| Please clarify the designer's intent:<br><br>Sheet SI-2303 indicates that the south end of Transfer Girder TR9 extends beyond the B87 and B88 beams southern edge and partially into the intersecting MFBI beam which is angular to the B87 beam. Section 8/S 1-3701 indicates that there are welded rebar couplers at the top flange of the TR9 girder to match the B78 beam reinforcing, but the B78 beam ends at the B87/B88 intersection prior to the southern end of the TR9 girder.  |  |                    |                     |                      |                      |  |                          |

| Per 05 15 21 Steel Castings (see attached), steel castings (most notably the cast nodes) are to be furnished as bare metal. This was confirmed in the construction issues meeting held on 04/17/14 (see attached), with the indication that coating of the bare metal is to be included in TG16.5 Painting. 09 97 16 High Performance Coatings & Superstructure Package (see attached) identifies a coating system for exterior exposed factory-primed metal surfaces, and a coating system for galvanized steel, but not a coating system for exterior exposed unprimed/non-galvanized metal surfaces. Please provide the coating |  |                    |                     |                      |                      |  |                          |

| <b>REQUEST:</b><br>Contract drawing S-3191 indicates two openings (for two tremies) in each Barrette's rebar cage. This drawing is in conflict with Contract Specification 31 63 32 3.4 D 3 that indicates that three tremies are needed for each Barrette (one tremie for each 7 feet of wall length). Please note that the Response to RFI-0050 allowed for the length of the barrette piles to be increased from 20'-0" to 21'-0".<br><br>The European Standard EN 1538 indicates two tremies (properly spaced so that the concrete does not have to travel more than 8 feet) is sufficient for each Barrette. Additionally, in reference to RFI BRP-0055 and, in an effort to reduce rebar congestion, 2 tremies are preferred.<br><br>Please confirm that two tremie pipes per Barrette are acceptable. |  | <b>SUGGESTION:</b>  |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> |                      |                    |                          |

| 1205.1   | BGP - Lower Concourse Blockouts to Pour Train Level Partition Walls | Closed  | 03/22/2014 | 04/01/2014   | 04/09/2014 | Potentially | <input type="checkbox"/> |
| <b>From:</b> Webcor Construction LP Claude Titcher<br><b>To:</b> Turner Construction Company Phil Militello<br><b>Co-Author:</b> Transbay Joint Powers Authority Sylvia Wong   |   | <b>ANSWERED BY:</b> Adamson Associates, Inc. George Metzger |            |  |            |             |                          |
| <b>REQUEST:</b><br>Please see attached drawing for the general layout of Lower Concourse blockouts taking into account the response to RFI T-1205.<br>Due to limited site access to the Train Level once the Lower Concourse is poured, the partition walls will have to be poured in 2 lifts, except for the tank walls which will be poured monolithically. In the case where a blockout coincides with features above or below (ie beam below or future partition wall above) the blockout will be offset and the train level partition wall be poured using the "Bird's Mouth" method (see Detail 3 on attached drawings). To ensure consolidation in differing height wall pours, SCCI will install top bulkheads on walls with lower heights due to overhead beams. SCCI will maintain minimum separation gap between the top of partition wall and Lower Concourse elements as detailed. The blockouts will be installed with styrofoam per Detail 4 in the attached drawings, prior to the Lower Concourse being poured. The blockouts will have a keyway on each side with top and bottom rebar dissecting the blockouts per Details 1 and 2 in the attached drawings. Once the partition walls have been poured, the blockouts |   | <b>SUGGESTION:</b>  |            | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Where the RFI states that walls will be poured in "two lifts", this is interpreted to mean "two phases". Blockouts shall be poured back with concrete or product approved through the submittal process. Coordinate layouts and phasing plan with comments noted on Submittal TG0600-907.0 BGP - Construction Joint Layout - Partition Walls Area 3 and 4. RFI is confirmed in other regards. |            |             |                          |

| <p><b>REQUEST:</b></p> <p>SCCI has received the response to RFI #0001 which provided a way to determine coordinates of the end of the "BBTT" alignment. However, no begin of curve (BC) or end of curve (EC) coordinates were given as requested. In order to properly lay out the alignments, SCCI will have to rely on CAD drawings provided in Transmittal No. 150-00268 from Jon Valencia (PMPC). SCCI would like to confirm that the CAD drawings provided in this transmittal are warranted to be used for construction.</p> <p>Please confirm.</p> |                                     | <p><b>SUGGESTION:</b></p>       |                     | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Coordinates of the begin and end of curves (BC and EC) can be calculated with the alignment data presented in the drawing. The distance and bearing to and from the survey control points can be used for checking the alignment layout.</p> |                      |                    |                          |

| <b>REQUEST:</b><br>As shown in the CIDH elevation detail on Contract Drawing S1-3190, there is an optional construction joint at the elevation of the bottom of column rebar cage, 18 feet below the cut off line. However, the Bent8 CIDH Elevation detail does not allow for an optional construction joint at the elevation of the bottom of column rebar cage. In order to facilitate the proper installation of the column rebar cages in CIDH Piles B8-1 and B8-2, it is necessary to have an optional construction joint at this location (see attachment for illustration). Therefore, SCCI proposes to revise the drawings to include this joint. Is this acceptable? |   | <b>SUGGESTION:</b>                    |                   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>This is acceptable. |                   |                    |                          |

**Co-Author:** Shimmick Construction Company, Inc. Ben Gordon

**REQUEST:**

Follow-Up To RFI B-0002 ERP-RESPONSE- Hazardous and Contaminated Materials Location:

RFI B-0002 ERP-RESPONSE- Hazardous and Contaminated Materials Location listed "Transbay Transit Center Program Limited Phase II Soil and Groundwater Investigation Report Transbay Terminal West Loop Bus Ramps and Future Transit Center Site East of Beale St." (ERM-West, December 2008) and "Transbay Program Site Management Plan Addendum Transbay Transit Center Bus Ramps" (Treadwell & Rollo, February 2013) as the basis of bid item estimates for bid items 40, 41, and 42.

These documents do not provide for specific quantities and locations of Class I (Bid Item 40), Class II (Bid Item 41) and Federal RCRA (Bid Item 42) contaminated materials on site.

Please provide a detailed map and/or plan indicating the locations of Class I, Class II, and Federal RCRA contaminated materials similar to the site plan sheets titled "Site Plan With Boring Locations and Map Extents" (Figures 2-7, Treadwell & Rollo) and provided in Spec 0 13 50/ AP A - Site Mitigation Plan of the project documents (provided as an attachment to this RFI).

Please confirm that all contaminated soils identification, testing, and analytics shall be provided by the TJPA and/or the prime contractor.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Please see attached Treadwell & Rollo memo "Preliminary Estimate of Volume of Fill Material" dated 4.25.13. This document served as the basis for assumed material off-haul quantities included in the Bus Ramps bid form.

| <p><b>REQUEST:</b><br/>                 Per RFI-0007.2 Response, a map of locations of Class I and Class II contaminated soils located on the Bus Ramps site was provided by Treadwell &amp; Rollo for use by SCCI. During the meeting held 6/20/2014 at the Webcor Offices to discuss the hazardous materials on site and development of a hazardous materials location map, it was indicated that there would be no federal RCRA material encountered on the site and that Class I and Class II contamination depths would vary between 1' and 2' below grade.</p> <p>During waste profiling with our disposal site, SCCI has encountered the following discrepancies:</p> <p>Per the T &amp; R map, the area around sample SB-05 should be Class I material. Per the soil test analytics provided in the Bus Ramps Site Mitigation Plan and the ERM-West Phase II Soils Report, samples SB- 5-3 and SB-5-6 test over the Class I limit for Lead and Barium, respectively. Without the STLC (Soluble Threshold Limit Concentration) and TCLP (Toxicity Characteristic Leaching Procedure)</p> |  | <p><b>SUGGESTION:</b></p> |                     | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> Peter Cusak 8/12/14:<br><br>As requested, additional samples were taken at deeper depths and tested including STLC and TCLP. The test results show soils locations and depths below 2' are Class II and as Class I Non-RCRA (See attached map dated 8/5/14).<br><br>Based on the recent samples taken at various location mentioned in the tables 1 & 2, and recent analytical report (copies attached), the results confirmed presence of Class I & Class II contaminations, and no Federal RCRA material encountered on site (map provided) |                      | <p>The abovementioned information is consistent with the Bid documents.</p> |                          |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

test results to confirm otherwise, material with these TTLC (Total Threshold Limit Concentration) results would have to be classified and disposed of as a federal RCRA material which is in conflict with the direction provided by the T &R map and the 6/20 meeting discussion.

Per the T&R map and meeting discussion, areas approximately north of Folsom Street would be contaminated with Class I material to a depth of 2' below grade, and areas approximately south of Folsom Street would be contaminated with Class II material to a depth of 1' below grade. A small portion of the area east of the Sterling substation would be contaminated with Class I material to a depth of 1'. Per the soil test analytics provided in the Bus Ramps Site Mitigation Plan and the ERM-West Phase II Soils Report, samples SB-5-3 and SB-5-6 are both potentially contaminated to a Class I or federal RCRA classification level at depths below 2', which is in conflict with the direction provided by the T &R map and the 6/20 meeting discussion.

The following is a list of possible soil samples provided which may be in conflict with the T &R map and 6/20 meeting discussion direction and may require additional testing to confirm soil classification:

SB-4-3 Need STLC and TCLP for Lead  
SB-4-28 Need STLC for Chromium  
SB-5-3 Need STLC and TCLP For Lead  
SB-5-6 Need STLC and TCLP for Barium  
SB-7-3 Need STLC and TCLP for Lead  
SB-7-5 Need STLC for Chromium, Need STLC for Copper,  
Need STLC and TCLP for Lead  
SB-8-3 Need STLC and TCLP for Lead  
SB-8-21 Need STLC for Chromium  
SB-9-3 Need STLC for Chromium, Need STLC and TCLP  
for Lead  
SB-9-6 Need STLC for Chromium, Need STLC for Nickel  
SB-10-12.5 Need STLC for Chromium

Please advise on discrepancies and additional test results and provide additional detail on location and depth of contamination on the site map.

Also, all soil samples begin at 3' or greater depth below

| <p>As shown in Contract Drawing D-1005, the entire existing Bent 20 foundation is to be removed. However, USA North ticket #219688 located two ATT duct banks 3' away from, and running parallel to, the property line on the south sidewalk of Clementina St. This utility is not shown on the Contract Drawings. The utility is located directly on top of the Bent 20 foundation as shown on the attached sketch.</p> <p>Per SCCI's understanding, the reason to remove Bent 20 is to facilitate the installation of CIDH B4-3 and the drainage system shown on Contract Drawings U-1005 and C-4102. Shimmick proposes to remove the Bent 20 foundation only to the extent needed to enable the installation of CIDH B4-3 and the drainage system (the catch basin and sewer manhole will still be protected and supported in place). The extent of demolition should end roughly 4'-8" north of the CIDH pile to allow sufficient room for shoring yet not intrude on the utility. See attached drawing for proposed limits of demolition. Is this acceptable?</p> |  |   |                     | <p>SCCI's proposal is acceptable.</p>  |                      |                    |                          |

| <b>REQUEST:</b>  |  | <b>SUGGESTION:</b>                                    |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>  |                      |                    |                          |
| <p>SCCI has reviewed Contract Drawing D-1006 and compared it to the Tieback As-built Document SH- 2600 per the Tieback Final Package from Balfour Beatty. The tieback angles are all different, most varying by roughly 8 degrees. The angle change affects the locations of the tiebacks as well. The precise location and angle of the tiebacks is paramount to the installation of shoring for pylon 9. SCCI would like to confirm that the As-builts are correct for layout use.</p>   |  |   |                     | <p>As indicated on Contract Drawing D-1006, location of tiebacks is approximate. The as-built tieback drawings should be used.</p> |                      |                    |                          |

Ben Gordon</p>  |                                     | <p><b>Answered By:</b> Arup</p> <p>Kevin Clinch</p> |                     |   |                      |                    |                          |
| <p><b>REQUEST:</b></p> <p>1) Distance from RDS line to centerline bearing is shown to be 1'-3". Distance from centerline bearing to "TTBB" STA 29+07.235 is shown to be 3'-0". So the distance from RD5 to "TTBB" STA 29+07.235 should be 4'-3". However RD5 is shown to be at "TTBB" STA 29+03.000 which is only 4.235' or 4'-2 13/16" from "TTBB" STA 29+07.235. Please explain why there is a discrepancy of 0.015' or 3/16".</p> <p>2) LD5 is shown to intersect the left edge of deck at "BBTT" STA 29+02.21, 10.51' left. LD5 is shown to intersect the right edge of deck at "BBTT" STA 29+02.67, 13.00' right. SCCI took the "BBTT" and "TTBB" alignments shown on sheet C-2101 and drew in the RD5 line at "TTBB" STA 29+03.00. SCCI then extended the RD5 line to create the LD5 line. When doing so, SCCI found that the LD5 line intersects the left edge of deck at "BBTT" STA 29+03.135, 10.51' left and intersects the right edge of deck at "BBTT" STA 29+02.594, 13.00' right. Please clarify whether the LD5 stations shown at edge of deck are correct.</p> |                                     | <p><b>SUGGESTION:</b></p>                           |                     | <p><b>ANSWER:</b> Accept Suggestion: <input type="checkbox"/></p> <p>Please see attached design sketch for clarification.</p> |                      |                    |                          |

**Co-Author:** Shimmick Construction Company, Inc. Ben Gordon

**REQUEST:**

SCCI bid and planned the shoring necessary for demolition of the existing footings per the response to Question TG18.1-037 of IFB Questions & Answers TG18.1 Set #3 which included the statement that the bents north of Folsom Street were similar to Section P on Contract Drawing D-1106. This section shows a footing that is immediately below existing grade and is eight feet thick.

Additionally, SCCI reviewed the reference documents to confirm the bottom of footing elevations for these footings. Supplemental Drawing Nos. 7A and 8A of the San Francisco-Oakland Bay Bridge Railway Facilities drawings show the elevations of the bottom of footings. The first note on the Supplemental Drawing No. F-112 of the SFO Bay Bridge Railway Facilities drawings states to subtract 11.71' from these elevations to correct them to the city datum. SCCI has done this and compiled these elevations below.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Arup does not have any more information than the Contractor has. We could not find a datum correction on the 1937 Contract R2 drawings, only on the 1939 Contract R3 drawings. For the purpose of proceeding with the work, we recommend that the contractor apply the datum correction from the Contract R3 drawings to the Contract R2 drawings and determine the existing foundation elevations based on this. Note the datum correction on Contract R3 drawing F-112 is from San Francisco-Oakland Bay Bridge Datum to City Datum. Refer to the survey drawings prepared by Martin M. Ron (specifically sheet 1 of 10) in the Contract Documents for the datum correction from NAVD88 to City datum.

This RFI will use the Bent 5 footing for example to show why SCCI does not believe that this is the correct datum correction to use. Section P on Contract Drawing D-1106 shows the Bent 5 footing immediately below grade and eight feet thick with a bottom of footing elevation of 53'-8". As shown in the table above, the elevation shown for this bottom of footing elevation on Supplemental Drawing 8A and correcting it to the city datum would provide an elevation of 29.29'. The same issue is easily seen using the section views on Bent 2 and 3 on the same Contract

Drawing.

Please confirm that the Datum Correction shown on Supplemental Drawing F-112 does not apply to Supplemental Drawings 7 A and 8A and provide the correct datum correction if necessary.

**REQUEST:**

On July 11, SCCI performed potholing for the existing foundations to be demolished and discovered that the depths of these foundations are significantly deeper than expected due to contradictory information provided in the responses to Bidder Questions and Reference Documents at bid time. The results of the potholing has allowed SCCI to eliminate certain information from these documents and is now proceeding under the assumption that the elevations provided in the San Francisco-Oakland Bay Bridge Railway Facilities and SFO Bay Bridge Railway Facilities are correct. These drawings indicate that these foundations are at depths as great as 34.5' from grade. SCCI requested that these elevations be confirmed in RFI B-0018 - Bottom of Existing Footing Elevations, submitted July 14.

**SUGGESTION:**

The foundations to be removed are located adjacent to major San Francisco thoroughfares and buildings of up to ten stories. SCCI believes that large excavations next to these structures could potentially undermine these streets and the foundations of these buildings. SCCI also believes that it is possible to reduce the number of these large excavations by reducing the volume of concrete to be removed from these foundations.

SCCI has reviewed Contract Drawings D 1000 through D 1106 and has determined that the existing foundations Bent 5, 7 and 11 need only to be partially removed to facilitate the installation of CIDH piles. Additionally, SCCI

**ANSWER:**

**Accept Suggestion:**

This is acceptable. The extent of existing footing to be removed shall equal the radius of the CIDH plus 1'-0" plus the maximum allowed tolerance (alignment and verticality) for the CIDH installation. Following removal, the excavation shall be backfilled and compacted in accordance with the requirements in Specification Section 31 00 06.

**Co-Author:** Shimmick Construction Company, Inc. Filip Filipic

**REQUEST:**

Based on discussion in Tuesday's (7/15/2014) meeting (Movement Review Committee), the following heavy equipment is required to install the barrettes at the Pylon 9 foundation:

1. Manitowoc 888 crawler crane: Maximum total load when holding full length barrette rebar cage = 705± kips. As shown on Figure 1, the crane will be set back a minimum of about 40' clear from the back of the TTC shoring wall when it is working. The "footprint" of the crane (defined as a rectangle with a length equal to the bearing length of the tracks and a width equal to the out-to-out track dimension) is 24.6'x23.2', which has a total area of 571 sqft. The average vertical surcharge load acting over the machine footprint is  $705,000/571 = 1235$  psf.

2. Bauer MC128 Foundation Crane with a BC40 Trench Cutter (Hydromill): Maximum total load when working = 540± kips (includes pull force when retrieving mill from trench). As shown on Figure 2, the hydromill will be set back a minimum of about 13' from the back side of the TTC shoring wall when it is working. The "footprint" of the hydromill is 23.0'x20.5' = 472 sqft. The average vertical surcharge load acting over the machine footprint is  $540,000/472 = 1144$  psf.

3. Liebherr HS855HD crawler crane with clam. Maximum total load when working = 260± kips. As shown on Figure 3, the clam will be set back a minimum of about 10' from the back side of the TTC shoring wall when it is working. The "footprint" of the clam is 17.6'x16.2' = 285 sqft. The average vertical surcharge load acting over the machine footprint is  $260,000/285 = 912$  psf.

Please confirm whether the TTC shoring system is capable of resisting the surcharge identified above.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

This is a Contractor's means and methods issue. The Contractor shall provide estimates for additional horizontal loading on the internal bracing system for evaluation by the TG06 trade subcontractor. This shall include a horizontal pressure diagram which can be added to the plots shown on TG06 drawing GT-1110 and additional kips per linear foot of wall values which can be added to Table 1 and Table 2 on TG06 drawing GT-1110.

**REQUEST:**

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

30100 - Transbay Transit Center Project

| <u>Number</u> | <u>Subject</u> | <u>Status</u> | <u>Date Created</u> | <u>Date Required</u> | <u>Date Answered</u> | <u>Cost Impact</u> | <u>Proceed</u> |
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

As discussed in Tuesday's (7/15/2014) Movement Review Committee, please confirm whether the TTC shoring system is capable of resisting the surcharge loads from the following equipment walking off the trestle to the east of the Pylon 9:

1. Manitowoc 888 crawler crane: Maximum total load when walking off trestle = 565± kips. The "footprint" of the crane (defined as a rectangle with a length equal to the bearing length of the tracks and a width equal to the out-to-out track dimension) is 24.6'x23.2', which has a total area of 571 sqft. The average vertical surcharge load acting over the machine footprint is 565,000/571 = 990 psf.

2. Bauer MC128 Foundation Crane with a BC40 Trench Cutter (Hydromill): Maximum total load when walking off trestle = 460± kips. The "footprint" of the hydromill is 23.0'x20.5' = 472 sqft. The average vertical surcharge load acting over the machine footprint is 460,000/472 = 976 psf.

3. Liebherr HS855HD crawler crane with clam. Maximum total load when walking off trestle = 240± kips. The "footprint" of the clam is 17.6'x16.2' = 285 sqft. The average vertical surcharge load acting over the machine footprint is 240,000/285 = 842 psf.

This is a Contractor's means and methods issue. The Contractor shall provide estimates for additional horizontal loading on the internal bracing system for evaluation by the TG06 trade subcontractor. This shall include a horizontal pressure diagram which can be added to the plots shown on TG06 drawing GT-1110 and additional kips per linear foot of wall values which can be added to Table 1 and Table 2 on TG06 drawing GT-1110.

**REQUEST:**

1. Detail C on sheet S-6217 shows an API 5L80X Schedule 120 pipe. At the right, an end plate is shown welded to the pipe with a ¼" fillet weld. Please clarify the size and thickness of the end plate. Also please clarify the extent of the pipe since the length is not shown. It is not clear how far the pipe extends beyond the stiffener plate which is 1'-0" behind the end plate. The pipe is also shown in plan view of sheet S-6216 but the length is not given there either.

**SUGGESTION:**

**ANSWER:**  **Accept Suggestion:**   
 See attached SK-S-0003 in Arup Response Transmittal.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

SCCI has found a conflict between demolition drawing D-1005 and specification section 011570 3.2G.

According to drawing D-1005, existing Bent 22 extends underneath the entire south Clementina sidewalk width and 3' into the street. The shoring required to remove this footing along with the water barriers will extend another 5' into the street totaling to 8' intrusion into the street. The street is 18' wide at this bent location leaving a 10' for vehicle traffic as noted in approved traffic control plan 002 (TG 1801-036.1 ).

Specification section 011570 3.2G requires a 5' pedestrian walkway on the north and south side of Clementina. This is not possible due to the demolition of Bent 22 described above. SCCI proposes to keep the sidewalk on the south side of Clementina closed during demolition and re-open it to pedestrians once the footing and shoring has been removed.

Please confirm this is acceptable.

According to drawing D-1005, existing Bent 22 is not demolished and is to remain - please resubmit RFI with correct information.

If the Contractor is referring to drawing D-1005 Bent 20 which does have a portion of the demolition beneath the Clementina Street south sidewalk, there is no conflict.

If the Contractor determines that a section of the sidewalk must be closed for any reason, obtain STP from SFMTA before closing sidewalk.

For example; even with an approved Traffic Control Plan, to close the sidewalk requires an approved STP Special Traffic Permit. If during potholing and investigative work or during construction activity you wish to close the sidewalk, it is the expectation of the City and specification section 01 15 70, 3.2G that pedestrians have the use of the sidewalk at all times when construction is not in progress.

As was discussed last week in the field, there are options such that the sidewalk can be re-opened at end of shift or peds diverted into a sidewalk using part of Clementina Street if necessary.

**Co-Author:** Shimmick Construction Company, Inc. Ben Gordon

**REQUEST:**

Contract drawings S-3174 through S-3182 show the details for Pylon 9. As per S-3175 and S-3176, the link beam has reinforcement through the Pylon 9. SCCI proposes to pour Pylon 9 using perimeter steel forms and double ended form savers to avoid running rebar through the steel form and compromising the structural integrity of the steel Pylon forms.

Is it acceptable to use double ended form savers for the

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

This is not acceptable. Continuity of the reinforcement at this critical connection is important. The drawings show the bars continuous through the pylon with a splice 20 feet from the centerline of the pylon.

|   |   |
|---|---|
| <p><b>REQUEST:</b></p> <p>SCCI has received the rejection of Traffic Control Plan numbers 007 (Folsom) and 008 (Harrison) and has attempted to design the falsework to span the entire width of the roads. Upon review by SCCI and VAK Construction Engineering Services, this design does not comply with the project specifications.</p> <p>Please see our concerns with spanning the full length below:</p> <ul style="list-style-type: none"> <li>- In order to cross Harrison without a center falsework support, our required span is 79'-6". Per specification section 03 11 14 1.7-A4, the maximum allowable falsework span is 60'-9".</li> <li>- In order to cross Folsom without a center falsework support, our required span is 76'-8". Per specification section 03 11 14 1.7-A4, the maximum allowable falsework span is 50'.</li> <li>- The minimum possible depth of the falsework is 3'6" (36" beam + 4x4s + plywood). The vertical clearance would be 14'-2" which is under the required 15' clearance.</li> <li>- Reference VAK's memo and Folsom Falsework Schematics attached</li> </ul> <p>Due to these design issues, SCCI proposes to use traffic islands to give the falsework a center support. This will divert traffic into the parking and maintain the same number of open lanes as shown in Traffic Control Plans 007 and 008. Is this acceptable?</p> | <p><b>SUGGESTION:</b></p> <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>WOJV to confirm the spans that are reported in the RFI as they are considerably longer than those listed in the August 10, 2012 memo from Sandis to WOJV.</p> <p>Please provide all dimensions including sidewalks and parking lanes which may be able to be used for Falsework.</p> |

**REQUEST:**

Please see attached Memo from Bencor, SCCI's Barrette subcontractor. In light of the recent issues they have encountered at a nearby project with similar design and specifications and the fact that we only have two production barrettes, restricting us having test barrettes, SCCI asks the following questions:

1. Can the drill core verification process be substituted for the Crosshole Sonic Logging as the post installation acceptance criteria?
2. If not, please provide actual acceptance criteria for the Crosshole Sonic Logging. 31 63 32 does not provide any criteria for what defines a rejected pile. The specification only references ASTM 06760, which SCCI understands only provides how to do the test and provide results, but not acceptance criteria.
3. Can the #6 cross-tie rebar spacing be opened up? Possibly even increasing the rebar size, as remediation for the increased spacing.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Specification Section 31 63 32 1.7 A requires the Contractor to submit qualifications for the contractor / subcontractors performing the barrette foundation work. Arup has not yet received this.

