following Notice to Proceed with pre-construction services, is highly interconnected with the work of other trade subcontractors and also contingent on their performance. If this is the case, it becomes very difficult to accurately assess risk of exposure to liquidated damages. The Joint Venture will need time to clarify with the CM/GC the relationship between the other trade

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Please refer to the answer to question 47 for information on the SBE program.

Response by Gerry MacClelland 8/18/2010

A forthcoming Addendum will include a time extension of 4 weeks beyond the current bid date. The TJPJA will continue to monitor contractor questions and the content of future addenda to be satisfied it allows a reasonable period to finalize contractor bids.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

subcontractors' work and the BSE Trade Subcontractor's substantial completion date. Then we can adequately assess the risk resulting from this relationship, include it in our pricing and secure surety commitment.

**Small Business Program**

The Trade Subcontractor is required to achieve a minimum small business enterprise participation of 24% of its' total bid. Given the magnitude of the principal scopes of work required in the BSE package - shoring/bracing, excavation, drilling - most small businesses will neither be interested in participating nor qualified to do so. Time will be needed to identify a sufficient amount of reasonable scopes of work for small business participation and to work with interested small businesses, as necessary, prior to bid day to help them with insurance, bonding, scheduling, and performance issues.

Given the circumstances outline above, Shimmick / Skanska / Traylor strongly urges the Transbay Joint Powers Authority and Webcor / Obayashi to postpone the bid date for the TG03 BSE Package until Nov. 9, 2010.

| <b>Co-Author:</b>   |  |  |                     |  |                      |                    |                          |
| <b>REQUEST:</b><br>Reference Exhibit A Section 5 last paragraph references Specification 00 05 20 for responsibilities for liquidated damages.  |  | <b>SUGGESTION:</b>                                     |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>  |                      |                    |                          |
| Q - The liquidated damages described in 00 05 20 are based on a requirement for the completion of Trade package No. 1 in 1,825 calendar days beginning with Notice to Proceed with Pre-Construction Services. 1) Please provide the Notice to Proceed date for Pre-Construction Services. 2) Please advise how liquidated damages will be assessed for late completion of Zone 1, Zone 2, Zone 3, and Zone 4. Since any of these zones could potentially be late, it is not clear how the CM/GC will assess potential LD's. |  |  |                     | It is anticipated that NTPs will be issued as described in the IFB. Liquidated damages as well as Contractor's costs and those of other Trade Subcontractor's may be assessed if the late completion of any zone impacts the critical path of the project or affects the work of follow on Trade Subcontractors. |                      |                    |                          |

**Co-Author:**

**REQUEST:**

Reference Exhibit A, Part IV and specification 00 08 21, paragraph B, item D and paragraph 1.3, item B.

Q - Exhibit A, Part IV., Scope of the Package and Bid Item Information, Paragraph B., General Work, Item D., SBE Program states "Trade Subcontractor shall obtain a minimum SBE participation of 24% of the total value of Trade Subcontractor's bid value." However, Section 00 08 21, Disadvantaged & Small Business Enterprise and Equal Employment Opportunity/Employment Nondiscrimination Requirements, Paragraph 1.3 Small Business Enterprise (SBE) Program Requirements, Item B. states "The TJPA has established an SBE Utilization Goal of 17% overall for this Contract."

Are we correct in assuming that the SBE participation is to be 24% of our bid value for this contract (Contract No. 08-04-CMGC-000), but that the SBE Goal for the entire Transit Center Project is 17%?

Submitted by Gerald Brown Tutor-Salib Corporation  
 08/12/2010

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

That assumption is correct. 17% is the overall SBE goal for the entire CM/GC contract. The CM/GC will set varying percentages for each individual package, and the goal for this package is 24%.

**Co-Author:**

**REQUEST:**

Reference Transbay Terminal Center Bid Package TG03 Shoring, Buttress and Excavation (Cont.)

Q - We have started into our second week of intensive review of bid documents and drawings in which to grasp what is prescriptive work and what requires additional contractor design and scheduling in our bid proposal preparation. Having been involved in not only pre-bid contractor designed support-of-excavations but final design and construction of numerous deep supported excavations in urban environments in numerous cities in California, we look forward to working on this unique and challenging project. This project brings additional elements to be considered during design of support-of-excavation

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

A forthcoming Addendum will include a time extension of 4 weeks beyond the current bid date. The TJPA will continue to monitor contractor questions and the content of future addenda to be satisfied it allows a reasonable period to finalize contractor bids.

and traffic supported trestles that would not normally be considered in below street level construction. One, the width of the supported excavation at approximately one hundred and eighty L.F., will require at least two intermediate vertical piles to support the horizontal bracing levels. Second, the need to incorporate both longitudinal and transverse traffic trestle decking whose vertical support locations will add to the constraints and interference with the location of the horizontal bracing levels. Third, the phasing of the shoring and excavation will require various locations of bracing levels of the CDSM cut-off walls. Fourth, the tie-down anchors will have to be designed to meet project specifications. Fifth, the volume of information including as-builts and the myriad of geotechnical information provided will consume considerable time which our designers can ill afford not to digest the pertinent information. And lastly, the tremendous coordination and evaluation of the various key subcontractors scopes and proposals will be itself a considerable effort since various proprietary information will be provided to them for pricing Tutor-Saliba's in-house designs. For these various reasons, we strongly urge a postponement of at least four weeks to the current scheduled bid date of September 14th in which we can properly develop the most complete and competitive design concepts and pricing proposal to Webcor/Obayashi. It is very important that you evaluate this request in a timely manner in which we can allocate the limited time available to our engineering and estimating forces. Your timely written response is appreciated.

| Q - Section 1.5 N states that primary struts are to be proof loaded to 125% of maximum design force. This appears to be either in conflict with 1.5 O, or is referring to something other than pre-loading by jacking. We note that proof load is defined, but the definition appears to be similar to what is generally understood by pre-load. Please clarify intent of proof loading. |                                       |                    |  | Responded by Fyfe, David (URS Corporation)   |                      |                    |                          |

**Co-Author:**

**REQUEST:**  
 Reference Exhibit A, Attachment 3 A.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 A. Per Exhibit A, Attachment 3 "The level of the Access Trestle shall be the same as the level of the Temporary Bridges at the connections."  
 B.(insert TT answer)

Q - We note that the access trestle is to be coordinated with permanent construction, not conflict with the permanent structure except for penetrations, and is to be at the same level of the temporary bridges at the connections. This would appear to require that the trestle deck be below the bottom of the ground floor permanent structure section, with built-up ramps to match the street bridges. We also note that the permanent ground level structure is lower at the street crossings than elsewhere. This would push the trestle deck further down, conflicting with the limits of placement of the top level bracing strut. No guidance is given regarding how the future Trade Subcontractor will want to use the trestle to construct the ground floor or the superstructure. Please clarify where the top of trestle deck is intended to be located, and whether it is acceptable to locate the trestle deck at ground floor level, such that it could be used for sequential construction of the ground floor and superstructure. Is there an upturned longitudinal beam down the middle of the street crossings? . Schedule A on S1-3201 only indicates a 30" slab.

| <b>REQUEST:</b><br>Reference drawing sheet GT-1111 Legend. A.  | <b>SUGGESTION:</b>                           |  | <b>ANSWER:</b>   | <b>Accept Suggestion:</b> <input type="checkbox"/> |                   |                    |                          |
| Q - Please help to clarify the strut and waler system stiffness requirements. Our initial interpretation and the associated analyses indicate that strut and waler sizes increase very significantly over what would be required by strength considerations alone. Please provide a sample calculation or procedure for determining stiffness for comparison with the values given in kip per foot, per foot of wall. B. Pre-loading will take out a portion of the axial shortening of the struts. We assume that it is appropriate to subtract out that deflection from the stiffness calculation. Please confirm. |  |  | The strut and waler system stiffnesses are governed by the need to control ground movements outside the excavation. Consequently the operational stresses in struts and walers implied by the specified stiffnesses will be lower than would be obtained by factoring ultimate stresses. See Attached SSK-RFI TG0300-058. Question B is not clear. |  |                   |                    |                          |

**REQUEST:**  
 Reference Proect Bidding Manual, IV.A.17(a)

Project Bidding Manual states, "Contractor will provide temporary power to distribution points in the Site Logistics plan (see Exhibit A) for the project. Subcontractor shall be responsible for all temporary power needs to complete their work beyond the distribution points provided by Contractor. Contractor will not provide temporary power for welding." A. Will the Owner (TJPA) pay for temporary power consumption, or does the Trade Subcontractor put thisin our Bid? B. Will the distribution points require separate metering for welding?

Submitted by Charles M. Gardner  
 Kiewit Infrastructure West Co.  
 08/17/2010

**SUGGESTION:**

**ANSWER:**  **Accept Suggestion:**

A. Refer to TG0300-0035.  
 B. Refer to Project Bidding Manual, Section IV.17.

**REQUEST:**

Reference specification 01 13 50, 1.5.I & 1.5.H.

Please confirm that "The TJPA is the "generator",...,of any hazardous waste,.." 01 13 50 1.5.I, and that, "The TJPA Representative only (and not the Contractor) will sign the manifest for the generator of the waste."

Submitted by Charles M. Gardner  
 Kiewit Infrastructure West Co.  
 08/17/2010

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. As stated in 01 13 50 ç 1.5.I, TJPA is the çgeneratorç of any hazardous waste encountered at the site, as exist, in the course of performance of the Work, but TJPA will not be responsible to any hazardous waste generated by the Contractor working at the Site, and the Contractor will be the generator of that material.
2. As per 01 13 50 ç 1.8.H, TJPA Representative will sign the manifest for the generator of hazardous waste, except the hazardous waste generated by the Contractor as stated above.

**REQUEST:**

A. Will the OCS system be removed to allow crane access across the temp bridges? If so, when? B. What closures (time/duration) will be allowed for the installation of the temporary bridges?

Submitted by Charles M. Gardner  
 Kiewit Infrastructure West Co.  
 08/17/2010

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

- A. OCS system can be removed and reinstalled by the Trade Subcontractor anytime at their convenience, as coordinated with local agencies. This shall be included in the scope of the work.
- B. Please refer to the traffic control specification. This shall be included in an upcoming addendum.

**Co-Author:**

**REQUEST:**

Ref: 2/S1-3003

Slip Detail @ Trestle Pile/Mat connection shows a pipe sleeve over the trestle pipe pile to allow for vertical movement of the mat slab per Note 2. Not clear how that will be achieved since the detail shows the Mat slab with the mud slab directly bearing on the concrete encasement of the trestle pipe pile. Please clarify.

Submitted by Kelly Turner  
 Granite / CJA / NCC Joint Venture  
 08/18/2010

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The slip detail is to allow the mat slab (and the waterproofing to adhere to the mat slab) to move upward when ground water table rises to the design level (mat slab will move up approximately 1" under the designed ground water pressure).

**Co-Author:**

**REQUEST:**

Ref: CSM Width/GT-5101

Plan Sheet 35 of 105, GT-5101, detail 2 shows 3' diameter multi auger soil mixing or a cutter soil mixing system (CSM) with conflicting widths. The stated width is 3'-6", yet the schedule width equals 3'-0", which matches dimension of the multi auger system. However, a 30" wide CSM system and a 36" multi auger system provide the same minimum width. Please confirm the desired width of the CSM system, 30, 36, or 42 inches.

Submitted by Andres Melgoza  
 Drill Tech & Shoring Inc  
 08/18/2010

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The 3'-6" dimension for the CSM system on detail 2/GT-5101 should read 3"-6" maximum. GT-5101 will be revised to reflect this in an Addendum.

Section states "Contractor shall provide uniformed...police officers, as required by the TJPA representative..." It is our understanding that per the contract definitions, the Contractor is defined to be Webcor/Obayashi. Please confirm that Webcor/Obayashi will direct and pay the costs for the uniformed officers described herein. If it is the intent of the contract that the Trade Subcontractor direct and pay the costs for these officers, please provide specific guidelines on when these officers will be required. Simply stating "as required by TJPA" will result in exorbitant bid costs due to the lack of specific information provided. Suggest an allowance for this.

will be issued in a upcoming addendum.

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:**

**REQUEST:**  
 Ref: GT-1110  
  
 Ref Note 3 "strut loads are working stress level." Regarding 301 Mission Buttress Case Table 3 & 7; is Table 7 loading cumulative, or must Table 3 & Table 7 be additive? Regardless of cumulative or additive do Table 3 & 7 loads represent "working stress level"?

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 Tables 5, 6, 7, and 8 are additive to Tables 1, 2, 3, and 4, respectively. All loads in these tables are working stress. Note: Tables 3 and 7 have been revised in Addendum 2.

requires Trade Subcontractor to maintain professional liability coverage continuously throughout the the term of the Contract, and without lapse, for 10 years beyond the Contract Final Final Completion date. The maximum policy term commercially available is 10 years combined for the construction and extended reporting period. A more usual reporting period is 3 years. Please change the extended reporting period to 3 years, or revise the requirement to a total of 10 years. Carrying \$25,000,000 professional liability insurance for 10 years will add significant cost to the Project without corresponding benefit as the majority of the design performed by Trade Subcontractor is for temporary work rather than the permanent structure.

|                   | Reference Exhibit A, paragraph 1.B   |                    | In an upcoming addendum, the following language will be added to 1.B of Exhibit A, VI. Insurance Requirement: Notwithstanding Section 16.7 of the Long Form Subcontract, the requirement to maintain \$100,000,000 in Commercial General Liability Insurance shall apply ONLY to the bidding Trade Subcontractor. Sub-subcontractors/Lower-Tier Subcontractors shall maintain the levels of Commercial General Liability Insurance set forth in Section 16 of the Long Form Subcontract agreement. |  |
|                   | Section 1.B requires the Trade Subcontractor to maintain \$100,000,000 Commercial General Liability Insurance. Section 16.7 of the proposed subcontract between Webcor and the Trade Subcontractor requires that Sub-subcontractors carry the same amounts of coverage. Potential SBE sub-subcontractors will not be able to provide \$100,000,000 CGL. As a result, Trade Subcontractors will not be able to reach the 24% SBE Goal. It is highly likely that all of the Trade Subcontractors will offer 0% SBE participation as a result of section 16.7. Please advise if Webcor intends to modify section 16.7 and if so, how will it specifically be changed? |                    |  |  |

strut's length & spacing regardless of the load. This makes a very inefficient bracing system . Would the Authority consider providing an allowable design deflection criteria, in lieu of the stiffness requirement.

Submitted by Shad Gardner  
 Balfour Beatty  
 08/23/2010

shoring wall segment X1-1 would interfere with the installation of shoring at the final southwest train box wall. Consistent with response to RFI 272, tiebacks are not acceptable at wall segment X1-1.

**REQUEST:**

Reference specification 39 09 13

The plans show geotechnical instrumentation including inclinometers, MPBXs, piezometers and settlement points. Specification Section 39 09 13 states that "... Geotechnical instrumentation consists of inclinometers, settlement casings, settlement monitoring points, survey reference points, piezometers and multiple point borehole extensometers." The plans state that the geotechnical instruments for monitoring the TBT excavation and shoring work are to be drilled and installed by the TJPA representative. However, the specifications call for "...furnishing, installing, monitoring, reading, recording, maintaining, protecting ..... geotechnical instrumentation." The specifications go on to state that "...where shown on the drawings, the Contractor will procure and install the specified instrumentation." We find no notes on the plans calling for the Contractor to procure and install the specified instrumentation nor notes as to who is responsible for monitoring the shoring performance. The plans appear to be inconsistent with local practice in that it is customary in Northern California for the Contractor to furnish, install and monitor appropriate geotechnical instrumentation when the Contractor is responsible for constructing works involving deep excavations and shoring. We recognize the Internal Bracing Specification requires a monitoring program for struts, but is silent on exterior monitoring.

1. What is the Owner's intent in this regard?
2. Will the TJPA be responsible for the exterior monitoring as implied, and the Contractor be responsible for monitoring the performance of the shoring systems in the Specifications which state "...furnishing, installing, monitoring, reading, recording, maintaining, protecting ..... geotechnical instrumentation." , Or will the TJPA representatives read and monitor for all the geotechnical instrumentation?
3. If the TJPA representatives read the geotechnical instrumentation, will the TBJPA representatives take the geotechnical instrumentation data readings on a daily basis? If the TJPA representatives are to be responsible for timely reading and reporting on the shoring systems

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. All instrumentation shown on the 7/30/10 geotechnical drawings will be procured, installed, and monitored by the TJPA's Representative. The specifications describe monitoring, which is the responsibility of the contractor, e.g., monitoring procedures to check internal bracing performance in Section 31 55 00, and monitoring wells for the dewatering system in Section 31 23 19.
2. The TJPA will monitor ground movements inside and outside the excavation using the instruments shown on GT-1301 and 1302. The Contractor will monitor the internal bracing system.
3. The TJPA is evaluating the implementation of an automated data collection and management system which uses a web-based portal to assemble data generated by contractor, the TJPA's Representative, and others for examination by relevant parties. In lieu of this, the TJPA's Representative will read the instruments at a frequency dictated by the stage of construction and by the magnitude of movements observed.

performance, will the TJPA representatives set up the geotechnical instrumentation to be read via dataloggers with in-situ sensors and cellular modems in the case of the inclinometers and/or similarly in the case of the piezometers and MPBXs? Timely notification of all parties should be required.

**Co-Author:**

**REQUEST:**

Per the Bid Documents, the Trade Subcontractor for the BSE package is responsible for removing the dewatering system. Is the Trade Subcontractor for the BSE package also responsible for pouring back the void left in the base slab once the dewatering well is removed? We also request confirmation that the waterproofing will be tied into the dewatering well casing by others. Finally, please provide a detail for abandoning the well casing in place.

