|---------------|---|---------------|---------------------|----------------------|----------------------|--------------------|--------------------------|
| T-1471.1      | <p>Detail 4 on S1-3010 includes a scaled dimension of 5'-0" from face of CDSM wall to the inside face of the west half of the seismic embed (See S1-3010 attached). Therefore, the bottom embed plate will need to extend 2'-6" beyond the 5' dimension per Detail 7 of AI -8881 (attached).</p> <p>Since the as-built dimensions of the edge of pits range from 5'-0" to 5'-11" from face of CDSM wall, the bottom embed plate will overhang the pit depression 2'-6" to 1'-7". The plate could be reduced up to 1'-11" (2'-6" minus the 8" for clamping detail) to accommodate the edge of pits and allow for waterproofing clamping detail. Is this acceptable?</p> <p>Please provide further details at locations where encroaching pits do not allow for sufficient room for bottom embed plate and clamping assembly.</p> | Closed        | 07/28/2014          | 08/07/2014           | 08/06/2014           | Potentially        | <input type="checkbox"/> |

| <b>REQUEST:</b><br>Please reference RFI T-0576 regarding the offset of the West Foundation Walls to account for the CDSM Encroachment. The west wall (GL 1) was offset 3 1/8" to the east while the southwest wall (GL XI-1) was offset 1 7/8" to the northeast. Currently there are no dimensions explicitly shown in the contract drawings for the width of the service corridor that runs along the very western edge of the Lower Concourse in Area 1 and 3. However there is a dimension shown on A1-3006 & A1-7004 that shows the eastern face of the service corridor at 5' to the west of GL 1.4 which translates into a service corridor width of 9' -8 7/8". Is it the designers intent to offset the service corridor walls similar to the foundation walls to maintain the 10' corridor width, or is it the designers intent to shrink the width of the service corridor and keep the interior walls in place? Please provide dimensions for the service corridor width. |   |               | <b>SUGGESTION:</b>  |                      | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>The location of interior walls of rooms along the west and southwest service corridors shall be maintained. The service corridor widths shall be reduced by 3 1/8" on the west and 1 7/8" on the southwest. |                    |                          |

| <b>REQUEST:</b><br>Shimmick is planning to use a similar form system for the fourth lift of the foundation wall to that used on the second wall lift. However, the second wall lift form system is a cantilever system and is supported by 1 row of anchors, exerting significant force on the wall lift below. Shimmick proposes to add a tie to the top of the forms and connect to the CDSM soldier piles in addition to using the third lift anchor to provide better support. The soldier piles extend above the ground level and this added tie would not affect the waterproofing (installed by others). See the attached marked up drawings for reference |   |               | <b>SUGGESTION:</b>  |                      | <b>ANSWER:</b> Accept Suggestion: <input type="checkbox"/><br>This is acceptable. | <b>REQUEST:</b><br>1. At the Roof Level EBF Link beams, the AESS fabricated roof nodes weld to the underside of the built-up beam protected zone as indicated in the sketch attached. Based the thickness of the SFRM coating and the profile of the node-to-flange weld, the coating boundary line between the protected zone paint and AESS primer is proposed at an elevation 3" below the bottom flange. This will allow for a clear delineation between the two coatings by avoiding the weld area, as well as allow for compatibility between the SFRM coating and prime coat. Please confirm this is acceptable.<br><br>2. The same elevation for the AESS to SFRM boundary is proposed at the Roof Level Brace beams; however, rather than the protected zone paint, the area above the AESS primer will be bare steel to receive SFRM by others. Please confirm it is acceptable to terminate the AESS paint 3" below the bottom flange of the Roof Level Brace beams. |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b>   |                      |                    | Accept Suggestion: <input type="checkbox"/> |
|   |   |                    |   | 1. This question is a means and methods coordination between trades which the CM/GC shall coordinate. We take no exception to the suggested method. However the ultimate approach selected shall meet the approval by the AHJ.<br><br>2. Same response as above. |                      |                    |   |