In response to the questions listed in the RFI:

1. No. Specification Section 31 63 32 1.8 D 1 a states "Crosshole sonic logging will be used to test the concrete density of the pile for homogeneity."
2. The test results will be reviewed for anomalies. An anomaly will be indicated by the CSL test if the first arrival time increases significantly, or if the energy reduces significantly, relative to a moving baseline. The evaluation of the test results will include the location, extent and quantity of anomalies. Acceptance or rejection of a pile will be based on the evaluation of the CSL test results, pile construction reports (see Specification Section 31 63 32 1.5 E), the results of additional testing if deemed necessary by the TJPA (see Specification Section 31 63 32 1.8 D 4) and any other information or observations which indicate conformance / nonconformance of the installed work with the Contract Documents.
3. The Contractor may propose alternate reinforcing steel arrangements for review. The capacity of the reinforced concrete section shall be the same as or greater than that shown on the Drawings and each longitudinal bar along the long faces of the pile shall be confined with a stirrup or tie as shown on the Drawings.

Arup will not comment on the July 29, 2014 Bencor memo attached to the RFI. This is internal correspondence between SCCI and their subcontractor. The Contractor's requests for interpretation or clarification of the Contract Documents are the three questions listed on the Webcor Obayashi Joint Venture letterhead.

Arup has not yet received the Comprehensive Construction Work Plan required by Specification Section 31 63 32 1.5 D.

| <b>REQUEST:</b><br>Shimmick Construction (SCCI) has verified the BBTT alignment per the beginning bearing and distance from the contract drawings, and the End bearing and distance per RFI B-001. The pylon center at Pylon 9 is listed per the alignment stations of BBTT & TTBB on S-2261. SCCI has noted a discrepancy in this position of .16 feet between the alignment position of the pylon and the center position of the pylon as shown in CAD drawing S-2261. SCCI has checked/verified the BBTT alignment positions of other CIDH centers as shown on the CAD S-2261 drawing. SCC realizes that CAD drawings are not for record, but this may indicate a possible issue of the pylon location. SCCI also noted that the pylon centerline coordinate on S-6079 (Cable stay drawing) is different from these values. Supporting documents are attached.<br><br>Please confirm the center coordinate for the bent 9 pylon. |  | <b>SUGGESTION:</b>                                    |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>See attached SK-S-0004 for the correct location of the pylon. **Co-Author:** Shimmick Construction Company, Inc. Jeremiah Kent

**REQUEST:**  
 Note 4 on Contract Drawing D-1006 states:  
  
 "De-tension and remove existing tiebacks which interfere with construction of the pylon foundation. Do not de-tension the tiebacks until the TTC mat slab in Zone 1 has been placed and has reached its 28 day strength."  
  
 The mat slab in Zone 1 has been placed and has reached its 28 day design strength.  
  
 SCCI submitted Submittal TG 1801-208.1 Selective Site Demolition - Pylon 9 Temporary Shoring which included the memo De-tensioning of Existing Tiebacks at TTC South CDSM Wall for Pylon 9 Foundation Construction. This memo provided a procedure for de-tensioning these tiebacks. The response to this submittal stated that the tiebacks were to be de-tensioned and removed one at a time and that "instrumentation placed at the adjacent TTC excavation shall be reviewed for movements".  
  
 In response to the submittal comments received, SCCI plans to establish a baseline survey of the CDSM wall at the tieback locations and to monitor these benchmarks after each tieback is de-tensioned. All surveying/monitoring will be done with a Total Station. If no movement is detected at the time of monitoring, SCCI will proceed with de-tensioning of the next tieback. Is this acceptable?

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 Arup has no issue with the plan proposed by SCCI in RFI B-0037 as Arup commented in the Submittal TG1801-208.1 Selective Site Demolition - Pylon 9 Temporary Shoring.  
  
 In response to WOJV/SCCI email dated 8/18/14 (attached) Arup has no issue with the plan proposed:  
  
 The proposed baseline survey of the CDSM wall at the tieback locations with "all surveying/monitoring will be done [by Shimmick] with a Total Station".  
  
 The de-tensioning and cutting of the first two (2) of the tie backs, at the end of the first day shift, and monitoring [by Shimmick] during the next day using the benchmarks with a Total Station.  
  
 The proposed "If no movement is detected at the time of monitoring", SCCI will proceed with de-tensioning of the next (3) tiebacks at the end of the second day's shift. This "will allow a cold cycle" prior to de-tension the remaining (3) tiebacks.  
  
 It is assumed that WOJV and the Internal Bracing contractor will continue monitoring movement as per contract. If movement is detected at the time of monitoring, and MRP meeting will be held to determine next steps in accord with contract.

**B-0038 BRP - Removal of Pylon 9 Soldier Piles**

**From:** Webcor Construction LP Claude Titcher  
**Co-Author:** Shimmick Construction Company, Inc. Jeremiah Kent

**Closed**  
**To:** Turner Construction Company Phil Militello

**08/14/2014 08/24/2014 08/20/2014 Potentially**   
**Answered By:** Arup Kevin Clinch

**REQUEST:**  
 Submittal TG 1801 -208. I - Selective Site Demolition - Pylon 9 Temporary Shoring detailed the procedure for the installation and removal of the beam and plate shoring system at Pylon 9. Step 15 of the Construction Sequence on Sheet SH-I stated that the final step would be to "extract" soldier piles. One of the comments received on

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 This is not acceptable. The soldier piles may not be removed by pulling.

| <u>Number</u> | <u>Subject</u> | <u>Status</u> | <u>Date Created</u> | <u>Date Required</u> | <u>Date Answered</u> | <u>Cost Impact</u> | <u>Proceed</u> |
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

this submittal was that the soldier piles "may not be removed by pulling as this will reduce the strength of the soil and its ability to resist later load-resisting capacity of the soil at the top of the barrettes". SCCI plans to remove these piles using a vibratory hammer as this will increase consolidation of the soil as the pile is removed.

Is this acceptable?

**Co-Author:** Shimmick Construction Company, Inc. Jeremiah Kent

**REQUEST:**

While excavating around existing Bents 16 and Bent 17 in Lot G, SCCI encountered an unexpected structure comprised of concrete and brick at a depth of approximately six feet. The extent and dimensions of this structure have yet to be detennined. SCCI has determined that this structure will conflict with the Bent 8 pile cap to be constructed as well as the shoring system to be used for the demolition of existing Bent 16 and 17 and the construction of new Bent 8.

Please advise on how to proceed.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

**REQUEST:**

Contract Drawing D-1005 calls for the removal of an existing column foundation at the location of new CIDH C1. The detail on this drawing shows a column coming up from a spread footing. Therefore, SCCI expected this bottom of this spread footing to be at a reasonable depth similar to other foundation to be removed. No as-builts of this footing have been provided. Potholing performed by SCCI on August 14 determined that no spread footing exists within 40 feet from grade. Without additional drawings or information about this footing, SCCI believes it is possible that this foundation is actually a CIDH installed in a retrofit contract.

If this foundation is indeed a CIDH pile and extends as deep as to bedrock, its removal would be both cost and time intensive if it is possible at all. As shown on the attached picture, the edge of CIDH C1 is in conflict with the existing foundation at grade. This condition will prevent the installation of CIDH C1. Possible solutions include decreasing the diameter of the CIDH or moving the CIDH and column away from the existing foundation.

Please advise on how to proceed.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Demolish the existing CIDH to an elevation of +14.00 (NAVD88). The location of column C1 will shift to clear the remaining portion of the existing CIDH. This will be issued in an upcoming ASI.

|   |  |        |                          |            |              |             |                          |

**REQUEST:**

SCCI previously submitted Rfl B- 040 which stated that the footing to be demolished adjacent to new CIDH C1 appeared to be a CIDH pile. SCCI has since received Reference Drawings SFOBB - San Francisco Approach Replace which appears to confirm that this footing is actually the CIDH at Bent 5 installed in this 2004 retrofit.

While doing hazardous material removal for new CIDH C1 on August 27, SCCI encountered an additional footing adjacent to the Bent 5 CIDH. Pictures of this footing are attached. Also attached are sketches for clarification that show the footing as currently exposed.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

See attached sketch SK-S-0007 for zone of removal.

| <p><b>REQUEST:</b></p> <p>Note 8 on Contract Drawing S-3190 states that the vertical reinforcement bars, CI , are to be fabricated ten feet longer and that ten feet of additional hoops, D, are to be provided. To avoid fabricating all CIDH cages ten feet longer than may be necessary, SCCI and Case Pacific preproposing to fabricate all CIDH cages to the lengths shown on Contract Drawing S-3190 and to splice the additional ten feet of rebar cage when conditions require it. The proposed splice detail is shown on the attached sketch. The additional reinforcement for these splice lengthened cages will be kept on site.</p> |   |               | <p><b>SUGGESTION:</b></p>                         |                      | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>This is acceptable. Contractor to ensure splice, if used, is adequately tied to longer cage to ensure the two do not separate during placement in shaft.</p> |                    |                          |
| B-0045  | BRP - Seismic Displacement of Sliding Bearings at Hinge 9 | Closed        | 08/29/2014  | 09/08/2014           | 09/05/2014  | Potentially        | <input type="checkbox"/> |
| <p><b>From:</b> Webcor Construction LP      Stephanie Azzolino      <b>To:</b> Turner Construction Company Phil Militello</p>   |   |               | <p><b>Answered By:</b> Arup      Kevin Clinch</p> |                      |   |                    |                          |

the CTSS, 49-3.02C(6)-5 is similar to the project specification 31 63 30 3.5, except it refers the "must comply" to a section on "Permanent Steel Casing Installation" {49-3.02C(5)}. As SCCI's Project Specification does not include a section on permanent steel casing materials, SCCI believes the reference to the Temporary Steel Casing to be inadvertent.

If safety and/or quality is a concern, SCCI can provide stamped engineering to stating that the CMP is capable of withstanding loads from installation, lateral concrete pressures and earth pressures and will support personnel working inside the casing after the CIDH installation is complete.

inside the casing after the CIDH installation is complete.

- The Contractor includes a description of the optional construction joint and the use of CMP in the Pile Installation Plan re-submittal. Include the name of a Caltrans project where CMP was used, and the name and contact information of the engineer or resident engineer.

Note: the Drawings specify permanent casing for the CIDH piers at the Fremont Off Ramp. Arup's acceptance of using CMP pertains to the bents at Frames 1 through 3 only at this time. Contractor to include a description of the work specific to the Fremont Street Off Ramp in the Pile Installation Plan re-submittal for Arup to evaluate. The description shall include the type of casing proposed for use, diameter, depth, etc.

**REQUEST:**

Part 2.4.A of Specification Section 31 63 31 - Barrette Piles - Bus Ramps provides the design criteria for the sodium bentonite slurry to be used at the Pylon 9 barrette piles. Based on their experience and their knowledge of constructability, SCCI's barrette pile subcontractor, Nicholson Construction Company (NCC), would like to propose the following changes.

1. 2.4.A.4.b.1 and 2: A mix of water and bentonite at the minimum 5.5% per unit weight of water produces a slurry density of 65 pounds per cubic foot (62.4 pcf + 0.055 x (bulk density of bentonite around 50 pct)= 65 pcf). A 3.5 - 4% per unit weight of water is required in order to produce an initial slurry density of 64 pounds per cubic foot as required in §2.4 A 4. Please confirm that a mix of water and bentonite at the minimum 4% per unit weight of water is acceptable.

2. 2.4.A.4.c.3: The maximum fluid loss, by filter press, is the same for in-trench as it is for initial slurry. This is not attainable in field conditions as the slurry fluid loss increases as the slurry is being reused. The widely utilized European standard (EN 1538) specifies the maximum fluid loss values of 50 cc (for in-trench slurry) and 30 cc (for initial slurry). As these are more attainable values based on experience, please confirm 50 cc (for in-trench slurry) and 30 cc (for initial slurry) is acceptable.

3. A significant part of the Barrettes will be excavated in clay and, when mixed with the bentonite slurry, the viscosity will increase. If the initial and in-trench slurry viscosity minimum is 40 seconds as specified, there is very little tolerance available on the slurry viscosity before it causes excess stress on the desanding pumps. The widely utilized European standard (EN 1538) specifies 32 seconds as a recommended minimum. Please confirm 32 seconds is acceptable as a minimum for slurry viscosity.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The changes proposed by the Contractor are acceptable provided all of the slurry test requirements and acceptance criteria, not just those listed in the RFI, follow Tables 1 and 2 from EN 1538.

**REQUEST:**

SCCI is actively pricing and re-designing the frame 5, drop-in span as part of CR B-005 and needs to better understand the original design intent for this bridge section as it relates to the intumescent paint.

1. The only drawings SCCI see reference to intumescent are S-5068, S-6111 Detail B, S-6112 Detail D, S-6113 Detail H and K, and S-6114 Detail N. Per these it appears the design intent is to install intumescent on the underside of the "tub" (S-5068), the additional "Tub" piece (N/S-6114), and all of the exposed steel on the frame 4 side, except the lowest horizontal steel (B/S-6111 and C/S6-112). At the building side, it is confusing as only H/S-6113 shows intumescent similar to the frame 5 side. K/S-6113 only shows the intumescent on the bottom of the restraining rod steel box. J/S-6113 and L/S-6114 do not show intumescent. Also of note, the steel link beam on details D and B of S-6115 do not show intumescent. Please confirm design intent of intumescent coverage.

2. Per specification 09 96 46 Intumescent Paint  $\zeta$  Bus Ramps, SCCI is to "provide the specified fire resistance classification approved by Authorities having Jurisdiction" Who are the authorities having jurisdiction? What is the fire resistance classification for frame 5? SCCI assumed during bid time and currently a 1- hour rating.

**REQUEST:**

Section A and B of Contract Drawings S-3191 call for 6" concrete cover around the reinforcing cage in the barrette piles. Per Nicholson Construction Company's experience, given the rebar congestion of the reinforcement cage, the 6" concrete cover allows for a path of least resistance for the concrete to rise faster on the outside of the cage and increase the risks of having bentonite being trapped inside the cage during the concreteting operation. Nicholson believes that reducing the concrete cover to 3" will decrease the risk of this happening. SCCI's proposal will not change the width of the barrette pile, it will increase the width of the rebar cage by 6". Please note that the response to RFI B-0050 allowed for the barrette pile to be on foot longer in length. These changes will be shown on the shop drawings, to be submitted in a forthcoming submittal.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Arup does not believe that the 6" clearance will allow for a path of least resistance for the concrete to rise faster on the outside of the cage and, therefore, increase the risk of bentonite being trapped inside the cage during the concreteting operation as posited in the RFI. The rate of placement of concrete, i.e., the velocity, is very low at the perimeter. If anything, fresh concrete tends to flow around the tremie annulus. However, if SCCI believes that reducing the clearance will reduce the risk of defects, then Arup takes no exception to reducing the clearance to 4" provided there is no additional cost to the TJPA.

Is this acceptable?

| <b>From:</b> Webcor Construction LP      Claude Titcher<br><b>To:</b> Turner Construction Company Phil Militello<br><b>Co-Author:</b> Shimmick Construction Company, Inc. Jeremiah Kent |  | <b>Answered By:</b> Arup<br>Kevin Clinch |                     |                      |                      |                    |                          |

**REQUEST:**

Contract Drawing S-3191 details the reinforcement needed for the Barrettes. The current reinforcement details indicate a clear space between rebar as low as 3.75" in some areas. Per Nicholson's experience and several codes (such as EN 1534 and US FHW A), a larger clear space is recommended as small clear spaces may impede the flow of concrete inside the cage and increase the risks of concrete anomalies.

As a result, Nicholson proposes to increase the bar sizes and use anchor heads (in lieu of hooks) in order to increase the clear space between rebar. Please see attached sketches SD-02 and SD-03. Note that the section of steel remains similar in any direction in order to avoid impacting the structural capacity of the Barrette.

Furthermore, due to space constraints at the site the cage will be built in two (2) 10ft wide by three (3) 60ft long sections approximately (the length will vary depending on the reinforcement requirement by elevation). Each 10ft x 60ft section will be prefabricated and transported to the site. Two 10ft sections will be joined together to form a 20ft section. Our sketches include the required horizontal reinforcement to join the sections. The three 20ft by 60ft sections will be lifted and installed in the trench.

Please confirm the reinforcement cage proposed is acceptable.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

SCCI's proposed reinforcement layout included with this RFI is not acceptable as it does not satisfy the requirements of AASHTO LRFD Bridge Design Specifications, Fourth Edition (2007) with 2008 Interim Revisions which is the governing Code for this project as noted on drawing S-0005. According to AASHTO 5.10.6.3, #11 bars shall be tied at a maximum 6" o.c.. The proposed layout shows spacing of the ties as 10.5" and 5"-0" o.c. .

Additionally, the horizontal bars which link the two cages, as proposed by SCCI, must have hooks to develop their capacity to make them effective in resisting the applied load.

The clear spacing between reinforcement is measured and codified along a distance normal to the length of the bar, not at hooks and not at two bars crossing perpendicular to each other, which is presumably where the quoted distance of 3.75" is measured. The clear spacing between bars in the reinforcement layout on Contract Drawing S-3191 is as follows:

Horizontal distance between ties: 8.9"

Vertical distance between ties: 5.4"

Horizontal distance between longitudinal bars: 6.4"

SCCI's proposed layout included with the RFI increases the horizontal clearances by only 0.48 inches.

The reinforcement layout on Contract Drawing S-3191 satisfies the requirements of EN-1538 (we believe the standard quoted in the RFI, EN 1534, is incorrect as this standard pertains to parquet flooring) which is a reference document, not a Code that applies to this project.

Arup has worked with the Nicholson, SCCI's subcontractor, in recent days to develop alternates to their proposal which satisfy the Code, which provide the same structural capacity as the layout shown on Contract Drawing S-3191, and which increase the

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

clear spacing in the cage. The attached sketch by Nicholson, received today, is acceptable provided there is no additional cost to the TJPA or there is a credit to the TJPA as the quantity of reinforcement is slightly less and there are fewer bars to handle.

Arup takes no exception to the SCCI's proposal to use headed bars instead of standard hooks at the top of the longitudinal bars. SCCI shall refer to Specification Section 03 20 56 for project requirements when using headed bars. However, the implied reasoning for the substitution, that the hooks cause congestion and impede the flow of concrete, is spurious as these hooks are located outside the barrettes.

**REQUEST:**

SCCI has received the following RFI from VStrutural LLC (VSL):

"The contract documents for the Transbay Transit Center Bus Ramp project (ASI 150-003) specify that the steel strand for the stay cables be 0.6" diameter, 270 ksi, weldless low-relaxation seven-wire strand with fy=0.9fs, conforming to the requirements of ASTM A416. The majority of VSL's recent and ongoing stay cable projects have used or are using strand with the same overall properties, but with a slightly larger diameter of 0.62". Some of the projects using the 0.62" diameter strand include:

- St. Croix River Crossing project in Stillwater, Minnesota (ongoing)
- Tappan Zee Bridge Replacement project in Tarrytown, New York (ongoing)
- Gerald Desmond Bridge Replacement project in Long Beach, California (ongoing)

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

This is acceptable provided that the 0.62" diameter strand is tested in accordance with the project specifications and that there is no additional cost to the TJPA.

## 30100 - Transbay Transit Center Project

| <u>Number</u> | <u>Subject</u> | <u>Status</u> | <u>Date Created</u> | <u>Date Required</u> | <u>Date Answered</u> | <u>Cost Impact</u> | <u>Proceed</u> |
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

Ironton-Russell Bridge project in Ironton, Ohio (ongoing)  
Audubon Bridge project in St. Francisville, Louisiana (recent)  
A25 Bridge project near Montreal, Quebec, Canada (recent)

In addition to being more widely utilized on recent stay cable projects than its 0.6" diameter counterpart, the 0.62" diameter strand has a slightly larger cross-sectional steel area (0.2325 sq in vs. 0.217 sq in for the 0.6" diameter strand). Using the larger individual strand steel area allows for the overall steel area in a particular stay cable to be achieved using fewer strands. Using fewer strands in a stay cable allows for extra unused holes in the cable anchorages, which allows for future expansion of load capacity within the stay. VSL's stay cable anchorages are designed to use either 0.6" or 0.62" diameter strand.

To illustrate the principle described above on the Transbay project, the currently project parameters specify that VSL's 109-strand anchorages be utilized with 109 EA, 0.6" diameter strands. In this configuration, the anchorages are completely filled with strand and thus cannot allow for future expansion of load capacity within the stays. The total required steel area for each cable is:  $0.217 \text{ sq in} \times 109 = 23.653 \text{ sq in}$ . By using 0.62" diameter strands, the strand count for each anchorage could be reduced to 102 EA ( $0.2325 \text{ sq in} \times 102 = 23.715 \text{ sq in} > 23.653 \text{ sq in}$ ). Using 102 EA strands in each cable leaves seven open holes in each anchorage, allowing for a significant expansion of load capacity should the need arise in the future. As noted above, VSL's stay cable anchorages are designed to be used with either strand size, and therefore the anchorages could sustain the extra loading that would come with any future addition of 0.62" diameter strands.

As one can see from the list above, 0.62" diameter strand has also become the norm for current and recent projects that VSL has worked on here in the USA. As such, it is more readily available from domestic strand suppliers.

VSL therefore proposes to use 0.62" diameter strands on the Transbay Transit Center Bus Ramp project stay cables in lieu of 0.6" diameter strands. The 0.62" diameter strand

**REQUEST:**

As shown on the Site Logistics Plan, Submittal TG 1801-81.1, Case Pacific's mud plant and baker tank will be staged in Lot H, North of Clementina St. In order to provide slurry and water to the CIDH locations in Lots G and I, SCCI has installed trenches across Clementina St. and Tehama St. for piping. However, due to the number and type of utilities (shown on the attached excerpt from SCCI Transmittal WOJV-0001 - Utility Locates per USA North) below Folsom Street, SCCI would like to avoid trenching at this location by hanging two 4" slurry pipes from the Fremont Street Off-Ramp. Based on this, SCCI has two questions:

1. Will Cal trans allow SCCI to install hangers of any sort from the Fremont Street Off-Ramp to facilitate this work?
2. If yes, is the attached detail provided by Case Pacific (SK-1) acceptable?

SCCI will work to prevent damage to the existing structure and would be responsible for any repairs caused by these hangers.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Bashar Dayoub 9/23/14

This is SCCI & Sub Means and Methods

WO need to facilitate approval from Caltrans and City  
 We recommend to pursue this method as a last resort

**REQUEST:**

Contract drawing S-3191 indicates two openings (for two tremies) in each Barrette's rebar cage. This drawing is in conflict with Contract Specification 31 63 32 3.4 D 3 that indicates that three tremies are needed for each Barrette (one tremie for each 7 feet of wall length). Please note that the Response to RFI-0050 allowed for the length of the barrette piles to be increased from 20'-0" to 21'-0".

The European Standard EN 1538 indicates two tremies (properly spaced so that the concrete does not have to travel more than 8 feet) is sufficient for each Barrette. Additionally, in reference to RFI BRP-0055 and, in an

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

The cross tie layout documented in the response to RFI B0055 can be revised to allow room for a third tremie pipe. It is the Contractor's option to use two tremie pipes or three.

**REQUEST:**

Please review the attached sketch as it pertains to the Pylon 9 vertical reinforcing and the Barrette vertical reinforcing. Please confirm the length of the horizontal hook on the Pylon vertical bars, normally if the hook length is not specifically called out it is considered to be a standard hook (in this case 1-10).

Additionally, to avoid conflict between the Pylon and Barrette vertical reinforcing and to facilitate the setting of a pre-built Pylon cage we propose to use an HRC-555 on the outside face bundled vertical bar and turn the inside face bundled bar inward as shown in the attachment. Is this acceptable?

**SUGGESTION:**

**ANSWER:**    **Accept Suggestion:**

Kevin Clinch 10/9/2014:

The hook shown at the bottom of vertical reinforcement shall be a standard hook.

It is acceptable to use an HRC-555 on the outside face bundled vertical bar and turn the inside face bundled bar inward as shown in the attachment.

**Co-Author:** Shimmick Construction Company, Inc. Jeremiah Kent

**REQUEST:**

Please review the attached sketch as it pertains to the Pylon 9 reinforcing and the barrette vertical reinforcing. Please confirm the length of the horizontal hook on the pylon vertical bars. Normally if the hook length is not specifically called out, it is considered to be a standard hook (in the case 1'-10").

RFI B-0063 - In the original RFI CMC Rebar asked to use HRC-555 on the vertical bars. In fact, CMC's intent was to request the use of an HRC-555 on the top #11 footing bars that will pass through the Pylon vertical reinforcing. This will facilitate the installation of the top footing bars.

Is the acceptable?

**SUGGESTION:**

**ANSWER:**    **Accept Suggestion:**

Substituting an HRC-555 head for a standard hook at the top #11 bars where they pass through the pylon is acceptable provided there is no additional cost to the TJPA. Provide 3" concrete cover at the face of the head and the edge of the head. The orientation of the headed end vs the hooked end shall be staggered. Comply with the requirements of Specification Section 03 20 56.