Submitted by Kelly Turner  
 Granite / CJA / NCC Joint Venture  
 08/24/2010

**SUGGESTION:**

**ANSWER:** Accept Suggestion:

TG03 Trade Subcontractor will not be responsible for the pouring back of the void. Waterproofing will be installed by others. Dewatering well casing shall be capped and left in place.

| Reference drawing sheet GT-1111, Legend<br><br>(TG0300-0058) requested: A. Please help to clarify the strut and waler system stiffness requirements. Our initial interpretation and the associated analyses indicate that strut and waler sizes increase very significantly over what would be required by strength considerations alone. Please provide a sample calculation or procedure for determining stiffness for comparison with the values given in kip per foot, per foot of wall. B. Pre-loading will take out a portion of the axial shortening of the struts. We assume that it is appropriate to subtract out that deflection from the stiffness calculation. Please confirm.<br><br>Q/A Answers received this morning did not address this question, and can have a significant impact on the Contractor's design and potential for competitive underbidding of this project. We request your clarification on a priority basis as this may affect our decision to Bid this project.<br><br>Submitted by Charles M. | Response to question TG003-0044 states "Protect in place New active sewers constructed as part of the Relocation of Utilities Project as shown on the plans." Please confirm that the project referenced is TG 04.5.1. As these are the only utility relocation plans available to the Trade Subcontractor, we need confirmation that these are the only drawings that must be reviewed prior to bid. If there are other plans the Trade Subcontractor must review in order to ascertain the impacts of new utility relocations, advise where they can be obtained. |                                |  |            | Accept Suggestion: <input type="checkbox"/><br>Refer to response TG0300-0105. |            |             |                          |

**Co-Author:**

**REQUEST:**  
 Reference specification 31 23 19, paragraph 1.1.A.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 Refer to response TG0300-0099.

Please refer to our previous inquiry regarding dewatering. (TG0300-0099) The bid form docs show 72 mo for maint. However, the above spec section allows for "transfer of ownership." Our concern for 72 mo has to do with issues related to bond limits/duration; definition of final completion; and retention release. Also, what is the warranty period and when does it commence.

**Co-Author:**

**REQUEST:**

Referene drawing sheet U-2009.

Per Transbay Transit Center Program Relocation of Utilities Project drawing sheet U-1121 (30 of 172) issued 8-6-10 there are 2 large vaults indicated on the SW corner of Minna and 1st Streets. According to the Demolition and Construction Sequence note 6 after electric services are connected and existing electric ductbank is abandoned by PG&E, demolish as indicated existing electrical ductbank manholes, and contents to the limits shown, as well as all other utilities that run North and South on 1st Street between Minna and Natoma. Drawing sheet U-2009 (50 of 172) do not indicate these utilities in the Composite Utility Plan and Elevation. Please confirm as per Transbay Transit Center Program Buttress/ Shoring/ Excavation drawing D-2230 detail 1 Remove Utilities that the utilities removal will be complete by the TG03 contract start date.

**Co-Author:**

**REQUEST:**

Reference Project Bid Manual IV.A.12.a, 27.b, and Site Logistics Exhibit A.

These sections reference material/personnel hoists. Is the TG03 Contractor to provide access for the follow on trade subcontracts? Please provide specifications for size, type, and capacity, otherwise hoists will be designed to minimum requirements for this Trade Subcontractor to complete its work.

Submitted by Charles M. Gardner  
 Kiewit Infrastructure West Co.  
 08/25/2010

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. Yes, the Trade Subcontractor shall provide the access. Refer to Exhibit A.

2. Minimum hoist requirement shall be dual hoists, each with 10,000 lb capacity, approximately 5' x 12' inside dimensions and non hydraulic system. This will be included in an upcoming Addendum.

| Reference drawing sheet GT-5102.<br><br>Section 9/GT-5102 Indicates CLSM Shoring wall placed abutting the existing 301 Mission Wall. 301 Mission Drawings Sheet SH-31 Wall D section indicates a grade beam which may extend south past the wall line. This may interfere with the CLSM Shoring wall installation. Please provide more detail to confirm the coordinates of the existing building at 301 mission and the interface with the new CLSM wall, and confirm that the CLSM wall is sufficient to act as one side of shoring for the existing pile removal program.<br><br>Submitted by Charles M. Gardner<br>Kiewit Infrastructure West Co.<br>08/26/2010   |                                      |                    |   | <b>Accept Suggestion:</b> <input type="checkbox"/><br><br>The 301 Mission drawings show the grade beam on the 301 Mission side of the property line and therefore should not interfere with installation of the Transbay Transit Center CDSM shoring wall. Regarding the adequacy of the existing 301 Mission shoring walls to act as one side of shoring for the existing pile removal program, no information regarding the as-built and as-remaining/buried condition of these walls has been provided. These walls should not be needed to retain earth on the 301 Mission side of the wall since the 301 Mission structure is deeper than the depth of excavation required to remove the timber piles. However, the integrity of the existing shoring wall to support itself is unknown. |                      |                    |                          |

**Co-Author:**

**REQUEST:**

Reference Base Bid Items Scope #1.

Base Bid Item Scope #1 Mobilization refers you to Section 01 15 05 which calls out in Summary of Work #3, to install temporary construction power and wiring. What temp power is this referring to? (Lay-down area, office trailers, etc.)

Are we to provide pricing for this scope of work? If so, please define the scope of work required in SOW #3.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Bidders shall include the cost of temporary power and lighting in the base bid. Refer to the Documents for the temporary power and lighting requirements.

| <b>REQUEST:</b>  |  | <b>SUGGESTION:</b>                                     |                   | <b>ANSWER:</b>   |                   |  |   |
| In regards to the temporary bridges at 1st, Fremont and Beale St. The contractor is to reference Spec. # 01 15 70-2 and # 01 53 13 -3.6. Section 01 15 70-2 states we are to provide three lanes at 11'. Section 01 53 13-3.6 calls for one 10' pedestrian path and three barriers assumed 1'-6" at the base. These dimensions add up to 47'-6". |  |  |                   | <b>Accept Suggestion:</b> <input type="checkbox"/><br>The dimensions in the drawing SL001 will be removed in an upcoming addendum. |                   |  |   |
| Exhibit A Trade Subcontractor Bid Package Drawing SL-001 shows road widths of 36" at these locations.  |  |  |                   |  |                   |  |   |
| Please confirm total width to be 47'6"   |  |  |                   |  |                   |  |   |

|  |  |  |                   |  |                   |  |   |

**Co-Author:**

**REQUEST:**  
 Reference specification 01 13 50 and 31 00 00.  
  
 Specification Section 01 13 50 requires management of existing soils consistent with the Contract Documents. Specification 31 00 00 1.3.J states the Testing Agency is an, "Independent testing and inspection organization complying with ASTM E32 and employed by the TJPA to perform verification and testing;" Please confirm that TJPA will perform testing and will pay the cost for analytical testing associated with soil characterization of Class I and Class II material if required by the appropriate disposal facilities.

**SUGGESTION:**

**ANSWER:**     **Accept Suggestion:**   
 Confirmed. Please note that Section 01 13 50 should be read in tandem with 01 13 50/APA, Site Mitigation Plan.

**TG03.00-0137**                      **TG03 Question 0137 - Unforeseen Or Differing Conditions**                      **Closed**                      **08/31/2010**     **09/07/2010**     **09/02/2010**                      **Potentially**   
**From:** Webcor/Obayashi Joint Venture     Manuel Saldana                      **To:** Turner Construction Company Daphne Faulkner                      **Answered By:** Transbay Joint Powers Au Gerry MacClelland

**Co-Author:**

**REQUEST:**  
 Reference specification 00 03 20-1, 1.5A.  
  
 "Refer to section 00 08 11 Unforeseen or Differing Conditions, for the differing site conditions." This section is not included Please provide.

**SUGGESTION:**

**ANSWER:**     **Accept Suggestion:**   
 The section entitled "Unforeseen or Differing Conditions" is found in Section 00 07 00.3.05.

**TG03.00-0138**                      **TG03 Question 0138 - Schedule**                      **Closed**                      **08/31/2010**     **09/07/2010**     **09/09/2010**                      **Potentially**   
**From:** Webcor/Obayashi Joint Venture     Manuel Saldana                      **To:** Turner Construction Company Daphne Faulkner                      **Answered By:** Webcor Construction LP     Joanne Filipas

**Co-Author:**

**REQUEST:**  
 Reference Exhibit A (NTPs).  
  
 There are no set dates for NTP's 6-10 and they are contingent on follow on Trade Subcontractor schedules. All of the excavation is required to be completed in 2014. Are NTP's 6-10 going to be issued in a timely manner to ensure the subcontractor is not waiting idle?

**SUGGESTION:**

**ANSWER:**     **Accept Suggestion:**   
 The concept schedule includes the construction plan per the most current construction documents. The concept schedule indicates an approximate start and duration for bracing removal.  
  
 Refer to response TG0300-0150.

| <b>REQUEST:</b><br>Reference Exhibit B "Long Form Subcontract". Some of the terms and conditions that were provided in the Long Form Subcontract to be utilized as the written agreement between Webcor/Obayashi and the low bid Subcontractor are overly burdensome, unacceptable and potentially not in conformance with statues and regulations. Please confirm that mutually agreeable terms can be negotiated with Obayashi/Webcor prior to the bid date for the Project. |   | <b>SUGGESTION:</b>  |                   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Refer to response TG0300-0150. |                   |                    |                          |
| If the terms and conditions for the Subcontract are not negotiable, then we regret to inform you that we will not be able to supply a bid for this Project.  |   |   |                   |   |                   |                    |                          |

**Co-Author:**

**REQUEST:**

The CDSM wall requires no vertical interruptions in its drilling path, the utilities will have to wait until a portion of the CDSM wall is complete. Once a portion of CDSM wall is complete then relocation may happen and the utilities will have to be cored through the CDSM wall. Why is the owner relocating the utilities prior; and just not wait until a portion of CDSM is in before locating?

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Refer to the current utility drawings for sequence. Utility relocation is sequenced such that utility service will remain uninterrupted during shoring wall installation. Refer to Addendum 3 for these reference documents.

**REQUEST:**

Zone 2  
 NTP within 235 cd of NTP 1  
 Finish within 570 cd  
 -----  
 From NTP1 805 cd

Zone 3  
 NTP within 265 cd of NTP 1  
 Finish within 535 cd  
 -----  
 From NTP1 800 cd

Is requirement to have zone 3 completed prior to zone 2 the owners true intent?

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

It is the intent to have both zones complete at the same time or, as per the schedule in Exhibit A, within 5 calendar days of each other.

**Co-Author:**

**REQUEST:**

Reference 301 Mission St. Drawings, drawing sheet GT-5102.

The Temporary Shoring and Earth Retention Drawings for 301 Mission St. show a grade beam on K line in Section 1 Drwg. SH-32 under the screening wall that is to be relocated by others, it appears that this grade beam carries through the parking structure as shown in Section 2 Drwg. SH-31 and Section 9 Drwg. GT-5102 of these bid documents. Please confirm this grade beam will be demolished prior to CDSM Shoring wall obstruction removal and Geotechnical Monitoring Instrumentation.

In Transbay Demolition Plans, drawing # D1060, and D1076, show the backfill material fill to first floor elevation in the area adjacent to 301 Mission Building. In BSE Plans, drawing # GT5000 shows the backfill material fill to about basement slab elevation. Please confirm which one is correct?

**SUGGESTION:**

**ANSWER:**    **Accept Suggestion:**

The 301 Mission drawings show the grade beam on the 301 Mission side of the property line and therefore should not interfere with installation of the Transbay Transit Center CDSM shoring wall.

GT-5000 is consistent with D-5103 regarding the amount of crushed concrete backfill at the start of the contract.

| <b>Co-Author:</b>  |                                       |               |   |                      |                      |   |                          |  |
| <b>REQUEST:</b><br>Schedule A on S1-3201 identifies top of structure elevations. When these elevations are cross referenced against the elevations of the cross streets the temporary bridges that tie into it will be several feet above grade, unless there is a provision for a concrete "leave out" Drawing A 5206 shows First Street Elevation at 14.94. The top of structure at this zone is from 12.79' to 13.47', this allows less than 2' for the temporary bridge installation. Depending on the final Temp. bridge design and clearance necessary to construct box structure below the bridge deck may be as much as 6' above the city street. Is it the owners intent to ramp up on the city street to the temp bridge elevation? If so what is the max grade allowed for the approach ramp?<br><br>Also, please comment on the intent for side sloping, access for business, support of fill, etc. This condition applies to Beale street as well.<br><br>Submitted by Charles M. Gardner<br>Kiewit Infrastructure West Co.<br>09/02/2010 |                                       |               | <b>SUGGESTION:</b>  |                      |                      | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>S1-3201 shows general top of structural elevations at the Ground Floor Slab. The schedule is not intended to show all top of structural elevations.<br><br>Utility corridors are to be provided at the cross streets of Beale, Fremont, and First. Where required, the temporary bridges are provided over the area of the utility corridors, which are lower than the adjacent slabs. See architectural drawings A1-6000, A1-6118, and A1-6231 provided for reference.<br><br>Note that drawing A-5206 referred to in the information request was not included in the BSE package.<br><br>The temporary bridges will be set to tie into existing street grades without significant changes in elevation. This approach will avoid the need for side sloping, or other grading for access. |                          |  |

| Spec Section 01 14 19 - Restriction to Use of Site Areas, lists the location of adjacent site areas and when they are available to the Trade/Subcontractor. This section does not address the area labeled in the drawings as the MUNI Hump or the area directly west of Zone 1. Is the trade/subcontractor to assume that both of these areas are not considered adjacent site areas, but areas acquired with the respective zones? Do these areas become available to the Trade/Subcontractor at NTP of Zones 1 and 3? |                                       |               |  |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Section 01 14 19 identifies staging areas outside the construction zone. The "hump" will be made available to the CM/GC as needed for direct construction activities. Currently, it is available to the demolition contractor until spring 2011. After that it becomes available during shoring wall installation activities. Following, this area will be made available to the CM/GC for other ongoing construction activities until such time as development of this parcel is ready for construction. That date is not currently known, but it is not expected to occur before the late months of 2012. The property west of Zone 1 is considered part of the construction site and is currently available to the demolition contractor. It will become available to the CM/GC in spring 2011. |                          |

**Co-Author:**

**REQUEST:**

Attachment 3, Access Trestle Criteria, of Exhibit A includes a section titled, Minimum Radius of Corner, which states, "Additional spaces at all inner corners of the Access Trestle shall be added for helping Truck/trailer/Crane turn." Temporary Bridges, 01 53 13 1.3 A. 5 establishes the gate requirements with, "Gates providing twenty-four feet (24') of clear unobstructed access shall be provided through all barrier systems at the center of the bridge."

Please confirm the intent confirm to add additional space for turning radius to the trestle at the bridges intersections, when the access is restricted by the clear opening of the gates.

Submitted by Charles M. Gardner  
 Kiewit Infrastructure West Co.  
 09/02/2010

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

The Trade Subcontractor shall configure traffic paths around the gate area considering smooth turn configurations for truck/trailer/crane, including adding turning radius space. Unnecessary turning radius space for the configurations can be avoided.

There is no conflict; 24-ft. (min.) of clear unobstructed access by operation of gates is required by specification.

**REQUEST:**

Information Requested  
 Reviewing Drawings GT-1110, GT-1111, GT-1112 and GT-5101, and our In-house Design, there seems to be a conflict in the TJPA Design of the CDSM wall. Drawings GT-1111 and GT-1112 note that the Max Cantilever to ground surface is 10' max (install) and 13' max (removal), but with the West, East, and Buttress Earth pressures from GT-1110 and Strut Elevation called out at + Elevation 11, + Elevation 6, and + Elevation 4 and the Top of Pile beams form GT-5101, produce cases where the install Cantilever exceed the 10' Max.

- A/1-5 +22.0 -11 = 11' that exceeds 10'
- 1-1 +24.0 -11 = 13' that exceeds 10'
- X1-1 +25.0 -11 = 14' that exceeds 10'
- X1-2 +24.0 -11 = 13' that exceeds 10'
- J/13-19 +18.0 -6 = 12' that exceeds 10'
- J/19-25 +17.0 -6 = 11' that exceeds 10'

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

The elevation of the top strut shall be no lower than the following elevations (NAVD88): at Case West +11.00 (install) and +8.00 (removal); at Case East +6.00 (install) and +3.00 (removal); at 301 Mission Buttress Case and 301 Mission Podium Case +4.00 (install) and +1.00 (removal). This information will be included in an Addendum.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

J/25-27 +15.0 +4 =11' that exceeds 10'

Does the note on Stage 2 on Drawing GT-1111 infer that the Owners Design of the CDSM wall can take the "Over Cantilever" because we can dig to a specific Elevation of +8 west of Grid Line 17 and to Elevation + 7 east of Grid Line 17? Or does the Owners Design need to be Revised to add an additional Strut/Waler Level to the Owners Wall Design? Can we get a clarification on the 10' max shown on Drawing GT-1111 and the west end walls? Can we use 14', 13', 12', 11' cantilever to the first strut level elevation shown at +11, +6, and +4 vs the 10' max shown on GT-1111 Drawings?

**To:** Turner Construction Company Daphne Faulkner

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:**

**REQUEST:**  
 Reference Earthwork 31.00.00, 3.19.B.2 which states "Protect newly excavated areas from traffic and erosion...Barricades shall be installed at the tops of the sloped embankments to prevent vehicles and storage loads within seven feet of the tops of the slopes."  
 a. Does this specification apply to the top edge of the vertical face main excavation? (i.e. perimeter shoring wall)  
 b. If seven foot distance is required (at the top edge of the main excavation), then can it be assumed to start at the inside face of CDSM wall and stop at the outside toe of barrier? If not, then please define start and stop of the seven foot distance.  
 c. CDSM wall and excavation occurring on Minna and Natoma streets exist in close proximity to numerous private garages, driveways, and pedestrian entryways. With a further 7 ft setback restriction, this will virtually take

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 The sentence, "Barricades shall be installed at the tops of the sloped embankments to prevent vehicles and storage loads within seven feet of the tops of the slopes" in Section 31 00 00, paragraph 3.19.B.2, will be replaced with, "Protection of sloped faces within the area being excavated is the responsibility of the Contractor." This change will be included in an upcoming addendum.

**Co-Author:**

**REQUEST:**

As noted in Question TG0300-0058, preloading the struts will increase the effective stiffness of the bracing system (particularly by pre-compressing the struts).

(1) Can this factor be considered when evaluating the average stiffness tributary to a given strut per the note in the lower right-hand corner of GT-1111?

(2) Can preload values higher than those specified in Tables 1 through 4 on GT-1110 be used to increase the effective stiffness of the bracing system?