| <b>REQUEST:</b>  |  | <b>SUGGESTION:</b> |   | <b>ANSWER: Accept Suggestion:</b> <input type="checkbox"/>  |                      |                    |                          |
| For roof level shear plate connection details at GL11D & GL11F, S1-2603 refers to 3/S1-5013. This detail calls for a 3sided PJP weld at the shear plates, with a t-1/8 bevel (t=shear plate thickness). The shear plate located at the center of the web has a thickness of 2 1/2", which results in a 2 3/8" bevel. The column web at this location has a thickness of 1 1/4"; the stiffener plates top and bottom have a thickness of 1/2". A 2 3/8" PJP weld will greatly distort the 1/2" stiffener plates. The weld size should not exceed the thickness of the thinnest member. Also, Detail 3/S1-5013 refers to Connection Detail 4/S1-5013 which in turn refers to Shear Connection Detail 3/S1-5013. Since both sides of the shear plate are accessible (note 1), is a 1/2" fillet both sides as shown in 3/S1-5011 acceptable for this location? |  |                    |   | Double sided 1/2" fillet welds are acceptable at the top and bottom stiffener plates as indicated in the RFI. Also, reduce the weld size at the column web from 2-3/8" PJP welding to double sided 1/2" fillet welds. |                      |                    |                          |

- Please confirm that cadweld or use listed irreversible compression connections to cross-grid and ground mat at 8' on center minimum is acceptable.

SFPUC acceptance.

- Please confirm ground potential rise study at each switch gear room is not required.

9) WSP has no exceptions to this proposal, subject to SFPUC acceptance. SFPUC to confirm if inspection by other parties is required.

- Please confirm which specification governs, IEEE142 per Transbay Transit Center contract documents or per PUC referenced specification IEEE80, which will require "Ground Grid Test". (See attached email).

- Please confirm the layout of grid does not extend past the walls in South Electrical room B1441.

- Please confirm that exothermic or irreversible compression connections listed for concrete encasement are required for all pigtailed main grid connections, (outside edge to cross members, corners, and main cross connectors), and connections to building ground wires (shown with "G" on plan).

- Please confirm that SFPUC and DBI will be the only entities inspecting the grounding grid.

**Co-Author:**

**REQUEST:**

Per breakout meeting held after the TTC progress meeting on 7/9 @10:30am, please confirm that PG&E will have no jurisdiction over approval and inspection of the grounding grid in electrical room B1441 GL 15/G.5.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

As SFPUC is the utility, SFPUC shall have jurisdiction over the approval and inspection of the grounding grid in electrical room B1441 GL 15/G.5. PG&E, as the WDT provider, may have jurisdiction only over the metering section of the WDT switchgear. For reference, please find attached an email from SFPUC on 7/25/2014 and PG&E on 7/14/2014 confirming PG&E does not have jurisdiction over the grounding grid in the electrical room. Please note, SFPUC, through Walter Melville, had inspected and approved the ground grid for the North electrical room on 7/16/2014

**Co-Author:**

**REQUEST:**

Per contract drawing S1-3205, the removable W14x61 steel corbel and WT8X28.5 angles it connects with are to be fabricated with a 2" vertical slotted hole.

In order to eliminate the lead time of field measured fabrication of the corbels after concrete formwork removal from the SJ assembly, the contractor is proposing either or preferably both of the following modifications:

1. Change the slotted hole from vertical to horizontal (east to west) direction on the angles and or the steel corbels
2. Change the finish of the removable W14X61 steel corbel only from galvanized to primed steel (all other embedded metals would remain galvanized per the contract drawing).

Please confirm if either of these proposals would be acceptable?

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

- 1.) Not acceptable.
- 2.) The beam portion of the corbel may be coated for corrosion protection rather than galvanized. Refer to specification section 09 97 13, part 3.6, item E for acceptable coating types.