**REQUEST:**  
 Section 3.2 A of contract specification section 31 63 30 states "The axis of the drilled hole must not deviate from plumb more than 6 inches per 00feet of length".  
 ACI 336 specification for the construction of Drilled Piers states in section 3.1.1, "Out of plumbness of piers shall not exceed 1.5%".  
 ACI 117-8 section 3 "Foundations", 3.1 "Vertical Alignment", States in 3.1.1.3, "Category C " for reinforced concrete shafts " not more than 2.0 percent of the shaft length".  
 Caltrans 2010 Standard Specification Section 49-3.02C(2) "Drilled Holes" states, "The axis of the drilled hole mist not deviate from plumb more than 1-1/2" per 10 feet of length.  
 Will 15" out of plumb vertical alignment over 100 feet of length be acceptable? The Sonic caliber device will be used to verify this requirement.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 15" out of plumb vertical alignment over 100 feet of length is acceptable.

| <b>REQUEST:</b><br>Based on Section A of Contract Drawing S-6400, the 732 Mod Concrete Barrier has indentations in the concrete, with the bottom line of the indentation showing to have a 1/2" draft. The same detail shows the other indentation lines being square which would not be able to be stripped. Attached is a drawing for a proposed form liner for the Barrier that is to be installed showing the same 1/2" draft, which is on the bottom of the indentation, all the way around the recess opening. This 1/2" draft around will allow the form liner to be stripped.<br><br>Is this acceptable? |   | <b>SUGGESTION:</b>  |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>This is acceptable.   |                      |                    |                          |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

SFMTA/MUNI will provide a revised Howard Street OCS system design including pole type, pole locations and OCS configuration of this area and also seek to locate the OCS poles so they do not move again after bus ramp construction completion.

However;

To assist the SFMTA/MUNI for the OCS system re-design , the Construction Manager/General Contractor is to coordinate delivery of appropriate Bus Ramp construction drawings at Howard Street (CADD file) to SFMTA/MUNI.

The OCS system design for construction (OCS poles, foundation, connections etc. ) is not within the scope of the Bus Ramp Project design, but are a City of San Francisco SFMTA/MUNI design. Construction Manager/General Contractor or Trade Subcontractor is to obtain the OCS pole location, pole type and foundation type and systems design from SFMTA/MUNI.

The OCS system specifications for construction (OCS poles, foundation, connections etc. ) is not within the scope of the Bus Ramp Project specs, but are a City of San Francisco SFMTA/MUNI system specifications standards. Construction Manager/General Contractor or Trade Subcontractor is to obtain the OCS pole location, pole type and foundation type and system specifications standards (SF Municipal Railway Engineering Standards) from SFMTA/MUNI.

Please also refer to Pre-Bid RFI No. TG18.1-077

Information Requested: Regarding the overhead power lines for lighting and transportation (buses): Will the lines be relocated during falsework installation and removal? What is the work window? Who is responsible for the cost of this work?

Response: If the falsework designed by the Trade Subcontractor requires OCS relocations, the Trade Subcontractor is responsible for relocations, restorations and all necessary permissions including all associated cost. If relocation is not required, existing OCS must be protected in order to uphold the safety of the public transportation system

**Co-Author:** Shimmick Construction Company, Inc. Jeremiah Kent

**REQUEST:**

As confirmed by SFDPW at the AWSS meeting, on 10/23/14, with Synergy Project Management (AWSS subcontractor), SCCI, WOJV, TCCO and SFDPW, submittals are not required for the following items:

- AWSS Dewatering Plan
- AWSS Valves and Fittings (also see attached email)

Please confirm.

**SUGGESTION:**

**ANSWER:** Accept Suggestion:

Submittals are not required for the valves and fittings. A submittal for the dewatering plan is not required at this time unless water is encountered at the site.

**B-0080 BRP - Anti Ram Barrier Specification**

**Closed**

**10/28/2014 11/07/2014 11/17/2014 Potentially**

**From:** Webcor Construction LP Claude Titcher

**To:** Turner Construction Company Phil Militello

**Answered By:** Arup Kevin Clinch

**Co-Author:** Shimmick Construction Company, Inc. Jeremiah Kent

**REQUEST:**

SENSITIVE SECURITY INFORMATION

Please see below questions from Shimmick's Anti-Ram Barrier subcontractor, FutureNet.

Question 1  
 Spec Section 28 16 34, 2.1 A 3 states "the design and structural materials of the vehicle barrier shall be the same as those used in the crash test."

Discrepancy: The original crash tested barriers are installed in dirt for a permanent in-ground installation. This project requires the barrier be installed into a bridge section. The barrier foundation will need to be modified to fit into and react with the bridge section. Dirt reacts differently than a concrete bridge section during impact and the bridge section has space restrictions. Therefore we need to provide a foundation design that varies from the original crash tested design for both fit and function.

Proposed Solution: Allow a modified foundation design, proven to absorb the minimum force via engineering calculations.

Is this acceptable?

**SUGGESTION:**

**ANSWER:** Accept Suggestion:

The response to this question contains Sensitive Security Information and is available only to individuals who have been granted access to the document that is the basis for the question.

| B-0081        | <p>Question 2<br/>                     Spec Section 28 16 34, 2.1 B. I. states "the barrier shall fail when subjected to the maximum input force."</p> <p>Discrepancy: Anti-ram barriers are not designed to fail. The industry designs to protect against a defined force and to meet or exceed that rating. No barrier company has defined a systems to fail completely. If the barrier absolutely must fail and allow a vehicle access, then we are back to discrepancy #1 which causes a variation from the barrier design as originally crash tested.</p> <p>Proposed Solution: Remove reference to barrier failure (allowing vehicle access above x weight and speed). The GRAB-300 system currently uses shear pins and energy absorption devises which may mitigate the requirement for barrier failure.</p> <p>Is this acceptable?</p> <p>For reference, please see attached cut sheet and sample drawing of a 48' GRAB-300 with standard foundation. TG 18.1 requires a 52' unit (drawings for this size are not readily available for this RFI), the foundations are identical except wider in the middle. The GRAB-300 foundation needs to be trimmed on the outside to fit the bridge section.</p> <p>WARNING: This record contains Sensitive Security Information that is controlled under 49 C.F.R. parts 15 and 1520. No part of this record may be disclosed to persons without a "need to know", as defined in 49 C.F.R. parts 15 and 1520, except with the written permission of the Administrator of the Transportation Security Administration or the Secretary of Transportation. **REQUEST:**

Spec Section 02723, 3.28, A States:

"The Contractor's Independent Testing Laboratory shall inspect and approve in writing the welds on two (2) test welded collar stops".

Following the AWSS meeting on 10/23/14, with Synergy Project Management (AWSS subcontractor), SCCI, WOJV, TCCO and SFDPW, it was confirmed that the only inspection required by SFDPW on the Sample Collar Stops (Submittal TG 1801-103) was the SF Water Department (SFWD) inspection. It was also confirmed that all SFWD inspections were to be requested through the BIM 360 IR process.

Please confirm no further inspection is required on Submittal TG 1801-103 and required SFWD testing will be arranged through the TJPA representative.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

| <p><b>REQUEST:</b></p> <p>Contract Drawing D-1007 states that the removal of the overhead sign truss on the Fremont Street Off Ramp is to be removed, including the "square pedestal post foundation". SCCI interprets the square pedestal post foundation to be the square block of concrete on top of the larger beam that extends from the bridge deck, as shown on the attached drawing. SCCI believes that this beam is intended to remain as Evans Brothers' experience has shown that these beams are tied into the bridge structure. Is this correct?</p> |   | <p><b>SUGGESTION:</b></p> |                     | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>See attached Sketch SK-D-0001 for reduced limits of demolition.</p> |                      |                    |                          |

| Contract Drawings D-1003 and D-1007 show the limits of removal of the existing Fremont Street Bus Off Ramp. SCCI would like to confirm the extent of the demolition off the off ramps concrete barrier at the limit of the demolition. SCCI believes that the concrete barrier should be removed to the limits shown on the attached picture as existing cracks in the concrete could lead to spalling if this section is not completely removed. |  |               |                          |                      |                      | See attached mark-ups to photo which was included with the RFI. Sawcut top of concrete at location indicated. Minimum sawcut depth 3". Concrete to remain, where noted on sketch, shall be protected. Cut rebar at face of sawcut line. |                          |
| Please confirm.   |  |               |                          |                      |                      |   |                          |

|   |  |               |                          |                   |                   |   |                          |

| <b>REQUEST:</b>   |  |               | <b>SUGGESTION:</b>       |                   |                   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>         |                          |
| A Quality Control inspection was performed by Nicholson on the reinforcement cage of Barrette PI. During the inspection, it was observed that 2 ea. 3"x3"x0.25" angles (which are part of the assembly to pick the cage) are welded to a total of 4 ea. #10 structural bars (2 bars on each angle). |  |               |                          |                   |                   | This is acceptable. If the coupler option is chosen, stagger the splices. |                          |
| After a discussion with ARUP, Nicholson proposes to install 4 ea. additional #10 bars 13' long to lap splice the structural bars affected by the weld. Those additional #10 bars will be centered on the weld location and installed before the Barrette is poured (see attached sketch).           |  |               |                          |                   |                   |   |                          |
| Alternatively, if the additional #10 bars cannot be supplied in time, Nicholson proposes to install Lenton mechanical couplers at the weld location.  |  |               |                          |                   |                   |   |                          |
| Please confirm this modification is acceptable.   |  |               |                          |                   |                   |   |                          |

**REQUEST:**

SCCI has made an overlay of the CIDH piles with the utility demolition drawings. It appears that there is a conflict with the CIDH at Bent 21 and a street light conduit. Please confirm. There are also no utility drawings for the area around CIDH 20A. Please investigate whether there is a utility conflict and provide utility drawings.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Updated Response 12/2/2014

Further review of project contract drawings, determine that SCCI is responsible to field verify existing utilities in the vicinity of Caltrans Substation

Please refer to Contract Utility plan sheet - U-3000 "General Notes"

\*\*\*\*\*  
 \*\*\*\*\*

This response is to confirm our verbal instruction to SCCI during the Site walk we had on Nov 24, 2014 adjacent to Caltrans Substation. Proceed potholing alleged utility conflict areas, as deemed necessary to identify exact location of underground service line adjacent to new bus Ramp Bent 20A and Bent 21. Please coordinate all work with Caltrans maintenance personal to gain access to existing manholes.

Work should be tracked on Force account and will be billed against CR B004 Unknown Utilities; additional \$5000 will be allocated to ensure sufficient funds available.

Please notify TJPA representative 24 hours prior to commencing any work. All tags for Daily Force Account Reports (T&M) are to be reviewed by both WOJV and TCCO and turned in daily per Contract.

| <b>REQUEST:</b><br>Please see below RFI from WPCS, SCCI's security and communication subcontractor.<br><br>Specification 27 1117 3.1.C. 1, requests a Cabinet to be a minimum of 1 8RU with a usable depth of 32" and sized to fit within the footprint of the guard booth. Upon looking into the B-line wall mount cabinet WPCS submitting on as an "or equal ", WPCS have looked into all the other manufactures listed as well as additional manufactures, and have found that no manufacture offers a half size wall mount cabinet with 32" of usable depth. The only way the specification can be met is if a full size 7' minimum cabinet were to be installed, however taking into account that this cabinet is being located in a fairly small guard shack, a full size cabinet will require a larger foot print and may not be the designer's intent. |  | <b>SUGGESTION:</b>       |                   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>See attached response from SMW. |                   |                    |                          |
| 1. Please confirm the specification requirements are correct. If not, please provide new cabinet dimension criteria.<br>2. If specification is confirmed, please confirm a full size   |  |                          |                   |  |                   |                    |                          |

| B-0122  | BRP - Seat Extender at Hinge 9 | Closed                                       | 12/09/2014          | 12/19/2014  | 01/06/2015           | Potentially        | <input type="checkbox"/> |
| <p><b>From:</b> Webcor Construction LP Andrew Kitchen</p> <p><b>To:</b> Turner Construction Company Phil Militello</p> <p><b>Co-Author:</b> Shimmick Construction Company, Inc. Jeremiah Kent</p>   |                                | <p><b>Answered By:</b> Arup Kevin Clinch</p> |                     |   |                      |                    |                          |
| <p><b>REQUEST:</b></p> <p>1. During the December 1, 2014 conference call to discuss the seat extender/vertical restrainer, Arup stated that the seat extender/vertical restrainer was initially intended to perform as only a vertical restrainer. As shown on the bid drawings and incorporated into OPAC's redesign, if the bridge falls off of its bearing, any deflection of the seat extender/vertical restrainer pipe would prevent the bridge from reseating on the bearing. An alternative to the seat extender would be to follow Caltrans MTD 20-22, "Seismic Design of Bridges with Isolation Bearings", which recommends that isolation bearings, such as PTFE sliding spherical bearings, have adequate sliding surface to permit 1.25 times the MCE displacement and that unseating be prevented through the use of catcher blocks at displacements higher than 1.25 time the MCE displacement. Is it acceptable to replace the seat extender component of the seat extender/vertical restrainer with bearings designed according to Caltrans MTD 20-22?</p> <p>2. As discussed and agreed upon, during the December 1, 2014 conference call, the Hinge 9 pipe vertical restrainer shown in the bid drawings and incorporated into OPAC's redesign prevents the Hinge 9 bearings from rotating as intended. Arup proposed providing a gap between the restrainer pipe and vertical restrainer assembly to allow the Hinge 9 bearings to rotate as intended. OP AC commented that a gap would allow for some uplift at Hinge 9. Arup agreed and said that some uplift maybe acceptable. We find that the vertical restrainer assembly requires a 2.5" gap top and bottom for the Hinge 9 bearings to be able to rotate the 2 degrees as specified. Is a 2.5" gap acceptable for the vertical restrainer assembly to perform as intended?</p> |                                | <p><b>SUGGESTION:</b></p>                    |                     | <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>1. This is not acceptable as the proposed solution does not provide a restraint against uplift.</p> <p>2. A 2.5" gap is acceptable for the vertical restrainer assembly. Related to this, the "WSP" dimension at the top sliding plate shown on S-6252 shall change to 30".</p> |                      |                    |                          |

**From:** Webcor Construction LP Andrew Kitchen

**To:** Turner Construction Company Phil Militello

**Answered By:** Turner Construction Company Steve Cunningham

**Co-Author:** Shimmick Construction Company, Inc. Jeremiah Kent

**REQUEST:**

Please see attached visual interpretation of the survey notes from RFI#132 of the (E) electrical duct bank at (N) Abutment 1. As noted in previously submitted SCCI's RFI # 132, per contract drawing U-1003, note 5, the existing electrical line is to be relocated by PG&E. Per Turner's direction, a survey was performed to see if removal was necessary (survey attached). SCCI believes this duct bank is above the sidewalk grade if the structure is to remain. Please confirm this line is to be relocated.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Following discussion during the Wednesday weekly progress meeting on 12/10/14. The approach to address the existing 12kv ductbank at Harrison Street Abutment #1 is as follow:

Shimmick to evaluate if they can complete demolition and install new work while protecting the existing 12kv ductbank in place? SCCI will submit their plan and cost impact for review?

SCCI plan will be submitted to PG&E to gain their approval.

Arup have confirmed that the existing ductbank does not appear to have significant impact on the structural components at Abutment #1.

|   | <p>Add'l Doc Ref: B-0133<br/>                     Location: Bus Ramp</p> <p>Per RFI Response B-0133, SCCI is not allowed to remove or trim trees on private property. SCCI has looked into available options and had certified arborists from The Professional Tree Care Company and Bartlett Tree Experts visit the site. They both refused to trim the trees at the property line due to stability concerns. They stated that these are Lombardy Poplars with soft wood, a short life span, and a tendency to drop limbs and have trunk or branch failures if the weight of the tree is shifted by significantly trimming them. The bridge cannot be built with these trees remaining in place as significant amount of branches directly conflict with the bridge structure. Please see the attached schematic and photo for reference. Please advise if the trees can be removed.</p> |   |                          |                      |                      |   |  |

**From:** Webcor Construction LP Andrew Kitchen **To:** Turner Construction Company Phil Militello **Answered By:** Turner Construction Company Jack Adams

**Co-Author:**

**REQUEST:**

Contract Doc Ref:  
 Sheet MA-0  
 Specification Section 02723

Location:  
 Bus Ramp

Add'l Doc Ref's:  
 RFI B-0139 Response

Further to WOJV's response to RFI 0139, SCCI would request to proceed with the work as follows:

1. Excavate and begin demolition of the upper abutment at the Caltrans lot. This Abutment is well clear of the AWSS line based upon the as-built drawings, USA markings, and a surface field investigation, where trench lines in the pavement are clearly visible.
2. As demolition of the upper abutment is ongoing, SCCI will pothole the AWSS near the lower abutment and sidewalk. The information gathered from this potholing will be transmitted to WOJV at this time.
3. Once it has been determined if the AWDD is far enough from the demolition work to safely remain in service, SCCI will proceed with the excavation and demolition of the lower abutment and sidewalk. If AWSS is in conflict with the excavation and demo work, SCCI will proceed with excavation and demo to th extent that is safe and practical to do so with the line remaining in service. The remainder of the excavation and demo will occur after the AWSS phase 1 removal and cap installation is complete.

SSI believes the intent of the drawings and notes to state that the AWSS system can only be disconnected for a maximum of 6 months to facilitate construction. By proceeding with the demolition and excavation work that does not affect the AWSS, SSI will be able to leave the AWSS in service longer than originally anticipated and reduce the downtime that this line must be sent out to service, which serves both the project and pubic interest.

Please advise if the above sequence of work is acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

RFI B-0139.1 Revised Response - updated 1/12/2015

Comments on the (3) proposed item work described in the original RFI

1. Acceptable.
2. Acceptable.
3. Acceptable.

This sequence is at the contractor's risk and at no cost to the TJPA. This sequence will require mitigating measures by the Contractor to ensure the AWSS piping materials required to safely restore AWSS are on-site. Also, welders, qualifications etc. are all approved and ready, if during excavation and demo AWSS damage occurs. If AWSS excavation and demo damage occurs, the start AWSS phase 1 removal and cap installation may then start with AWSS phasing as detailed on the drawings including the duration must be adhered to.

\*\*\*\*\*

This is a work sequence request and is an inappropriate use of an RFI. RFI's shall not be used for "Questions relating to construction means, methods, techniques, sequences, procedures or safety precautions."

The sequence of both demolition of the upper abutment, excavation and demolition and potholing near the AWSS at the lower abutment and sidewalk is a contractor sequence question. The sequence and scheduling of excavation and demolition of footing and the AWSS relocation is contractor responsibility. The AWSS phasing is clearly detailed on the drawings including the duration of AWSS line remaining in or out of service.

If there are questions on sequence or scheduling, this is to be coordinated by the CM/GC and Trade Subcontractor outside of the RFI process. The AWSS

| <b>REQUEST:</b><br>Contract Doc Ref: RFI B-0140<br>Location: Bus Ramp<br><br>The RFI B-0140 response directs us to the Cal trans Standard Plans ES-14C. The details on ES-14C pertain to a light weight sign structure with a 4'-0" tall EMS panel. The drawings for ES-14C appear to have the signal in the center of the EMS panel. The sign structure we are fabricating (SP-2 & SP-3) will have an aluminum sign panel that is 6'-8" tall. It appears from the project plans that the signals are located near the top of the panel, which is contradictory to Caltrans ES-14C. Based on the project plans and our experiences we would assume the centerline of the signals would be located approximately 12" to 24" below the top of the sign panel.<br><br>Please provide the location of the signal face from the top of truss or from the top of the sign panel. |  | <b>SUGGESTION:</b>                         |                   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>The location of the top edge of signal indication and associated backplate shall be placed below the top truss member and clear it. There is no exact dimension, the location of the signal backplate just needs to be clear of this member. |                   |                    |                          |

| Contract Doc Ref: 31 63 30<br>Location: Bus Ramp<br><br>Contract Specification Section 31 63 30 - Cast-In-Drilled-Hole Piles details the material and testing requirements for the bentonite slurry used in the CIDH piles. This specification states that slurry testing should be performed every two hours. Per Case Pacific's experience, the slurry in the shaft during the drilling operation will not meet the specifications per the Mineral Slurry Requirement table in Section 2.4-A-6 because suspended material created by drilling will make the slurry thicker. Therefore, SCCI and Case Pacific propose to only test the bentonite slurry in drilled CIDH shafts once the slurry has been recirculated before the concrete placement. Per Arup's previous request, slurry testing will be possible after periods of 48 hours of no drilling operation.<br><br>Please confirm that this is acceptable. |   |   |                     | <b>Accept Suggestion:</b> <input type="checkbox"/><br>This is not acceptable. The slurry shall be re-circulated, de sanded or replaced as necessary to maintain the pH, density and viscosity requirements in the specifications. Exceptions to this will be evaluated on a case-by-case basis. |                      |                    |                          |

| Please reference S-3177, S-3180, attached sketch of the pylon 9 reinforcement and draft drawing of the cable stayed bridge saddle assembly. In order to efficiently utilize the splices in the pylon 9 vertical reinforcement, SCCI proposes to shift the splice locations as shown on the attached sketch: Lower splice (near EL 64.80') will be shifted up approximately 6', and the upper splice (near EL 102.80) would be shifted up approximately 12". |  |   |                   | The splice locations as shown on the sketch included with the RFI are acceptable. Contractor to verify that no construction joints are located at the saddles as shown on S-3177. |  |                    |                          |

| <b>REQUEST:</b><br>Contract Doc Ref: 03 20 56, TG1801-345.1<br>Location: Bus Ramp<br><br>Drawing P2R1 in Submittal TG1801-345.1 - CIDH Reinforcement Cage Shop Drawing shows that the headed rebar on the Bent 8 CIDH reinforcement cages are to be HRC-555 T-Heads. Upon further review of the Contract Specifications, CMC Rebar noted that Contract Specification 03 20 45 - Headed Bar Reinforcement, Section 1.4 B states that "headed bar reinforcement must have full size heads and must be on the Caltrans Authorized Material List". HRC-555 T-Heads are on the Caltrans Authorized Material List but under the reduced size heads not the full size heads. Please confirm that the HRC-555 T-Heads are acceptable. An alternative to the HRC-555 is the HRC-120 which is on the Caltrans list and has full size heads. |  |               | <b>SUGGESTION:</b>  |                      |                      | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> |                          |  |
|   |  |               | Use HRC-120 heads.  |                      |                      |   |                          |  |

| <b>REQUEST:</b><br>Contract Doc Ref: S-6067, 03 30 06<br>Location: Bus Ramp<br><br>Data table on referenced drawings depicts a temporary tiedown at hinge 8 on the $\zeta$ seat $\zeta$ portion of the hinge. Based on the construction sequence shown in the contract drawings and current TG18.1 schedule, SCCI believes that this tiedown at Hinge 8 is not needed. It's SCCI interpretation that temporary tiedown at hinge 8 would be needed only if the frame 4 is constructed independently without frame 3 and hinge 8 to counter the "curling" effect of the frame 4 on bent 8, once falsework on frame 4 is removed. If frame 3/hinge 8 is constructed prior to completion of frame 4, as currently shown on the schedule, the tiedown at hinge 8 would not be required. Please confirm. |   | <b>SUGGESTION:</b>                    |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>If frame 3/hinge 8 is constructed prior to completion of frame 4, the temporary tiedown at hinge 8 is not required. |                      |                    |                          |

| <b>REQUEST:</b><br>Location: Bus Ramp<br>Add'l Doc Ref: Attached CMC Rebar Shop Drawing P3, attached email<br><br>Due to the taper of Pylon 9 (see attached drawing), there are 59 sets of varying diameter hoops (both resistance welded and coupled). Whereas the specifications define a Lot as 150 count or fraction thereof, of each hoop diameter, CMC Rebar's experience has been that when the design is such as to require minimal quantity of hoops in varying diameters (as in Pylon 9, quantities of 5 to 10 per diameter) each set would not be treated as an individual lot. It is CMC Rebar's position that the intent of the specifications is not necessarily based on quantity per size, rather than a means of quality control which would meet good engineering perspective. Fifty nine lots (59) on 236 hoops is clearly not the intent.<br><br>CMC Rebar proposes propose the following:<br>Welded Hoops - 140 Required - Provide sets 1 QA (4 samples), 1 QC (4 samples)<br>Coupled Hoops - 129 Required - Provide sets 1 QA (4 samples), 2 QC (8 samples)<br>Coupled Hoops - 117 Required - Provide sets 1 QA (4 samples), 2 QC (8 samples) |  | <b>SUGGESTION:</b>                    |                   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Consider each section view on drawings S-3178 and S-3179 as representative of one lot each provided the bars within a given section are from the same heat. |                   |                    |                          |

The samples to be randomly selected from the smallest diameter or as directed by the engineer. Is this acceptable?

Please note that this RFI was discussed at the 12/17/14 BRP Progress Meeting.

**Co-Author:** Shimmick Construction Company, Inc. Jeremiah Kent

**REQUEST:**  
 Contract Doc Ref: S-3215, C-4302, 33 46 06  
 Location: Bus Ramp  
  
 Contract drawing C-4302 says that the down drain pipe beneath CB #12 is per MSE wall drainage detail. Per MSE wall drainage inlet at RW10 detail on sheet S-3215, no pipe type is called out. SCCI intends to use a 3" to 4" PVC connection as is shown on sheet S-3214.

**SUGGESTION:**  
  
  
  
  
  
  
  
  
  
 Is this acceptable?