Submitted by Rich Zito  
 Shimmick / Skanska / Traylor JV (SST)  
 09/07/2010

**SUGGESTION:**

**ANSWER:**    **Accept Suggestion:**

We do not believe that preloading increases the effective stiffness of the struts. The struts will expand and contract due to temperature variations and this could be interpreted as changing the effective stiffness, but we do not believe it is feasible to control the temperature at the time of installation and pre-loading to account for this when selecting the member sizes.

**REQUEST:**

Reference Exhibit A, Section V. In reference to the concept schedule (Exhibit I), it is stated that although the schedule activities should not be assumed to be a complete or binding work plan. . . it is mandatory that each Completion Date be met so as not to impact follow-on Trade Subcontractors or the Critical Path of the Project. Are the Excavation Finish Dates for each of the Zones the mandatory Completion Dates referred to above?

Submitted by Rich Zito  
 Shimmick / Skanska / Traylor JV (SST)  
 09/07/2010

**SUGGESTION:**

**ANSWER:**    **Accept Suggestion:**

Yes, the durations indicated in the milestones for NTP 2-5 are mandatory.

**Co-Author:**

**REQUEST:**  
 The response to previous question TG0300-0054 states that the rebracing loads can be determined based on the information provided on GT-1110. Please identify the specific information on GT-1110 that is to be used to determine these loads. We note that the computation of these loads will depend upon the assumed degree of CDSM wall fixity at the base slab, the assumed distribution of seismic loads, as well as, other inherent assumptions. The CDSM wall analysis and design computations (which we assume must have included an analysis of the bracing removal/rebracing stages) have not been made available to the bidders so it is not possible to ascertain the basic loading and support conditions assumed by the CDSM wall designer for the bracing removal/rebracing conditions. We recommend that the static and seismic components of the rebracing design loads be provided so that all bidders are designing the rebracing for bracing demands that are consistent with the CDSM wall designer's computations.

Submitted by Rich Zito  
 Shimmick / Skanska / Traylor JV (SST)  
 09/07/2010

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Our staged analysis of the build-out case indicates that the total compressive force due to soil pressure does not change from that obtained from our analysis of the excavation case. This is compatible with the need to control ground movements during the build-out stages. The soil loads on the temporary re-bracing struts and the permanent structural elements used for propping the shoring wall can be determined by tributary area using the pressure diagrams on GT-1110.

**TG03.00-0176**      **TG03 Question 0176 - Below Grade Structure**      **Closed**      **09/09/2010**      **09/09/2010**      **09/08/2010**      **Potentially**

**Co-Author:**

**REQUEST:**  
 Will it be permissible to incorporate additional reinforcing steel in the permanent structure concrete walls so that a portion of the wall can act as a wale to spread loads to the rebracing rakers/struts?

Submitted by Rich Zito  
 Shimmick / Skanska / Traylor JV (SST)  
 09/07/2010

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

The Shoring Contractor may propose a waler design that would allow the concrete wall to act as a waler. Contractor-proposed design shall include calculations and supporting design data. All aspects of the design shall comply with requirements in the Contract Documents and the design intent of the building systems not fully designed at this point.

Note the maximum spacing of rebracing elements is to be modified in Addendum 3.

| Sheet GT-1110 shows numerical values for horizontal strut loads. GT-1110 also shows a design profile. Are we to use the numerical values shown or are we to calculate loads based upon the design profile?<br><br>Shimmick / Skanska / Traylor JV (SST)<br>09/07/2010   |  |                    |                     | The "Design Profile" earth pressure was obtained by fitting a trapezoidal diagram to the strut loads obtained by analysis. Therefore, the results obtained using tributary areas from the "Design Profile" will vary slightly from the strut loads presented in tables 1 thru 4. Tables 1 thru 4 shall be used for strut loads. For seismic increment strut loads, refer to tables 5 thru 8. |                      |  |                          |

|  | <p><b>REQUEST:</b></p> <p>In specification section 00 08 21 - 1.3.D it states that DBE's currently certified by CUCP, CCSF HRC, &amp; OSOD may participate in the TJPA's SBE Program. Specification section 00 08 21/AT1 states that DBE's currently certified in only CUCP may participate in the TJPA's DBE Availability Advisory Percentage. Please clarify which certification agencies will qualify the DBEs &amp; SBEs for the TJPA SBE Program. Also will LBEs certified by CCSF(.) HRC qualify as SBEs under the SBE Program?</p>  |  |   |                      |                      |                    |                          |
|  | <p><b>SUGGESTION:</b></p> <p>Answered by Sara Gigliotti, 9/10/10</p> <p>As stated in 00 08 21, 1.3.D, DBEs currently certified in the CUCP, as well as SBEs certified by the City and County of San Francisco Human Rights Commission (HRC), and the California Department of General Services Office of Small Business and Disabled Veteran Business Enterprise Services (OSDS) may participate in the TJPA's SBE Program. HRC issues LBE certifications. OSDS issues SBE and DVBE certifications. These count toward participation in the TJPA's SBE Program.</p> <p>00 08 21 also states that the Contractor is responsible for reviewing the policies outlined in the TJPA's SBE Program. The TJPA SBE Program is available on the TJPA website: <a href="http://www.transbaycenter.org">http://www.transbaycenter.org</a> &gt; TJPA &gt; Doing Business with the TJPA &gt; Small Business Enterprise (SBE) Program.</p> <p>Only DBEs (certified in the CUCP) may participate in the TJPA's DBE Program.</p>   |  |   |                      |                      |                    |                          |

| TG03.00-0199  | TG03 Question 0199 - Retention          | Closed   | 09/13/2010          | 09/19/2010   | 09/14/2010           | Potentially        | <input type="checkbox"/> |
| <p>From: Webcor/Obayashi Joint Venture Manuel Saldana</p> <p>To: Turner Construction Company Daphne Faulkner</p> <p>Co-Author:</p>  |   | <p>Answered By: Transbay Joint Powers Au Gerry MacClelland</p> |                     |  |                      |                    |                          |
| <p><b>REQUEST:</b><br/>Reference Answers to Pre-Bid Meeting Questions.</p> <p>The answer to Question 13 says that retention is withheld for the duration of each subcontractor's scope of work rather than the entire project. Most of the SBE Subcontractor's scope of work will be complete with the placing of the rat slabs. However, the contract will continue until the SBE Subcontractor's responsibility for shoring/bracing removal and trestle/bridge removal is complete. The schedule for this work is contingent on other Trade Subcontractors and the completion date for the entire scope of the SBE Trade Subcontract Package is unknown. Will Webcor/Obayashi release retention attributable to all work completed up until the placing of the rat slabs when the placing of the rat slabs is complete?</p> |   | <p><b>SUGGESTION:</b></p>                                      |                     | <p><b>ANSWER:</b>     <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Answered by Gerry MacClelland, 9/14/10</p> <p>Retention to the CM/GC shall be reduced as described in 00 70 00.9.04. Section 00 05 20.5.04D states "the CM/GC must proportionately reduce retainage for its Trade Subcontractors." The amount of retention released upon placement of the rat slab will be based on the amount to the Trade Contractor's contract billed at that time.</p> |                      |                    |                          |

|  | Reference specification 01 14 00, paragraph 1.8.B.<br><br>This section requires a full time graduate licensed engineer or architect to be on site as CQC manager. Is this position filled with CMGC or Trade Contractor for TG04.5.1.   |  |  |  |                   |                    |                          |   |
|  | The Contractor's Quality Control (CQC) Manager, as referenced in Section 00 14 00, Quality Control, paragraph 1.8.B, will be provided by the CM/GC. Trade Subcontractor is responsible for providing QC personnel as required by Section 01 14 00, Quality Control, paragraph 1.8.C. Qualifications for this personnel include a minimum of 10 years of relevant construction experience, specific to the Trade Subcontractor's scope of work, of which 5 years must be in quality control for public works projects. |  |  |  |                   |                    |                          |   |

|---|-----------------------------|---|---------------------|---|----------------------|--------------------|--------------------------|
| <p><b>REQUEST:</b><br/>                     This project is indicated as to be 100% SBE. Please confirm that this means that all of our subcontractors (and sub tier subcontractors if any) and truckers must therefore be SBE companies. Please also confirm that not all suppliers must be SBE. It will be impossible to obtain quotations for asphalt, VCP, aggregate import materials etc. from SBE companies.</p>  |                             |   |                     |   |                      |                    |                          |
| <p><b>SUGGESTION:</b></p>   |                             |   |                     |   |                      |                    |                          |
| <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>All subcontractors, at any tier, including truckers, must be SBEs. Good faith efforts must be made to purchase materials and supplies from SBE manufacturers or dealers. If materials or supplies are purchased from an SBE manufacturer, 100 percent of the cost counts as SBE participation. If materials or supplies are purchased from an SBE dealer, count 60 percent of the cost of materials and supplies toward SBE participation.</p> |                             |   |                     |   |                      |                    |                          |
| <b>TG043-0003</b>   | <b>Lead in AWSS Pipes</b>   | <b>Closed</b>   | <b>11/02/2010</b>   | <b>11/16/2010</b>   | <b>11/03/2010</b>    | <b>Potentially</b> | <input type="checkbox"/> |

| <b>From:</b> Webcor Construction LP      David Hungerford<br><b>To:</b> Turner Construction Company Daphne Faulkner<br><b>Co-Author:</b><br><br><b>REQUEST:</b><br>The bid form is far too complex. We can possibly understand the need for the data indicated by the bid form from the subcontractor awarded the project, but we can see no need for each and every bidder to fill out every space in a ten page bid form. In addition the bid form requires us to fill in the quantities. As every subcontractor will have different quantities, this seems somewhat odd. A typical SF PUC style bid form, with quantities provided, would result in bids that could be confidently compared with each other- ¿Apples to Apples¿, not¿ Oranges to Apples¿. We request that such a bid form be provided. If the bid form is not simplified greatly, we will not be able to bid this project, since it will take more time to complete the form than actually estimate the project.<br><br>W/O to provide answer. |                        | <b>SUGGESTION:</b> |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>See revised bid form in Addendum 3.                    |                      | <b>Answered By:</b> Webcor Construction LP      David Hungerford |                          |

| Exhibit I, Schedule, appears to show the physical work occurring between 1/27/11 and 3/31/11, approximately 68 calendar days (CD). This is approximately 48 working days. In this amount of time we are to install the sewer, install the water, get SFWD to do the tie ins (which often takes 2 weeks) and then do all the demolition and restoration. Please confirm that this is your intent. Also note that Exhibit A.V appears to require (under milestones) that the water work be completed within 80 CD of NTP-thus it seems that the water will have to be completed prior to the sewer. Please confirm this is your intent. |   |  |            | VOID                                       |            |  |                          |

| Exhibit A.IV, Clarification of Bid Package. It states that The revisions are for construction of Bid Package TG04.5.1 ONLY. However the Delta 1- Field Order-revisions state that the revisions (are) for TG04.3 and TG 04.4. So if they are for construction of Bid Package TG04.5.1 ONLY, why are they revisions for TG04.3 and TG04.4? Are you trying to say- Use all the drawings as provided, and then when we give you a contract we will reissue the drawings, without changes, other than stating |  |  |            | The list of drawings to be used in this bid package is found in section 00 01 15.1 of the specifications. Use all of the drawings provided. Upon completion of this bid process, a conformed set of these documents for this trade package will be issued at a later date. |            |  |                          |

| <b>TG043-0017</b> | <b>Open Trenches</b>   | <b>Closed</b>   | <b>11/02/2010</b>   | <b>11/16/2010</b>    | <b>11/04/2010</b>  | <b>Potentially</b>  | <input type="checkbox"/> |
|                   | <p><b>From:</b> Webcor Construction LP                      David Hungerford</p> <p><b>Co-Author:</b></p> <p><b>REQUEST:</b><br/>                     Exhibit A.IV.D.11 (page 9) discusses the two investigation trenches to be excavated (and backfilled) in this scope of work. For these trenches, do we open up end to end and plate? If so, how long will they be kept open, who will move and replace the plates etc.? Or, can we trench and backfill concurrently, with representatives observing and taking requested measurements, thus limiting the amount of open trench?</p>   | <p><b>To:</b> Turner Construction Company Daphne Faulkner</p> <p><b>SUGGESTION:</b></p> |                     |                      |  | <p><b>Answered By:</b> Webcor Construction LP    David Hungerford</p> <p><b>ANSWER:</b>    <b>Accept Suggestion:</b> <input type="checkbox"/></p> VOID  |                          |
| <b>TG043-0018</b> | <b>Mark Up Clarification</b>   | <b>Closed</b>   | <b>11/02/2010</b>   | <b>11/16/2010</b>    | <b>11/04/2010</b>  | <b>Potentially</b>  | <input type="checkbox"/> |
|                   | <p><b>From:</b> Webcor Construction LP                      David Hungerford</p> <p><b>Co-Author:</b></p> <p><b>REQUEST:</b><br/>                     Specs. 000700.6.06.C.2 states that markup on labor is direct cost plus Caltrans surcharge plus 15%, or is it direct cost including bonds and insurance plus 15%? As the current Caltrans surcharge is approximately 11% and our liability insurance and WC insurance total 16.21% and adding the approximately 6.20% FICA, 1.45% medicare, 1.5% SF payroll tax, 7.1% unemployment &amp; training taxes equals approximately 32.5% which exceeds the sum of the 11% surcharge and 15% markup, this is a very important point. As currently written, we would do any extra work at a loss. Note that Caltrans uses the surcharge plus 33% for labor, which allows a profit. Please explain why we should bid a project that guarantees that all extra work would be performed at a loss, or change or clarify the specification.</p> | <p><b>To:</b> Turner Construction Company Daphne Faulkner</p> <p><b>SUGGESTION:</b></p> |                     |                      |  | <p><b>Answered By:</b> Webcor Construction LP    David Hungerford</p> <p><b>ANSWER:</b>    <b>Accept Suggestion:</b> <input type="checkbox"/></p> This is to confirm that 00 07 00 i 6.06.C.2 allows, for Work performed by a Subcontractor, a markup that equals a maximum of 15% of its direct costs, as defined in 6.06.A., including Subcontractor bonds and insurance. |                          |

**Co-Author:**

**REQUEST:**

Specs. 321217.3.4.A.

This section states that Contractor shall mill and fill AC pavement as directed by TJPA representative. Prior to bid we must be told exactly which areas are to be milled & filled. If you cannot provide exact and complete parameters (such as a drawing showing the exact limits of the mill and fill required), we will have to assume that absolutely no mill and fill is required. We cannot be expected to know what the TJPA representative will require.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Restore all excavations for the Work in accordance with the specifications inclusive of DPW Order No. 176,707, "Regulations for Excavation and Restoring Streets in San Francisco," which describes the limits of milling and filling for ACWS restoration.

**Co-Author:**

**REQUEST:**

Specs. 321724.

Typically in SF all permanent pavement restoration is provided by SF at no cost. Are we to provide permanent restoration of pavement markings or will SF provide at no cost?

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The Paint Division of the SFMTA will furnish and install all the permanent thermoplastic stripes and pavement markings in accordance with Section 01 15 70.3.8.

| <b>From:</b> Webcor Construction LP      David Hungerford <b>To:</b> Turner Construction Company Kevin Chiu<br><b>Co-Author:</b><br><br><b>REQUEST:</b><br>In the Traffic Control Specification 01570-2F # 10 "TEMPORARY PAVEMENT" is Temporary Pavement in regards to traffic controls limited to the following:<br>A. Pothole Patching;<br>B. "Cutback or Coldpatch" at bridging and plating, handicap ramps, and sidewalk repairs;<br>C. Misc Roadway Maintenance;<br>D. Does not include Roadway Grinding or Hot Asphalt Application. |  | <b>SUGGESTION:</b> |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Section 01 15 70, paragraph 1.2.F.10 defines $\zeta$ temporary pavement $\zeta$ as part of the scope for Traffic Routing Work. The requirement for $\zeta$ temporary pavement $\zeta$ is to accommodate construction traffic control and maintenance of public and construction safety throughout the complete construction duration. It is envisaged that the scope may include pothole patching; "cutback or coldpatch" at bridging and plating, handicap ramps, and sidewalk repairs; and misc. roadway maintenance. Usually, roadway grinding and hot asphalt application, which are typically utilized for larger paving areas, and possibly permanent installations, will not be necessitated by $\zeta$ temporary pavement $\zeta$ work. However, without the opportunity to review the traffic control plan as stipulated in 1.2.A of the same section, we cannot preclude the need at this time. |                      |                    |                          |

**Co-Author:**

**REQUEST:**

Per W/O Field directions, TCI was required to install 1-1/2" sleeves for future light fixtures at new concrete footing below the asphalt paver. Please confirm if this is acceptable.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

See attached URS email for direction on placement of conduit installations through the 301 Mission concrete wall.