| <b>REQUEST:</b>  |  | <b>SUGGESTION:</b> |  | <b>ANSWER:</b>   |                      |                    |                          |
| This is a follow-up to the response of RFI T-1532.<br><br>As per the response, restricting welding to only the girder flange creates several issues:<br>1. See detail 17 on SK1 - an additional 4" would be required on the vertical leg of the angle to allow welding to the girder flange. This creates a 12" vertical leg, welded at the bottom toe to the girder and supporting a 13" concrete slab. Our decker does not believe this is adequate support. This occurs at 9 locations.<br><br>2. See detail 5 & 17 on SK1 - overhead welding will be required from the underside to weld to the girder flange. Detail 5 occurs at 67 locations and 17 occurs at 9 locations. Our decker will incur additional labor and equipment costs for this work.<br><br>If welding to the base plate is prohibited, an alternative solution which will have lower additional cost impact is to use Hilti pins to attach the gauge angle to base plate or girder flange. See attached product data and application details. See attached SK2 for clarification.<br><br>Please confirm if welding to the column base plate is prohibited, Skanska can use Hilti pins as per SK2. |  |                    |  | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Welding the deck support angle to the base plate is acceptable if the welding is made only in the zones marked on attached sketch SKS-0396. The gage angle welded to the base plate will provide adequate deck support. Using Hilti pins to attach the angle to the base plate is not acceptable. We disagree with the claim that overhead welding at the deck support angle constitutes a "cost increase". Detail 8/S1-3705 which shows deck support angle detail at the transfer girder flanges was part of bid documents. The only exception to this detail at the column base plates is that the angle is being welded to the base plate and not the transfer girder flange. Also, refer to details on A1-9317 for slab edge detail at the column base plates. |                      |                    |                          |

| T-1532.3   | SSS - Deck Support Angle at Column Base Plate | Closed                    | 10/07/2014          | 10/17/2014   | 10/17/2014           | Potentially        | <input type="checkbox"/> |
| <p><b>From:</b> Webcor Construction LP Gregory Kemerer</p> <p><b>To:</b> Turner Construction Company Phil Militello</p> <p><b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton</p>   |   |                           |                     | <p><b>Answered By:</b> Adamson Associates, Inc. George Metzger</p>   |                      |                    |                          |
| <p><b>REQUEST:</b></p> <p>Please provide a structural detail indicating the designer's requirements for the deck support/closure angle around the column base plate to top of transfer girder connection on all sides of the base plate.</p> |   | <p><b>SUGGESTION:</b></p> |                     | <p><b>ANSWER:</b> <input type="checkbox"/> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Our response to RFI 1532.2 stands. This RFI is written in a misleading manner. In the 10/02/2014 meeting, we have reiterated that temporary shoring of slab is a means and methods issue. This RFI does not include any new information over the .2 version therefore refer to .2 version which already provided a direction as part of question 1. What was stated in the 10/02/2014 meeting was SER agrees to look at the proposal of the contractor to help resolve the issue however the RFI question is identical to the first question in RFI 1532.2 therefore no further action taken.</p> |                      |                    |                          |

with the detailing of shop drawings. Please note this condition occurs at CS1 and throughout the central zone and is currently holding up the resubmittal of the metal deck shop drawings for the central zone.

Additionally, the RFI response identified a "no weld zone" that was not shown on the design documents. As this was not called out on the contract drawings, this zone is not being identified with paint strips as per the protected zone requirements. This may lead to trade workers accidentally welding in the field. Please provide direction for the identification requirements for the base plate "no weld zone".

the base plate will likely require proper corrective actions to be submitted to the SER for review.

| <b>REQUEST:</b><br>Drawing SI-3201 and other similar foundation wall sections call out a 2" concrete cover on the terminators of the foundation wall vertical rebar. These vertical bars have no adjustability because one end is a terminator and the other end is a male coupler end. The elevation of the top of terminator will be dependent on the coupler elevation above the Lift 3 Foundation Wall. The ground floor slab is 10" thick and sloped along the top of foundation wall.<br><br>To allow for maximum deviation to accommodate for the slope of the slab, tolerances in rebar fabrication and location from the previous wall lifts and the final wall lift:<br>1. Shimmick proposes to change the concrete cover from 2" to 5" and increase the tolerance to 2.5". Please confirm this is acceptable.<br>2. If the proposal is not acceptable, please provide a concrete cover and tolerance that is acceptable. |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Standard ACI tolerance shall apply on concrete cover, increasing the cover and deviation of the tolerance is not acceptable. These proposed modifications to the cover and tolerances would be acceptable only if contractor provides additional U bars over the moment frame beam top rebar with size and spacing matching the size and spacing of stirrups in Zone 1 of Detail 6/S1-3600 at no cost to the owner. The U bars would span between the top corner bars of the moment frame beam have vertical legs that are equal to embedment length per 1/S1-3001. No additional U bars is required between the beams. |                   |                    |                          |