**ANSWER:** **Accept Suggestion:**   
 Use 12" diameter pipe for the down drain at CB #12.

**REQUEST:**

Location: Bus Ramp Pylon 9  
 Add'l Doc Ref: Attached email, Lenton Lock Product Data, and photos

Per the attached e-mail correspondence, and the discussion during 2/11/2015 TG18.1 progress meeting SCCI proposes to repair the damaged #10 vertical reinforcement bars using Caltrans Approved Erico International Lenton-Lock rebar couplers (see attached Caltrans authorized list of couplers for reinforcement steel). As discussed in the noted progress meeting these couplers shall be for ultimate splice condition. The only applicable coupler for this condition would be Lenton-Lock B-1 Series couplers (data sheets are attached).

Is this acceptable?

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

It is acceptable to repair the damaged bars with mechanical couplers. The mechanical couplers shall be rated as an ultimate splice.

**REQUEST:**

Contract Doc Ref: RFI B-0193  
 Location: Lot F

In recent developments, due to unsatisfactory sample couplers testing results of the Lenton Lock couplers, CMC Rebar (SCCI Subcontractor) proposes to use HRC 500/510 type couplers on the damaged vertical reinforcement in the barrette piles. All previously installed Lenton lock couplers will be replaced with HRC 500/510 coupler. HRC 500/510 coupler satisfies ultimate condition requirement and is on the authorized list of couplers for reinforcement steel.

Is this acceptable?

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

This is acceptable

piles. SCCI's subcontractor, Case Pacific, utilized the optional construction joint and made the first concrete placement to this elevation using approved mix design DDJSP8Q3 per Submittal TG 1801-301.1. Upon setting the column rebar cage in piles 5-1 and C-1 , Case Pacific then made a second concrete placement to the cut off elevation using the same mix design. Upon setting, the concrete in the second pour shrunk, lowering the elevation of top of concrete below the cut off elevation. The actual elevation vs. cut-off elevation is shown in the following:

CIDH Pile 5-2:  
 Cut-off elevation: 29.7 ft.  
 Actual elevation: 29.5 ft.  
 delta: 4.4 in.

CIDH Pile C-1:  
 Cut-off elevation: 31.8 ft.  
 Actual elevation: 31.43 ft.  
 delta: 2.4 in.

SCCI proposes to make an additional concrete placement to the cut-off elevation once the column concrete placements have been completed.

Is this acceptable?

**ANSWER:**  **Accept Suggestion:**   
 This curb need not be demolished. It may be removed at the Contractor's option. If removed, it shall be replaced when the new sidewalk is placed. If not removed, it shall be protected in place

The limits of demolition shown on the contract drawings show that a small concrete "curb" will be left behind at Harrison St South (See A/D-1100 at existing Bent B). We believe the remaining "curb section" will be in an undermined condition and not suitable for pouring the new footpath against later. See attached image for limits of

**REQUEST:**

Contract Doc Ref: 09 97 06  
 Location: N/A  
 Grid Line: N/A  
 Add'l Doc Ref's: RFI B-0174

- Following the response of RFI B-0174 please confirm the following -
1. Depth of outer surface of isolation casing to be painted?
  2. Depth of inner surface of isolation casing to be painted?
  3. Color of paint (per 09 97 06 section 2.3 A, color is to be selected by TJP A representative)?
  4. Section 09 97 06 section 2.5 is applicable for this coating?

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. The outer surface shall be painted from the top of the isolation casing to 2 feet below the cut-off elevation.
2. The inner surface shall be painted from the top of the isolation casing to 2 feet below the cut-off elevation.
3. The color of the final coat shall match Federal Standard 595B No. 36373.
4. Section 09 97 06 section 2.5 is applicable for this coating.

Contract Doc Ref: U-1003  
 Location: South of Harrison

SCCI's utility locator found a line running alongside the South Harrison sidewalk handrail toward the traffic light located at the corner of Harrison St and Essex On Ramp (please see attached images). This utility line is not shown in the contract drawings. Please advise how to proceed.

There are (2) Services in the Vicinity of sidewalk south of Harrison

(see photos attached)  
 1.Caltrans and City Signal box has been confirmed to be abandon.  
 2.High voltage Box, SCCI should seek confirmation by PG&E.

**Co-Author:** Shimmick Construction Company, Inc. Ben Gordon

**REQUEST:**  
 Contract Doc Ref: S-3177, S-3178  
 Location: Lot F

**SUGGESTION:**

See attached marked up CD S-3177 and S-3178. For the constructability purposes SCCI's Subcontractor CMC Rebar proposes to make all pile cap top mat #11 bars that pass thru the pylon 9 column in 3 pieces. The 3 pieces will be connected with HRC 500/510 coupler as shown in the referenced drawings. HRC 500/510 coupler is on the pre-approved list and satisfies ultimate condition.

**ANSWER:**      **Accept Suggestion:**   
 This is acceptable.

Is this acceptable?

| Contract Doc Ref: ASI 006<br>Location: Lot F<br><br>Attached are sketches for the Link Beams post-tension tendons. As shown in ASI 006 Drawings of the link beams, the Pjack of 1,500 kips requires a tendons size of 32-0.6" with 37-0.6" anchorage. The beam cannot accommodate a 37-0.6" anchorage due to the size of bearing plate (20 dia. With 22 diam. spiral) and the size of the blockout to stress the tendon. We propose (see sketches):<br>1. For the top Pjack of 1,500 kips , use two 16-0.6" tendons.<br>2. Place the two tendons side by side.<br>3. Increase the width of beam at the last two exterior cells to 4'-0"<br>4. Stress the two top tendons from left end and stress the bottom tendon from the right end.<br>5. Revise the C.G. of the Prestressing force at the end. If revising the C.G. requires additional force, up to 280 kips of additional force can be added to the top tendons by adding 3 strands on each tendons.<br><br>Is this acceptable? |   |                    |                     |                          |                      |  |                          |

| <p>CMC Rebar (CMC) is moving forward with the option of field installing HRC 500/510 couplers to the Barrette vertical bars which were originally repaired with Lenton Lock couplers (that failed during QC/QA testing). CMC was onsite on Saturday March 21, 2015, and brought the head forging tool for the HRC type couplers, as well as sample bars and coupler halves.</p> <p>CMC will proceed as follows:</p> <p>Using the installation method described in the HRC 500/510 coupler product data, CMC will make up 4 QC samples, 4 QA samples and 2 operator qualification samples. CMC will also make themselves access into the Mat, and remove all of the Lenton couplers from the barrettes in Pylon 9. This will be done by cutting through the bars below the couplers. At that point CMC will stop. On Monday March 23, 2015, SCCI will send off the QC samples to MRT and the QA samples to ISI, so they can get pull tested by noon. If everything passes testing, CMC will proceed to make the full repairs in the field, installing couplers and forging heads on the in place Barrette Verticals and new T-heads they have supplied using the same methods and operators used for making the test samples. They will then splice the bars and repair any bars they had to shift or move to make access to the repair areas.</p> <p>Attached is information on the HRC coupler with fabrication information/instructions.</p> <p>Please confirm the described method of repair is allowable.</p> |  |                          |                     |  |                      |                    |                          |

| Contract Doc Ref: RFI B-0034<br>Location: Folsom St.<br>Add'l Doc Ref: Attached sketches   |  |               |                     |                      |                      |   |                          |
| Please see attached sketch of the falsework vertical clearance at Folsom Street. The vertical clearance will be approximately 14'-0" at the crest of the road. Per RFI Response B-0034, SFMTA will allow a vertical clearance of 14'-2" or greater with proper signage. Per communication with V AK, this is not possible without a center median to reduce the spans. This option was not allowed per RFI responses and traffic coordination meetings with SFMT A. SCCI proposes to have a 14'-0" clearance at Folsom Street for the duration of the falsework set up at Folsom Street. SCCI will transmit a Traffic Control Plan detailing the signage for the street and will submit this for a Special Traffic Permit upon falsework erection. |  |               |                     |                      |                      |   |                          |

| Contract Doc Ref: S-2200<br>Location: Caltrans Substation, Lot A   |   |             |                     |                   |  |   |                          |
| The survey calculations and layout for the bents 20A, 21,22 and 23 was incorrect. The centers were set radial to FMT-1 and not at the bearings noted on S-2200. The theoretical out of position (not the as built position) is as follows, all South parallel to the alignment from the plan position. Bent 23 is 0.58 to the South, Bent 22 is 0.21 to the South so the span over Harrison is 0.37 shorter. This is the longest FMT bridge span in frame 1. The connection to abutment 24 would be a 0.58 longer. Bents 20A-22 as built position would result in the span 22 to 21 being 0.25 longer and 21 to 20A being .25 shorter. |   |             |                     |                   |  |   |                          |

| Contract Doc Ref: 03 70 06<br>Location: Lot F<br><br>Section 3.1 F of Specification Section 03 70 06 Mass Concrete - Bus Ramps details the requirements for the grout to be used in the mass thermal cooling pipes once thermal cooling is complete. Following this specification, SCCI attempted to pressure grout the pipes with Dayton Superior 1107 Advantage Grout. However, the grout is unable to be pumped through the pipes, probably due to the viscous consistency and the loops in the cooling pipes. To ensure complete grouting of the tubes, SCCI proposes to fill the cooling pipes with a Type II/V Portland cement and water mixed at a ratio of 5 gallons of water per 94 lb bag of cement. The product will be the same as specified in Submittal TG1801-449.<br><br>Is this acceptable? |   |                    |                     |                      |                      |  |                          |

| Contract Doc Ref: S-3173<br>Location: Lot F<br><br>Contract Drawing S-3173 shows the dimensions of the Pylon 9 column to be 9'-0"x 11'-0" at the top of the pile cap, 8'-2"x8'-4" at the bottom of the Link Beam and 8'-0"x8'-0" at the top of the Link Beam. The shop drawings for the Symons form work for the first lift (from top of pile cap to bottom of link beam) of the column match these dimensions. However, the forms were fabricated so that the dimensions of the column at the bottom of the link beam are 8'-0"x8'-0". SCCI proposes to raise the Symons formwork the thickness of the link beam (5'-0") and field build 5'-0" tall forms with dimensions that match those of the Pylon 9 column at the top of pile elevation. See the attached SK-1 for details. SCCI will use the same steel forms as previously approved and may cut the top 5' of Symons form work if conflicts with protruding conduits exist.<br><br>Is this acceptable? |  |                    |                     |                      |                      |  |                          |

**REQUEST:**

Based on the discussions at today's BSE meeting, BBII understands that the W/O's intention is to relocate the Beale Bridge from the location depicted in BBII's current submittal in order to accommodate work of future trade packages. Please provide detailed information regarding where to place the bridge, and what horizontal and vertical clearances are required. Time is of the essence for BBII to receive this additional, previously unavailable information, so the re-design process can be started as soon as possible.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Refer to TCCO response to submittal TG0300-206.1.

**Co-Author:**

**REQUEST:**

In order to construct the Beale Street Bridge per submittal: TZ1030-015313A38, it must be pre constructed in Lot N. In order to do this the overhead power lines located on the east side of Lot N must be taken down throughout the bridge deck fabrication phase and during the final installation of the deck on Beale Street. The attached drawing illustrates the fabrication area in Lot N and the location of the overhead power lines through this area. BBII will also need to acquire a section of the W/O lot to complete the bridge deck fabrication. Please confirm that these items will be resolved before the Beale Street Bridge deck fabrication commences.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Submittal TZ1030-015313A38 was returned "Not Reviewed" on 10/3/12. BBI's Beale St. bridge layout proposal is currently under review by the TJPA as RFI T-0264.7.

In response to the existing utility facilities inquiry: Contractor to follow the provisions set forth in the contract documents regarding existing utility facilities.

In response to inquiry relative to W/O lot south of parcel parcel N: Infringing on W/O's lot south of lot N in order to construct the Beale St. Bridge is a Trade Subcontractor is means and methods issue. As a result, all cost associated with this work would be borne by BBII. In order for W/O to respond relative to the logistics of this inquiry at a minimum a plan demonstrating the following would need to be provided:

-W/O's trailer complex will maintain ADA compliance. Drawing(s) should show relocated K-Rails and other

**Co-Author:**

**REQUEST:**

BBII will be relocating equipment along the North perimeter wall in Zone 3 per W/O and TCCO direction. Items to be relocated include but are not limited to dewatering header pipe, dewatering control boxes, site electrical, monitoring equipment, etc. Please see the attached photos and sketches and for approval to proceed with relocation of said equipment.

Please confirm the utility locations shown herein do not conflict with other trade subcontractors and can remain for the duration of the dewatering system.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. The direction to evacuate the Muni Hump was provided by QBD #TG0300-0162.  
 2. WOJV recommends relocating the utilities consistent with BBII's RFI #352 SK(s) 1/2 & 2/2.  
 3. While WOJV will coordinate as necessary to avoid utility relocation(s) WOJV cannot confirm the utilities may remain the duration of the dewatering system, nor is WOJV obligated to:  
 a. Specification section 31 23 19.1.3.C instructed bidders to "Locate system components to allow continuous dewatering operations without interfering with installation of permanent Work and existing public right-of-way, sidewalks, and adjacent buildings, structures, improvements and construction operations performed under this Contract or other contracts."  
 b. Exhibit-A. Section IV.C.15 instructed bidders to "he design and the installation sequence shall be coordinated with Permanent Structure construction, Temporary Structures / Equipment by other Trade Subcontractors, Internal Bracings, Access Trestle, Temporary Bridges and other structures."  
 BBII was instructed as what to anticipate as it pertains to the permanent structure reference the BSE A-series drawings.

W/O received the Division 01 specifications on 1/13/10, but did not include Division 00. Please confirm when W/O will receive Division 00. |  | <b>SUGGESTION:</b> | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Response Notes:<br>PMPC sent Division 00 to W/O on January 18, 2010.                  |                      |                      |                    |                          |

of the wall will coincide with the location of the future seismic joint, PCPA indicated yesterday (January 13th) in a conference call @ 3:00PM that the final design team recommendation is awaiting feedback from Thornton Tomasetti. We expect this decision will be made this week. The final dimensioned location will be documented in the 100% Shoring Construction Documents however it is likely that the final dimensioned location will be available sooner. The exact dimension is indicated on sheet GT-2013 of the 100% Buttress/Shoring/Excavation Submittal dated 2/26/10. The centerline of the shoring wall is 9'-7 1/2" east of Column Line 35.

Co-Author:

**REQUEST:**

Reference: AECOM Early Release Package dated 1-15-10; U-1122, Note 13; U-2023

Sheet U-1122, Note 13 calls for the water line in Fremont Street to be demolished, but not in the early package. Sheet U-2023 of the early package does call for the relocation of a small portion of that waterline between stations 4+00 and 4+50 to accommodate the shoring wall.

After review of the demolition drawings as provided by TJPA to Webcor/Obayashi for reference only, and a field review taking into account the extent of the footings we see a conflict with the (E) water line based on the location of the water line provided thru U.S.A. The footings are extensive and demolition will require shoring that will be very close to the existing water line if not on top of the line.

Please review and provide a solution. Webcor/Obayashi JV believes that a temporary relocation of that water line from station 2+50 and 4+50 is a potential solution.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Sheet U-1123 Note ER10 calls for the demolition of the existing water line between the limits of early release as shown (between STA ~3+80 and ~4+60) due to the existing water line affected by the hammer head portion of the temporary shoring wall.

Sheets U-1122 and U-1123 show the temporary shoring wall for Transbay Terminal footing demolition labeled as "TEMPORARY SHORING WALL BY OTHERS". The wall is based on information included in the Buttress/Shoring/Excavation package.

Based on the temporary shoring wall as shown in the Buttress/Shoring/Excavation package, the location of the existing water line as shown in the Program Topographic and Underground Utility Survey, and as shown on U-1122, appears not in conflict with the existing water line south of STA ~3+80.

AECOM believes that the water line may be improperly marked by CDD in response to USA ticket recently activated. Blue water line markings in the field show the water in the same alignment as the PG&E HP Gas (steel gas pipe). Based on the Transbay Program Topographic and Underground Utility Survey the existing water line should be ~3.2' west of the existing PG&E HP Gas line. Trenching work on Fremont St. at Natoma St. performed by AECOM found the water line to be 3.25' west of the PG&E HP Gas line. Additionally, visual observations made by AECOM during PG&E HP Gas work in Fremont St., it appeared that the HP Gas line was in the location as shown on the plans and there was no indication of the water line in the bell hole excavated by PG&E.

AECOM recommends the following:

PMPC/TJPA provide CAD files that show the location of the temp shoring wall for Transbay Terminal footing demolition. Confirm what is shown in the Buttress/Shoring/Excavation package is accurate. PMPC/AECOM Notify SFPUC CDD that they suspect their water line has been improperly marked and request CDD remark the existing water line.

Co-Author:

REQUEST:

Below is a list of questions that provide an overview of information Webcor / Obayashi needs clarified for the Comment Logs provided with the 100% CD Shoring. These are not the only questions we have or will have.

- 1) The "Design Team Response" comments do not appear to be final answers. For example, the Shoring comments #2 and #5 say items "will" be submitted / provided. What date will they be provided?
- 2) What date can Webcor / Obayashi expect the final response / answer for items that are unresolved (i.e. #5 on the Shoring Comment Log- "TJPA to respond", and #329 on the Buttress Comment Log - "PMPC to respond.")?
- 3) What is Webcor / Obayashi expected to do with response comments like Shoring comment #5.10 - "Alternate solutions to the buttress scheme should be considered"; and #5.12 - "Needs further discussion"?

SUGGESTION:

ANSWER: Accept Suggestion:

These comments will be addressed along with the remainder of Webcor / Obayashi Comments dated April 6th 2010 regarding the review of the 100% CD: Buttress / Shoring / Excavation - Issued for Structural Design Review.

Co-Author:

REQUEST:

In Volumes 1 & 2 of the 100% DD specifications, sections 07 18 23 and 09 27 13 have the following discrepancies:

- 1) Spec. section 07 18 23 - Vehicular Traffic Coating (02/16/10) is missing from Volume 1 of the 100%DD specifications, but is marked as issued in the Table of Contents. Please confirm spec. section 07 18 23 no longer exists, it's corresponding information has been inputted / consolidated with spec. section 07 18 00 - Traffic Coatings (02.16.10), and update contract documents accordingly.
- 2) In Volume 2 of the 100%DD specifications, section 09 27 13 - Glass-Fiber Reinforced Plaster-GFRP-Fabrications (02.16.10) is labeled as 09 27 16 in the Table of Contents. Please confirm whether spec. section #09 27 13 or 09 26 16 is correct for the Glass-Fiber Reinforced Plaster-GFRP-

SUGGESTION:

ANSWER: Accept Suggestion:

1. Confirmed - Vehicular Traffic Coatings are specified in 07 18 00. Spec Section 07 18 23 no longer exists.
2. Section 09 27 13 is correct. There is a typographical error in the Table of Contents.

**Co-Author:**

**REQUEST:**

Ref: Adamson Associates Phasing Plan, dated 2/26/10; SKA-0778 and SKA-0779; 100% Design Development drawings, dated 2/16/10; A-2203 and A-2303

**SUGGESTION:**

**ANSWER:**

Acceptable

**Accept Suggestion:**

SKA-0779 identifies the following vertical transportation areas (grids 10-11) as Phase 1 or Phase 2:  
 - Stairs 309 & 311 (serving lower concourse and ground levels) in Phase 1 (note: SKA-0778 shows these stairs constructed in Phase 2)  
 - Escalators 303 & 304 (serving lower concourse and ground levels) in Phase 2  
 - Escalators 305 & 306 (serving ground and bus deck levels) in Phase 2

It looks as if the phases for stairs 309 & 311 and escalators 305 & 306 could be reversed seeing the floors that they serve. Please confirm the phases for each area above, so we can provide an accurate 100% DD schedule.

| <b>REQUEST:</b>   |  | <b>SUGGESTION:</b> |  | <b>ANSWER:</b>  |                   |                    |                          |
| Ref: 14/SI-6092<br><br>1. The strut connecting the basket columns to the glazing sub framing is currently shown as part of the TG08.1 package. Because of structural steel tolerances of the basket columns, the length of the strut will vary depending on the final location of the basket column. The discussions have been going on for months about speeding up the fabrication and installation of the glazing system, therefore we would like to incorporate the strut as part of the TG07.1 Structural Steel package. Please confirm it is acceptable to incorporate the strut into the Structural Steel package. |  |                    |  | <b>Accept Suggestion:</b> <input type="checkbox"/><br>This request is neither an RFI nor QBD. If W/O would like to pursue this issue, please formalize a letter addressed to PMPC and route through the proper venue. |                   |                    |                          |

| <b>REQUEST:</b>   |  | <b>SUGGESTION:</b> |   | <b>ANSWER:</b>   |                      |                    |                          |
| Reference: 28 16 44 (SSI), A1-2304, A1-2306, A1-2307, A1-2302, A1-2303, A1-7402, A1-7418 from ASI 118, A1-7418 (SKA-3526) issued in ASI 119   |  |                    |   | <b>Accept Suggestion:</b> <input type="checkbox"/>   |                      |                    |                          |
| RFI response P1-0032: "Equipment and detail to be provided by the Operable Barrier manufacturer/supplier. Locations for photoelectric beam pylons identified on updated sheets A1-2302, A1-2303, A1-7402 and A1-7418 included with MEPTSc Addendum # 4, to be issued 06/20/2014."                   |  |                    |   | 1. Location of photoelectric beams are not called out on sheets A1-2302, A1-2303 and A1-2304. However, location of indicator light pylons and/or knock box and key switch + indicator light is clearly shown, (see attached). Per section 28 16 44.2.7.C, Custom Pylons describe two configurations of the pylon matching the annotations on plans. Design of custom pylon, complete with photoelectric beams and other equipment shall be provided by the Bollard Manufacturer. |                      |                    |                          |
| - Locations of photoelectric beams are not called out on sheet A1-2302, A1-2303. Provide updated details. Also provide details for sheets A1-2304, A1-2306, A1-2307.<br>- Confirm that photoelectric beam on A1-7402 is wide enough to cover the entire wedge barrier if someone is standing on it. |  |                    |   | Additionally, photoelectric beams are not shown on sheets A1-2306 and A1-2307, which describe the wedge barriers at West and East ends of the MUNI Bus Plaza, because they are not required at those locations.  |                      |                    |                          |
|   |  |                    |   | 2. Photoelectric beam shown on sheet A1-7402 does not require full width coverage of the entire wedge because of the limited accessibility by the general public and saturated video area coverage.  |                      |                    |                          |
|   |  |                    |   | 3. Sheets included with this response include [A1-2302, A1-2303, A1-2304 from ASI 0119], [A1-3100, A1-3105 from ASI 0123], [A1-7402 and A1-7418 from ASI 0121].  |                      |                    |                          |

| Detail 1 shows 6" for the topping slab, including waterproof membrane. Calculations from elevations and slab thicknesses for the Bus Deck equal 5.5". Correct this discrepancy.   |  |                    |   | The 6" dimension in question identifies the total thickness of the build-up assembly on top of the structural concrete slab. The dimension is being revised to 5 3/4" and will be issued in a future ASI.   |                      |                    |                          |

|                  | <p><b>REQUEST:</b><br/>REFERENCE: RFI Response P1-0099, Detail 1/A1-7575, Specification Section 09 21 16 3.7 F 2</p> <p>As stated in RFI Response P1-0099, "The elevator shafts interiors shall be painted."</p> <p>Specification Section 09 21 16 3.7 F 2 states that the interior faces of the shafts are to be a Level 1 finish. Per RFI Response P1-0099, the interiors of all elevator shafts are to be painted. It is not industry standard to paint a Level 1 finish. Please confirm that a Level 1 finish is to be used as a paintable surface within the elevator shafts, and provide a paint finish standard for this work (typically, a min. Level 3 finish is used for painted surfaces, and the industry standard finish requirements are based upon the drywall finish level).</p> |   |   |                      |                      |                    |                          |
|                  | <p><b>SUGGESTION:</b></p>  |   |   |                      |                      |                    |                          |
|                  | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Confirmed, we want a paint finish in the elevator shaft on the least expensive drywall finish possible (level 1). The paint is being utilized to enhance the durability of the materials in the elevator shaft. WOJV should inform the design team if there is a constructability issue here, or if paint on a level 1 drywall finish is just not pretty.</p>   |   |   |                      |                      |                    |                          |

**From:** Webcor Construction LP Zachary Moore **To:** Turner Construction Company Phil Militello **Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:**

**REQUEST:**

reference: 07 54 19 2.2A

07 54 19 2.2A specifies only Sika Sarafil Waterproofing systems, or substitute products of another manufacturer for RF-1. Webcor intends to require all manufactures be approved via QBD prior to bid. If this is not acceptable, please provide specific manufacturers and products which are acceptable to use.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

The Request for Substitution process established by TJPA and WOJV as outlined in the General Conditions specification section 00 04 40 is the process to be utilized for Bidder proposed substitutions to the Basis of Design. In the Substitution Request, the bidder shall provide the information that outlines how the product is equivalent for the JPA representative's review. The QBD process is not the correct process, because it will leave the burden for researching how the product is equivalent on the TJPA team rather than the bidder and manufacture who are the experts on their proposed products.

**Co-Author:**

**REQUEST:**

REFERENCE: RFI Response P1-0108, Specification Section 00 04 40

RFI Response P1-0108 states, "The Request for Substitution process established by TJPA and WOJV as outlined in the General Conditions specification section 00 04 40 is the process to be utilized for Bidder proposed substitutions to the Basis of Design."

Specification Section 00 04 40 states, "Contractor will be provided a period of 10 days after the date of each Trade Package award for submission of data substantiating a request for a substitution with an "or equal" item."

The specification section referenced in RFI Response P1-0108 indicates that substitutions are addressed post-bid.