Email from David Fyfe on 04/07/11 states:  
 "We met in the field this morning and agreed to provide/install three conduit layout options to maintain scheduled pour and help ensure the new electrical/conduit alignment provides a code compliant preferable connection to the future lights;

- 1) conduit/boxes in wall as installed prior to today with minor adjustments to provide required clearances to steel;
- 2) conduit running east-west along north side of wall as installed this morning;
- 3) conduit running east-west along south side of wall, (note this option only required providing 4 short

| This is to respond to submittal title TA1010.S-5000.A01 Rapid Set for Concrete Repair ( TCI #31) Please identify a product or a custom mix design that would meet these specifications. In our past practice we have successfully used the suggested grout product as a concrete patch. In our investigations with suppliers and other contractors, it seems that the general conclusion is that using a grout product (such as the one proposed) would be the appropriate product for this application and condition. The proposed grout seems to offer greater strength and structural performance than the original concrete that has since been removed. Is there another product that you could identify that would achieve these specifications? Since we are not the project designers, we can only suggest those products that would generally be used and accepted in our standard of practice It was based on this standard of practice that we submitted the RapidSet grout product. |   |  |                     | <b>Accept Suggestion:</b> <input type="checkbox"/><br>The submittal response referenced in this RFI is incorrect. The suggested product was never submitted past Webcor-Obayashi's possession. Due to compliance with the direction given per response to RFI T-0130, a submittal was not required.<br><br>An email chain was generated from conversations between W/O and Turner, then a message sent between Turner and URS, which relayed the product type and an email chain starting from URS was recieved noting that the material is not acceptable. Upon further review of codes, the material is acceptable, which had been discussed in the weekly subcontractor meeting held on Monday June 6, 2011.<br><br>This RFI is no longer valid. Transworld is to submit products that will be used to repair this condition, per sub meeting.<br><br>Transworld is aware of this and is submitting product for review. |                      |                    |                          |

|---|---------------------------|--|
| <p><b>REQUEST:</b></p> <p>Reference sheet U-3407.<br/>         PG&amp;E has been potholing on the south east corner of Minna @ 2nd St. for a new gas line over the past number of days. We have observed in their potholes that a basement structure for the Rickenbacker Restaurant (123 2nd St.) extends out beyond the property line and under the sidewalk, along both Minna and 2nd Street. The basement appears to extend almost up to the roadway curb on 2nd Street and to face of curb or beyond on Minna. The joint trench at its current alignment (on Plan Sheet U-3407) along the south east corner of 2nd &amp; Minna will be in conflict with this basement structure. Please review and advise.</p> | <p><b>SUGGESTION:</b></p> | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>E. Zagol 1/11/11</p> <p>See revised Joint Trench Plan and Elevation Phase I Plans titled "Revisions - Minna Street 12/27/10" for realignment of Joint Trench.</p> <p>*****</p> <p>E. Zagol 12/17/10</p> <p>The Joint Trench as currently shown in Sheet U-3407 is in conflict with the 123 Second Street sidewalk basement between Minna Street stations 0+75 and 0+90.</p> <p>Separate from the conflict mentioned above, PG&amp;E has requested TJPA to add additional conduits to the Joint Trench.</p> <p>Revised drawings will be provided that address the following:</p> <p>Realignment of Joint Trench west of station 2+00, realignment of the sewer west of station 2+25, and revisions to the water line (vertical and hydrant lateral) west of station 1+02 to address the conflict with 123 Second Street sidewalk basement.<br/>         Modifications to Joint Trench sections from First Street to Second Street to accommodate PG&amp;E's additional conduits.<br/>         Modifications at the future Transit Center stubouts to accommodate PG&amp;E's Joint Trench configuration revisions.<br/>         RFI-U0050.<br/>         *****</p> <p>E. Zagol 11/18/10</p> <p>AECOM will attend the planned site visit to 123 Second Street on 11/19/10 to evaluate conflict. We are actively working with PG&amp;E to identify options for the Joint Trench alignment west of STA 1+12 if 123 Second Street basement is confirmed in conflict.</p> |

On 11/17/10 PG&E reported at TJPA's weekly PG&E coordination meeting that the preferred realignment option, north of the proposed sewer utilizing existing PG&E MH 1319, was electrically feasible. PG&E has scheduled field crews for the week of 11/29/10 to confirm that there is adequate space in their existing manholes to facilitate the preferred option.

Proceed with Joint Trench subsurface investigations and Joint Trench shop drawing preparation in accordance with plans and specifications for the Joint Trench east of STA 1+12 to STA 9+31.32 at First Street.

Question from RFI #U-0019.1

-----  
 Reference: RFI #U-0019, attached picture and sheet U-3201

The streetlight at station 4+12.03 was laid out per the response to RFI #U-0019. When the new location was potholed, a number of existing utilities were discovered. Per inspection with BLHP on 12/20/2010, inspector Robert Kawano requests to re-route existing conduits in the new light pole ftg. location at STN. 4+12.03. Utilities seem to be privately owned by 555 Mission St.. Please advise.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Electrical conduit has been relocated by 555 Mission St. property management. Webcor/Obayashi to relocate irrigation conduit to be out of the way of the light pole base location. Coordinate with 555 Mission (Julian Marsh 415-546-6036 or Rob Edlenbos 415-546-6037) to have the irrigation controllers shut off for the work.

-----  
 RFI U-0019.1 Response - Eric Zagol - 12/27/2010

Unforeseen condition requiring improvements by property owner to relocate privately owned utilities in the City right of way. TJPA Representative to coordinate with property owner to relocate utilities.

**REQUEST:**

Reference Plan/Drawing: U-3021

During potholing activities in 1st St. where Manhole #501 is to be installed Trinet has encountered a number of existing utilities which occupy the same intended space for Manhole #501. Please see the attached sketch for locations and clarifications of these utilities.

Some of these utilities, particularly UT Group #2 and UT Group #5 (reference sketch) are intended to be disconnected by PG&E by November 24th. Please confirm.

UT Group #1, which appears to be owned by ATT is noted on the drawings as to be disconnected and demolished. Please advise as to when this utility is scheduled to be disconnected.

UT Groups #3 and #4 are unidentified and were not included in the USA markings for this area. In order to construct M.H. #501 per the contract drawings these utilities must be removed or relocated. Please advise as to the ownership of these utilities and provide direction on how to proceed.

Note: due to construction, we are requesting that this RFI be answered by 11/22/10 if possible.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Please provide a mark up of U-3021 indicating the horizontal location of the utilities discovered that correlate to the section sketch provided. Also, please clearly indicate those utilities that were not marked in the field in response to the USA ticket for this excavation work.

\*\*\*\*\*

E. Zagol 11/24/10

In response to items listed above:

- As of 11/17/10 PG&E has stated that the de-energization of Minna St. will be complete by 11/24/10. In accordance with Specification 024100 1.3 B and 024100 3.5 B obtain in writing a Utility Severance Certificate (or equal) that all connections have been disconnected and the utility is not active.
- As of 11/17/10 AT&T has stated that contents in AT&T existing ducts along First St. have been terminated with the exception of the new duct from Howard St. to 400 Howard St. property. Confirm that the existing AT&T duct subject of discussion is the exiting duct from TMH-1887 to Existing Transbay Terminal as shown to be demolished on U-1121. In accordance with Specification 024100 1.3 B and 024100 3.5 B obtain in writing a Utility Severance Certificate (or equal) that all connections have been disconnected and the utility is not active.
- Groups #3 and #4 utilities are not shown on AECOM's existing utility plans and as noted in the RFI are not included in the USA markings. Pending direction from TJPA's representative in accordance with Specification Section 00 08 10 the suggested first course of action is to notify USA and request a "No Response Follow Up Message". Other suggested actions have been provided to TJPA PMPC for consideration and direction further direction provided by the TJPA's Representative.

**Co-Author:**

**REQUEST:**

Reference Plan/Drawing: U-1002 and attached PDF.

Current USA markings have identified (2) SFWD laterals which are not indicated on the drawings. These are located at approximately STA 8+59 and 9+06 and extend from the main in Minna St., North toward the building of 100 1st. ST. These laterals need to be identified and recorded in order to properly document and construct both the new water line and the new joint trench.

Any additional work associated with these utilities may result in a cost or schedule impact. Please review and provide direction on how we should proceed.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

100 First St. Building Engineer confirmed existing laterals do not provide service to 100 First St.

After new water in Minna Street is constructed, water services and hydrant laterals are connected; main to main connections are made by CDD, and pipes are secure; and the existing water main is abandoned, demolish existing laterals identified at approx. STA 8+59 and 9+06.

DO NOT provide a connection from new water main to existing laterals at approx. STA 8+59 and 9+06.

\*\*\*\*\*

Tap record and meter information provided by SFPUC Customer Service Bureau indicates two water laterals to the 100 First St. property entering the building from First Street approximately 50 feet south of Mission St. Meter boxes located along First St. west sidewalk.

Coordinate with the 100 First St. Building Maintenance, Bradford J. Collins (CAC Real Estate Management Co., Inc.), Tel: 415.243.8803 thru the TJPA's representative to confirm that laterals do not provide service to 100 First St. property from Minna Street.

enclosed.

Also per spec section 02 41 00-3 (Vol. 20 Contract # CMCG 08-04 Existing Utilities)  
 Item A - "Coordinate the shut off or disconnect of existing utilities affecting demolition work with the utility owner at least (7) seven calendar days prior to commencing with the work. The TJPA Representative will coordinate with the utility owner to open/close valves on piping, perform piping disconnects required and perform electric and telecommunication disconnects required. Do not proceed with this phase of work before getting the approval from the TJPA Representative".

Please provide approval.

In addition, per item B of spec section 02 41 00-3, "Prior to removal of any non-governmental (privately owned) ductbank, conduit or gas lines, obtain in writing a Utility Severance Certificate that all connections have been disconnected and the utility is not active".

Please provide a Utility Severance Certificate per item B above.

Sewer work on First Street is scheduled to start 12/1/10. Work cannot proceed until the conduit is de-energized.

Thank you.

**REQUEST:**  
 Due to ongoing demolition work by EBI, W/O is requesting formal transmission of the most current demolition drawings and schedule.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 Per our utilities working session yesterday (12/7/10), the demolition drawings being used are the original set issued for construction, dated 1/14/10. C. Traylor will follow up to find out if/when Webcor/Obayashi was issued a copy of this set, or issue a new one for you

These documents will be used for coordination efforts with

**REQUEST:**

Reference: Sheet U-3109 (dated 2010-09-29)

During Trinet's potholing for the Joint trench along the North side of Minna St, a basement for building "100 First St." was revealed. The basement wall is located just behind the face of curb and extends to more than 8 feet below finish grade. The extent of the basement is unknown, but assumed to run the length of the "100 First St" property. The basement structure is in conflict with the proposed new fire hydrant installation at Station 9+10.

Please provide layout for the fire hydrant.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The wall encountered appears to be an abandoned side walk basement wall for the 4 story brick building that existed prior to the current 100 First St. building. Approximate width of wall is 2 feet and the outside face is approximately at the face of curb. Neatly cut and remove wall to form a trench. Required trench width and depth per Detail 7 on U-5101. Construct hydrant lateral, riser and hydrant as shown in Detail 2 on Sheet U-5101.

**Co-Author:**

**REQUEST:**

Reference: Sheet U-3023, U-3033 (Detail B), Attached detail from Department of Public Works Bureau of Engineering

Trinet is concerned that the installation depth for many of the new catch basin does not comply with SFDPW Sewer Department guidelines, specifically regarding access to the traps for the maintenance department. The DPW sewer maintenance crews need to have ready access to the p-trap during flooding emergencies. DPW crews need to be able

to reach the p-trap to, either remove the cleanout cap and release the flow to the culvert pipe (if the trap bottom is plugged), or rod the culvert line through the trap (if the culvert is plugged). To get some clarification of the installation

guidelines, Trinet had informally talked to one of the design engineers at the SF Bureau of Engineering, Hydraulics

Department. He advised Trinet that new catch basins should be installed with center of trap and discharge piping grade located between 3 and 4 feet below the culvert runs to cross under existing utilities that are in conflict with a direct run to the discharge manhole. Bends should be 22

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

AECOM has confirmed with SFDPW Hydraulics that limited vertical bends in the 10-inch culvert run are acceptable. SFDPW also confirmed that from a maintenance perspective the clean out on the cast iron trap is more accessible at a depth of 3 to 4 feet below ground surface.

Please submit subsurface utility investigation information including top, bottom and size of existing utilities along the 10-inch culvert alignment from catch basin to manhole such that the 10-inch culvert can be engineered and the catch basin depth can be determined to avoid existing and future utilities.

**Co-Author:**

**REQUEST:**

Refer to Sheet U-3023, U-3033 (detail B) and see RFI #U-0035

Per the response to RFI #U-0035, find attached for your review a drawing showing the proposed alignment for the catch basin (CB# 603) installation and storm drain run to the existing manhole on Fremont St.

Please confirm this proposed alignment is acceptable or provide another solution.

\*\*\*Please confirm this alignment by 12/27/10 if possible.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Based on a site visit on 12/28/10 with Jason Dunne (W/O) and Victor (Trinet) to review exposed trench alignment for 10-inch culvert it was confirmed that the culvert alignment will clear the new temporary 8-inch water and existing 8-inch water main with adequate separation.

Alignment as shown in the attached drawing is acceptable.

Note, existing 3" HP Gas immediately west of the catch basin is to be abandoned by PG&E per Sheet U-1123 Demolition and Sequence item 2. Coordinate with PG&E to confirm 3" HP Gas is inactive and can be demolished and removed to facilitate construction of the catch basin and culvert, if required.

**Co-Author:**

**REQUEST:**

Reference: Sheet U-1008, attached sketch of section from Trinet RFI 28 and documentation of notifications to USA North

See the attached section through the investigative trench at station 4+40 on Fremont St. Per note 4 on sheet U-1008, Trinet hereby requests that Webcor "notify TJPA" of the unidentified 6" steel pipe at 7'-9" from the east face of curb and 3'-4" to cover that Trinet encountered in their trenching which was not indicated on the contract plan. Per the same note, Trinet requests "direction on the demolition" of this line.

Trinet has this plated but would like to backfill the trench as soon as possible. An expedited response is requested with official direction on how to proceed with this facility by 12/16/10.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Unknown unforeseen existing utility condition.

In accordance with specification 00 08 10 section 1.3 EXISTING UTILITIES NOT INDICATED and specification 020630 section 4.1 POTHOLES AND TRENCHING OPERATIONS paragraph C, please proceed with the following in order to identify all interfering utilities that are unknown after all specified procedures or other non destructive methods proposed by the contractor have been exhausted:

Pipe: If conductive material, perform subsurface investigation via electromagnetic detection (or other nondestructive methods) to trace utility back to nearest vault, pull box, manhole or valve to identify owner and content. If nonconductive, excavate along pipe alignment to expose coating and a joint. Inspect and provide information on coating and joint type. If content is still unknown, tap each line in order to identify contents and operating status of utility (i.e. abandoned or operational.)

Conduit and duct bank: Determine if utility is a charged electric utility utilizing a contractor that performs NETA type work. Determine if telecommunication cables are operational.

Once the utility has been identified including owner and contents, and determined inactive or de-energized, cut and cap utility at the demolition demarcation line shown in the drawings.

Note, 6" steel pipe is in the same alignment as PG&E's excavated manhole 1675. Coordinate with PG&E to see if PG&E has demolished this line.

Co-Author:

**REQUEST:**

Reference: Sheet U-1007, attached sketch of section from Trinet RFI 20 and documentation of notifications to USA North

See the attached section through the investigative trench at station 2 + 29.68 on Minna St. Per note 4 on sheet U-1007, Trinet "hereby requests that Webcor "notify TJPA" of the unidentified 1" steel line found 2' 9" from north face of curb and 18" to cover. Per the same note, Trinet requests "direction on the demolition" of this line.

Trinet has this plated but would like to backfill the trench as soon as possible. An expedited response is requested with official direction on how to proceed with this facility by 12/16/10.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Unknown unforeseen existing utility condition.

In accordance with specification 00 08 10 section 1.3 EXISTING UTILITIES NOT INDICATED and specification 020630 section 4.1 POTHOLES AND TRENCHING OPERATIONS paragraph C, please proceed with the following in order to identify all interfering utilities that are unknown after all specified procedures or other non destructive methods proposed by the contractor have been exhausted:

Pipe: If conductive material, perform subsurface investigation via electromagnetic detection (or other nondestructive methods) to trace utility back to nearest vault, pull box, manhole or valve to identify owner and content. If nonconductive, excavate along pipe alignment to expose coating and a joint. Inspect and provide information on coating and joint type. If content is still unknown, tap each line in order to identify contents and operating status of utility (i.e. abandoned or operational.)

Conduit and duct bank: Determine if utility is a charged electric utility utilizing a contractor that performs NETA type work. Determine if telecommunication cables are operational.

Once the utility has been identified including owner and contents, and determined inactive or de-energized, cut and cap utility at the demolition demarcation line shown in the drawings.

**Co-Author:**

**REQUEST:**

Reference: Sheet U-1008, attached sketch of section from Trinet RFI 30 and documentation of notifications to USA North

See the attached section through the investigative trench at station 4+40 on Fremont St. Per note 4 on sheet U-1008, Trinet hereby requests that Webcor "notify TJPA" of the unidentified 6in x 6in concrete duct at 10'-1" from the east face of curb and 5' to cover that Trinet encountered in their trenching which was not indicated on the contract plan. Per the same note, Trinet requests "direction on the demolition" of this line.

Trinet has this plated but would like to backfill the trench as soon as possible. An expedited response is requested with official direction on how to proceed with this facility by 12/16/10.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Unknown unforeseen existing utility condition.

In accordance with specification 00 08 10 section 1.3 EXISTING UTILITIES NOT INDICATED and specification 020630 section 4.1 POTHOLES AND TRENCHING OPERATIONS paragraph C, please proceed with the following in order to identify all interfering utilities that are unknown after all specified procedures or other non destructive methods proposed by the contractor have been exhausted:

Pipe: If conductive material, perform subsurface investigation via electromagnetic detection (or other nondestructive methods) to trace utility back to nearest vault, pull box, manhole or valve to identify owner and content. If nonconductive, excavate along pipe alignment to expose coating and a joint. Inspect and provide information on coating and joint type. If content is still unknown, tap each line in order to identify contents and operating status of utility (i.e. abandoned or operational.)

Conduit and duct bank: Determine if utility is a charged electric utility utilizing a contractor that performs NETA type work. Determine if telecommunication cables are operational.

Once the utility has been identified including owner and contents, and determined inactive or de-energized, cut and cap utility at the demolition demarcation line shown in the drawings.

Note, 6"x6" conc. duct is in the same alignment as PG&E's excavated manhole 1675. Coordinate with PG&E to see if PG&E has demolished this line.

See the attached section through the investigative trench at station 4+40 on Fremont St. Per note 4 on sheet U-1008, Trinet hereby requests that Webcor "notify TJPA" of the unidentified pair of 2.5" steel pipes at 4'-10" from the west face of curb and 21" to cover that Trinet encountered in their trenching which was not indicated on the contract plan. Per the same note, Trinet requests "direction on the demolition" of this line.

Trinet has this plated but would like to backfill the trench as soon as possible. An expedited response is requested with official direction on how to proceed with this facility by 12/16/10.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Unknown unforeseen existing utility condition.