| <b>REQUEST:</b><br>Detail 10/S1-4202 shows the protected zone signage attached directly to both sides of the beam. The response to submittal package TG0701-37A includes a note directing the contractor to remove the signage before SFRM application, and then reattaching it after the SFRM is applied (See SK1). Please confirm this note is to be ignored. |  |               | <b>SUGGESTION:</b>  |                      | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Contract documents indicate paint and signage for protected zone. It has been previously established that the paint may be applied directly to the beam before the application of SFRM. This should serve to designate the protected zone during erection and over the life of the building. The signage is intended to be an exterior alert, over the life of the building, and must be visible from the exterior. Therefore, the signage must be outside of the SFRM. The contract documents do not specifically indicate that the signage be present before the application of SFRM as the contract documents generally show the final condition. It would, however, behoove the contractor to have the signage present at all stages of construction, before and after application of SFRM, in order to mitigate the risk of accidental damage to the part, which would be very expensive to replace. |                    |                          |

RFI RESPONSE T-1562

Per RFI T-1562, the painting of the steel protected zone is to be concealed by the SFRM, but the warning signage is to be affixed over the top of the SFRM at the protected zone.

Attachment details for the protection zone warning sign have not been provided.

Please provide attachment details for the protection zone warning signs over SFRM.

following:

1. The sign should be installed at all times after the erection of each required piece of steel with a protected steel zone ζ THIS IS A CODE REQUIREMENT.
2. Any damage to the SFRM during installation of these signs must be repaired per Division 07.
3. No additional details will be provided.
4. The sign applies to the following:
  - a. Protected Zone signage indicated in Detail 10/S1-4202 shall be provided exterior to the fireproofing within the following protected zones:
    - b. Moment Frame Beams: Details 1/S1-4201, 3/S1-4201
    - c. Moment Frame Columns: Details 2/S1-4201, 3/S1-4203, 5/S1-4203
    - d. EBF Link Beams: Detail 1/S1-4205
    - e. Protected Zone signage is not required in the Protected Zone of BRBF gusset plates.
5. Wingdings 3 is not a recommended font.
6. Where required, signage is to be conspicuously placed near the center of the Protected Zone on both sides of the beam or column web. The sign needs not be flush with the fireproofing.
7. Attachment directly to and solely dependent on the fireproofing is not acceptable. Attachment must comply with the Protected Zone Signage itself, i.e. without bolts, shot pins, welds or screws to the actual structural steel within the zone.
8. Suggested acceptable methods of attachment are:
  - a. Hang the sign with ceiling tie wire from the

**From:** Webcor Construction LP Claude Titcher **To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Shimmick Construction Company, Inc. Sylvia Hartanto

**REQUEST:**

SCCI is in receipt of RFI response T-0741. RFI response T-0741 references RFI response T-0264.3, which states: "... Note that a pile in this location will require the pile to be cut off at a lower elevation than the typical detail, which will involve a larger block-out..."

1. Please provide an elevation, referenced in the above mentioned RFI response, which the pile will be cut.

RFI response T-0264.3 also states: "... the mat shall be re-braced at the block-out by TG03 ... "

2. Please provide a detailed description of this required re-brace and how it will effect TG06 formwork, rebar, etc.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

1) Per the RFI attachments, the bridge pier appears to be completely contained between the shallow eastern sump and the deeper sump immediately west. As such, the cutoff elevation for the bridge pier may be the same as for blockouts at the typical top of mat slab elevation. Detail 4/S1-3009 will apply to the blockout in the north-south direction except that diagonal trim bars are not required. For the east-west direction, Detail 4 would not apply but may be modified such that the #5 at 8" infill cap bars lap with the pit wall reinforcing on the west side and lap with embedded dowels of same size and spacing on the east side. The resultant depth of blockout will be approximately 30". The (6) additional #11 bars shown on 1/S1-2065 may be relocated adjacent to the pier below the shallow east sump. Additional reinforcing beyond the (6) #11's mentioned is not required above the bottom of the mat. Additional reinforcing per Detail 7/S1-3009 is required at the bottom of the pit.

Temporary blockouts are the responsibility of the contractor and the suggestion above is but one acceptable way to accommodate the change in pier location. The contractor is requested to provide a sketch of the final proposed configuration and reinforcing for confirmation through the RFI process.