Per the meeting between TJPA, PCPA, Turner, and Webcor-Obayashi on 7/17/14, the response to RFI P1-0108 is to be revised to state that the QBD process is to be used for suggested alternate materials/manufacturers pre-bid.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Your understanding is not correct. TJPA will alter Specification section 00 40 40 to adjust the current process.

| REFERENCE:<br>RFI Response P1-0114<br>Sketch SKA-3693<br>Sketch SKA-3695<br>Sketch SKA-3696<br>Sketch SKA-3697<br>Sketch SKA-3698<br>Detail 2/SKA-3538 (ASI 119 dated 6/20/14)  |   |               |   |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>1) Correct, metal plates are not required at locations noted, only concrete protection slab as indicated on SKA-3693.<br><br>2) Correct, metal plates are not required at locations noted, only concrete protection slab as indicated on SKA-3695.<br><br>3) Correct, metal plate is not required at locations noted, only concrete protection slab as indicated on SKA-3696.<br><br>4) Correct, metal plates are not required at locations noted - these are interior locations, |                          |
| Per RFI Response P1-0114:<br>1. Sketch SKA-3693 does not show metal plates at the following Gridlines: C/2 and G/4.<br>2. Sketch SKA-3695 does not show metal plates at the following Gridlines: G/9.9, G/10.1, G/12, and F/9.  |   |               |   |                      |                      |   |                          |

| <u>Number</u> | <u>Subject</u> | <u>Status</u> | <u>Date Created</u> | <u>Date Required</u> | <u>Date Answered</u> | <u>Cost Impact</u> | <u>Proceed</u> |
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

- 3. Sketch SKA-3696 does not show a metal plate at Gridline G/16
- 4. Sketch SKA-3697 does not show metal plates at the following Gridlines: D/19.9, D/20.1, D/21, D22, D24, F/19.9, F/20.1, F/21, F/22, and F/24
- 5. Sketch SKA-3698 does not show metal plates at any location.

However, Sketches SKA-3693, SKA-3695, SKA-3696, and SKA-3697 show metal plates are to be installed at significant amounts of similar conditions.

Please note Detail 2/SKA-3538 of ASI 119 shows metal plates at GL G/10.1 but steel plates are omitted on Sketch-3695 at this location

Please confirm that only locations identified as having metal plates on Sketches SKA-3693, SKA-3695, SKA-3696, and SKA-3697 require metal plates.

Protection Slab plans refer to perimeter and exterior conditions only.

5) Incorrect - SKA-3698 shows a metal plate all along GL 34.8 and 35, from A through J.

Note: Details are typical and protection slab drawings show extent of metal plate and concrete protection slab at the ground level based on depth of landscape finishes or roadways. Locations as identified on the sketches noted indicate where metal protection plates are required.

**Co-Author:**

**REQUEST:**

Reference: 07 13 55 2.1

07 13 55 2.1 does not provide a specific manufacturer for thermoplastic water tank liners. Webcor intends to require all manufactures be approved via QBD prior to bid. If this is not acceptable, please provide specific manufacturers and products which are acceptable to use.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Manufactures that meet the Performance requirements specified in the referenced specification section are acceptable. The successful bidder shall submit the product the meets the specification requirements as a shop drawing submission.

The QBD process is not the correct process for determining quality of products. If WOJV wants to vet products during the bid process, than utilize the Request for Substitution process established by TJPA and WOJV as outlined in the General Conditions specification section 00 04 40.

**REQUEST:**

REFERENCE: RFI Response P1-0118, Specification Section 00 04 40

RFI Response P1-0118 states, "The Request for Substitution process established by TJPA and WOJV as outlined in the General Conditions specification section 00 04 40 is the process to be utilized for Bidder proposed substitutions to the Basis of Design."

Specification Section 00 04 40 states, "Contractor will be provided a period of 10 days after the date of each Trade Package award for submission of data substantiating a request for a substitution with an "or equal" item."

The specification section referenced in RFI Response P1-0118 indicates that substitutions are addressed post-bid.

Per the meeting between TJPA, PCPA, Turner, and Webcor-Obayashi on 7/17/14, the response to RFI P1-0118 is to be revised to state that the QBD process is to be used for suggested alternate materials/manufacturers pre-bid.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Your understanding is not correct. TJPA will alter Specification section 00 40 40 to adjust the current process.

| The contract documents show fire blankets within the ceiling space at several locations. Are these part of the rated seismic joint assemblies? The seismic joint assemblies note that the assembly must have a "fire barrier", but does not identify the barrier as a "fire blanket." If the "fire blanket" is the "fire barrier" identified in 07 09 13, please remove/revise the language on the drawings to match the specification. If this is an added material to be furnished and installed separately, please provide a spec., extent, and details for the fire blanket. |   |                    |   | The Fire Blanket is part of the seismic joint assembly. The annotation has been revised to match the Specification. Refer To SKA-3692.  |                      |                    |                          |
| This affects TG16.1 Framing/Drywall and/or TG07.8 Expansion Joints. Please provide the requested information so as not to impact the bidding schedule.   |   |                    |   |   |                      |                    |                          |

|                | 1.9 B requires that relative humidity in the area of work does not exceed 55% humidity for the duration of the project. The average relative humidity for San Francisco is above 55% for +80% of the year (and those days below 55% are intermixed between days above 55%). By this standard, we would need to scaffold, shrink wrap, rent air conditioners/dehumidifiers and run them for several years until substantial completion. Please rewrite this requirement to follow the manufacturer's written recommendations.   |   |   |                      | Specification Section 09 80 00 1.9 B shall be revised to state: "Ensure manufacturer's written installation requirements for ambient conditions are met." |  |   |

| <p>From: Webcor Construction LP      Zachary Moore</p> <p>To: Turner Construction Company Phil Militello</p> <p>Co-Author:</p>   |                | <p>Answered By: Adamson Associates, Inc. George Metzger</p>   |                     |                      |                      |                    |                          |
| <p><b>REQUEST:</b></p> <p>reference: 07 13 54 1.8 A 2</p> <p>Per 07 13 54 1.8 A 2, the roofing subcontractor must be prepared to cover unfinished work with temporary covers in the event of an unexpected rainfall. Per 07 13 54 1.8 B, the roofing subcontractor must leave the building in a completely watertight condition at the end of each day, and make unfinished work watertight. Based upon these requirements, Webcor will be requiring the roofing subcontractor to protect the entire area of the roof until it is completely watertight. This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.</p> |                | <p><b>SUGGESTION:</b></p> <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>The referenced specification section 07 13 54 / 1.8.A2 states "Be prepared to cover unfinished work with temporary covers in the event of an unexpected rainfall." The statement does not state that the entire area of the roof shall be covered every night. This is required to prevent damage to the incomplete ongoing waterproofing work, which might result from issues such as water entrapment within the system.</p> <p>Specification section 07 13 54 / 1.8 B will be revised in a future ASI to delete the requirement that "At the end of each day, leave the building in a completely watertight condition." WOJV has bid manual</p> |                     |                      |                      |                    |                          |

Per the contract documents, WPM-3 is to be used at the roof park level below grade. Per 07 13 54, WPM-3 is Sika Sarnafil Waterproofing System PVC G476-20. Per the product data for Sarnafil PVC G476 (see attached), WPM-3 can be exposed for a maximum of 3 months. Based upon this limitation Webcor will be requiring the waterproofing subcontractor to protect the waterproofing permanent overburden (foam fill, soil, rock, etc.) can be installed. This may lead to substantial added cost to the project. Please confirm that this is acceptable, or revise the contract documents to a product which can be exposed for an extended duration.

See Application specification section 07 13 54 / 3.3 that states "The waterproofing sequence in general shall be as follows: install the first ply of the membrane to serve as temporary waterproofing until the building is ready to receive the overburden at Park level. Following installation of ..... Additional protection in areas where construction will occur above the membrane will be installed and removed by other contractors."

The Contractor is responsible for means and methods of construction and scheduling the interaction of trades to complete the work. The contractor shall determine the most cost effective means of water management during construction to reduce project costs. The suggested construction phase water management process outlined in specification section 07 13 54 can be altered as desired by the Contractor to reduce costs and coordinate with the Contractor's means and methods. The completed waterproofing system, testing, etc. shall comply with 07 13 54 and the drawings in the Contract Documents (e.g. waterproofing detail 7/A1-8851).

**REQUEST:**

reference: 07 54 19 1.9 A 5

Spec Section 07 54 19 1.9 A 5 requires "at the end of each day, leave the building in a completely watertight condition. Make unfinished work watertight." This requirement will require the tenting of the entire building in order to make the building and unfinished work "watertight." This may add substantial added costs to the project. Please confirm this is the desired requirements, or revise the contract documents.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The following sentence; "...at the end of each day, leave the building in a completely watertight condition. Make unfinished work watertight." Will be deleted from Spec Section 07 54 19 1.9 A 5. You are correct, construction phase weather protection is a means and methods issue.

WOJV shall review this changed specification in relation to the Bid Manual and adjust the Bid Manual as required. The Bid Manual previously stated: "It shall be the responsibility of the Trade Subcontractor to take all measures to protect Work from inclement weather, including that determined by WOJV, until completion of the work and acceptance by the Owner." and "In the event that the building requires weather protection and rain water control, Trade Subcontractor shall furnish and install all weather protection as required for Work to continue unabated and will be liable for damage to other Work or costs for weather protection installation due to Trade Subcontractor's failure to timely or properly install weather protection." We also don't believe your text is intended to require each individual trade subcontractor to fully tent the building each day or even on a rainy day.

| <b>REQUEST:</b>   | Reference: 4/A1-0022<br><br>4/A1-0022 indicates that a "CC" accompanies the CMU wall symbol if a concrete curb is to be erected below the wall. 1/A-0025 indicates that typical CMU walls do not have curbs. 2/A-0025 indicates that if a CMU wall is on a sloped slab, a curb is typically required below the CMU wall. Enlarged floor plans in architectural plans do not typically show a concrete curb below CMU walls (i.e. no "CC" adj. to the symbol). Typical structural details (1 & 2/S1-9001) show concrete curbs at all CMU walls. Are all CMU walls supposed to receive concrete curbs or only the ones identified on architectural plans? | <b>SUGGESTION:</b> |  |                      | <b>ANSWER:</b>   | <b>Accept Suggestion:</b> <input type="checkbox"/> |                          |
|                   |   |                    |  |                      | Not all CMU walls have concrete curbs. The CMU walls that have a concrete curb have annotation "CC" specified on their wall tag. These walls, with their wall tags, have been illustrated on the architectural zone plans.<br><br>S1-9001 illustrates curbs for CMU walls, where they exist. |  |                          |

| reference: S1-2502, A1-2892, A1-9532   |                                 |                    |   | <b>Accept Suggestion:</b> <input type="checkbox"/>  |                      |                    |                          |
| Per S1-2502 and A1-2892, the structural slab extends 1'-7" south past GL H to meet the bus bridge. Per A1-9532 the bus deck topping slab stops 3'-4" north of GL H. This will leave a 4'-11" area with no topping slab between the bus deck and bus bridge. Please revise the drawing to show the desired condition.   |                                 |                    |   | Topping extents revised per attached SKA-3723 based on sheet A1-9532. Refer also to details 2 & 3/A1-8378 previously issued, for extent of slab and bus bridge interface.                                     |                      |                    |                          |

| attached: S-6113   |                                 |                    |   | <b>Accept Suggestion:</b> <input type="checkbox"/>  |                      |                    |                          |
| Per the bus bridge plans S-6113, a 2' wide piece of expansion material is to be inserted between the bus bridge and bus deck. This does not appear to be a waterproof assembly, and may leak onto the building/people below. Please confirm this is acceptable.  |                                 |                    |   | See detail 3 on A1-8378 for the waterproof joint assembly at the Bus Deck to Bus Ramp transition. Waterproofing details will typically be found in the architectural drawings and not on structural drawings. |                      |                    |                          |

issued in a future package."

RFI Response P1-0166 indicates that documentation for pre-fabricated booths will be issued in a future package. The work around the pre-fabricated booths is not included in the same bid package as the pre-fabricated booth. Please provide the information regarding structures supporting the pre-fabricated booths.

**Co-Author:**

**REQUEST:**

Reference: 05 15 21

Per 05 15 21 Steel Castings (see attached), steel castings (most notably the cast nodes) are to be furnished as bare metal. This was confirmed in the construction issues meeting held on 04/17/14 (see attached), with the indication that coating of the bare metal is to be included in TG16.5 Painting. 09 97 16 High Performance Coatings - Superstructure Package (see attached) identifies a coating system for exterior exposed factory-primed metal surfaces, and a coating system for galvanized steel, but not a coating system for exterior exposed unprimed/non-galvanized metal surfaces. Please provide the coating system for all unprimed/non-galvanized metal surfaces.

Revised: IFC Set 09 97 15 2.5 B calls out for "Shop Primer" in the "Coating System for Exposed Unprimed and Non-Galvanized Steel Surfaces." Based on this information the painter (who is not under contract yet) would need to go to the steel erector's shop to prime the steel (which is currently in production) with the materials called out in 05 10 00 and 05 12 13. Based on the current schedule, the unprimed/non-galvanized steel will be erected before the painter is under contract. In addition, adding priming of these surfaces to the steel scope of work would negatively impact the delivery and erection schedule of steel. Please revise the spec to provide priming of unprimed and non-galvanized metal in the field,

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Per specification section 09 97 16, part 1, 1.1, A.1; all AESS are to receive high performance coatings. Per specification section 05 10 00 part 2, 2.2, A and 2.2, C indicate all structural steel is to be either primed or galvanized; there is no exception for the cast steel items. Shop Primer is required as specified.

The specifications are intended to be read as a whole and as such, specification section 05 15 21 only speaks to the fabrication of steel castings, a sub-set of structural steel which is governed by section 05 10 00.

| <b>From:</b> Webcor Construction LP | Tram Nguyen  | <b>To:</b> Turner Construction Company Phil Militello | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |                   |                   |                    |                          |

**Co-Author:**

**REQUEST:**  
 REFERENCE: (All Attached)  
 - RFI Response P1-0169  
 - Specification Section 05 10 00 (IFC Drawings for Main Package dated 3/31/14)  
 - Sheet S1-1023  
 - Submittal TG0701-99C.1

**SUGGESTION:**

Per RFI Response P1-0169 (Attached), cast nodes are governed by Specification Section 05 10 00 (Attached), and shall be shop primed.

- Per Specification Section 05 10 00 3.2 P 1 (See attached Specification Section 05 10 00), "Unless otherwise specified in Section 3.2.P.3, shop prime all structural steel..."

- Per Specification Section 05 10 00 3.2 P 3 d (See attached Specification Section 05 10 00), "Surfaces requiring preheat are not to be primed until preheat has been performed."

- Per structural drawings (Example Sheet S1-1023 attached) cast nodes are to be field welded to the adjacent tube columns.

**ANSWER:** **Accept Suggestion:**

WOJV, Turner, and TJPA shall address the questions related to scope of work in the current construction Contract.

The cast nodes are to exhibit a final finish that is completely primed when the welding, grinding and installation is complete with no schedule or cost impacts. The finish is to adhere to the final finish standards for the cast nodes that were established during a series of meetings between the Design Team and Bradken, less the shop prime coat.

In order to weld the cast nodes to the adjacent tube columns, the cast node must be preheated as confirmed in the reviewed welding procedure from Submittal TG0701-99C.1 (Attached). Since surfaces to be preheated are not to be shop primed, base contract documents explicitly mandate that cast nodes are not to be primed until after welded in the field.

Please confirm TJPA intends to add shop priming of cast

**REQUEST:**

Reference: P1-0184, 8/S1-6010, and 1 and 2/S1-6020

RFI P1-0184 Response: "Detail 8/S1-6010 does not show a bearing support, the detail shows a cross section of the structural steel.

The detail has been updated to add more dimension lines to clearly indicate that 8/S1-6010 does indeed match the details 1/S1-6020 and 2/S1/6020. This will be issued in a future Addendum.

The bearing itself is described in great detail in the specification section on drawing S1-6020. "

P1-0184.1: Response to P1-0184 refers to a revised detail to be issued in a future bid package. The detail is required to accurately bid the associated trade package. Please provide the revised detail referenced in the RFI response.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Updated drawings will be submitted with ASI 0120 dated July 11, 2014.

| <b>REQUEST:</b>   |  |               | <b>SUGGESTION:</b>  |                      |                      | <b>ANSWER:</b>   |                          |
| Reference: IFC Set 07 81 23 2.4 C   |  |               |   |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Specification 07 81 23 2.4 C is correct. The topcoat or finish coat of steel members fireproofed per 07 81 23 shall adhere to the paint systems specified on 09 97 15.   |                          |
| Per IFC Set 07 81 23 2.4 C, the decorative top coat for intumescent paint is as specified in 09 97 15, and the custom color is to be selected by TJPA. There does not appear to be a system for top coating intumescent paint specified in 09 97 15, nor a color shown for the finish. Please specify the top coat material, and color. |  |               |   |                      |                      | The specified epoxy intumescent coating system is compatible with a wide variety of paint system top coats. Additionally, the contractor shall comply with 09 97 15 1.3 B and 2.3 A and 2.3 B.   |                          |
|   |  |               |   |                      |                      | The colors will be indicated in the drawings in upcoming ASI.  |                          |

| Reference: Detail 1 / A1-7844. Detail 1 shows a future W5 Wall Cladding (as part of Phase 2) which will be attached to a train platform partition (partition type 31 as part of Phase 1). Specification 09 22 19 requires that the metal framing of the partition be designed by the Trade Contractor. Is the trade contractor to include the loading of the future W-5 cladding in his design calculations for the metal framing? If so please provide the loading of the future W-5 cladding to be used in the design calculations. |  |               |   |                      |                      | 1. The trade contractor is responsible to include the loading of the future W-5 cladding in his design for the metal framing.<br><br>2. For loading requirements of the future W-5 cladding system to be used in the design calculations for metal framing, refer to specification section 08 44 39 under 2.3 Design Criteria. |                          |

| Per 1/A1-8894 FJC3A is to be installed at the bus deck level guardrail, and to refer to specification. 07 09 15 indicates that FJC3A is specified in 07 09 13. 07 09 13 does not indicate the manufacturer, type, gutter, or integration into FJC3. There does not appear to be details showing extent of FJC3A, or tie-in to adjacent expansion joints. Please provide omitted specification and drawing information.  |  |               |   |                      |                      | See specification section 07 09 13 / 3.4 C & D: "Moisture Barrier: Manufacturer's standard modified as shown on drawings."   |                          |

**Co-Author:**

**REQUEST:**

Reference Specification Section 08 44 27 Section 2.2N (TG08.2 Issued for Rebid Documents)

Please confirm that noise due to wind moving through the patterns cut out in the Aluminum Panels of the Exterior Awning and through the gaps between the panels Exterior Awning and noise due to wind moving above and below the entire system is not to be considered an unacceptable condition. The contractor is providing the pattern per the contract documents and they will have no control over any noise due to wind moving through the predetermined pattern, gaps between each panel and wind moving above and below the entire system. The contractor should only be responsible for noise due to vibration caused by poor workmanship and should not be responsible for any noise due to the inherent design of the W-1 Exterior Awning.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

**Co-Author:**

**REQUEST:**

Reference 08 44 27 3.10 F.1.b Specification Section 08 44 27 calls for touchup so that repair is invisible from a distance of 2 ft. According to PDCA P1-04 TOUCH-UP PAINTING AND DAMAGE REPAIR (see attached), Section 2.3 states: "...In order to determine whether a surface has been "properly painted" it shall be examined without magnification at a distance of thirty-nine (39) inches or one (1) meter, or more, under finished lighting conditions and from a normal viewing position."

Based on PDCA recommendations, anything less than 39 inches may result an unnecessary increase in cost to the bids. Additionally, the nearest normal viewing position of the final constructed awning will be several meters. Please confirm that the 2 ft. requirement is to remain.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**   
 Confirmed, follow the Contract Documents.

**Co-Author:**

**REQUEST:**

REFERENCE: Sheet A1-9522 (Attached), Specification Section 03 30 03 (IFC Drawings for Main Package dated 3/31/14)

Per the notes on Sheet A1-9522, the concrete topping slab in the following locations are to be provided with the required thickness and as described by the structural engineer in Specification Section 03 30 03:

- Train Platform & Lower Concourse Level
- Vehicle and Bicycle Ramp
- Bus Deck Level Topping & Curbs
- All Other Concrete Toppings

No documentation is provided for Specification Section 03 30 03. Please provide the specifications for section 03 30 03.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The notes on the drawings have been revised from "section 03 30 03" to read "section 03 30 02". Refer to the attached SKA-3750 which reflects updated Trainbox topping slab notes. This amendment is applicable to drawing sheets# A1-9520, A1-9521, and A1-9523 to A1-9537.

**Co-Author:**

**REQUEST:**

REFERENCE: RFI Response P1-0230

Per RFI Response P1-0230, topping slab concrete is to be as specified in Specification Section 03 30 02. Per Specification Section 03 30 02, all concrete mixes, excluding the concrete fill at basket columns, have a 3/4" aggregate.

In several locations (Train Platform Level GL 2 - 4 and GL A - F for example) show the topping slabs sloping to zero thickness. This condition will not allow the use of aggregate or reinforcing as noted on the revised sheets in the response to RFI Response P1-0230.

Please provide details and specifications for sloping of concrete to zero thickness.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

For typical detail for concrete at the small ramps, refer to Structural detail 5/S1-5003.

|--|---------------------------|--|
| <p><b>Co-Author:</b></p> <p><b>REQUEST:</b><br/>Reference: L-0006 and L-0007</p> <p>While sizing the maximum load for the rooftop cranes it was communicated by PWP and TT that the maximum tree size will be no greater than 25,000 lbs and that the roof is designed for a maximum of 26,000 lbs. Confirm that the structure will be able to accommodate the additional tree weight which will incur over the years as the trees grow.</p> | <p><b>SUGGESTION:</b></p> | <p><b>ANSWER:</b>    <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>TT Response:</p> <p>The roof structure was designed for the tree weights given to us by PWP during the course of the design. It was noted that the tree weights are the "average" weight of the mature tree. For seismic design, the "average" tree weight was used, because the floor slab diaphragm will distribute the weight of all trees to the seismic force-resisting system. For gravity design of steel beams carrying the tree, a factor of safety of 2 is applied to the "average" weight to account for the situation when a specific tree outgrows the "average" weight. The tree weight for the seismic design and gravity design is tabulated in the contract document Detail 2/S-1013.</p> <p>PWP Response:</p> <p>The "average" size of tree materials was determined by species and available soil volume (growing medium).</p> |

**Co-Author:**

**REQUEST:**

reference : ASI 121: A1-2870, A1-2862, A1-2864, A1-2866, and A1-2867

RFI P1-0241 response: "Refer to Edge of Slab sheets in ASI-0121 issued on 07/18/2014. Design Team does not assign scope for Trade Groups."

Edge of Slab sheets do not show block outs for bollard and barrier hydraulic and electrical lines to each of the HPUs as was discussed in RFI meeting on 05/23/2014.

- A1-2870 - Provide sleeves or blockouts for retractable bollards and barriers in the shoring wall area at vehicle ramp so that hydraulic and electrical lines may reach the HPU.

- A1-2862 - Provide sleeves or blockouts for retractable bollards and barriers at GL 1 and Natoma St. so that hydraulic and electrical lines may reach the HPU.

- A1-2864 - Provide blockout and/or sleeves for Natoma loading dock area so that hydraulic and electrical lines may reach the HPU.

- A1-2866 and A1-2867 - Confirm that 4" SL's on GL 27 and 343.5 are for the wedge barrier hydraulic and electrical lines to reach the HPU below. If not, provide sleeves or blockouts so that hydraulic and electrical lines may connect to the HPU.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Refer to sheets A1-2852, A1-2862, A1-2864, A1-2866 and A1-2867 issued with ASI# 0123 on 08/06/2014. Also refer to attached SKA-3432 (based on sheet A1-2870).

**Co-Author:**

**REQUEST:**

REFERENCE: Sheet A1-3105 (IFC Drawings for Main Package dated 3/31/14)

The "Corner Guards by Misc Metals" called out on Sheet A1-3105 are referencing Specification Section 05 51 00. Specification Section 05 51 00 is for Steel Stairs and Railing.

Please confirm that the "Corner Guards by Misc Metals" should be referencing Specification Section 05 50 00 for Metal Fabrications.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Confirmed, corner guards are referenced in Specification Section 05 50 00 Metal Fabrications.

Co-Author:

REQUEST:

Reference: ASI 118, 119 and A1-7420 (SKA-3528)  
 There are discrepancies between ASI 118 (Addendum #4) and ASI 119 for this sheet. ASI 118 and 119 are both dated 06/20/2014. Confirm that ASI 119 is meant to take precedence. It does not appear to be the most current version.

SUGGESTION:

ANSWER:

Accept Suggestion:

Per request of WOJV and PMPC, all VE items issued in ASI 0118 (MEP/TE/SE/VT Issued for Bid Addendum 4) which were not related to MEP package were provided in ASI 0119. ASI 0119 is a combination of "VE Round 2" and "MEP/TE/SE/VT Issued for Bid - Addendum #4". This sheet - A1-7420 (SKA-3528) is the same sheet in each package. This is noted on the revision narrative provided with ASI 0119.

Per specification section 01 10 40 / 1.6 C.2.d "RFIs shall not be used for the following: the TJPA will not reply and will reject the RFI: d. Questions on contract administration procedural matters, unless they required interpretation or clarification of the Contract Documents." This questions relates to a contract administration procedural matter that WOJV jointly determine and assisted in providing direction on how the documents were to be issued and labeled. WOJV has not coordinated knowledge of this matter between the internal parties. WOJV shall void this RFI and Turner shall reject the RFI.