In accordance with specification 00 08 10 section 1.3 EXISTING UTILITIES NOT INDICATED and specification 020630 section 4.1 POTHOLES AND TRENCHING OPERATIONS paragraph C, please proceed with the following in order to identify all interfering utilities that are unknown after all specified procedures or other non destructive methods proposed by the contractor have been exhausted:

Pipe: If conductive material, perform subsurface investigation via electromagnetic detection (or other nondestructive methods) to trace utility back to nearest vault, pull box, manhole or valve to identify owner and content. If nonconductive, excavate along pipe alignment to expose coating and a joint. Inspect and provide information on coating and joint type. If content is still unknown, tap each line in order to

| <p><b>REQUEST:</b><br/>                     Reference: Sheet U-3107 (dated 2010.09.29)</p> <p>During excavation for the 8" water main along Minna Street, Trinet encountered a 1" Polyethylene service lateral at station 3+08, that extended into the vacant lot on the south side of the street. The service was broken during construction and Trinet has temporarily capped it. The utility was not shown on any utility plans. There is also no new service lateral, or reconnection of an existing, depicted on the new water main drawings at or adjacent to this location. Please advise on what should be done with the service. The repair is only temporary and a permanent reconnection will need to be performed by the SFWD if the service is to be maintained active. If the service is to be de-activated, then Trinet recommends that it be shut off at the connection to the old main.</p> |   | <p><b>SUGGESTION:</b></p> |                     | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Unknown service lateral to vacant lot. **Co-Author:**

**REQUEST:**

See attached drawings and photos

During the water main installation on Minna St, Trinet encountered what appears to be an old abandoned sewer manhole in the trench line at station 1+15. The structure was not indicated on the drawings and was not discovered until the pavement asphalt was removed. The sewer manhole is directly in conflict with the alignment of the new water main. The installation of the watermain cannot proceed further until the manhole is demolished and/or abandoned.

Per a field walk with Eric Zagol on 12/23/10, the existing MH was confirmed abandoned. Please confirm/ advise the top of the MH will be demolished to allow the installation of the waterline, and the MH will be backfilled with CDF.

\*\*\*\*Please provide direction by 12/28/10.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. Remove and dispose of existing abandoned separated sanitary sewer system manhole to a depth of 1 foot below bottom of new water main.
2. Plug existing abandoned 8-inch sanitary sewer with concrete per 024100 3.6 A.
3. Backfill abandoned manhole with CDF to an elevation 1 foot below bottom of new water main.
4. Provide 6-inches of bedding material between CDF and bottom of trench bedding per Detail 7 on Sheet U-5101 such that the total depth of trench bedding crossing the abandoned structure is 1 foot.

Per contract, Trinet is required to remove and salvage the existing light pole indicated in the attached drawing. Through observation in the field, the existing light pole has a MUNI cable attached which runs to the intersection of Fremont St. and Mission St.. Based on these findings, should the light pole be removed as indicated? Mario Saldana from W/O was present when this item was observed and issue has been discussed with Eric Zagol from AECOM.

Please advise. An expedited response is requested by 01/12/2011.

These are MUNI OCS Poles not Lighting Poles. Both OCS poles along east side of Fremont near 301 Mission Tower are in use by MUNI OCS System. MUNI has designated each OCS pole to hold different guy wires at Fremont and Mission see Demolition drawing Sheet 105 of 137. The poles are to remain and be deleted from Webcor-Obayashi/Trinet scope.

NOTE: Evans Bros Subcontractor Reliance Electric are to correct OCS cables to both of these OCS Poles. Reference Demolition drawing plan sheet 105 of 137. A second cable will be installed at OCS Pole 4030 and the cable will be reinstalled at OCS Pole directly north of Pole 4030 per contract.

\*\*\*\*\*

J. Adams 01/13/2011

The MUNI Overhead Contact System (OCS) Pole in question not light pole. This OCS pole was to have the guy wires relocated to nearby MUNI OCS Pole by the Demolition Contractor in July 2010 during mods to Transbay Terminal MUNI OCS system. Demo drawing plan sheet 105 of 137 shows the guy wires relocated to pole 4030 - this is in EBi scope.

Pole 4030 is shown to remain per Demo drawing above - But, Pole 4030 is shown to be removed per RUP U-3302 .

It should be noted that upon relocation of this OCS guywire the removal of the pole is Webcor-Obayashi scope per drawing U-3302.

\*\*\*\*\*

E. Zagol 01/13/2011

Change in existing conditions. New MUNI guy wire was attached to existing pole at STA 5+45 as part of the Existing Terminal & Ramps Demolition Plans project.

1. Remove and salvage traffic signal equipment per U-

| At the intersection of 2nd St and Minna St, there is an existing 2in gas line running directly on top and next to the existing 8in main to be tied into. SFWD cannot make the Tee connection due to the bells of the fittings with the 2in gas line so close.<br><br>The end of the new line installed by Trinet will need to be exposed about 2ft for SFWD to move the end of the line by 1ft east so that SFWD can make the connection without moving the gas line. This will require extra work for Trinet to expose the new line for SFWD. Eric Zangol from AECOM and Dan Helminiak from SFWD were present during the discussion of this issue.<br><br>Please provide direction as soon as possible as this will impact the chlorination and tie-in schedule. |   |                    |  | Provide labor and equipment to excavate and shore trench for pipes, fittings, and valves as necessary for connections to the existing water mains by SFWD in accordance with U-3100 Note 4 and specification section 33 11 00 par. 3.5. |                      |                    |                          |

| <b>From:</b> Webcor Construction LP      David Hungerford <b>To:</b> Turner Construction Company Michelle Smith  |   |                    | <b>Answered By:</b> AECOM Technical Service Eric Zagol |  |                      |                    |                          |
| <b>Co-Author:</b>  |   |                    |  |  |                      |                    |                          |
| <b>REQUEST:</b>  |   | <b>SUGGESTION:</b> |  | <b>ANSWER:</b>   |                      |                    |                          |
| Reference Sheet U-3107   |   |                    |  | <b>Accept Suggestion:</b> <input type="checkbox"/>   |                      |                    |                          |
| With reference to the fire hydrant at Minna St. Stn. 0+90, (northeast corner of Second St. and Minna St.) General Note #5 on sheet U-3107 directs Trinet to "replace in place existing fire hydrant."  |   |                    |  | As discussed on site with Daniel Helminiak (SFPUC Inspector) and those mentioned above, the proposed construction sequencing of the fire hydrant at Minna St. STA 0+90 is acceptable.  |                      |                    |                          |
| Per on site field discussions with Eric Zagol from AECOM, Robert Friend from Trinet and Mario Saldana from W/O, it was determined that the existing hydrant would remain in place until after the new water main connections are performed by CDD crews. After which the existing hydrant will be removed and new hydrant and lateral piping will be installed and tested. |   |                    |  | Coordinate with Daniel Helminiak (or assigned SFPUC Inspector) and the SFWD to ensure the fire hydrant is properly decommissioned by SFWD and SFFD following main connections by SFWD and prior to abandonment of the existing main in Minna Street by SFWD prior to fire hydrant installation by Trinet. Coordinate with SFPUC inspector to ensure SFWD and SFFD installs a black hydrant "donut" on the existing fire hydrant and new fire hydrant prior to the new fire hydrant being placed in service. Coordinate the removal of the "donut" once new fire hydrant is in service. |                      |                    |                          |
| Please confirm if this is acceptable. An expedited response is requested.  |   |                    |  |  |                      |                    |                          |

|   |  |                    |  |   |            |             |                          |

| The existing 4" water service found at Stn. 5+37 has been confirmed abandoned by SFWD personnel through on site investigations. Since the service is determined to be inactive, Trinet intends to not provide service from the new main for this 4" service as discussed in the field, with Eric Zagol from AECOM, Mario Saldana from W/O, Dan Helminick from SFWD and Robert Friend from Trinet. In addition, Dan Helminick from SFWD requested to have the service tee installed in the new 8" main which was to provide service for this 4" lateral removed and straight pipe installed. Please confirm if this is acceptable. |  |                    |  | Existing 4" water service at STA 5+37. Subsurface utility investigations should have been performed and submitted prior to installation of water main to determine status of existing lateral in accordance with U-3108 General Note No. 3. It is acceptable to remove the 8"x8"x4" tee installed and replace with straight pipe per the request of SFPUC SFWD inspector. |            |             |                          |
| The 6" water service lateral found at Stn. 5+30 has been confirmed as an active fire service to 2 Shaw Alley by SFWD personnel through on site investigations. Trinet   |  |                    |  | Provide 6" water service later at STA 5+30 per contract documents.  |            |             |                          |
|   |  |                    |  | AECOM suggests that there is no change in contract price to perform this work.  |            |             |                          |

| <p><b>Co-Author:</b></p>  |   |                           |                     |                      |  |                    |                          |
| <p><b>REQUEST:</b><br/>Reference Sheet U-3123 and attached detail</p> <p>During Trinet's installation of the temporary water line in Fremont St., Trinet encountered an existing AT&amp;T duct that was in direct conflict with the temporary water line. Trinet was directed by Eugene Chu of SFWD/SFPUC to run the temporary water line over the existing AT&amp;T duct using 45 degree bends. This resulted in less cover for the piping than what is required by the Water Department. Due to the lack of cover, Trinet was directed to install a 1/2in steel plate beneath the concrete base along the trench as depicted in the attached detail. The plate was approximately 2ft wide by 6ft long and extended to the limits of the installed 45 degree bends.<br/>Please provide confirmation that this is acceptable.</p> |   | <p><b>SUGGESTION:</b></p> |                     |                      | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>It is AECOM's understanding that Trinet encounter an existing PG&amp;E electrical duct (4-4") crossing the water alignment feeding 301 Mission property and not an AT&amp;T duct as referenced above. It is also AECOM's understanding that Trinet encountered an existing PG&amp;E electrical duct (8-3") parallel to the water alignment which is ultimately to be abandoned by PG&amp;E and demolished by Trinet. Both PG&amp;E ducts are shown in the plans. Per sequencing shown on U-1123, the water line should be constructed after PG&amp;E completes their work on Fremont Street.</p> <p>Given the fact that the PG&amp;E duct parallel (8-3") has not been abandoned by PG&amp;E, and given the fact the option to go under the existing 4-4" PG&amp;E duct per plans is not feasible because the existing 8-3" PG&amp;E duct is not demolished, and given the fact that the new water main is a temporary condition, the above mentioned installation proposal is acceptable.</p> <p>AECOM suggests no additional cost to contract price to perform this work.</p> |                    |                          |

| Reference Sheet U-2021 and attached drawings<br><br>Trinet proposes to change the design of sewer manhole #501 from a Modified Box Manhole (per SF Standard Plan #87,184) to a Precast Concrete Manhole (per SF Standard Plan #87,181 - see attached drawing). The proposal includes the installation of a temporary 24" PVC pipe stub, extending south from the manhole and connected to the brick sewer per SF Standard Plan #87,197.<br><br>The proposed manhole design will facilitate construction around the many utilities identified in the excavation - see RFI # U-0021 (Trinet RFI 04). It is also the preferred manhole design for 24in pipe per the SF Standard Drawings, especially since the brick sewer on the south side will later be abandoned and plugged (in the manhole) by the owner. This plan will also facilitate the later abandonment of the outlet to the south, as the owner will just have to plug the 24in outlet pipe and not a 3x5 brick sewer.<br><br>Please consider. An expedited response is requested. |                                    |               |  |                      |                      | Accept Suggestion: <input type="checkbox"/><br><br>CCSF DPW Standard Plan #87,181 referenced specifies a 4 ft diameter precast concrete manhole. Three (3) 24-inch pipes connecting to a 4 ft diameter manhole at invert elevation as proposed by contractor may yield an unstable structure and is not approved. A larger diameter precast concrete manhole may be acceptable however the alternative would need to be submitted as a substitution for CCSF SFDPW approval.<br><br>As per the response to RFI U-0021, please provide a mark up of U-3021 indicating the size, and horizontal and vertical location of the utilities identified in the excavation for review. |                          |

| <b>REQUEST:</b><br>Reference Sheet U-3119 and attached drawing<br><br>Please confirm that it is acceptable for M Squared to install the new 12in water line in a straight line as sketched on the attachment. Contract Drawings show the pipe offsetting between Sta 18+72 and Sta 19+98. Due to existing utilities discovered in potholes the 12in line will be installed 18ft from centerline.<br><br>Also, please confirm the elevations of the water line can be raised dependant on the depths of the existing utilities<br><br>Also, the referenced drawing has a discrepancy shown between the 12in water line bend station called out and the location shown in plan view. Please confirm that the first 45degree bend is located at 18+72, and not 18+27. |  |               | <b>SUGGESTION:</b><br><br>Provide flexible pipe connections to the 5-foot diameter precast concrete manhole as shown in SFDPW Standard Plan #87,181.<br><br>As per the response to RFI U-0080 and U-0021, please provide a markup of U-3021 indicating the size, and horizontal and vertical location of the utilities identified in conflict for review. This request is now 7 weeks outstanding.<br><br>AECOM suggests a cost credit for the substitution of the 5-foot diameter precast concrete manhole for the larger cast in place Modified Box Manhole per contract documents. |                      |                      | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br><br>1. Contract Drawings indicate an offset to avoid a bus island, as shown on the plans, that was to be constructed as part of the Transbay Temporary Terminal Project. AECOM received confirmation from Philip Sandri TJPA/PMPC that the bus island was deleted from the Transbay Terminal Project. It is acceptable to eliminate the offset and construct water main between STA 18+72 and STA 19+98 at 18ft from centerline.<br><br>2. Elevations of the water line can be raised dependant on the depth of the existing utilities. Minimum depth of cover shall be 18-inches below the bottom of the concrete base pavement section per DPW Order No. 176,707 or 28" which ever is greater. |                          |

Trinet requests an expedited response.

Plan #87,184 included in the contract documents to a 5-foot diameter precast concrete manhole with a temporary 24" PVC pipe connection to the existing 36"x54" brick sewer per SFDPW Standard Plan #87,197 is acceptable.

Provide flexible pipe connections to the 5-foot diameter precast concrete manhole as shown in SFDPW Standard Plan #87,181.

As per the response to RFI U-0080 and U-0021, please provide a markup of U-3021 indicating the size, and horizontal and vertical location of the utilities identified in conflict for review. This request is now 7 weeks outstanding.

AECOM suggests a cost credit for the substitution of the 5-foot diameter precast concrete manhole for the larger cast in place Modified Box Manhole per contract documents.

| <b>REQUEST:</b><br>Reference Sheet U-3125 and attached sketch<br><br>The existing 4no. 4in AT&T lines on Beale Street at Sta 6+10 are not as shown on the contract drawings. See attached sketch. Contract drawings show the conduit crossing M Squared's trench for 6 or 7 feet, however the duct bank is in the trench for 37 feet due to the alignment and width of the duct bank. The conduits are covered with a 2 foot wide concrete cap and appear in the trench for the new 12in water main at Sta 6+12 before leaving the trench at Sta 5+75. M Squared cannot lay the pipe on top of the concrete cap as the pipe will not have the required coverage. Due to this M Squared is unable to install the new 12in water as shown. Juan with AT&T advised that M Squared remove the concrete cap from the conduits to allow for excavation of this portion of trench. With the cap removed it is more likely that the pipe will have the necessary minimum coverage.<br><br>Please confirm that this is how M Squared is to proceed. An expedited reponse is requested. |                                     |               | <b>SUGGESTION:</b>                                     |                      |                      | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Please proceed as per AT&T's suggestion.<br><br>Please coordinate with AT&T's representative Huan Hunynh and field representative Dave Olson for an onsite inspection by AT&T of the affected AT&T conduits prior to backfill.<br><br>Confirm minimum cover of 30-inches or 18-inches below concrete pavement base which ever is greater, is maintained.<br><br>Provide distance between top of water main and bottom of AT&T conduits for review. |                          |

the MFS (fiber optic) conduits will be damaged as these conduits sit on top of the slab.

Breaking off an 18in section of the concrete slab and also a section of the rail ties would allow M Squared to excavate and install the new water pipe, while keeping away from the MFS conduits and not damaging them. However this will be time consuming.

An alternative option is to move the trench for the new 12in water pipe 18in south and just remove the wooden rail ties (as shown in sketch).

Mario S. from W/O and Eric Z. from AECOM were present during the discussion of this issue with M Squared in the field.

Please direct M Squared on how to proceed with the water line installation. An expedited response is requested

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**REQUEST:**

Reference San Francisco Standard Specification Section 703.08, attached

Trinet requests authorization from the Engineer to compact the sewer trench backfill sand by jetting in accordance with the San Francisco Standard Specification Section 703.08.

The native material along Minna, which Trinet is re-using for trench backfill, is a clean well grade dune sand. Trinet believes jetting is an ideal method of compaction for this type of material. It is also an effective means of compacting the sand around the top and sides of the pipe without disturbing the pipe, and backfilling any voids left from removal of the shoring or that might have formed behind the shoring. This method of compaction is commonly utilized in San Francisco for sewer projects in similar ground conditions.

An expedited response is requested.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Jetting in accordance with CCSF DPW Standard Specification Section 703.08 of the backfill layers above the sand backfill (pipe zone) as specified in CCSF DPW Standard Specification Section 703.06 for sewer installations is acceptable.

Contractor shall determine that jetting will not result in damage to sewers, adjacent structures, or cause adjacent materials to be softened. Any resulting damage shall be repaired at the Contractors expense.

Meet compaction requirements for each horizontal lift. If compaction requirements are not met, discontinue the use of jetting.

Notify TJPA's geotechnical engineer through the TJPA representative in advance of jetting to coordinate on-site observation of jetting and compaction testing.