- 2) The comment regarding re-bracing may be ignored.

| <b>REQUEST:</b><br>Please reference Contract Drawing S1-3010 and Submittal TG0600-051 .1.<br><br>Please clarify the following:<br><br>1. Sheet 8.01 of Submittal TG0600-05 l.1 calls for a M30x4-1/2" stud welded to the embed. Due to the unavailability of M30x4-1/2" studs, please confirm it is acceptable to fillet welding M30x4-1/2" long cut pieces of fully threaded rod.<br><br>2. Submittal TG0600-051.1 requested design to determine bar lengths for the hooked #6 welded rebar. Please provide missing lengths for the hooked welded #6 rebar.<br><br>3. Please clarify the (. 11 7) at the double flare bevel weld on the hooked #6 rebar and the deformed #6 bar. It is SCCI's understanding the 3/8" is the weld size and the 5 is the weld length. What is the (.117) referring to?<br><br>4. See attached SI-3010. The east embed top vertical leg appears to be welded to the horizontal leg with a square bevel and convex weld with a fillet on the other side. Typically, a square bevel has a given dimension that depicts the gap between plates. As no dimension is given and the other side is a fillet weld, it appears to be a flat fillet laid down on the joint, with no gap. Please confirm this is the design intent. |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br><br>1). The headed studs, their weld attachment forming a part of clamping assembly are a part of assembly designed by seismic joint supplier. Changing of the clamping assembly shall be approved by the supplier.<br><br>2). The hook #6 shall be 36" long (length without hook) same length as the 3/4" deformed bar anchors.<br><br>3). The double flare weld is 3/8" with 0.117" effective throat.<br><br>4). Gap of the square groove weld shall be per AWS prequalified weld joint detail. The gap size depending on the weld process used. |                      |                    |                          |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 474 SK1 to SK6 for item 1 to 10:  
 1-  
 8) Several of the shop and field welds required at the ground level corner cast nodes are inaccessible once the cast node is set in position. Please see items 1 through 8 on SK1 through SK8 for clarification and provide direction.  
 9) Supply the welding for the north flange plates of the BU column to the node.  
 10) The welds required at this external corner create an unweldable condition, See SK5 & SK6 for clarification. Please provide direction.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

- 1). The CP weld noted may be achieved by weld a backup bar/angle prior to setting the column.
- 2). The CP weld noted may be achieved by weld a backup bar/angle prior to setting the column. The back-gouge and 5/16" reinforcing fillet may be deleted.
- 3). The double bevel weld may be changed to single bevel weld from the east side.
- 4). The CP weld noted may be achieved by weld a backup bar prior to setting the column. The back-gouge and 5/16" reinforcing fillet may be deleted.
- 5). See response #4
- 6). See response #4
- 7). Backup bar may be installed prior to fitting the transfer girder to the cast node. The back-gouge and 5/16" reinforcing fillet may be deleted.
- 8). Cannot see when the weld cannot be made. The vertical stiffener may be installed after the 2" PP weld is completed.
- 9). The weld info is called out as CP weld with back gouge and 5/16 reinforcement weld, which is questioned in item 4 above.
- 10). Weld access hole per AWS D1.1.

| <b>REQUEST:</b><br>See attached diagram of a wall lift construction joint overlay on the ground floor plan. Per Specification Section 03 30 02 - 3.2, Foundation wall and ground floor construction joints shall align with the location of joint below in TG06 and will not impair the strength of the structure. A conflict occurs at the noted areas of the attached diagram, where the wall joint placed according to specification, will intersect at a moment frame beam. SCCI proposes to move wall construction joints in order to avoid conflicting with the moment frame beams.<br><br>Please confirm shifting construction joints to not align with the construction joints below is acceptable and provide permissible parameters to assign new construction joints for SCCI to reflect upon and modify the construction joint layout. A conceptual sketch is attached reflecting the proposed shift in vertical construction joint. |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>The foundation wall construction joints cannot run through Ground Level MFB's. The best option to avoid this situation is to jog Foundation Wall construction joints around the MFB's as proposed. The recommended location for the offset is the horizontal Foundation Wall construction joint immediately below the MFB's. The Design Team will evaluate contractor proposed construction joints during submittal review of the Ground Level construction joint layout that shall include any modifications to the previously reviewed and approved Foundation Wall construction joint layouts. |                      |                    |                          |