Co-Author:

REQUEST:

Reference: ASI 118 and 119 - A1-7420 (Detail C), A1-7420 Detail C - Indicator light pylons and photo electric beam pylons are missing from either side of the retractable bollard sets based on A1-7418 and 28 16 44. Confirm that indicator light pylons and photo electric beam pylons are intended to be included in this detail and provide an updated detail.

SUGGESTION:

ANSWER:

Accept Suggestion:

Confirmed, indicator light and photo electric beam pylons are included. Refer to the attached sketches SKA-3903 and SKA-3904 showing indicator light pylons and photo electric beam sensors.

**REQUEST:**

REFERENCE: Specification Section 05 50 00 2.5M (IFC Drawings for Main Package dated 3/31/14)

Specification Section 05 50 00 2.5M states: "M. Corner Guards For Concrete Columns/Concrete Block Walls: as detailed, 4' x 4" x ½" fabricated aluminum angles, 4'-0" high minimum and as shown on drawings with anchor straps at 12" o.c."

The referenced details do not appear to be provided. Please provide the details called out in Specification Section 05 50 00 2.5M.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The corner guards are indicated in the Ground Floor Loading docks, refer to drawings A1-3100 and A1-3105 and at the B1 Level Oversized Equipment Storage Overhead Door, refer to drawings A1-7426 and A1-7427.

Per specification section 01 10 40 / 1.6 C.2.f "The TJPA will reject requests for interpretations or clarification of the Contract Document which can reasonably be derived from a review of the Contract Documents."

Turner shall void this RFI and delete it.

**REQUEST:**

Reference: 28 16 44 1.2.A ASI 119

1.2.A states that "Contractor is responsible for having the manufacturer of the product on site during the installation process to monitor the work associated with their product." Clarify how many hours the manufacturer needs to be on site. Is the Contractor required to have the manufacturer on site full time?

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The Manufacturer shall be the entity that determines how much time they require for their representative to review the work to certify the installation.

Co-Author:

**REQUEST:**

Reference: ASI 118, 119 and A1-8720 (SKA-3542)

There are discrepancies between ASI 118 (Addendum #4) and ASI 119 for this sheet. ASI 118 and 119 are both dated 06/20/2014. Confirm that ASI 119 is meant to take precedence. It appears that neither ASI on its own is the most current for this sheet. Provide a revised sheet incorporating the most current information.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Per request of W/O and PMPC, all VE items issued in ASI 0118 (MEP/TE/SE/VT Issued for Bid Addendum 4) which were not related to MEP package were provided in ASI 0119. ASI 0119 is a combination of "VE Round 2" and "MEP/TE/SE/VT Issued for Bid - Addendum #4". This sheet - A1-8720 (SKA-3542) is the same sheet in each package. This is noted on the revision narrative provided with ASI 0119.

Per specification section 01 10 40 / 1.6 C.2.d "RFIs shall not be used for the following: the TJPA will not reply and will reject the RFI: d. Questions on contract administration procedural matters, unless they required interpretation or clarification of the Contract Documents." This questions relates to a contract administration procedural matter that WOJV jointly determine and assisted in providing direction on how the documents were to be issued and labeled. WOJV has not coordinated knowledge of this matter between the internal parties. WOJV shall void this RFI and Turner shall reject the RFI.

Co-Author:

**REQUEST:**

Reference: ASI 118, 119 and A1-8721 (SKA-3543)  
 There are discrepancies between ASI 118 (Addendum #4) and ASI 119 for this sheet. ASI 118 and 119 are both dated 06/20/2014. Confirm that ASI 119 is meant to take precedence. It appears that neither ASI on its own is the most current for this sheet. Provide a revised sheet incorporating the most current information.

**SUGGESTION:**

**ANSWER:** Accept Suggestion:

Per request of WOJV and PMPC, all VE items issued in ASI 0118 (MEP/TE/SE/VT Issued for Bid Addendum 4) which were not related to MEP package were provided in ASI 0119. ASI 0119 is a combination of "VE Round 2" and "MEP/TE/SE/VT Issued for Bid - Addendum #4". This sheet - A1-8721 (SKA-3543) is the same sheet in each package.

Per specification section 01 10 40 / 1.6 C.2.d "RFIs shall not be used for the following: the TJPA will not reply and will reject the RFI: d. Questions on contract administration procedural matters, unless they required interpretation or clarification of the Contract Documents." This questions relates to a contract administration procedural matter that WOJV jointly determine and assisted in providing direction on how the documents were to be issued and labeled. WOJV has not coordinated knowledge of this matter between the internal parties. WOJV shall void this RFI and Turner shall reject the RFI.

2.8.D.2 states "Any features not able to operate in a virtualized server environment shall be described as an exception by the Contractor as a part of the Contractor's bid." Since exceptions are not allowed in any bids for this project and would render the bid invalid, the statement needs to be removed.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

The last sentence in Specification Section 28 16 44, paragraph 2.8.B.4 the reads: "Any features not available through the API or SDK interface shall be described as an exception by the Contractor as part of the Contractor's bid." shall be deleted.

A revised specification section will be issued in ASI 127.

2.8.B.6 states that "The Contractor shall furnish the API or SDK to the Construction Manager at the time of system procurement. Any updates to the API or SDK shall be provided to the Construction manager at the time of release throughout the lifecycle of the project." "Construction Manager" needs to be replaced by "TJPA".

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

The term "Construction Manager" shall be revised to "TJPA Representative."

Provide sequence of operation for Bus Plaza Anti-Ram Barriers and their integration with the traffic control system, including but not limited to, types of output required (when does the traffic light change color, which traffic light changes color for each barrier, what stage of barrier operation aligns with each output) and extent of interaction with traffic lights. For example, do lights at Howard and Mission street change color depending on status of lights at the Bus Plaza Anti-Ram Barriers?

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

- Control system to provide an output to the traffic control system in Section 34 41 13 to indicate barrier deployment.
- The barrier control system will trigger a relay associated with the specific lane/barrier that the operator is controlling for an outbound bus.
- The traffic lights controlling the flow of traffic on the public street is to begin their sequence to stop traffic (e.g. turn red).
- After the traffic light has indicated vehicles on the public street are to stop, the light associated with the lane of the exiting bus shall change state to indicate to the bus operator that they can proceed.
- After the bus clears the barrier, the barrier operator will trigger the system via the control to change the bus exit light to red.
- Once the exit light is red, the barrier is to rise to the secure position and the traffic light associated with the vehicles traveling on the public roadway is to reset to indicate that vehicles can proceed.
- Final sequence operations to be coordinated with the Owner's security concept of operations and with the traffic light control system contractor.

3.5.L. - Provide time period required before vehicle barrier should automatically rise.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

A vehicle barrier shall automatically raise if the barrier up loop has not been activated within fifteen (15) seconds. This shall be a base design parameter and is to be field coordinated during operational testing.

**REQUEST:**  
 REFERENCE: RFI Response P1-0227, Sketch SKA-3736.4, Detail 2/A1-8885 (ASI 118 dated 6/20/2014)  
 Per RFI Response P1-0227 received on 07/10/14, FJC8 is to be furnished and installed between the W-13 and terrazzo flooring at Ground Level GL 23 (see SKA-3736.4).  
 Per ASI 118, Detail 2/A1-8885 received 07/07/14, FJC8 is located at the vehicle/bicycle ramp.  
 Please clarify the type and specification of FJC8 located at the vehicle/bicycle ramp.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 Seismic joint type FJC8 at the Vehicle Ramp has been renamed FJC9, see enclosed SKA-3926. Joint Schedule in A1-8880 and Specification 07 09 13 seismic joint assemblies will reflect the added joint type. This will be issued in ASI 127.

**REQUEST:**

REFERENCE: Sheet A1-2207 (ASI 118 dated 6/20/14)

Sheet A1-2224 of ASI 118 calls out concrete curb types at the following locations:

GL 14/G, GL 19/C, GL 24/H, GL 31/F.7, GL 32/C, and GL 32/G

The concrete curbs at the above locations are depicted with dashed lines. Are concrete curbs called out but shown dashed to be furnished and installed as part of Phase 1?

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

The concrete curbs at locations mentioned and depicted with dashed lines are furnished and installed in Phase 2. These dashed lines are for setting out of splice couplers for future phase 2 washrooms walls with concrete curbs.

**REQUEST:**

REFERENCE: A1-2104 (ASI 119 dated 6/20/14)

ASI 119 calls out for a chain link fence at several locations (A1-2104 for instance), but no chain link fence specification exists.

Please provide a specification for chain link fences.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Jeff Heath, WOJV indicate they do not require a specification for Chain Linked Fences as requested by this RFI. Therefore this RFI should be withdrawn.

**Co-Author:**

**REQUEST:**

REFERENCE: ASI 119 (dated 6/20/14), Specification Section 07 62 00 2.3A (IFC Drawings for Main Package dated 3/31/14)

ASI 119 calls for painted galvanized flashing to be used in several locations (for instance, Detail B/A1-7407 of ASI 119). Specification Section 07 62 00 2.3 A states, "Galvanized Steel: Do not use."

Please provide a specification for the painted galvanized flashing.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

See the attached Specification Section 07 62 00 / 2.3.A that has been revised to include the galvanized steel flashing language.

Co-Author:

**REQUEST:**

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)  
 Specification Section 01 80 50 1.1 B  
 Specification Section 01 80 50 1.2 A  
 Specification Section 07 81 00  
 Specification Section 07 81 23

Per Specification Section 01 80 50 1.1 B, "the requirements of this Section apply when to all non-structural components, unless otherwise noted."

Per Specification Section 01 80 50 1.2 A:  
 "Non-structural building components are components that are not part of the building structural system whether inside or outside the building enclosure, above and below grade. Nonstructural components of the Transbay Transit Center include, but not necessarily limited, to the following:  
 1. Ceilings, glazing, awnings, and similar components and assemblies.  
 2. Electrical: Power and lighting components and systems; substations; switchgear and switchboards; auxiliary engine-generator sets; transfer switches; motor control centers; motor generators; selector and controller panels; fire protection and alarm components and systems; and telephone and communication components and systems.  
 3. Mechanical: Heating, ventilating, and air-conditioning components and systems; plumbing components and systems; fire sprinkler components and systems.  
 4. Vertical Transportation: Mechanical, electrical and supporting elements for transport systems, including elevators and escalators. "

Specification Section 07 81 00 Sprayed Fire Resistive Material and Specification Section 07 81 23 Intumescent Fire Resistive Material do not include items specifically noted in the non-structural list, however, Specification Section 01 80 50 1.2 A explicitly states the list is not all inclusive. In addition, 07 81 00 and 07 81 23 do not specifically exclude the requirements associated with 01 80 50.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The work of Specification Section 07 81 00 Sprayed Fire Resistive Material and Specification Section 07 81 23 Intumescent Fire Resistive Material do not have seismic requirements.

Specification Section 01 80 50 will be revised to list applicable Specification Sections and Specification Sections requiring seismic criteria will reference Section 01 80 50.

| Per Detail 6/A1-9306, the HD galvanized rail embed shows a drain hole in the bottom of the embed. The detail goes on to show the bottom of the embed seated in grout which will prevent water from draining out of the drain hole. |   |   |                   | Provide 1/2" diameter drain hole in embed; drill 3/8" diameter hole through mortar to allow for drainage down to substrate. |                   |  |   |
| Please confirm plugging the rail embed drain hole as shown in 6/A1-9306 is acceptable.   |   |   |                   |   |                   |  |   |

**REQUEST:**

REFERENCE: Detail 2/A1-8237D (ASI 120 dated 7/11/14)

Detail 2/A1-8237D of ASI 120 calls for fireproofing at the steel ring beam.

No fireproofing is shown at the column supporting the steel ring beam.

Please confirm that fireproofing is not required at the column shown in Detail 2/A1-8237D. If fireproofing is required at the column supporting the steel ring beam, please provide the details and type for the required fireproofing.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Sheets A1-8662 and A1-8663 indicate the scope and application of steel fireproofing requirements for the project. Details graphically show the fireproofing in the vicinity of the specific condition drawn, if the steel element is being cut, the fireproofing is shown in section, if the element is not cut (it is in the background) typically the fireproofing is not shown-- this is standard graphic convention. For the extent of all fireproofing of ALL structural steel, please refer to Fire Protection Matrix and Schedule in sheets A1-8662 and A1-8663.

| Reference 08 44 25 (ASI 120 and Div. 00/01 Specifications)<br><br>Specification Section 08 44 25 subsection 1.3 calls for a unit price for Temporary Retail Façade and Glass Retail Façade for 2, 3 and 4 bay modules. There is not a Schedule of unit prices specification for the W-2 system in the Div. 00/01 dated August 11, 2014. If a unit price is required for the Temporary Retail Façade it needs to be included in the Div. 00/01. Currently the only unit price specifications listed are 01 10 20/APA for TG03, 10 10 20/APB for TG04.5.1, 01 10 20/APC for TG04.3, 01 10 20/APD for TG04.4, 01 10 20/APE for TG04.1, 01 10 20/APF for TG04.2, 01 10 20/APG for TG04.6, 01 10 20/API for TG06.0, and 01 10 20/APJ for TG18.1. If unit pricing for Temporary and Glass Retail Façade is desired, provide unit price specification, otherwise revise specification to not include unit pricing language. |                                    |               |   |                   |                   | The unit price requirement for the temporary retail facade change to a glazed facade will be changed to an additive alternate, to be priced below the line. Please refer to attached marked up specification sections 01 10 30/APA and 08 44 25, and to attached sketches A1-8189 (SKA-3851-R2) and A1-8190 (SKA-3852-R2). |                          |

**REQUEST:**

REFERENCE: Detail 6/A1-7554 (IFC Drawings for Main Package dated 3/31/14)

Detail 6/A1-7554 calls for WPM-5 crystalline waterproofing to cover insulation and a steel mullion at the second level of the W-2 escalator pit.

WPM-5 crystalline waterproofing is specifically intended for sealing of concrete, and will not work on steel.

Please provide direction to the type of waterproofing to be used at this condition, and associated waterproofing details.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Correction, the detail does not call for the WPM-5 waterproofing to cover insulation and steel mullion. The detail calls out for a "AIR/VAPOUR BARRIER LAPPED TO WPM-5 AND SEALED". Refer to W-2 specification 08 44 25 for Air/Vapour type.

**REQUEST:**

REFERENCE: Specification Section 05 50 00 2.5 M 1 & 2 (ASI 123 dated 8/6/14)

Specification Section 05 50 00 2.5 M 1 & 2 of ASI 123 states,  
 "1. For Concrete Columns/Concrete Block Walls: as detailed, 8' x 4" x 1/2" fabricated aluminum angles, 8'-0" high typical or as shown on drawings with anchor straps at 12' o.c.  
 2. For Gypsum Board Walls: as detailed, 8' x 4" x 1/2" fabricated aluminum angles, 8'-0" high typical or as shown on drawings. Flush countersunk fasteners"

A standard size for corner guards are 4" x 4" x 1/2". Please confirm that corner guards are required to be the dimensions referenced in Specification Section 05 50 00 2.5 M 1 & 2.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

"M. Corner Guards:  
 1. For Concrete Columns/Concrete Block Walls: as detailed, 4" x 4 $\frac{1}{2}$ " x 1/2" fabricated aluminum angles, 8'-0" high typical, or as shown on drawings with anchor straps at 12' o.c.  
 2. For Gypsum Board Wall: as detailed, 4" x 4 $\frac{1}{2}$ " x 1/2" fabricated aluminum angles, 8'-0" high typical, or as shown on drawings. Flush countersunk fasteners."

**REQUEST:**

REFERENCE:  
 Sheet A1-8880 (ASI 123 dated 8/6/14)  
 Sheet A1-9604 (IFC Drawings for Main Package dated 3/31/14)

Sheet A1-8880 of ASI 123 directs for the installation of a CJC4 expansion joint within the gypsum board ceiling at GL 10 on the Second Level.

Per Sheet A1-9604 of IFC Main Package, the ceiling for Room 02320 is exposed to structure, not a gypsum board ceiling.

Please confirm no ceiling expansion joint is to be installed at Second Level GL10.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Confirmed, ceiling expansion joint type CJC4 is not to be installed in Room 02320.

**Co-Author:**

**REQUEST:**

REFERENCE: Specification Section 07 21 00 1.1 1 d, Specification Section 07 21 00 (IFC Drawings for Main Package dated 3/31/14)

Specification Section 07 21 00 1.1 1 d indicates Specification Section 07 21 00 does not apply to parapets.

Several details (for example, Details 1 & 2/A1-7870) show insulation within parapets.

Please provide a specification for insulation shown within parapets.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Refer to attached sketch SKA-4056 for insulation type within parapet and to Specification Section 07 21 00 / 2.3 C for INS-3 description.

Specification Section 07 21 00 / 1.1 A is being revised as follows:

1. Section includes thermal insulation to limit thermal gains and losses at the following locations:

1. Building envelope, excluding the following locations:

- a. Roof insulation specified elsewhere.
- b. Doors.
- c. Glazed assemblies. DELETED
- d. Parapets. . DELETED
- e. Louvers, except where blank-off panels occur.
- f. Flexible Head and edge of Wall firestopping sealants and membrane.
- g. Fire safing and smoke seals at slab edges. DELETED.

2. Beneath the suspended concrete floor slabs where indicated, including beneath the radiant floor heating system.

3. Elsewhere as indicated. DELETED

**Co-Author:**

**REQUEST:**

REFERENCE: Specification Section 09 21 16 3.7 F 5 (IFC Drawings for Main Package dated 3/31/14)

Specification Section 09 21 16 3.7 F 5 indicates a Level 5 finish is to be installed at surfaces to be painted, which are not Finish Levels 1 - 4.

Level 4 finish level is to be used "for all other areas".

There does not appear to be any areas not covered by Levels 1 - 3 and 5. Please confirm Finish Levels 4 finish is not used on the project.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Level 4 finish is to be provided where a flat paint, light texture or lightweight wall covering is specified.

**Co-Author:**

**REQUEST:**

REFERENCE: Specification Section 09 25 50 3.2 A 4, Specification Section 09 31 00 (IFC Drawings for Main Package dated 3/31/14)

Specification Section 09 25 50 3.2 A 4 references Specification Section 09 31 00.

Specification Section 09 31 00 is not part of the contract documents.

Please revise the referenced specification number.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Specification Section 09 25 50 3.2 A 4 is revised to reference Section 09 30 00 in lieu of Section 09 31 00, which does not apply.

**REQUEST:**

REFERENCE: Specification Section 09 51 00 1.9 A, Specification Section 09 51 00 3.2 A (IFC Drawings for Main Package dated 3/31/14)

Specification Section 09 51 00 1.9 A requires temperatures be not less than 70 degrees F at least 3 days prior to and 3 days after installation of ACT.

Specification Section 09 51 00 3.2 A requires temperatures of at least 72 degrees F 3 days prior and after installation of ACT.

Please clarify acclimatization requirement. (NOTE: changing the requirement to maintaining minimum requirements of the product manufacturer may reduce acclimatization costs).

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Specification Section 09 51 00 paragraphs 1.9 A and 3.2 A are revised to state: "provide and maintain environmental conditions and ambient acclimatization requirements per manufacturer's written requirements.

**Co-Author:**

**REQUEST:**

REFERENCE: Specification Section 09 51 00 1.7 C, Specification Section 09 51 00 3.2 M (IFC Drawings for Main Package dated 3/31/14)

Specification Section 09 51 00 1.7 C requires that light fixtures, air supply diffusers, boots, fire alarm grills and exhaust and return air grilles are not supported from the ACT system.

Specification Section 09 51 00 3.2 M requires that upon request, written confirmation be provided that the work of Divisions 21, 22, 23, 26, 27 and 28 can be supported by the ACT system. Per Typical Suspended Panel Ceiling Note 11/A-0034, light fixtures and air terminals weighing less than 56 pounds may be supported directly on the heavy duty ACT system.

Please clarify what elements of Divisions 21, 22, 23, 26, 27 and 28 are to be supported by the ACT system.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Item 3.2.M of Specification Section 09 51 00 will be deleted. Only elements as defined in drawing 5/A-0034 are permitted.

REFERENCE: Specification Section 10 44 13 2.2 (IFC Drawings for Main Package dated 3/31/14)

Specification Section 10 44 13 2.2 indicates fire extinguisher cabinets are "TBD".

Please provide information on the fire extinguisher cabinets.

Fire Extinguisher Cabinet information follows:

Specification Section 10 44 13 2.2

FIRE EXTINGUISHER CABINETS 10 44 13

PART 2

2.2 FIRE EXTINGUISHER CABINETS

Is revised as follows:

Delete: A. TBD

Add:

A. FULLY-RECESSED CABINETS:

Basis of Design inside box dimensions for fire extinguisher: 24" height x 11" width x 8" depth, coordinate with specification section 10 44 16.

Cabinet Box: Steel cabinet, white baked enamel box  
 Trim and Door Material: Stainless steel door and handle with full panel clear acrylic glazing; stainless steel trim Larsen's Manufacturing Co. model number: SS 2712-RK

B. ENCLOSED SURFACE MOUNTED CABINETS:

Basis of Design inside box dimensions for fire extinguisher: 24" height x 11" width x 8" depth, coordinate with specification section 10 44 16.

Cabinet Box: Steel cabinet, white baked enamel box  
 Trim and Door Material: Stainless steel door and handle with full panel clear acrylic glazing; stainless steel trim Larsen's Manufacturing Co. model number: SS 2712-SM

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

C. COLUMN COVER CABINETS:

Basis of Design inside box dimensions for fire extinguisher: 24" height x 11" width x 8" depth, coordinate with specification section 10 44 16.

Cabinet Box: Steel cabinet, white baked enamel box  
 Trim and Door Material: Aluminum door and handle with full panel clear acrylic glazing; aluminum trim (as indicated on drawings) Larsen's Manufacturing Co. model number: AL 2712-RK, AL 2712-RT

Specification Section 10 44 16 2.1 B

FIRE EXTINGUISHERS 10 44 16

PART 2 - PRODUCTS

2.1 FIRE EXTINGUISHERS

Is revised as follows:

Delete: B

Add:

B. Fire Extinguisher Types

Type A: Fire Extinguisher UL 20A-120 B:C 1. Dry Chemical Type Fire Extinguisher: Steel tank with pressure gage 2. Class: ABC 3. Valve: Chrome plated brass 4. Extinguishing Agent Weight: 20 pounds 5. Finish: Baked polyester powder coat, red color

**Co-Author:**

**REQUEST:**

REFERENCE: Specification Section 01 80 50 1.1 B (IFC Drawings for Main Package dated 3/31/14)

Specification Section 01 80 50 1.1 B states, "The requirements of this Section apply to all non-structural components, unless otherwise noted."

Per previous meetings with PMPC, 01 80 50 is to be specifically referenced in each specification to which it applies.

Please provide the areas and specification sections to which Specification Section 01 50 80 Seismic Design Criteria for Nonstructural Components applies.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Specification Section 01 80 50 is revised to include this statement in the Summary:

"B. The requirements of this Section apply when adopted by reference by other Sections of the Specifications."

The Specification Sections listed below include nonstructural components requiring seismic criteria in their work, thus they will contain a reference to Section 01 80 50 Seismic design Criteria for Nonstructural Components.

- 07 09 13 - Seismic Joint Assemblies
- 07 09 15 - Vehicular Seismic Joint Assemblies
- 09 22 19 - non structural metal framing
- 09 24 00 - Portland Cement Plastering (W-18)
- 09 51 00 - Acoustic ceiling tiles
- 09 69 00 - Access Flooring
- 10 14 19 - Dimensional Lettering
- 10 14 26 - Pylon Signage
- 10 14 33 - Illuminated Panel Signage
- 10 14 36 - Non-Illuminated Panel Signage
- 10 14 66 - Floating Signage
- 10 14 83 - Interpretive Graphics
- 10 18 00 - Informational Kiosks
- 10 21 13 - Toilet partitions and screens
- 10 22 39 - Operable Partition

**Co-Author:**

**REQUEST:**

Access panels will be required within gypsum board ceilings.

Typical access panel ceiling framing has not been provided.

Please provide the desired framing detail for access panels within gypsum board ceilings.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Refer to drawing A1-9042 for detailing of ceiling access panel within a gypsum board ceiling.

**Co-Author:**

**REQUEST:**

REFERENCE: Note PA-1/S-0008, Note PA-3/S-0008 (IFC Drawings for Main Package dated 3/31/14)

Note PA-1/S-0008 defines a powder actuated fastener as a post installed anchor.

Note PA-3/S-0008 states to use scanning equipment or other means to locate and avoid cutting or damaging reinforcing bars.

Based upon these requirements, scanning for rebar will be required prior to the installation of any powder actuated fasteners (metal framing top and bottom tracks, ceiling wires, etc.).

This could significantly increase the cost and duration of the work. Please confirm scanning or other methods for locating rebar is required prior to the installation of powder actuated fasteners.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

If powder actuated fasteners are long enough to cause damage to rebar, then scanning per PA-3 is required. If the powder actuated fasteners are short enough not being able to hit or damage rebar, then section PA-3 is not invoked hence scanning is not required.

**Co-Author:**

**REQUEST:**

REFERENCE: Specification Section 09 24 00

Specification Section 09 24 00 2.7 B indicates that the cement plaster color is to be Gray. No other integral colors are noted.