**Answered By:** AECOM Technical Service Eric Zagol

**Co-Author:**

**REQUEST:**

Reference Sheet U-2007 and attached drawings

During layout for the installation of the new 18in Sewer Main on Minna St., Trinet observed that the alignment of the 18in Sewer Main is in conflict with existing PG&E MH #1355 at STA 1+77.50, which is to remain in place. The center line of the new sewer main is 0.10ft north of the outside edge of the manhole wall, as depicted in the attached drawing. The north side wall of the manhole is constructed on top of the existing 3ft x 5ft brick sewer. The brick sewer structure extends approximately 16in into the vault along its entire length. The brick sewer therefore cannot be demolished without undermining the north wall of the electric vault. Eric Z. of AECOM was notified of this issue via phone call on 01/21/2011.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

==UPDATE== 3/24/11  
 See revised drawings Minna Street Revisions dated 3/16/11 associated with ASI#003.

| Reference Sheet U-3108 and attached sketch and photos<br><br>The original plan for connection of the 6in Fire Service Lateral @ 46 Minna St. was to leave the existing 6in gate valve (which is located at FOC) in place and connect the new 6in fire line to the downstream side of the old valve (See attached photo and sketch). This plan was proposed by SFWD inspectors, Tom Farhnam and Dan Helminiak, at a field meeting on 12/28/10. On Friday 1/28/11 the SFWD, plumbers when taking measurements for the tie-in, proposed a different plan. They want to extend the new 6in fire line beyond the curb and into the basement, and connect to the homeowners fire line inside the basement (under the sidewalk).<br><br>Note: This will require coordination with building owner to put a hole through their foundation. Layout and a detail would need to be provided for the wall penetration, as well a detail to plug the hole where the existing water line is entering the basement.<br><br>Please provide direction on how to proceed. |   |   |                     | <b>Accept Suggestion:</b> <input type="checkbox"/><br><br>VOID.<br><br>See RFI U-0093, 46 Minna 6in FS Water & 1in Copper Water Service Lateral at STA 5+17 Tie-In.                                       |                      |                    |                          |

**REQUEST:**

Webcor/Obayashi has received Bid Addendum #1 for the TG04.2R bid. As part of this addendum, note number 8 under "General Notes" on sheet U-0008 is deleted. This note had previously placed a constraint on the AWSS construction schedule that the Mission Street work must be complete prior to cutting both the Beale Street and the 1st Street lines. It was acceptable to abandon one or the other prior to the Mission Street work but not both.

Based on the deletion of this note, it is our understanding that there is no schedule constraint on any of the AWSS system modifications other than the cutting & capping procedures at 1st Street and Beale Street which are required for construction of the TTC Building. Please confirm.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

02/11/2011 - Richard Buellesbach Email to Michelle Smith & Kevin Chiu - The received response to RFI U-0092 is not complete. We require a final resolution for the following language from the RFI response: "TJPA is currently coordinating with SFPUC to determine when AWSS improvements, other than the improvements required to abandon existing AWSS mains on First and Beale streets, are required to be complete." Please be sure that this RFI remains open in Constructware.

-----  
 02/10/2011 - Eric Zagol - The construction sequence constraint has been removed per GENERAL NOTE 8 on U-0008 (rev. 2 01/31/11) and as detailed in SFDPW BOE AWSS drawings (rev. 1 01/31/11) MA-0, MA-5, MA-6, MA-8, MA-10, MA-11 and MA-19.

TJPA is currently coordinating with SFPUC to determine when AWSS improvements, other than the improvements required to abandon existing AWSS mains on First and Beale streets, are required to be complete.

**REQUEST:**

Reference Sheet U-3108, attached sketches, and material information sheets

At 11:30am on 2/2/2011, Michelle Smith (Turner), Eric Zagol (AECOM), Guy Hollins (TJPA), Rick Bowling (46 Minna Property Manager), Dan Helminiak (SFWD Inspector), SFWD water department crew, Robert Friend (Trinet), Jason Dunne (Webcor Obayashi), and Mario Saldana (Webcor Obayashi) met to discuss the 6in Fire Service Lateral and 1in Water Service Lateral for the 46 Minna building.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

AECOM has coordinated with SFPUC Engineering (Chi Yu, Division Manager) and SFPUC inspector (Eugene Shu) and the direction agreed to is as follows:

6-inch Fire Service Renewal -

1. Coordinate with SFWD for the shutdown of the existing 6-inch fire water service. Shutdown by SFWD. SFWD to coordinate shutdown with SFFD.

| Reference Sheet U-3012 and attached drawing   |  |                    |  | Accept Suggestion: <input type="checkbox"/><br>02/14/2011 Kevin Chiu   |                      |                    |                          |
| On 02/07/2011, M Squared encountered what appeared to be a live PG&E duct bank during their sewer installation excavation on Natoma Street STA 9+50. Due to this conflict, M Squared was unable to continue excavating for the sewer (See attachment). On 02/09/2011, M Squared's Superintendent met with a PG&E Representative and PG&E Representative confirmed that the duct bank is live and is not due to be decommissioned for at least 3 months. |  |                    |  | See CR U-006 issued on 2/14/11<br><br>-----<br>02/10/2011 Eric Zagol   |                      |                    |                          |
| In order for M Squared to continue with the sewer installation, M Squared is proposing to:<br>- install MH #305 and begin installing pipe west of MH #305<br>- perform a temporary connection from MH#305 to the existing 3' x 5' brick sewer   |  |                    |  | Demolition and Construction Sequence shown on U-1112 and U-1120 lists per sequence order that the sewer work is to commence after PG&E has completed their Phase I work in Natoma and First St., all services cut over and existing duct bank is abandoned by PG&E. Given the fact that PG&E has experienced construction delays associated with their structures on First Street, the proposed sequence for sewer construction is acceptable. |                      |                    |                          |
| M Squared can then perform the remainder of the work once PG&E has decommissioned the duct bank.  |  |                    |  | Submit a temporary connection detail for review.   |                      |                    |                          |
| M Squared estimates that the additional cost to perform the temporary tie-in would be approximately \$4,500.  |  |                    |  | Coordinate with PG&E to abandon the existing 2-inch HP Gas along Natoma per U-1112 and U-1120 prior to demolition.   |                      |                    |                          |
| Please confirm how you would like M Squared to proceed. M Squared requests an expedited response as they are currently stopped work and awaiting a response.  |  |                    |  | Coordinate with Verizon to abandon existing conduit (labeled "U" on base plans) prior to demolition per U-1112 and U-1120.   |                      |                    |                          |

|   |   |                    |  |   |            |             |                          |

**Co-Author:**

**REQUEST:**

Reference Sheet U-3012

Following on from M Squared's RFI #U-0096, M Squared has confirmed in the field that there is a grade conflict between the proposed sewer and the existing electrical duct bank on Natoma between STA 9+30 to 9+50. The conflict is between the bottom of the electrical duct bank and the top of the new 24" sewer pipe.

The elevation of bottom of electrical duct bank is 11.5'  
 The top of the 24" VCP sewer is 11.82'

M Squared has also confirmed with PG&E that 3 of the 4 concrete encased conduits are occupied, 2 being occupied by 12KV lines. The duct bank is to be abandoned in the future but PG&E was unable to provide a schedule for this work.

Please advise M Squared on how to proceed.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Demolition and Construction Sequence shown on U-1112 and U-1120 lists per sequence order that the sewer work is to commence after PG&E has completed their Phase I work in Natoma and First St., all services cut over and existing duct bank is abandoned by PG&E.

Proceed per response to RFI U-0096.

**Co-Author:**

**REQUEST:**

M Squared is planning to pothole next week at Howard STA 9+40, First St STA 1+50 and First St STA 2+10 to confirm the alignment and depths of the new 12" water main on First St. from Howard to Natoma.

Guy Hollins from TJPA has advised M Squared that Blackrock is requesting additional potholing in the off-hours to determine locations of AT&T facilities in the area.

Please provide M Squared information regarding the locations of the additional potholes requested, including the requested depths and sizes.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

| <p><b>From:</b> Webcor Construction LP      Colin Azevedo</p> <p><b>To:</b> Turner Construction Company Michelle Smith</p> <p><b>Co-Author:</b></p> <p><b>REQUEST:</b><br/>                     Please clarify the following items relating to the re-design of CB#206:</p> <p>1) The only specification section addressing mortar coating is in 33 31 10 Paragraph 2.1.I, which specifies a "Wet Spray Mortar" application. This process would be cost prohibitive for coating only one catch basin. Trinet proposes the use of "SikaTop 123 Plus" mortar - product data sheets are attached. Please advise if this product is acceptable or specify an alternate material.</p> <p>2) The RFI response directs Trinet to use ductile iron pipe for culvert runs with less than 3' of cover. If 22.5% DI bends are required to construct the culverts Trinet would prefer to use Mechanical Joint Fittings. Please advise if these are acceptable.</p> |                           | <p><b>SUGGESTION:</b><br/>                     Eric Zagol 4/12/2011: 1) SikaTop 123 Plus mortar is acceptable. 2) MJ DIP for 22.5 degree fittings is acceptable for culvert runs with less than 3 feet of cover.</p> |                     | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p><b>Answered By:</b> AECOM Technical Service Eric Zagol</p> |                      |                    |                          |
| <p>In lieu of installing a new catch basin barrel to replace existing modify the existing catch basin as follows:</p> <p>Clean interior walls and bottom.<br/>                     Apply 1/2-inch thick uniform layer of mortar on interior walls and bottom.<br/>                     Install cast iron trap.<br/>                     Install pipe culvert and connect to MH#207 as shown in Plans. New culvert size and invert shall match existing culvert at catch basin. Use ductile iron pipe if depth of cover is less than 3 feet.</p>  |                           |  |                     |   |                      |                    |                          |

**REQUEST:**

Reference drawing sheet U-3409 and attached sketch.

During our excavation for the joint trench on the east end of Minna St. (STA 9+29) Trinet encountered the (E) 8" water main in Trinet's trench line, approximately 1 foot from our termination point. The existing alignment is different from what is shown in the contract drawings. The drawings do not show the water line crossing the joint trench. The alignment and grade of the water main changed in Trinet's excavation to avoid the adjacent catch basin. A 22.5 degree elbow is located in the center of the joint trench excavation. The elbow is rolled up to accommodate the grade change and there is a thrust block under the footing. Trinet does not believe that it would be safe to excavate under the water main for Trinet's duct bank without having the line shutoff. Extending the PG&E ducts to FOC will also place the connection point for PG&E's extension of the duct bank directly under the water main fittings and elbows. There is adequate clearance to install the 4" gas line above the water main and extend it out to FOC per contract. The top of the water main is 49" below FG at the south side of the joint trench, at the location of the gas line.

Trinet proposes to terminate the concrete encased duct bank approximately 5 ft. back from FOC. This would allow adequate room for Trinet to mandrel the ducts after the joint trench is installed without undermining the water main. PG&E could then extend their duct bank under the water main to connect to Trinet's water main. Please advise.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Per request to Jason Dunne (W/O) via email on 3/4/11 please provide the following information for review:

Horizontal (from a known point i.e. FOC along First St.) and vertical location of "top of water main".  
 Horizontal (from a known point i.e. FOC along First St.) and vertical location of water line at "22.5 degree elbow".  
 Determine if the water main is mechanically restrained with tie rods at each bend in questions.  
 Approximate size of existing concrete thrust block at the "22.5 degree elbow".

**Co-Author:**

**REQUEST:**

Sheet U-3022 shows MH601 @ Sta 0+70 on Fremont Street. This location is also in the middle of the crosswalk on Fremont Street. USA markings show the existing traffic signal conduits crossing thru the center of the manhole. By moving the manhole approx 8' north the conflict with the traffic signal conduits would be avoided and it would also avoid having a manhole cover in a crosswalk. Please advise on how you would like to proceed.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

Move proposed sewer MH north to STA 77.56 to avoid existing Traffic Signal conduit conflict as shown in SK-U-013 attached. Construct 10-inch CB culvert lateral as shown SK-U-013 attached.

| 1 - Current bid documents for Trade Group TG04.2R (AWSS system at Mission Street) call for capping of the AWSS system on Beale Street near the intersections with Howard Street and with Mission Street. Because of delays in the bid schedule for TG04.2R, the construction schedule dictates that these caps be completed well before the anticipated start of the TG04.2R field work. Please provide details so as to allow this capping work to be done in advance of the awarding of the TG04.2R scope of work. |                           |               |  |                      | Pothole the existing AWSS gate valve at the Beale at Mission street proposed cap location as shown on M-6 (Rev No. 1, 1/31/11) to determine if the existing gate valve has lugs. SFWD to inspect condition of gate valve once excavated, coordinate with SFWD inspector accordingly. |                    |                          |
| 2 - Please confirm whether the material required to do this work is available at the City of San Francisco.  |                           |               |  |                      | Details for the capping work at Beale and Mission, and Beale and Howard will be provided following gate valve inspection.  |                    |                          |
| 3 - Please provide direction as to how this scope of work should proceed.  |                           |               |  |                      |  |                    |                          |
| This capping is near critical path on the current construction schedule. An expedited response is requested.   |                           |               |  |                      |  |                    |                          |

| M Squared has confirmed that the 14" AWSS Line shown on sheet U-3024 is in conflict with the proposed 24" VCP on Beale Street. The AWSS line is shown on the plan view but not on the elevation view on sheet U-3024. M Squared also shot the elevation of the existing sewer manhole. The elevation is 4.60, and not 4.70 as shown on the plans. The invert of the 14" AWSS is 6.2. (See attached) Please advise. |   |               |   |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Eric Zagol 4/26/2011: Construct temporary 2-10" VCP and new SMH as shown on revised U-3024 (rev 2 4/26/11) and SK-U-0018. | In lieu of a cast in place base per CCSF DPW Standards, M Squared would like to propose the use of a precast catch basin. The catch basin barrel is attached to the precast base and it comes as one single unit. Before installing the precast catch basin base with barrel, M Squared will place a minimum 6" compacted level layer of crushed rock as the sub base. The proposed material                       |   |               |   |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Eric Zagol 4/12/2011 Precast catchbasin base is approved with conditions specified. The 5 foot catchbasin barrel shall be attached to the base section to form a monolith structure with the same dimensions, compressive strength and reinforcement as the CCSF DPW Standard cast in place base.   |                          |

**Co-Author:**

**REQUEST:**

While potholing the Second St. Joint Trench crossing Trinet encountered an existing brick sewer man hole which is in conflict with the joint trench alignment. The manhole is not shown on the plans and had been paved over. The manhole also appears to have been previously abandoned. See the attached sketch and photograph detailing the location of the manhole.

Please advise on how to proceed.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Eric Zagol 4/12/2011: Confirm existing abandoned sewer manhole is filled with slurry grout to 4 feet below rim elevation.  
 Demolish and remove existing abandoned sewer manhole as required to construct the Joint Trench to an elevation 1-foot below bottom of Joint Trench.  
 Backfill and restore in accordance with contract documents.

**Co-Author:**

**REQUEST:**

Plan Sheet U-3007 shows MH#201 to be installed in the center of the crosswalk @ Minna and Second Street. The City of San Francisco typically avoids locating manholes in crosswalks, whenever possible, for ADA considerations. Please advise if MH#201 should be installed outside of the crosswalk.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Eric Zagol 4/13/2011: Sewer manhole location can not be adjusted due to an existing 8-inch Water and 4-inch HP Gas main. Construct manhole at the location per Plans.

In lieu of CCSF DPW Standard MH cover, provide an ADA complainant cover that meets the following specifications:

1. MATERIAL - The cast iron shall be in accordance with ASTM "Standard Specifications for Gray Cast Iron Castings" Designation A 48, Class 30. The tensile strength shall be considered the primary test for qualification.
2. FINISH- STANDARD FINISH SHALL BE RAW, AS CAST, AND YIELD A MINIMUM COEFFICIENT FOR FRICTION OF .6 OR BETTER IN WET OR DRY CONDITIONS.
3. CASTINGS - SHALL BE FREE OF BLOW HOLES, FLASHING, GRIND MARKS, AND OTHER SURFACE BLEMISHES.
4. Cover shall incorporate a "pic-hole" for lifting purposes.
5. ADA COMPLIANCY- CASTINGS SHALL HAVE HOLES NO GREATER THAN 1/2" IN THE DOMINANT DIRECTION OF MOTION, NO VERTICAL RISE OF GREATER THAN 1/4", IF THE RISE IS GREATER THAN 1/4" THE RISE/RUN RATIO NEEDS TO BE 1:2 AND THE MAXIMUM HEIGHT SHALL BE 1/2".
6. Cover shall BE MADE TO FIT EXISTNG FRAMES OR be MACHINED to FIT EXITNG FRAMES PER SFDPW STANDARD PLAN 87,190.
7. Cover should be MADE of quality EQUAL TO OR GREATER then THE PRODUCTS MADE BY D&L Foundry or Equal, see attached product data sheet.

| Per the response to RFI#U-0128.1 a design to relocate the AWSS line @ Howard and Fremont is forthcoming. Please advise the status of this design.  |  |               | Eric Zagol 7/20/2011 Design is being performed by SFDPW BOE and will be tracked and issued via a forthcoming ASI. Schedule will be discussed with SFDPW BOE on 7/22/11. An update will be provided in the RUP OAC on 7/26/11. |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>RFIs U-128.2 and U-124.1 were responded to in July of 2011 and provided temporary solutions to utility conflicts with a full resolution planned to come via future ASI. ASI 21, which addresses these issues, was uploaded to Constructware on 3/21/12 by Eric Zagol for design approval. A CR for this work will be issued in the near future. |                          |

| M Squared is unable to excavate/shore/install the 18" VCP from the existing manhole at Sta 0+45 to MH#301 at Sta 0+81 as shown on sheet U-3010. While excavating for the sewer installation M Squared encountered several unknown utilities which were unmarked and not shown on the contract drawings. Also, some of the known utilities are at different locations and elevations than indicated on the drawings. Due to the quantity and proximity of these utilities it is not possible to excavate and shore between MH#301 and the existing MH at Sta 0+45. Additionally PGE have yet to relocate their gas and electric utilities out of the area of the proposed MH#301. See attached drawings illustrating M Squared's pothole findings. Please advise on how to proceed. |  |               |   |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Eric Zagol 4/27/2011: AECOM has reviewed the information provided and requests a meeting with W/O and M Squared to review the data, review the demolition and construction sequencing shown in AECOM plans, and further understand why excavation and shoring is not possible.  |                          |

Co-Author:

**REQUEST:**

Trinet has been advised by Mission Clay (the VCP manufacture) that the hydrostatic test described in the SF Standard Specification Section 319.02 is primarily for cast iron or ductile iron pipe and is not recommended for clay pipe. The National Institute of Clay Pipe and Mission Clay recommend a low pressure air test in accordance with ASTM C 828. See attached copy of ASTM C 828. Trinet proposes using this low pressure air test in lieu of the 10psi hydrostatic test called for in the standard specifications. The low pressure air test will allow test on pipe runs with no service laterals ie: MH501-502, 206-207, 203-204, 202-201. Please advise if this is acceptable.

With regards to the three remaining pipe runs that have lateral connections, please provide direction of how to plug the laterals if required to test the main lines.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

=====UPDATE 5/23/2011=====

Kevin Chiu 5/23/2011 Below are links to devices for testing newly installed sewer pipes, specifically for main lines with active lateral connections that have been suggested within conversations between SFDPW, SFPUC and AECOM

[http://newsite.cherneind.com/pneumatic/Long\\_Test\\_Ball\\_MS2\\_Test\\_Ball/](http://newsite.cherneind.com/pneumatic/Long_Test_Ball_MS2_Test_Ball/)

[http://www.munipipe.com/chemical\\_grouting.html](http://www.munipipe.com/chemical_grouting.html)

<http://veoliaes-is.com/Services/Environmental-and-Waste-Management/Total-Sewer-Management/Chemical-Grouting>

Whether or not the contractors decide to utilize these devices is still up to them, as these are suggestions, not specifically required devices to be used for testing. It is the contractor's responsibility to perform testing on newly installed main lines, laterals, and manholes with their own means and methods while still protecting new and existing utilities.

=====

Eric Zagol 5/10/2011 ASTM C828 air test is an acceptable method to test sewer pipe in lieu of hydrostatic testing.

**Co-Author:**

**REQUEST:**

Reference attached layout and submittal package#TG0406-014:

Due to the future use of lot N and N' prime, the temporary telecom poles must be relocated. The attached sketch indicates the proposed layout of these poles which has been coordinated with AECOM. Submittal Package#TG0406-014 has been submitted for formal approval of the pole locations.

Please confirm relocating the poles is acceptable.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Eric Zagol 5/10/2011 The pole alignment changes requested by CMGC along with additional requests from Telecommunications companies has required a pole and pole placement redesign. An ASI has been generated for the redesign with a CR forthcoming.

**Co-Author:**

**REQUEST:**

Today while trying to execute the USAR for the existing 12" water line on Beale Dan Helminiak with SFWD informed Webcor/Obayashi and M Squared that the existing water line will remain active until the water tie in at First and Natoma is completed and the existing 8" is capped at First and Howard as shown on sheet U-3116.

The water tie in and capping of the existing line on First Street is currently being delayed by separate issues and it is unclear when this work will be completed.

Dan Helminiak suggested that the existing 8" water line running down Howard could be capped by the water department at one of the existing tees which would allow the decommissioning of the existing line on Beale.

Please advise.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Eric Zagol 5/10/2011 Please clarify the question(s).

Subject states "Existing Water Line on Beale in Conflict with New Sewer". Per U-1124 Demolition and Construction Sequence order, Beale Street sewer is to commence after existing water main in Beale Street is abandoned. Please clarify where and what the conflict is.

Also, please confirm the following:

1. Is the new 12" main along Howard Street between First and Main streets active?
2. Is the new 12" main along Beale Street north of Howard Street active?
3. Is the new 12" main along Beale Street south of Mission Street active?

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**REQUEST:**

- New 12" water main along Howard between First and Main is active.
- New 12" water main along Beale Street North of Howard is active.
- New 12" water main along Beale Street South of Mission is active.

Per U-1124 Demolition and Construction Sequence order, Beale Street sewer is to commence after existing water main on Beale is abandoned.

- The old water line on Howard Streets and Beale Streets is currently not active because the valves on the line at First and Howard are currently shutdown. Dan from the water department has expressed his concern that anyone can just open these valves and fill the old line along Howard Street. He is also concerned that the valve is not 100% closed and that the SFWD cannot get a complete shutdown on the old line. This means when M Squared removes the old water line on Beale Street in order to install the new sewer, it is possible that there will be a constant flow of water in the old line.

The suggestion from Dan is to cap the old water line on Howard Street so that When M Squared removes the old line on Beale Street there will be no possibility of water flow. A cap on the line at Howard would also confirm for definite that the old line on Howard and Beale Street is "abandoned".

Please provide direction for capping the existing water line on Howard so the sewer installation on Beale can proceed.

**SUGGESTION:**

**ANSWER:**     **Accept Suggestion:**

Eric Zagol 5/23/2011 Coordinate construction of the cap on the old Howard St. main at the intersection of Main St. with SFWD as shown on U-3119.

Coordinate construction of the cap on the old Howard St. main at the intersection of First St. with SFWD as shown on U-3116 (latest rev per SK-U-0003 1/28/11).

Per discussions with SFWD inspector, the old Howard St. main has been capped at Main St, Beale St. (south of the cross) and at the Fremont St. by-pass connection by SFWD. Additionally, the two line gates at First and Fremont streets are closed and have been filled with concrete.

The caps at Main, Beale, Fremont in combination with the closed line gates at First St. will allow sewer installation on Beale St. to proceed.

| In the response to our RFI # U-0016, Trinet was directed to connect the street lighting conduit on the west end of Minna into PG&E MH #1319 on 2nd St. At a field meeting on 5/10/11 with Eric Zagol and Robert Kawano, to discuss the alignment of the street lighting run for the relocated light on the west end of Minna, Eric advised that PG&E was contemplating a change in the connection point for this conduit run from MH 1319 to MH 1320. MH #1320 is located to the south of 1319 and further west towards the middle of 2nd St. Please confirm the connection point on 2nd St for the street lighting conduit. |  |               |  |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>***5/26/11 UPDATE***<br><br>Supply point has been confirmed as PG&E EMH 1320. Coordinate connection location with PG&E Field Engineer.<br><br>Eric Zagol 5/19/2011 Related to Joint Trench changes and PG&E's de-energization of Minna Street after the response to RFI U-0016 was provided, PG&E has revised their electrical plans with respect to EMH 1319 and has indicated that the preferred location for new street light power would be EMH 1320.<br><br>In accordance with U-3201 Note 7, AECOM considers this RFI as the request to coordinate connections with BLHP and PG&E through the TJPA representative for new street light circuit connections. AECOM and the TJPA Representative are in the process of coordinating Street Light Service Orders with BLHP and PG&E. Once the Service Order is processed the final connection point will be provided. |                          |

Construct Driveways in accordance with DPW Std. Plan 87,171

Construct Joints for Concrete Pavement Base in accordance with DPW Std. Plan 87,174

Per Contract specification SECTION 32 12 17, reconstruct curb returns at Second and Minna Per DPW ORDER NO. 178,940 (superseding DPW ORDER 176,707) Regulations for Excavating and Restoring Streets in San Francisco Section 9.4 B. Excavation affecting curb returns, stated as follows:

1. Any excavation (including trenchless technology) encroaching upon any part of an angular corner requires the installation or reconstruction of curb ramp(s) at the affected corner to current standards by the Permittee. Permittee's are encouraged to contact BSM Inspection Division to determine if curb ramps within a project are compliant or must be replaced at least 45 days prior to the commencement of any work.

2. Curb ramps must be constructed in accordance with current City standards (Drawing Nos. 55,017 Rev. 3; 55,017.1, 55,018 Rev.3; 55,018.1; 55,018.2; 55,018.3 "Exception to Standard Curb Ramps") (Appendix 5).

Co-Author:

**REQUEST:**

Attached, please find a sketch detailing Trinet's revised pavement reconstruction plan for Minna St., between 1St to 2nd Streets, which incorporates Balfour Beatty's request that Trinet stop the new pavement section 5' north of centerline of the CDSM shoring wall (2' north of demarcation line).

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

\*\*\* 5/31/11 Revision \*\*\*

Restore entire width of Minna street using concrete road base and ACWS curb to curb in accordance with Contract drawings and DPW Order No. 176,707 (and latest revision 178,940) Section 11.

5/27/11 Response:

Please provide BBIs traffic control plan and construction logistics plan for Minna St. during pre-trenching and CDSM shoring wall construction.

AECOM's specific questions are as follows:

1. What portion of Minna St. will be maintained for vehicular traffic during pre-trenching and CDSM wall construction? Please provide dimensions from face of north curb along Minna St.
2. Is a traffic barrier (k-rail or other) planned to be installed along Minna St. during pre-trenching and CDSM wall construction? Provide location, dimension from face of north curb along Minna St.
3. If a traffic barrier is planned, what is the schedule for the installation?
4. Once pre-trenching is complete will any of the pretrenching trench area be restored and used for vehicular traffic?
5. Once the CDSM shoring wall is constructed will the traffic barrier move south and the vehicular area be widened? If so by how much? Please provide a dimension from the face of north curb along Minna St.

This information is critical in order to provide a responses to this RFI as well as RFI U-147 and U-148 in an effort to determine how RUP will restore Minna St.; crowned or sloped, and how the Minna St. restoration conforms to the future Transit Center Minna St. design.

| <b>REQUEST:</b>   |   | <b>SUGGESTION:</b> |  | <b>ANSWER:</b>  |                      |                    |                          |
| <p>The existing driveways entering the 575 Mission St building, are depressed between 2 ½" to 3" below the adjacent top-of-curb and sidewalk grades - see attached drawing depicting the driveways. This condition seems to be a consequence of repeated overlaying of Minna street, which has resulted in a curb height in many areas far less than the City standard of 6 inches. The street grade along the north side of Minna along the 575 Mission building ranges from 3 ½ to 4 ½ inches below top-of-curb grade.</p> <p>Trinet has been directed in the field by Jason Chin, and by the Engineer in RFI #U-0146, to construct the new roadway with finish grade at curb line 6" below top-of-curb grade. This is consistent with City standard plan # 87,169. The new roadway grades will result in 3" to 3 ½" of exposed curb height at the driveways to 575 Mission, which is considerably deeper than the 1" called for in the San Francisco standard plans for driveway construction (plan # 87,171). It will also not be possible to raise the street grade at the driveways without impeding road runoff drainage and causing ponding.</p> <p>Please review and advise.</p> |   |                    |  | <p><b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Eric Zagol 5/31/2011 Restore pavement along existing curbs and driveways along the north side of Minna St. in accordance with Contract drawings and DPW Order No. 176,707 (and latest revision 178,940) Section 12 to match existing flow line elevations at curbs and driveways shown on U-1001. 6-inch curb and driveways along Minna St. will be reconstructed at a later date as part of the Transit Center Project.</p> |                      |                    |                          |

| <b>REQUEST:</b>   |   |               | <b>SUGGESTION:</b>   |                      | <b>ANSWER:</b>   |                    |                          |
| Please provide a pavement reconstruction drawing, or typical cross section detail, for the west end of Minna St from Stn 2+15 to 2nd St. Trinet had planned to reconstruct the street in this area from curb to curb. We find however, that there is a grade difference of approximately 6 inches between top-of-curb on the north side of the street and the south side, with the south side being at the higher grade. The construction detail approved in RFI #U-0146 (Trinet #094) cannot be utilized in this area, because the street already has a cross slope of approx. 2% from south to north. |   |               |  |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Eric Zagol 6/7/2011 See response to RFI 146.2  |                    |                          |

| The 14" AWSS line west of MH#701 was found to be constructed thru the roof of the existing 3x5 sewer. Several bends were used in the AWSS line construction and these bends included lugs and tie rods. As a result of the presence of these tie rods and fittings we can now not move MH#701 any further west. To install the new 24" VCP in a straight line (perpendicular to MH wall), and in order to get by the existing PGE MH we will have to pour the pipe wall and 2" of the internal diameter of the pipe into the west wall of MH 701. Please advise on how to proceed.                      |   |               |  |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Eric Zagol 6/8/2011 Deflect VCP pipe joints in accordance with ASTM C425 (max 1.8 degrees per joint) to allow for 6" of deflection to avoid the existing PG&E MH and connect to MH#701 as shown in the attached SK-U-0019.<br><br>Confirm in the field that 6" deflection will allow the 24" VCP to be clear of the MH wall. |                    |                          |

**Co-Author:**

**REQUEST:**

Please see the attached detail from Trinet Construction Inc for their proposed solution to mitigate the incorrect installation of CB203 identified in Field Condition Report 40C.

Please advise if the proposed solution is acceptable.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Eric Zagol 6/1/2011 The proposed solution has been reviewed and approved by SFDPW BOE and is acceptable. Construct catch basin as shown in the Trinet proposed construction detail attached to CR40C. Construct the clean out on the cast iron trap such that it is accessible from above for maintenance via removal of the grate. Coordinate inspection during installation with DPW BCM inspector through the TJPA's Representative.

| U-0151   | Additional Sewer Lateral Connection for 100 1st Street | Closed | 06/02/2011   | 06/12/2011 | 06/08/2011 | Potentially | <input type="checkbox"/> |
| <b>From:</b> Webcor Construction LP      Colin Azevedo <b>To:</b> Turner Construction Company Gary Krutsch |  |        | <b>Answered By:</b> AECOM Technical Service Eric Zagol |            |            |             |                          |

**Co-Author:**

**REQUEST:**

Trinet has discovered an additional sewer lateral for the 100 1st Street building which was not connected to the new 24" sewer main - see attached sketch. The lateral is located at sta. 7+09 and services a single toilet and the rear of the building. This lateral was not shown on the plans and there was no vent in the sidewalk to indicate the existence of a lateral. Trinet potholed the lateral in the sidewalk and a 4" cast iron lateral, a 4" cast iron trap and a 4" cast iron vent pipe capped 2' below grade. Please confirm Trinet is to tie the lateral into the new 24" sewer main on Minna. Also, please advise what is to be done with existing cast iron trap and vent pipe assembly which are not up to current DPW standards.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Eric Zagol 6/8/2011 In accordance with U-3000 General Note 12, contractor was to verify that there are no active sewer lateral connections to the existing sewer prior to sewer demolition.

Please provide the elevation of the existing sewer lateral and the location of existing 4" cast iron vent pipe for review.

Renewal of this lateral will be discussed with TJPA and 100 First St. property owner, final direction forthcoming.

| U-0153   | Concrete Slab and Rail Ties Conflict with Sludge Line on Howard | Closed  | 06/03/2011 | 06/13/2011   | 06/21/2011 | Potentially | <input type="checkbox"/> |
| <b>From:</b> Webcor Construction LP      Colin Azevedo |   | <b>To:</b> Turner Construction Company Gary Krutsch |            | <b>Answered By:</b> AECOM Technical Service Eric Zagol |            |             |                          |

**Co-Author:**

**REQUEST:**

While potholing for the sludge line alignment along Howard Street between Beale and Main at Sta 18+00 and Sta 19+42 M Squared discovered the presence of wooden rail ties and concrete slab (see attached photos). These are possibly the same ties and slab that M Squared encountered while installing the water line on TG04.3. They are in direct conflict with the proposed location of the new sludge line along Howard Street. Please advise.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Eric Zagol 6/21/2011

\*\*\* 6/21/11 Update \*\*\*

Based on follow up discussions with W/O and M2, and further understanding of the extents of the concrete slab and wooden rails ties found further West (Howard and Fremont streets TG04.3), remove and dispose of concrete and wooden rail ties as required to construct 12" sludge line.

Eric Zagol 6/8/2011 Pothole at STA 18+00 to determine the extents (southern and northern) of the concrete slab and wooden rail ties. Submit pothole data for review.

**Co-Author:**

**REQUEST:**

This RFI is a follow-up to discussions in the field with AECOM and the SFDPW Inspector and Trinet, regarding Trinet's inability to perform a pressure test on sewer manholes 501 & 502 on 1st St. due to field conditions. MH #502 is constructed around the existing 3x5 brick sewer on one side (per SF Standard Plan #87,184) and Trinet has no means of plugging the brick sewer effectively to withstand a pressure test.

In the case of sewer MH #501, the original design was similar to MH #502 and a pressure test would not have been possible. The revised design (see attached drawing) includes a temporary 24" corrugated PVC pipe stub extending south from the manhole and connecting to the existing 3x5 brick sewer. The inside of the temporary 24" pipe stub is also corrugated, and therefore cannot be sealed with an inflatable pipe plug, as would be required to perform a pressure test of the manhole structure.

Please confirm that a pressure test will not be required for sewer manholes 501 & 502 on 1st St.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Eric Zagol 7/8/2011 Confirmed. Pressure tests for sewer manholes #501 and #502 are not required due to the restrictive conditions.

**Co-Author:**

**REQUEST:**

During our sewer work at 2nd and Natoma M Squared discovered that the Telecom Vault shown on the drawings is in fact significantly larger in the field than is shown on the plans. In order to be able to shore for MH#301 construction M Squared has had to move the location of MH four (4) feet east along Natoma. As a result the jack and bore alignment is now a few inches south of what is shown on the plans.

Please confirm that these adjustments are acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Eric Zagol 7/20/2011 Adjustments proposed are acceptable.

Since the adjustment pushes the MH and cover into the crosswalk path of travel, in lieu of CCSF DPW Standard MH cover, provide an ADA complainant cover that meets the following specifications:

1. MATERIAL - The cast iron shall be in accordance with ASTM "Standard Specifications for Gray Cast Iron Castings" Designation A 48, Class 30. The tensile strength shall be considered the primary test for qualification.
2. FINISH- STANDARD FINISH SHALL BE RAW, AS

**Co-Author:**

**REQUEST:**

Sheet MA - 12, Note 4 refers to TJPA Composite Utility Drawings for that area. M Squared currently has composite utility drawings for trade packages TG04.3, TG04.4, TG04.6, and TG04.1. M Squared does not have composite utility drawings for the TG04.2 project.

Please provide these drawings.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Eric Zagol 9/15/2011 TJPA does not have existing utility composite drawings for this area. SFDPW BOE has information and records provided by utilities in response to a notice of intent that can be provided to the TJPA for use as reference.

Jeff Thiel 10/3/2011 SFDPW BOE has provided the documents referenced in Eric Zagol's original response to this RFI.

These documents have been uploaded to Constructware and can be found in the following File Director path: Sitework & Utilities\5 Program Coord\30 Utilities\Notice of Intent\...