If the cement plaster requires paint, the plaster will need to cure for an extended duration before paint is applied. This will impact the duration the scaffold is in place.

Please note that TG16.1 Drywall/Framing is currently scoped to leave the scaffold in place if the cement plaster requires painting.

Please confirm that the gray cement plaster is to remain exposed and does not require paint.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Specification Section 09 24 00 paragraph 2.7 B has been revised. Please refer to attached markup of this section for revised plaster system and materials.

Issues related to curing times per specification are determined by the plaster system manufacturer's recommendations.

Please refer to paragraph 2.5 in the attached revised plaster Section. The color is integral to the pre-mixed exterior finish coat, which is applied over the plaster mesh over the brown coat. The basis of design specified is Parex "Image Smooth Finish" with a custom color - The color is BM 1548 classic gray to match TJPA's Representative sample.

The duration of the scaffold in place is a Means and Methods decision to be determined by the Contractor.

**Co-Author:**

**REQUEST:**

REFERENCE: Sheet A1-9703 (ASI 124 dated 8/18/14)

Sheet A1-9703 of ASI 124 calls out Doors 01901A and 01920A.

The plans do not show these doors.

Please provide a plan showing Doors 01901A and 01920A.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Both doors are located in at the Ground Floor Zone 10 SW area in the vicinity of the Vehicle and Bicycle Ramp. Door 01901A is the exterior exit door from Stair 901 and Door 01920A is the door for the Communication Vault to the south and west of the stair exit door.

Please see attached SKA-4077 for the location and SKA-4078 for the updated Door Schedule showing these two doors.

Coordinate and revise accordingly.

-PE704 and PE705 3/A1-7204 references 4/A1-7830 which is regarding stair 501 and not PE704 and PE705. Revise callout for the elevator jamb/head condition for the second level.

-PE302, PE303, PE502, and PE503 provide detail of elevator jamb/head condition, electrical drawings show an automatic smoke and fire curtain on the bus deck level for these elevators however there are not details for that.

**REQUEST:**

REFERENCE:

Specification Section 01 10 30/APE E.1.12 (IFC Drawings for Main Package dated 3/31/14)  
 Sheets A1-9562 through A1-9567 (ASI 119 dated 6/18/14)

Per the Deduct Alternates meeting between TJPA, AAI, WOJV, and PCMP on 8/20/14, Alternate No. 24 (Specification Section 01 10 30/APE E.1.12) to substitute Terrazzo floor with Single Color Polished Concrete was accepted.

Sheets A1-9562 through A1-9567 currently call for Terrazzo flooring at the Bus Deck Level.

Please provide drawings and specifications that reflect the Single Color Polished Concrete to be installed at the Bus Deck Level.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Per agreement with TJPA/PMPC, WOJV and the Design Team, a conformed set incorporating all approved Alternates is being scheduled for delivery in December 2014. Documentation containing drawings and specifications for the Single Color Polished Concrete shall be provided at that time.

**Co-Author:**

**REQUEST:**

Reference Specification Section 09 66 23 2.3.C IFC Main Set (03/31/2014)

09 66 23 2.3.C indicates that 56 bronze floor inserts are to be furnished and installed as part of the terrazzo work. Please see the following and provide responses accordingly:

- 1) No drawings or specifications (grade of bronze, required finish, patina, etc.) have been provided showing the bronze floor inserts. Please provide these drawings/specifications.
- 2) 09 66 23 2.3.C states that there are 6 different designs of bronze inserts, but the list below only shows 5. Please revise so these are no longer in conflict.
- 3) 09 66 23 2.3.C.5 shows "12 inch TBD". Please provide the missing information that is currently shown as "TBD".

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. Specification for the bronze inserts (grade of bronze, required finish, patina, etc.) shall be provided by the Artist.
2. 6 Designs is correct. Artist shall provide the design and description of the 6th element. For the remaining 5 elements refer to attached "20142703\_JC Bronze Inset Sketch 1.pdf", and "20132212\_JC Bronze Inset Sketch 2.pdf".
3. Refer to the attached " 20132212\_JC Bronze Inset Sketch 2.pdf" for illustration of "12 inch TBD".

**Co-Author:**

**REQUEST:**

Reference Specification Section 09 66 23 2.4.F IFC Main Set (03/31/2014)

09 66 23 2.4.F indicates that anchoring devices are as indicated on the drawings. No anchoring devices are shown on the drawings. Please provide anchoring device information.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Anchoring devices are not shown on the drawings. Anchoring devices are to be provided by the contractor if and where required.

**Co-Author:**

**REQUEST:**

Reference Specification Section 09 66 23 1.9.A IFC Main Set (03/31/2014)

09 66 23 1.9.A states ζThe minimum slab temperature shall be 60 degrees F before commencing installation, during installation, and for at least 72 hours after installation is complete. The substrate temperature must be at least 5 degrees F above the dew point during installation.ζ The Manufacturer's written installation instructions state "Throughout the application process, substrate temperature should be 60°F ζ 90°F. Substrate temperature must be at least 5°F above the dew point. Applications on concrete substrate should occur while temperature is falling to lessen offgassing. The material should not be applied in direct sunlight, if possible. Protect material from freezing prior to installation.." The specifications do not match manufacturerζs written installation instructions. Please confirm the environmental conditions required within 09 66 22 shall override the manufacturerζs written installation instructions.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Environmental conditions for Terrazzo are to be as per Manufacturer's written instructions.

Co-Author:

**REQUEST:**

Reference Specification Section 03 30 02, 09 66 22, 09 66 23 IFC Main Set (03/31/2014)

03 30 02 3.6.A.2 states to comply with dimensional tolerance limitations given by ACI 117 for Concrete Finishes, and 03 30 02 3.6.A.4.c states "FI numbers shall not apply to unshored slabs or shored slabs with camber." ACI 117 4.4.1 states that slabs on structural steel or precast concrete have no deviation from elevation requirement. However, 09 66 22 3.2.B states that the Terrazzo Trade Subcontractor must level the floor to a specific FI, and 09 66 23 3.3.F refers to 09 66 22 3.2.B for FI requirements for Epoxy Terrazzo Flooring. As such, the concrete filled metal pan deck and topping slabs have a FI requirement which conflicts with the allowable FI referenced in 09 66 22 and 09 66 23. In addition, the concrete substrate may continue to move after installation of terrazzo. Please provide direction on installation of terrazzo epoxy crack suppression and epoxy terrazzo flooring where their FI requirements conflict with the FI requirements of the concrete substrate.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Specification Section 09 66 22, 3.2 B: Reference to tolerances is to be removed from this section.

Specification Section 09 66 22, 3.2 C to be revised as follows: Before installation of the moisture control system, engage a California licensed surveyor or civil engineer to make a survey of the floor to confirm the flatness SOF of 50 and elevations as indicated on drawings using a self propelled profilometer or a similar instrument that will give an accurate measurement downloadable to a computer in the form of a floor survey. Report any deviations from the floor flatness criteria or floor level to General Contractor for correction.

Specification section 03 30 02, 3.6 G: Revise section to add 3. Finish surface of topping slab to SOF of 50. Elevation of topping slab to be as shown on drawings.

To facilitate installation of reinforcing in topping slab at Grand Hall and to mitigate conflict with Hydronics Piping substitute #4 bar with WWR 6x6x4.5/4.5 on bolsters. WWR to be flat sheet.

| Reference Specification Section 09 51 23 2.9.A.8 ASI 127  |  |               |   |                      | <b>Accept Suggestion:</b> <input type="checkbox"/>  |                    |                          |
| 09 51 23 2.9.A.8 discusses creating penetrations in metal ceiling panels and prohibits any field modifications. Please confirm if this language applies only to penetrations or if it applies to modifying panels at edge condition as well. Where the panels meet finishes installed by others and the structural steel superstructure it's likely that field modifications will be required to accommodate as-built conditions. Please confirm that this is acceptable. |  |               |   |                      | Please see enclosed revised Specification Section 09 51 23 Paragraph 2.9 A.8.   |                    |                          |

| Reference Specification Section 12 93 00 IFC Main Set (03/31/2014)  |  |               |   |                      | <b>Accept Suggestion:</b> <input type="checkbox"/>  |                    |                          |
| The above referenced specification includes Power Bollards. No Power Bollards are shown on the drawings. Please provide locations for Power Bollards, and all details or remove from specification.   |  |               |   |                      | Refer to L1-2605. "Utility bollard" equals power bollard.   |                    |                          |

Please provide specification for the Fiberglass OCS Switch Shield.</p>                         |   | <p><b>SUGGESTION:</b></p> |                     | <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Please refer to Specification Section 05 50 00 Metal Fabrications paragraph 2.5 U.</p>                     |                      |                    |                          |

provide a connection detail. In addition, a potential concern if a static connection is provided here is that vibration and/or movement caused by the fan may cause damage to ceiling, as well as the fan sleeve itself. Please provide detail for the connection between the W-14 Metal Ceiling and the Large Fan Sleeve.

between the grommet and the pipe to isolate the fan from the ceiling as noted in 2/A1-8536.

The connection to the fan steel sleeve at the light diffuser panels is not fixed; the diffuser panels are meant to rest loosely on the angle on a rabbetted edge similar to a tegular ceiling lay-in tile. Ultimately, the final design is to be coordinated by the W-14 Design Build contractor.

**ANSWERED BY:** Adamson Associates, Inc. George Metzger

**ANSWER:** **Accept Suggestion:**

See enclosed A1-8551 with detail clarifying the transition of W-14 ceiling panel to OCS Switch shield.

**ANSWERED BY:** Adamson Associates, Inc. George Metzger

**ANSWER:** **Accept Suggestion:**

Please refer to Specification Section 05 50 00 Metal Fabrications paragraph 2.5 U.

 Detail A/A1-7803, Detail E/A1-7803, Detail 2/A1-7830

Sheet A1-2305 of ASI 127 shows Stair 501A and 502A at the Ground Level.

- Stair 501A references Detail 8/A1-7010 and Detail A/A1-7110 for details. Detail A/A1-7110 depicts a concrete lid at Stair 501A.

- Stair 502A references Detail 1/A1-7009 and Detail A/A1-3021 for details. Detail A/A1-3021 depicts a concrete lid at Stair 502A.

- Details A & E/A1-7803 reference Detail 2/A1-7830. Detail 2/A1-7830 also depicts a concrete lid.

Structural does not call for concrete lids at Stair 501A and 502A. Please identify and provide details for the structural slab required at Stair 501A and Stair 502A.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Please refer to Architectural Edge of slab drawing A1-2885 for location and structural sheet for S1-9001 for typical structural details for the concrete lid at stair 501A & 502A. The lid slab is Type S13 and this information will be added to the structural drawings in a future ASI.

 Specification Section 10 14 16  
 Specification Section 10 14 19  
 Specification Section 10 14 26  
 Specification Section 10 14 33  
 Specification Section 10 14 36  
 Specification Section 10 14 63  
 Specification Section 10 14 66  
 Specification Section 10 14 73  
 Specification Section 10 14 83  
 Specification Section 10 18 00

The following Specification Sections require bidders to "employ workers that will be employed during the construction at the Project.":

- Specification Section 10 14 16 1.3 E 3 Cast and Etched Graphics
- Specification Section 10 14 19 1.3 E 3 Dimensional Lettering
- Specification Section 10 14 26 G 3 Pylon Signage
- Specification Section 10 14 33 1.3 F 3 Illuminated Panel Signage
- Specification Section 10 14 36 1.3 E 3 Non-Illuminated Panel Signage
- Specification Section 10 14 63 1.4 J 3 Electronic Panel Signage
- Specification Section 10 14 66 1.4 G 3 Floating Signage
- Specification Section 10 14 73 1.3 F 3 Glass Signage
- Specification Section 10 14 83 1.4 E 3 Interpretive Graphics
- Specification Section 10 18 00 1.4 H 3 Informational Kiosks

Subcontractors will not be able to guaranty employment of specific workers producing material. Please confirm it is acceptable that personnel may change throughout the project.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

- Specification Section 10 14 16 1.3 E 3 Cast and Etched Graphics: Delete in its entirety, sentence 10 14 16 1.3 E 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.
- Specification Section 10 14 19 1.3 E 3 Dimensional Lettering: Delete in its entirety, sentence 10 14 19 1.3 E 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.
- Specification Section 10 14 26 1.4 G 3 Pylon Signage: Delete in its entirety, sentence 10 14 26 1.4 G 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.
- Specification Section 10 14 33 1.3 F 3 Illuminated Panel Signage: Delete in its entirety, sentence 10 14 33 1.3 F 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.
- Specification Section 10 14 36 1.3 E 3 Non-Illuminated Panel Signage: Delete in its entirety, sentence 10 14 36 1.3 E 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.
- Specification Section 10 14 63 1.4 J 3 Electronic Panel Signage: Delete in its entirety, sentence 10 14 63 1.4 J 3, ¿Employ supervisory personnel who will oversee sample construction. Employ workers that will be employed during the construction at the Project.¿ See attached.
- Specification Section 10 14 66 1.4 G 3 Floating Signage: Delete in its entirety, sentence 10 14 66 1.4

REQUEST:

REFERENCE: (ASI 127 dated 9/12/14)  
 Specification Section 10 14 16

Specification Section 10 14 16 1.6 A 2 Cast and Etched Graphics indicates the warranty period is subject to final approval by TJPA representative.

This requirement may impact pricing of the bid.

Please provide a specific time period for the warranty.

SUGGESTION:

ANSWER:      Accept Suggestion:

· Specification Section 10 14 16 1.6 A 2 Cast and Etched Graphics: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified. ¿ See attached.

· Specification Section 10 14 19 1.6 A 2 Dimensional Lettering: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified.¿ See attached.

· Specification Section 10 14 26 1.7 A 2 Pylon Signage: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified. ¿ See attached.

· Specification Section 10 14 33 1.6 A 2 Illuminated Panel Signage: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified. ¿ See attached.

· Specification Section 10 14 36 1.6 A 2 Non-Illuminated Panel Signage: Change current ¿ Warranty Period: Sign Subcontractor to provide information determined from date of Substantial Completion. Period subject to final approval by ArchitectTJPA representative.¿ to ¿ Warranty Period: Ten (10) years from date of substantial completion unless otherwise specified. ¿ See attached.

**Co-Author:**

**REQUEST:**

REFERENCE: (ASI 127 dated 9/12/14)  
 Specification Section 10 14 16  
 Specification Section 10 14 19  
 Specification Section 10 14 66

Specification Section 10 14 16 2.6 A Cast and Etched Graphics, Specification Section 10 14 19 2.3 A Dimensional Lettering, and Specification Section 10 14 66 2.3 A Floating Signage, call out for the use of "lead expansion-bolt devices".

The use of lead expansion-bolt devices could cause lead residue within the building, and dramatically increase the health and safety costs associated with construction as required by Specification Section 00 08 14 Health and Safety Criteria.

Please revise Specification Section 10 14 16, Specification Section 10 14 19, and Specification Section 10 14 66 to remove the use of lead expansion-bolt devices.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Specification Section 10 14 16 2.6 A: Change second sentence from "Use toothed steel or lead expansion bolt devices for drilled-in-place anchors." to "Use toothed steel expansion bolt devices for drilled-in-place anchors."

Specification Section 10 14 19 2.3 A: Change second sentence from "Use toothed steel or lead expansion bolt devices for drilled-in-place anchors." to "Use toothed steel expansion bolt devices for drilled-in-place anchors."

**REQUEST:**

REFERENCE: (ASI 127 dated 9/12/14)  
 Specification Section 10 14 16  
 Specification Section 10 14 19  
 Specification Section 10 14 26  
 Specification Section 10 14 33  
 Specification Section 10 14 36  
 Specification Section 10 14 63  
 Specification Section 10 14 66  
 Specification Section 10 14 73  
 Specification Section 10 14 83  
 Specification Section 10 18 00

The following Specification Sections requires the sign subcontractor to review and finalize the construction schedule:

- Specification Section 10 14 16 1.3 F 1 Cast and Etched Graphics
- Specification Section 10 14 19 1.3 F1 Dimensional Lettering
- Specification Section 10 14 26 H 1 Pylon Signage
- Specification Section 10 14 33 1.3 G 1 Illuminated Panel Signage
- Specification Section 10 14 36 1.3 F 1 Non-Illuminated Panel Signage
- Specification Section 10 14 63 1.4 K 1 Electronic Panel Signage
- Specification Section 10 14 66 1.4 H 1 Floating Signage
- Specification Section 10 14 73 1.3 G 1 Glass Signage
- Specification Section 10 18 00 1.4 I 1 Informational Kiosks

Subcontractors are not responsible to establish the construction schedule. Please remove the requirement for the signage contractor to review and finalize the construction schedule.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

- Cast and Etched Graphics, Specification Section 10 14 16 1.3 F 1: There is no  $\zeta$ 10 14 16 1.3 F 1  $\zeta$  in this Section.
- Dimensional Lettering, Specification Section 10 14 19 1.3 F 1: Delete in its entirety the sentence  $\zeta$ Sign Subcontractor to review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays. $\zeta$  See attached.
- Pylon Signage, Specification Section 10 14 26 1.4 H 1: Delete in its entirety the sentence  $\zeta$ Sign Subcontractor to review and finalize construction schedule and verify availability of materials, Sign Subcontractor's personnel, equipment, and facilities needed to make progress and avoid delays. $\zeta$  See attached.
- Illuminated Panel Signage, Specification Section 10 14 33 1.3 G 1: Delete in its entirety the sentence  $\zeta$ Sign Subcontractor to review and finalize construction schedule and verify availability of materials, Sign Subcontractor's personnel, equipment, and facilities needed to make progress and avoid delays. $\zeta$  See attached.
- Non-Illuminated Panel Signage, Specification Section 10 14 36 1.3 F 1: Delete in its entirety the sentence  $\zeta$ Sign Subcontractor to review and finalize construction schedule and verify availability of materials, Sign Subcontractor's personnel, equipment, and facilities needed to make progress and avoid delays. $\zeta$  See attached.
- Electronic Panel Signage, Specification Section 10 14 63 1.4 K 1: Delete in its entirety the sentence  $\zeta$ Sign Subcontractor to review and finalize construction schedule and verify availability of materials, Sign Subcontractor's personnel, equipment, and facilities needed to make progress and avoid delays. $\zeta$  See attached.
- Floating Signage, Specification Section 10 14 66 1.4 H 1: Delete in its entirety the sentence  $\zeta$ Sign

**REQUEST:**

Reference 09 51 23 ASI 127

09 51 23 2.5.B.10.A, among other sections in this specification, discusses providing perforation holes in the aluminum ceiling panels. The perforation holes are visible on some of the drawings for the aluminum ceiling, but there are no callouts, and there is no specified hole pattern shown. Please confirm there are to be perforation holes in the aluminum panels, and if so, please provide pattern and any other specifications needed.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The aluminum panel perforation pattern shall meet the acoustic requirements on Specification Section 09 51 23 paragraph 2.4 Q and paragraph 2.5 B.10. Please see enclosed SKA-3934R for added detail notes.

**Co-Author:**

**REQUEST:**

**REFERENCE:**

Detail 2/SG1-6023 (IFC Drawings for Main Package dated 3/31/14)

Key Note 9 on Detail 2/SG1-6023 indicates that the final artwork for Sign KM1 Static Map and Digital Display is to be supplied by owner.

Please provide the final artwork, information on amount of letters to be priced, or allowance amount to be used.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The detailed configuration of the Transit Center is specific to all interior spaces and uses -- has not yet been finalized. Consequently, artwork for the final graphic for the static map is not yet available. Pricing can be based on the assumption that the final static map will be a large format digital print map of the Transit Facility, fabricated and installed as per the current drawings and specifications. There is no Dimensional Lettering as a component of this sign type.

**Co-Author:**

**REQUEST:**

**REFERENCE:**

Specification Section 10 14 26 (ASI 127 dated 9/12/14)

Specification Section 10 14 26 2.1 B 4 r Pylon Signage indicates that the integrated speaker is "TBD Refer to telecommunication sheets for specifications."

Specification Section 10 14 26 2.1 B 4 r 1 - 6 go on to specify a product.

Please revise 10 14 26 2.1 B 4 r to agree with the provided information.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

In the now correctly referenced Specification Section 10 14 26 2.1 B 4 r, Pylon Signage, delete the sentence, "TBD Refer to telecommunication sheets for specifications." in its entirety. See attached.

**Co-Author:**

**REQUEST:**

**REFERENCE:**

Detail 3/SG1-6003 (IFC Drawings for Main Package dated 3/31/14)

Per Key Note 9 on Detail 3/SG1-6003, Sign Type PD1 Bus Deck Dock Identification and Sign Type PD2 Muni Plaza Identification are to be provided with a GFIC duplex outlet.

Sheet E1-2306 and Sheet E1-2502 through Sheet E1-2507 do not show outlets or circuiting for outlets at these locations.

Please confirm no outlets are required at these locations, or provide circuiting information.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

WSP Response:

15A convenience outlets will be added within signage pylons for the following sign types:

PS1

PS2

PS4

PS5

PS6

PD1

PD2

These convenience outlets will be connected to existing spare 20A circuit within nearby LP panel, no more than 8 outlets per circuit. Outlets are being provided by signage contractor. Refer to future ASI 0128 drawings for circuiting info.

WRNS Response:

We have confirmed that outlets are required as indicated for Sign Types PD1 and PD2. See associated, revised Electrical Drawings for outlets and circuiting.

**Co-Author:**

**REQUEST:**

Reference 13 34 24 2.4.B.3 ASI 127

Specification calls out Wall Wainscoting in the Restrooms of Booth Type 2 as "Stainless Steel panel four (5) feet in height above wall base."

- a) Is the correct height 4 ft or 5 ft?
- b) Please define the stainless steel type, thickness, finish, and the method of fastening to the substrate.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

- a. Five (5) feet is the correct height.
- b. Stainless steel Type 316, 16 Gage, No 4 satin finish, mechanically fastened using countersunk stainless steel screws/fasteners tamper resistant.

 Detail 2/SG1-6202 (IFC Drawings for Main Package dated 3/31/14)  
 Detail 3/SG1-6030 (ASI 124 dated 8/18/14)

Specification Section 10 14 66 Floating Signage indicates that the signage contractor is to provide power requirements to TJPA/verify electrical power is sized to accommodate Sign Types BS1 Wall Mounted Blade Sign, BS3 4-Icon Overhead Directional, BS4 6-Icon Overhead Directional, SD1 Zone 2 Post-Mounted Bicycle Directional Sign, and SD5 Zone 2 Wall-Mounted Vehicular Directional Warning Sign in the following subsections:

- 10 14 66 2.2 C 1 p (Sign Type BS1)
- 10 14 66 2.2 C 2 n (Sign Type BS3)
- 10 14 66 2.2 C 3 o (Sign Type BS4)
- 10 14 66 2.2 C 4 m (Sign Type SD1)
- 10 14 66 2.2 C 6 m (Sign Type SD5)
- 10 14 66 3.1 B

In addition, General Sheet Note H on Detail 2/SG1-6202 and General Sheet Note H on Detail 3/SG1-6030 requires the sign subcontractor to provide power requirements to TJPA representative.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Specifications Section 10 14 66 3.1 B, Floating Signage, delete in its entirety the sentence "Verify that items, including anchor inserts, and electrical power are sized and located to accommodate signs." And replace with the following sentences: "Verify that anchor and anchor inserts are sized and located properly to accommodate installation of Pylon Signage. Sign Subcontractor to design signs to conform to electrical circuiting power allotments existing in the current design and if necessary, include additional electrical circuits in pricing if additional power is determined to be required." See attached.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

---

Per the response to Constructability Comments 7924 the signage specifications will be revised to require the design-build signage contractor to design the signs within the electrical circuiting power allotments in the current design, and to include additional electrical circuits in their signage bid if additional power is determined to be required.

Please revise the specifications and general notes to agree with the response to Constructability Comments 7924.

The Contract Documents do not dimension the exterior window glazing for the Prefabricated Guard Booths. Please dimension the exterior window glazing before bid so that this package can be accurately priced.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Prefabricated booths are design-build elements. To realize the maximum design-build value, Design Team will rely on the booth manufacturer's standard fabrication modules.

Specification section 13 34 24, 2.3.H, shall be modified as follows:

2.3.H.

1. Maximize window size for all non-restroom spaces within manufacturer's standard module/panel size.
2. Window sill shall clear built-in work counter height, and be located between 2'-8" and 3'-0" above finished floor.
3. Window head height shall not exceed booth ceiling height.
4. Minimum window height shall not be less than 3'-6", and width of window is to suite manufacturer's building module.
5. Window framing system shall consist of continuous galvanized steel interior and exterior retainer along window perimeter used to secure window glazing.

**Co-Author:**

**REQUEST:**

**REFERENCE:**

Detail 2/SG1-6190 (IFC Drawings for Main Package dated 3/31/14)  
 Signage Plan Sheets (IFC Drawings for Main Package dated 3/31/14)  
 Sign Message Schedule (ASI 127 dated 9/12/14)

Signage Plan Sheets call out Sign Type CT1 at multiple locations. Detail 2/SG1-6190 calls for Sign Type CT1 Clipper Tag on Elevator.

The Sign Message Schedule indicates that Message A for Sign Type CT1 is to be determined. This is not biddable with the current information.

Please provide the verbiage for Sign Type CT1 at all locations shown on the Signage Plan Sheets, information on amount of letters to be priced, or allowance amount to be used.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The message for Sign Type CT1 is integrated with the "Clipper Tagging" device and is part of the vendor-supplied system to be bought-out separately by TJPA. The Sign Subcontractor would be responsible only for its installation and integration within the pylons and wall surfaces in which the devices are designated to be installed. See attached revised Signage Message Schedule.