If the files are too large to open in Constructware they can also be found on the FTP site by following this link:

<ftp://ftp.tjpa.org/Document%20Control/11011824/>

| M Squared's supplier, Control Systems West, have been coordinating with SFWD regarding which of the City's panels will be used for the TG04.2 project. Tom Reid with SFWD has designated 3 panels to be used for this project. These panels are to be picked up at SFWD, transported to Control Systems West for testing, programming etc and then returned to the job for use at 3 of the valve locations. As the panels have been selected M Squared would like to begin the process of getting the panels to their supplier so they can begin the work. |  |               |   |                      | Accept Suggestion: <input type="checkbox"/><br>Jeff Thiel 9/26/2011 Contact Bill Gunn at (415) 706 0688 or WGunn@sfgwater.org  |                    |                          |

**Co-Author:**

**REQUEST:**

Per the response to RFI #U-0176 a field meeting was attended by Michael Smith and M Squared. M Squared received direction to perform additional potholes further west of First St on Howard St. Please see attached pothole findings. Please advise how you would like to proceed.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Michael Smith's (SFDPW) response, "Please refer to comments on attached sheet. SFDPW Response: This conflict between the existing AWSS line and utilities at the original design location are unforeseen field conditions due to incorrect information being furnished to the City. Thus the motorized gate valve vault is being relocated west of the original location. The contractor shall pothole 10-feet west of Pothole No. 1B and 10-feet east of Pothole No. 1A to verify that there is adequate clearance for installing a horizontal offset and motorized gate valve vault the approximate location of Pothole No. 1A. Please notify the engineer of the potholing schedule in order that we can request the major utilities to attempt to identify the 4-inch steel pipe running parallel on Howard Street." Signed and Dated 11/18/11 (see attached)

Co-Author:

REQUEST:

Per response to RFI#U-0176.1 M Squared performed additional potholing at Location 7.

Please see the attached pothole findings.

Please advise how you would like to proceed.

Note: The 4" Unknown Utility was confirmed to be an abandoned PG&E gas main. On 1/10/12 PG&E drilled the line and confirmed it to be abandoned.

SUGGESTION:

ANSWER:

Accept Suggestion: [ ]

Jeff Thiel 2/15/2012 Michael Smith's (SFPD) Response.

"Furnish and install horizontal offset as shown on the attached drawing in order to locate the proposed concrete valve vault with minimum 6-inches clearance to the existing electrical duct bank running on the North side of Howard Street. Adjust nipple lengths as required between elbows and to connect into the ends of the existing cast iron pipes. Concrete valve vault and placement of motorized gate valve shall otherwise be shown on drawings MA-22 and MA-25.

Work for installation of new concrete valve vault and gate as show on Drawing MA-18 shall be deleted from the scope pending installation of the new valve vault as shown on the attached drawing."

Signed and dated 2/13/12.

Christina Young 2/15/2012 Pending TJPA approval, a CR will be issued.

Table with columns: Number, Subject, Status, Date Created, Date Required, Date Answered, Cost Impact, Proceed. Row 1: U-0179, AWSS Main line conflicts at Location 7, Closed, 10/05/2011, 10/15/2011, 11/21/2011, Potentially, [ ]

Co-Author:

REQUEST:

Some of the existing utilities are not shown on the drawings and have been installed on top of the existing 12" AWSS line. Due to the proximity and volume of these utilities it is not possible to even hand excavate down to the existing AWSS line to verify its location and depth. Please see attached pothole information. Please advise.

SUGGESTION:

the following response received 10-17-2011 does provide direction in this matter: It shall be the contractor's responsibility per the Contract Documents to perform the required potholing in order to identify the existing AWSS facilities prior to actual excavation. Background utility information was provided by TJPA/consultants and shall be verified in the field by contacting Underground Service Alert (USA). Direct conflicts noted during potholing shall be directed to the utility owner(s) for relocation/removal as required to perform the contract work. NOTE: email from Rick Buellesbach 10-18-2011 requests an answer to the question.

ANSWER:

Accept Suggestion: [ ]

UPDATED RESPONSE (11/18/11) Michael Smith's (SFDPW) response, Refer to comments on attached sheet. These comments supercede response provided on 10/17/11. SFDPW Response: This conflict between the existing AWSS line and utilities are unforeseen field conditions due to incorrect information being furnished to the City. There are no design alternates at this location due to the necessity of removing the existing cross that was capped on the First Street side outlet to accommodate the utility relocation work for the proposed transit center. The engineer will contact the owners of the utilities in conflict with the AWSS facility for resolution." Dated 11/18/11 (see attached)

| Per the response to U-0182.1, M Squared potholed the locations shown. See attached pothole data.<br>- The pothole 24' north of Mission appears to have a substructure underneath PGE duct banks.<br>- The pothole 12' north of Mission St had several utilities in them that have since been confirmed abandoned. |  |               | Relocate the street light/ traffic signal conduits and shift the vault location 3 feet north away from the 12inch gas main. In doing so, this could potentially be the location for a cast in place concrete valve vault. |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Michael Smith's (SFDPW) response,<br><br>- Proceed as per Contractor's recommendation for locating motorized gate valve vault.<br><br>- Contractor shall field verify alignment of pipe North/South of proposed vault location for connection into (E) lines.<br><br>Signed and dated 8/9/12. (See attached)  |                          |
| Per discussions between TCCo/PMPC/SFDPW, Contractor to trench the Second Street AWSS alignment per the attached sketch. Upon completion of trenching advise TJPA if there will need to be a change in material/fittings required to complete the AWSS installation work.  |  |               |   |                      |                      |   |                          |

and provided alternate direction in the field. Please provide this direction in writing so work may resume.

to RFI U-0190 based on his observations in the field. Existing rebar was found to be uncut but lacking sufficient concrete cover. Please see supplementary instruction below.

Per William Liang of SFDPW,

1. Chip out concrete inside of saw-cut area; do not damage (E) rebars,

2. (E) main rebars are found to be intact but have insufficient bottom concrete cover; (E) wire-mesh above the main rebars are found to have been cut during the sawcut process. Install 3-#4 dowels @ 12"o.c. max set in epoxy along three sides w/ 6" embedment into (E) concrete (see attached photo), maintain 6" max from corners, epoxy shall be SIMPSON SET-XP or HILTI HIT-RE500-SD.

3. Install swellable waterstop (Greenstreak Hydrotite CJ-0725) above installed dowels, provide min 1.5" concrete cover.

4. Form and pour w/ Emaco S66 CI by BASF (see attached cut sheets). Perform surface preparation and provide curing in accordance w/ manufacturer's recommendations. Note continuous special inspection shall be provided for the dowel installation and concrete pour.

ORIGINAL RFI U-0190 RESPONSE FOR REFERENCE

1. Chip out concrete inside of saw-cut area; do not damage (E) rebars.  
 2. If (E) rebars are found to have been cut during the saw-cutting process, chip out enough concrete around the cut rebars for installation of Lenton Quick-Wedge Splicing system at both ends; splice new rebars with

size to match (E). If (E) rebars are found to be intact, proceed to Step 3.  
 3. Install keyway around perimeter of opening (keyway shall be a minimum 1.5" below top of slab), install swellable water stop (Greenstreak Hydrotite CJ -0725) in keyway.  
 4. Form and pour with Emaco S66 CI by BASF. Perform surface preparation and provide curing in accordance with manufacturers recommendations.  
 Note: continuous special inspection shall be provided for the concrete pour."

**Co-Author:**

**REQUEST:**

Current project drawings show that this project requires two (2) 14" Strong Backs and two (2) 10" Strong Backs to be used at different locations. Olympic Foundry does not produce strong backs and were unable to include them in the order to M Squared. M Squared has contacted several sources trying to locate the strong backs but have yet to find a supplier. Please advise if it is possible to purchase these from the City stock. If this is not possible M Squared will have no other option but to have them manufactured at a steel mill and this may take a considerably long time due to the lead time in the specialized steel.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Jeff Thiel 2/3/2012 Response per Michael Smith (SFDPW),

-"We have been advised that the SFWD does not have the requested strong backs in their inventory.

-Typically strong backs were torch cut at local machine shops that handle larger fittings. Suggest contacting other contractors who have performed AWSS work for sources."

|               | <p><b>SUGGESTION:</b></p>  |               |                     |                      | <p>ANSWER:      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Jeff Thiel 4/12/2012 Per email conversation with Alex Demisch of the SFpark Project (SFMTA), any parking sensors found on Mission Street from 2nd Street to Main Street are inactive. SFPark's vendor plans to remove these parking sensors late April or early May of this year 2012. SFPark realizes TJPA plans to conduct AWSS construction work in the upcoming months and has asked if it was possible to for the TJPA sub-contractor, once AWSS construction begins, to separate the parking sensor equipment from other construction debris so that SFPark may dispose electronic waste properly if there are any parking sensors still remaining. However, if the parking sensors cannot be separated then SFPark understands they will end up being demolished from TJPA AWSS construction work.</p> |                    |                          |

plan and maintain minimum clearance required in the AWSS specification. Please advise how M Squared is to proceed.

contact with the existing AWSS pipe.

The two options to rectify this situation include:

- 1.) Request that PG&E or their contractor vertically relocate the recently installed duct bank in order that there is the required 12-inch clearance between the two utilities.
2.) Realign the proposed replacement AWSS main either over or under the PG&E duct bank by the installation of a vertical offset.

Should option No. 2 be selected, please advise as soon as possible since revision drawing(s) for the vertical offset will need to be prepared prior to the installation of the vertical offset."

Signed and Dated 4/11/12.

The phase two duct bank was not installed per PG&E Green Book requirements for minimum clearance between utility services, and the contractor failed to properly coordinate utility installation.

Work related to this RFI response shall be performed at no additional cost to the owner.

**Co-Author:**

**REQUEST:**

Please refer to attached detail 3/U-5001.

Detail 3 on sheet U-5001 which shows the connection detail for 12" HDPE to existing 10" steel, uses a 10" steel to 12" sleet reducer and then using a 12" steel to 12" HDPE Coupling in order to connect new sludge main to existing sludge main.

Our preference is to use a 10" steel to 10" HDPE coupling and then install a 10" HDPE to 12" HDPE Reducer. As the O.D of the existing sludge is unknown it will cause significant delay in the ordering of the 10" steel to 12" steel reducer as we will have to get the OD at the connection point and then order the material. Even with this piece of material, it will be extremely difficult to get a welder into the trench to weld the reducer on to the exiting pipe as a result of the amount of utilities which were discovered in potholing.

The use of the 12" HDPE to 10" HDPE reducer eliminates the need for a welder in the trench.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Proposed modification is acceptable.

**Co-Author:**

**REQUEST:**

Specification section 02225 Section 3.7 C forbids the use of flooding or jetting in order to gain the necessary levels of compaction in the AWSS pipe trench.

However due to the amount of utilities and duct packages in the trenches it will not be possible to gain the necessary levels of compaction under and around these utilities by utilizing the methods referenced in the specifications. By not gaining the necessary compaction around utilities it is possible that voids will occur over time causing the utility to be come unsupported and the street surface to sink.

We are requesting the use of jetting (as described in Section 703.08 of the City and County of San Francisco Standard Specifications) as a method to gain the

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

6/11/2012 Michael Smith's (SFDPW) response:

"Water jetting to compact soil will be approved for locations where there are adjacent utilities that prevent compaction by vibratory methods. Use vibratory compaction once the backfill is clear of utilities and up to finish grade under road base/paving."

**Co-Author:**

**REQUEST:**  
 Please refer to spec section 33 34 10-3.1 H

The method of HDPE pipe testing listed in the contract documents differ from the testing methods provided by the pipe manufacturer: The specifications call for the pipe to be filled 24hrs in advance and then the pipe pressurized to 115psi for a duration of 4hrs, The manufacturer's method involved filling the line with pressure for 3 hrs to allow expansion etc. in the pipe and then adding additional water, per Table 2 of the attached document. Once this additional water has been added the pressure can hold for the duration listed. Or alternatively allowing a 5% fluctuation in the pressure target for the test over 1 hour.

Please see attached pipe manufacturer's data attached and provide direction. M Squared believe that the testing method in the specifications is not suitable for HDPE due to its flexibility and would be more suited to steel pipe.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Eric Zagol 7/3/2012 It is acceptable to perform HDPE Hydrostatic Testing per HDPE pipe manufacturer's recommendations. The test phase shall be performed based on the specified "Test Phase - Alternate 2" in manufacturer's data sheet for 3-hour test.

 Specification section 33 34 10 (3.1, C-7) forbids the use of flooding or jetting in order to gain the necessary levels of compaction in the HDPE pipe trench. However due to the amount of utilities and duct packages in the trenches it will not be possible to gain the necessary levels of compaction under and around these utilities by utilizing the methods referenced in the specifications. By not gaining the necessary compaction around utilities it is possible that voids will occur over time causing the utility to be come unsupported and the street surface to sink.

M Squared is requesting the use of jetting (as described in Section 703.08 of the City and County of San Francisco Standard Specifications) as a method to gain the necessary levels of compaction for the Sludge Line trenches.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Zagol 7/5/2012 Flooding or water jetting is not an acceptable method of compaction for HDPE pipe trench backfill.

In limited areas, under and around adjacent utilities, consider using a low strength, low water content concrete fill material. Submit proposed alternate backfill material and mix design for review.

**REQUEST:**

Please refer to drawing MA-17.

Due to the high number of utility duct banks on Main Street & Mission Street Intersection M Squared's crews effectively tunneled under sections of the street in order to install the new AWSS main. Where possible M Squared removed the street base and excavated as much as we could. The remainder of the trench was tunneled under duct banks and under the street, with the street base remaining in place.

Now that all the AWSS main has been installed M Squared will shortly be faced with backfilling this intersection. There is currently only a small portion of trench that can be backfilled using conventional methods i.e ram compactor etc. The remainder of the trench will also not be suitable for backfilling using the jetting method as there will be no way to compact the area directly underneath the street base.

M Squared is requesting permission to create several small holes (approx. 6" dia) in the street base, between some of the utilities and backfill the AWSS trench using a sand cement slurry backfill. See attached submittal sheets. This mix design is effectively sand and water, with just a minor amount of cement included to allow the sand to reach 95% compaction.

If this is not acceptable please provide direction.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

This is acceptable provided that the dried sand/cement mixture has a minimum density of 120 lb/ft3. Please provide test verification of this density with site test as continued from previous sheet: "witnessed by SFWD Inspector". Test can be performed at contractor's yard.

Due to the unforeseen utilities in place, M Squared cannot install the concrete vault around the gate valve at STA 16+40. In order to avoid delays to the project M Squared reached out to the engineer of record to bring this issue to his attention. See attached email chain.

Gunn CF SFWD to review valve installation for providing design for modified valve box and gate valve support.

Michael. B. Smith SFPDW/IDC/EME 02/07/14

As it appears M Squared is directed to return to 1st Street and work east again; M Squared will be unable to build any structure around the gate valve at Sta 16+40. Due to the flip flop of the schedule we will not be able to tie in at this point for several months so we suggest the following:

- Install the gate valve at Sta 16+40 and direct bury the valve, leaving access to the gates with ductile risers and valve caps. FYI - these gates should not be opened anyway as the line will be out of commission during construction.
- Re-excavate this gate valve when M Squared installs the pipe from Fremont St heading east and tie in the pipe to it then. In the interim M Squared will drive a sheet pile behind the gate valve and support it with a 1.5ton concrete block. This will prevent any gate valve movement.
- As M Squared will be working their way from 1st St towards Beale Street, they should have several weeks in which to design some sort of modified manhole, custom sized vault in which to encase the valve.

Please advise if this is acceptable.

**From:** Webcor Construction LP Jackson Tukuafu **To:** Turner Construction Company Phil Militello

**Answered By:** Turner Construction Comp. Judith Long

**Co-Author:** M Squared Construction, Inc. Aidan Foley

**REQUEST:**

Please refer to drawing MA-15 and attached M Squared sketch SK-TG04.2-069.

**SUGGESTION:**

According to the plans the tee is to be rolled down, however the existing tee is rolled out flat and there are 2 x 45 degree elbows installed to raise the line over the existing brick sewer.

**ANSWER:** **Accept Suggestion:**

1. Please coordinate with the SFWD inspector to identify if the (e) SFWD line is abandoned. If abandoned, cut line as required.
2. Furnish/Install 45 degree elbows as required to match (e) horizontal alignment.
3. Proceed as required following lateral South to identify usable lead joint to connect to (e) line. We

1. Due to existing utilities, the area is congested and has

**Co-Author:** M Squared Construction, Inc. Aidan Foley

**REQUEST:**

Please refer to drawing MA-16 and attached M Squared sketch SK-TG04.2-071.

There are 3 duct banks exiting out of PG&E Vault #1669:

1. PG&E Duct bank #1 runs from 1st Street down Mission to Fremont Street and has been in our trench all that time. It has not encroached on the AWSS Main alignment and there is enough clearance from AWSS main most of that time. It has impacted excavation but should not pose too much of a problem for pipe installation.
2. PG&E Duct bank #2 sits on top of the existing 12" AWSS Main and runs directly on top of the AWSS Main for a large portion of the intersection. Due to this duct bank we are unable to excavate down to the AWSS Main, unable to remove pipe and will be unable to install new 16-inch AWSS.
3. PG&E Duct bank #3 runs underneath the existing 12" AWSS main, it is concrete encased and part of the concrete encasement encroaches onto the existing 12" AWSS Main. This duct bank appears to leave our trench after 10ft or so.

Where duct bank #2 and duct bank #3 cross each other there is only 11-inch between the two duct banks. Not

**SUGGESTION:**

**ANSWER:** Judy Long 4/1/2014  
**Accept Suggestion:**

PG&E shall remove/relocate conflicting duct bank(s) as identified by the contractor in order to obtain the necessary working space and clearance as required to remove the (e) AWSS pipe and install the (n) pipe. PG&E shall demo portions of their electrical vaults that were constructed on the (e) AWSS pipe.

Currently should the (e) CI AWSS be compromised, the SFWD would not be able to even access the fire fighting line due to the three conflicting PG&E duct banks surrounding the AWSS pipe. City Standards call for a minimum 12" separation for utilities being installed in the proximity of the AWSS line.

| <b>REQUEST:</b><br>See attached sketch.<br><br>The existing lead joint (outside contract scope) is leaking. It appears that the pressure of the string back pulling on the lead has caused the lead to leak.<br><br>Our crews have excavated further north and exposed more of the existing main to allow our plumber to repack the lead joint. In doing so we discovered ears on the existing pipe approx. 3ft north of the lead joint.<br><br>Our suggestion is to repack the lead joint and tie back the adaptor to the ears on the existing pipe. In eliminating the strong back we will be eliminating the pressure on the repacked joint.<br><br>Please confirm you are in agreement with our suggestion. |  | <b>SUGGESTION:</b>  |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Please proceed as suggested above. Spare strong back shall be delivered to the San Francisco Water Department at the close of the project. |                      |                    |                          |