**REQUEST:**

**REFERENCE:**

Sign Message Schedule (ASI 127 dated 9/12/14)

The Sign Message Schedule states the following for Sign Type ST1 Floor Level ID:  
 "Verify stair information with contractor prior to fabrication"

For examples, see the following pages in the Sign Message Schedule:  
 Pg. 1: Sign ST1-T-02-007  
 Pg. 5: Sign ST1-L-02-0214  
 Pg. 11: Sign ST1-G-02-005  
 Pg. 28: Sign ST1-G-10-002

Please provide the omitted information to be "verified".

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Specific to Sign Type ST1, please see revised Sign Message Schedule, attached. The specific text for the messages on each of the referenced "Sign Type ST1" cannot be finalized until each individual exit stair function and operation is also finalized, as information for each stair and floor level will vary (e.g., levels accessed/not accessed, re-entry information, etc.). Pricing can be based on the General Sheet Notes, Key Notes, and the example of text/graphics indicated on Detail 3/SG-6200 text example, as well as on the associated specifications.

Specification Section 10 14 66 (ASI 127 dated 9/12/14)  
 Sheet E1-2203 (ASI 118 dated 6/20/14)  
 Sheet E1-4203 (ASI 118 dated 6/20/14)

Per Specification Section 10 14 66 2.2 C 6 m Floating Signage, Sign Type SD5 Vehicular Direction Warning Sign is to have power, but Sheets E1-2203 and E1-4203 do not show power for Sign Type SD5 at the vehicular ramp.

Per Specification Section 10 14 66 2.2 C 4 m Floating Signage, Sign Type SD1 Post-Mounted Bicycle Directional Sign is to have power, but Sheet E1-2310 does not show power to the SD1 signs.

Please provide electrical information for all floating signage.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Confirmed that as per Specification Section 10 14 66 2.2 C 6 m, Floating Signage, Sign Type SD5 Vehicular Direction Warning Sign is to have power.

Confirmed that as per Specification Section 10 14 66 2.2 C 4 m Floating Signage, Sign Type SD1 Post-Mounted Bicycle Directional Sign is to have power.

WSP Response:

Refer to the following sketches for revised signage circuiting:

**REFERENCE:**

Specification Section 10 14 66 (ASI 127 dated 9/12/14)  
 Sheet SG1-6030 (ASI 124 dated 8/18/14)

Per Specification Section 10 14 66 Floating Signage subsections 2.2 C 1 i, 2.2 C 2 i, and 2.2 C 3 n, the mounting height above grade for Sign Types BS1 Wall-Mounted Blade Sign, BS3 4-Icon Overhead Directional, and BS4 6-Icon Overhead Directional is 9'-0".

Per SG1-6030, the min. mounting height for Sign Types BS1, BS3, and BS4 9'-2" AFF.

Please revise the drawings and specifications to agree with each other.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Confirmed that as per SG1-6030, the min. mounting height for Sign Types BS1, and BS4 is 9'-2" AFF. Note that Sign Type BS3 has been eliminated as per RFI #P1-0561. The following specification revisions have also been made:

- Specification Section 10 14 66 2.2 C 1 i, Floating Signage, delete the second sentence, *ζ*9'-0'*ζ* mounting height above grade.*ζ* and replace with the sentence, *ζ*See Signage Drawings for mounting height.*ζ* See attached.
- Specification Section 10 14 66 2.2 C 2 i, Floating Signage, Sign Type BS3 has been eliminated as per RFI #P1-0561. See attached.
- Specification Section 10 14 66 2.2 C 3 n, Floating Signage, delete the second sentence, *ζ*9'-0'*ζ* mounting height above grade.*ζ* and replace with the sentence, *ζ*See Signage Drawings for mounting height.*ζ* See attached.

 Specification Section 10 18 00 (ASI 127 dated 9/12/14)

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**   
 Refer to Specification Section 01 17 40 for specified warranty period of 24 months.

Specification Section 10 18 00 1.7 A 2 Informational Kiosks indicates that the warranty period for informational kiosks is subject to final approval by TJPA.

Please provide the desired warranty duration to be bid.

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:**

**REQUEST:**

**REFERENCE:**  
 Specification Section 10 18 00 (ASI 127 dated 9/12/14)  
 Detail 1/SG1-6020 (IFC Drawings for Main Package dated 3/31/14)  
 Sign Message Schedule (ASI 127 dated 9/12/14)

Specification Section 10 18 00 2.2 C 1 i Informational Kiosks indicates that Sign Type KC1 Combined Touchscreen & Digital Display has 2 faces with graphics.

Per Detail 1/SG1-6020 a graphic is only present on the front face of the kiosk.

Per the Sign Message Schedule, Message D is (NO MESSAGE).

Please clarify the messages/graphics to be used for Sign Type KC1.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Specification Section 10 18 00 2.2 C 1 i, Informational Kiosks, delete the number 2, and replace with the sentence Refer to Signage Drawings and Sign Message Schedule. Please note that for this sign type, the designated message (the information symbol), is located on the side of the sign that the touchscreen display is located. Also note that the orientation of locations A (reference north), B (reference east), C (reference south), and D (reference west) that refer to sign elevations are constant throughout the Signage Drawings. In the case of two Sign Type KC1s, if the signs themselves are oriented differently from one another, a common message assigned to location A on one may be assigned on location B on the other. If in the Sign Message Schedule no message is called out for a sign's particular location (A, B, C, or D), assume that the particular location is not meant to carry a message.

| REFERENCE:<br>Specification Section 10 18 00 (ASI 127 dated 9/12/14)  |  |   | Circuiting has been provided on the electrical drawings based on a preliminary estimate of power allocation for signage components. No electrical changes are proposed at this time. Per the signage drawings, signage contractor must confirm all power requirements on system submittals. In addition, the ticket machine power requirements need to be confirmed. When this info is provided, if additional power is required, wiring can be pulled in the existing conduits. |                           |                          |                    |                          |
| The following Specification Sections indicate that the ticket and added value machines have separate power requirements from the associated kiosks:<br><br>10 18 00 2.2 F 1 n<br>10 18 00 2.2 F 1 o<br>10 18 00 2.2 F 2 n<br>10 18 00 2.2 F 2 o |  |   | UPDATE: Please see response to RFI PI-0530.  |                           |                          |                    |                          |
| Electrical drawings do not show separate power for the ticket and added value machines.   |  |   |  |                           |                          |                    |                          |
| Please confirm no additional circuits are required for the ticket and added value machines, or revise the electrical documents to reflect the desired power and data requirements.  |  |   |  |                           |                          |                    |                          |

 Color/Font/Material/Symbol/Icons Report  
 Detail 4/SG1-6001

Per the Color/Font/Material/Symbol/Icons Report, Materials M8 and M13 require painting in some locations (Sign Types PS4 Rooftop Directional Pylon Sign with Exit Sign and RR4 Restroom Signage for example).

While colors are provided, no specification for painting of the signs has been provided (i.e. multiple manufacturers, mil thickness, prep requirements, etc.).

Please provide a specification (including light enhancing paint called out on Key Note 3C on Detail 4/SG1-6001) for signage to receive paint.

SUGGESTION:

ANSWER:

Accept Suggestion:

Paint, where indicated on Signage Drawings, has been addressed in the following specification revisions:

- Specifications Section 10 14 19 2.1 C, Dimensional Lettering Signage, add *Paints and Coatings: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposures indicated.*
- Specifications Section 10 14 19 2.6 C, Dimensional Lettering Signage, add *Baked Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils (0.04 mm). Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.*
- Specifications Section 10 14 19 2.7 A 7 b, Dimensional Lettering Signage, delete in its entirety, *Spraylat Star-Brite White EF as manufactured by Spraylat Corporation (914-738-1600, http://www.spraylat.com) or equal.*

- Spraylat Star-Brite White EF as manufactured by Spraylat Corporation (914-738-1600, http://www.spraylat.com) or equal.
- Matthews Paint 281 500SP High Reflective White 1.800.323.6593
- Polar White as manufactured by Prismatic Powders 1.866.774.7628
- Or equal . . . 1

and replace with the words, *manufacturer's standard white reflective paint.*

- Specifications Section 10 14 19, Dimensional Lettering Signage, throughout the specifications section, remove the words *Construction Intent* and replace with the word, *Signage*.

Sheets SG1-6000 through Sheet SG1-6202 (IFC Drawings for Main Package dated 3/31/14)

Several General Sheet Notes and Key Notes on Sheet SG1-6000 through Sheet SG1-6202 require that all dissimilar materials be isolated (ex. General Sheet Note F and Key Note 1c on Sheet SG1-6002).

Please provide the requirements for isolating each material from each other.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

- Specifications Section 10 14 16 2.3 A 4, Cast and Etched Graphics, add the sentence, ¿Where dissimilar metals are in contact, the surfaces are to be protected against galvanic or corrosive action.¿
- Specifications Section 10 14 19 2.7 A, Dimensional Lettering Signage, add the words, ¿against galvanic or corrosive action.¿ to the last sentence.
- Specifications Section 10 14 19 2.4, Dimensional Lettering Signage, add:

¿2.4 FABRICATION

A. Dissimilar metals: Where dissimilar metals are in contact, the surfaces are to be protected against galvanic or corrosive action.¿

- Specifications Section 10 14 26 2.3 A, Pylon Signage, delete the word, ¿or lead¿. Add the words ¿against galvanic or corrosive action.¿ to the last sentence.
- Specifications Section 10 14 26 2.4 E, Pylon Signage, add the sentence ¿Where dissimilar metals are in contact, the surfaces are to be protected against galvanic or corrosive action.¿
- Specifications Section 10 14 33 2.3 A, Illuminated Panel Signage, delete the word, ¿or lead¿. Add the words ¿against galvanic or corrosive action.¿ to the last sentence.
- Specifications Section 10 14 33 2.4 E, Illuminated Panel Signage, add the sentence ¿Where dissimilar metals are in contact, the surfaces are to be protected against galvanic or corrosive action.¿
- Specifications Section 10 14 36 2.4 C, Non-Illuminated Panel Signage, add the sentence, ¿Where dissimilar metals are in contact, the surfaces are to be protected against galvanic or corrosive action.¿
- Specifications Section 10 14 66 2.3 A, Floating

**From:** Webcor Construction LP      Tram Nguyen      **To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:**

**REQUEST:**

REFERENCE: (IFC Drawings for Main Package dated 3/31/14)  
 Detail 4/SG1-6021  
 Detail 6/SG1-6021

Per Detail 4/SG1-6021, the nominal depth of Sign Type KT2 Ticket Vending Kiosk with Digital Display is 1 $\frac{1}{2}$ -5 $\frac{1}{2}$ .

Per Detail 6/SG1-6021, the nominal depth of Sign Type KT2 is 1 $\frac{1}{2}$ -0 $\frac{1}{2}$ .

Please clarify the nominal depth of Sign Type KT2.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Nominal depths have been revised. See SKSG #2025, attached.

**REQUEST:**

**REFERENCE:**

Detail 3/SG1-6022 (IFC Drawings for Main Package dated 3/31/14)  
 Specification Section 10 18 00 (ASI 127 dated 9/12/14)

Detail 3/SG1-6022 title is ¿KP1: One-sided Digital Display Panel Kiosk ¿ With Speakers¿.

Specification Section 10 18 00 2.2 E 1 does not call out speakers, and drawing details within Detail 3/SG1-6022 does not call out speakers.

Please confirm no speakers are to be included with Sign Type KP1.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

In regards to Sign Type KP1, drawings and specifications section have been revised to confirm/accommodate the inclusion of speakers. See attached SKSG #2028. Specification Section 10 18 00 2.2 E 1 o, Informational Kiosks, add the following:

o. Speakers:

1)Manufacturer: See Specifications Section 27 51 16 2.19.

2)Model: See Specifications Section 27 51 16 2.19.

3)Internally Mounted

4)Aluminum sheet grille integral to access door and flush with FRP surface, painted, Gray.

5)Speaker grill material specifications: Stainless steel, 22 gauge (0.032¿)  
 Round hole diameter = 0.0625¿ (1/16¿). Hole centers = 0.0938¿ (3/32¿)  
 Hole pattern = staggered. % open area = 41%.  
 Transparency Index = 16,422. Example Product: as manufactured by McNichols Part#1511332238

See attached.

REFERENCE:

Specification Section 09 91 00 (ASI 127 dated 9/12/14)

Specification Section 09 91 00 1.8 A 4 c Paint indicates that paint is not to be applied when there is a threat of impending rain.

This requirement precludes installation of paint in areas that cannot be impacted by rain (i.e. interior spaces, covered spaces, etc.).

Please revise to indicate environmental conditions are to be per the manufacturer's written installation instructions.

Please see enclosed revised language on Specification Section 09 91 00 paragraph 1.8 A.4.

**REQUEST:**

REFERENCE:

Specification Section 09 97 15 (ASI 127 dated 9/12/14)

Specification Section 09 97 15 1.1 A 4 High Performance Coatings identifies the bus crash rail as an exposed steel surface to be painted with High Performance Coatings.

Currently the bus crash rail is to be structural concrete.

Please revise specification omitting the bus crash rail.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Please see enclosed revised language of Specification Section 09 97 15 1.1 A.4 that deletes Bus Deck crash rail work.

**Co-Author:**

**REQUEST:**

Reference L1-2630, L1-8633, L1-8687, L1-9621, L1-9622, 04 43 00, 01 10 30/APE (IFC Main Set)

Clarify if the amphitheater/great lawn stairs, between gridlines 3 and 4 are stone slab stairs as described in specification 04 43 00, or are wood deck as shown on L1-9621 and L1-9622. L1-2630 points to details that show stone (1/L1-8633, 1/L1-8687) and wood (L1-9622). The Note in details 2/L1-9621, 3/9621 and 1/L1-9622 refer to Alternate 33 which is for modification of stone paving. Sheet L1-9621 is referenced under Alternate 33 in specification 01 10 30/APE, but L1-9622 is not. Sheet L1-9621 and L1-9622 are labeled as wood deck and details refer to boards, not slabs and are using concrete masonry anchors. These details conflict with L1-8633 which shows the stairs as stone slab using stone stair anchor pins. L1-8687 also conflicts with L1-9621 and L1-9622. Overall there appear to be conflicting details for the amphitheater/great lawn stairs. Clarify which set of details are meant to be followed and delete any extraneous details. Correct 01 10 30/APE E.1.21 Alternate No. 33 reference drawings and specification sections.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Revisions to drawing and spec will be reflected in forthcoming 12/16/2014 ASI-0128.

| <b>REQUEST:</b>                                       | Reference Specification: 02 41 19<br>Reference Drawings: GT-2103 & D-2213   | <b>SUGGESTION:</b>                     |                     |                      | <b>ANSWER:</b>       | <b>Accept Suggestion:</b> | <input type="checkbox"/> |   |
|   | demolished during exaction for the pile cap.  |  |                     |                      |                      |                           |                          |   |
|   | SCCI believes that using drain rock or sand, instead of CLSM, to backfill above the structural concrete will ensure that the rebar cage is clean upon the backfills removal. Using this lighter material will also work to ensure that bearing pressure limits are not exceeded while the second barrette pile is installed.  |  |                     |                      |                      |                           |                          |   |
|   | Is it acceptable to use drain rock or sand instead of CLSM for this backfill?   |  |                     |                      |                      |                           |                          |   |
|   | Based on conversation at the 4/3/13 weekly coordination meeting, BBII understands that the TJPA may consider lifting the ban on pile extraction previously issued in COM1347 (TCC letter dated 10-10-12) which directed all remaining piles to be removed by excavation and cutting.  |  |                     |                      |                      |                           |                          |   |
|   | BBII requests an exemption to the direction issued in COM 1347 that will permit the timber piles beneath the existing footing on gridline 33.5 to be extracted per the contract documents. The piles beneath this footing should be considered for exemption since they fall outside of the Zone 4 J-line "critical areas", the thin strip orientation has a minimal area of influence on the J-Line wall, and the geotechnical drawings already allow non-ground deformation control pile removal along most of the footing (see sheet GT-2103 & D-2213 attached). |  |                     |                      |                      |                           |                          |   |
|   | Please advise if this request is acceptable?  |  |                     |                      |                      |                           |                          |   |

| RFI T-1096    | BGP - Area 4 Exterior Wall Verts in Contact With Waterproofing | Closed        | 01/09/2014          | 01/19/2014           | 01/14/2014           | Potentially        | <input type="checkbox"/> |

**From:** Webcor Construction LP Michael Spillane

**To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Shimmick Construction Company, Inc. Sylvia Hartanto

**REQUEST:**

In Area 4, between soldier piles #41 and #42, there are approximately 13ea wall vertical bars that are in contact with the waterproofing due to CDSM Encroachment. Soldier Piles #41 and #42 were surveyed and shown to not encroach more than 1/2". However, at the elevation of wall lift 1, it appears that the CDSM encroaches vertically into the foundation wall. Due to the wall verticals having little or no clearance to the waterproofing, the first list wall vertical bars cannot be coupled onto the dowels protruding from the top of the haunch. Per discussion with TT field representative, Gerdau proposes the following:

Option 1: Remove the waterproofing, chip the CDSM wall between soldier piles 41 and 42 to allow for clearance between the vertical bars and waterproofing. Vertical bars adjacent to soldier piles 41 and 42, up to 6 total, will be abandoned.

Option 2: The dowels above the haunch will be slightly bent away from the CDSM wall to allow for threading of the first lift wall vertical bars. Prior to bending the bar, the haunch concrete will have to be chipped out a minimum of 1.5 ft wide by 1ft deep to allow for hickey bar access. Once the first lift vertical bar is threaded onto the dowel, then the vertical bar will be transitioned back into vertical alignment with a slight bend over approximately 6ft. Note that this transition will require the wall horizontals to be bent and cross-ties will need to be shortened to follow the profile of the wall verticals.

Please confirm if proposed options are acceptable.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Option 2 is preferred with the following modifications and additions:

- 1.Depth of haunch concrete removal shall be 1'-3" minimum at the encroaching bars.
  - 2.Bars shall be bent such that the top of coupler is displaced 1" from the waterproofing.
  - 3.Displacement shall be made in a controlled fashion.
  - 4.Bars shall only be bent in one direction.
  - 5.Embedded horizontal wall reinforcing that might prevent the field bend from occurring at the bottom of the 1'-3" excavation shall be locally removed. Other reinforcing shall be protected in place.
  - 6.As proof of concept, work shall begin with the bars immediately in front of steel soldier piles. If displacement cannot be controlled for all bars at the soldier pile locations, Option 2 shall cease and Option 1 shall commence. No bars will be accepted that have displaced more than 2" without nondestructive testing; 1", however, is the target. Option 1 may continue to bars between steel soldier piles only after acceptance of work by the structural engineer.
  - 7.The integrity of the waterproofing behind the excavation shall be maintained. Acceptance of the waterproofing by the manufacturer's representative and waterproofing contractor at the completion of field bending is required prior to patching the haunch excavation.
- Option 1 is acceptable only if Option 2 does not produce acceptable results. Modification and additions to Option 1 are as follows:
- 1.The target cover for wall reinforcing bars is 2" minimum.
  - 2.The minimum acceptable concrete cover over a bar or coupler at the level of the haunch is 3/4". This may require that CDSM grout be removed at the level of the haunch. To facilitate a smooth grout transition, this may require that grout be removed below the level of the haunch and perhaps excavation of the haunch itself. This has implications for waterproofing.
  - 3.At locations where 3/4" cover is not provided to the coupler at steel soldier pile locations, the coupler shall be removed with due regard to protecting the adjacent installed waterproofing.
  - 4.Any bars abandoned shall be replaced with bars having proper clear cover. It is not required that these

| <u>Number</u> | <u>Subject</u>                 | <u>Status</u> | <u>Date Created</u> | <u>Date Required</u> | <u>Date Answered</u> | <u>Cost Impact</u> | <u>Proceed</u>           |
|---------------|--------------------------------|---------------|---------------------|----------------------|----------------------|--------------------|--------------------------|
| RFI T-1124    | SSS - Plate Grade Substitution | Closed        | 01/21/2014          | 01/31/2014           | 01/27/2014           | Potentially        | <input type="checkbox"/> |

bars be doweled or spliced with the abandoned stubs.  
5. The integrity of the waterproofing shall be maintained. Acceptance of the waterproofing by the manufacturer's representative at the completion of CDSM grout removal and patching is required. This RFI may serve as the basis of a Corrective Action Plan which shall include:  
Limits, products, and method of excavating and patching haunch concrete  
If Option 1 is triggered, the CAP shall include:  
Selective demolition plan and procedure for removal of the existing waterproofing and for the replacement of the back-up layers of materials and waterproofing.  
Products and methods of CDSM grout removal and patching  
Option 1 will not proceed until review and approval of the CAP Submittal by the design team and the owners waterproofing consultant.  
Additional Requirements:  
If waterproofing is damaged or otherwise deemed unacceptable, a supplement to the CAP shall be issued containing the repair.  
Regardless of the option used to address the rebar issue, the contractor shall perform a vertical survey to establish the location of the CDSM wall and will establish its verticality. Sign off on the associated Nonconformance, NCR#441, will not occur before the contractor has presented documentation quantifying the presence or absence of a CDSM wall encroachment. Acceptable documentation would contain a vertical array of points capable of capturing bulges in the CDSM wall.  
The owner's waterproofing consultant, the waterproofing contractor, the contractor's waterproofing designer, and the waterproofing manufacturer shall review the completed repair work to verify that the waterproofing has been properly protected or replaced (depending upon the repair procedure) prior to the continued installation of rebar. Option 2 excavation and bar realignment may proceed per this RFI response

**Co-Author:**

**REQUEST:**

Specification Section 07 12 10, 3.2

The concrete surface profile (CSP) required by the waterproofing manufacturer Laurencio, ranges between a CSP level of 2 and 4 as defined by the International Concrete Repair Institute (ICRI) of technical guide "Selecting and Specifying Concrete Surface Preparation for Sealers, Coatings, and Polymer Overlays." The ICRI defines the levels of CSP as 1 (nearly flat) to CSP Level 9 (very rough). The Laurencio waterproofing system requires "a good wood screed or broom finish...often referred to as a 'sidewalk' finish..Do not use a steel trowel finish." See attached excerpt of the manufacturer specification.

1. Please confirm the specified ICRI CSP requirements as it relates to surface finish are to supersede the varying ASTM F-value requirements setforth in specification section 030300-3.6, B1 or provide a revised specification section 033000 incorporating the ICRI requirement.
2. Please confirm a wood screed or broom finish is accpetable for the mud slab.

Reference Drawing: A1-8710

Per Detail 1 on plan sheet A1-8710, the pipe penetration sleeves are not to be anchored to any portion of the CDSM wall. The sole mounting connection for these pipe sleeves is the bitumen waterproofing membranes. The waterproofing membrane is not strong enough to use as anchorage for these sleeves even with temporary support. The likelihood of jeopardizing the membrane with the design in Detail 1 is high.

S3H proposes a constructable solution. Please find attached the details for a constructible design. This design eliminates the waterproofing anchorage support of the

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Reference Note 5 on Sheet M-0006 which states "The header pipes shall be installed up to the ceiling of the lower concourse level recessed in the face of the CDSM shoring wall. Prior to construction of the top of the foundation wall the pipes shall run to grade where they are capped with pressure gauges. During the forming of the final portion of the foundation wall, the headers are to be modified and installed in their final position through the foundation wall. In their final position the headers will be valved and capped with a pressure gauge."

**Co-Author:**

**REQUEST:**

After observing existing subgrade compactions varying from 88%-95%, it appears that the existing conditions of the soil could be below the 95% compaction requirement. In the case of a geothermal loop being installed in areas with existing soils below 95%, can the geothermal loop be compacted to the localized compaction level in accordance with ASTM DI557? For example, if the first field has an existing condition of 88% compaction, can the geothermal loop trenches be compacted to 88%? 95% compaction may not be possible with the existing soils and existing compaction in some areas.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

See Response to RFI T-0387 and RFI T-0405.

Please advise.

**To:** Webcor Construction LP Robert Kjome

**Answered By:** Webcor Construction LP Robert Kjome

**Co-Author:**

**REQUEST:**

Exhibit "I" of the TG06.1 bid package is a conceptual schedule. This schedule does not provide a date for the installation of the stainless steel geothermal manifold sleeve penetrations or manifolds themselves. Please provide a date of installation for the sleeve penetrations and manifolds for each of the 15 fields.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Refer to 01 13 10 .1.2.C & F. Provide a revised schedule showing activities pertaining to the installation and testing of the geothermal sleeve penetrations and manifolds. Note that the installation of this work cannot delay follow on trades (i.e. superstructure concrete, superstructure steel). Coordinate with W/O as to the timing of the installation of these systems so as not to affect follow on trades.

Please coordinate off of the P6 schedule that W/O sends to SCCI weekly.

sleeve prior to the mat slab pour for access purposes. However, in the submittal comments to SUB-TG0600-036, the Engineer clearly states that the "contract documents specify a field weld of the steel ring such that the pile can be cut and removed without the ring installed." Without access to weld the collar after the mat slab has been poured, it isn't possible to weld the assembly in the field. Additionally, if the collar is to be welded prior to the pile being cut, damage will most likely occur to the ring plate or sleeve during the cutting process as stated in the submittal comments. With the comments to submittal TG0600-036 and the response to RFI T -0411 clearly contradictory, please provide the necessary construction sequencing to avoid damage to the assembly in the field and enable a constructible design.