| <b>REQUEST:</b>   |  | <b>SUGGESTION:</b> |                     | <b>ANSWER:</b>   |                      | <b>Accept Suggestion:</b> <input type="checkbox"/> |                          |
| <p>A unique support system is necessary for the foundation wall under the temporary bridges (First, Fremont, Beale). Shimmick proposes that in these areas, the form work will kick to support brackets mounted to the underside of the bridges to provide better support. Without this, the form system will be a cantilever system supported by 1 row of anchors which will exert a significant force on the wall lift below.</p> <p>Please confirm it is acceptable for the fourth lift form system to be supported by the bridge underside.</p>   |  |                    |                     | <p>The bridge is designed by a WOJV subcontractor. WOJV shall respond to this RFI.</p>   |                      |  |                          |

| <b>From:</b> Webcor Construction LP      Claude Titcher<br><b>To:</b> Turner Construction Company Phil Militello<br><b>Co-Author:</b> Shimmick Construction Company, Inc. Henry Chiang  |  |                    |                     | <b>Answered By:</b> Adamson Associates, Inc. George Metzger  |                      |  |                          |
| <b>REQUEST:</b>   |  | <b>SUGGESTION:</b> |                     | <b>ANSWER:</b>   |                      | <b>Accept Suggestion:</b> <input type="checkbox"/> |                          |
| <p>Per Specification Section 03 20 02-1.4-A-7, "test results for [pendulum] bearings with similar size" are to be submitted for approval. Per Mageba, they have test data on pendulum bearings (isolators) with similar sizes which they believe have been tested under more severe conditions than the ones required for this project. See attached email correspondence with Mageba for further explanation and more specific details in regards to their test and how the results apply to satisfy the requirements in the specifications. The referenced Annex documents in the email are also attached. Only a sample of the data has been included for preliminary approval; full test data will be submitted once this data is confirmed acceptable.</p> <p>Please confirm that the mentioned test reports could serve as evidence of the proper functioning of mageba pendulum bearings, as well as the fulfillment for the requirements in the specifications.</p> |  |                    |                     | <p>Reports from past test data can serve as a basis to waive the testing requirement. However, the information provided with this RFI is not sufficient to waive the testing requirement. The test data provided in the RFI seems to belong to a bearing of similar size but it does not seem to meet vertical load carrying requirements outlined in the specifications. It is also not clear whether it meets the horizontal force requirements (friction coefficient) outlined in the specifications or not.</p> <p>To waive the testing requirement:</p> <ul style="list-style-type: none"> <li>- Provide specifications for the product that is intended to be used in this project that meets the design requirements outlined in the contract documents.</li> <li>- Provide test data for a bearing that is comparable in size and performance to those intended to be used in this project tested with conditions that are comparable to the design requirements.</li> </ul> |                      |  |                          |

| A unique support system is necessary for the foundation wall under the temporary bridges (First, Fremont, Beale). Shimmick proposes that in these areas, the form work will kick to support brackets mounted to the underside of the bridges to provide better support. Without this, the form system will be a cantilever system supported by 1 row of anchors which will exert a significant force on the wall lift below.<br><br>Please confirm it is acceptable for the fourth lift form system to be supported by the bridge underside. |  |   |  |                      |  |                    |                          |

| It has been understood that, due to the availability of mill r un plate size and length, it would be necessary to splice s ome of the top and bottom flange components of several o f the Transfer Girders in order to achieve the overall length required. The Contract provisions and AWS D1.1 Structu ral Code require that all splices made by welding are to be shown on the shop drawings. However, the location of the shop splice(s) was not shown on the shop drawings that were issued for fabrication to Thompson Metal Fab. TMF has fabricated flanges that have been spliced by full penet ration welds. The welds have been inspected and have be en accepted in accordance with the provisions of the AWS D1.1 Structural Code for static load criteria. The locations of the splices in the transfer girder components and the af fected flanges are shown in the attached documentation. |   |        |   |            |            | <b>Accept Suggestion:</b> <input type="checkbox"/><br>Confirmed that the as-built shop splices shown in Appendix B and proposed splice locations in Appendix C are acceptable. |                          |

George Metzger</p> |   |                      |                    |                          |
| <p><b>REQUEST:</b><br/>                 Please refer to attached SK RFI 744 SK01.<br/>                 The shear plates at drag connection type 1-A at cast node 29B-01 and 29A-01 land on the edge of the welding pad. This condition does not make allowance for as-cast tolerances on the welding pad edge and may impact our ability to achieve effective weld size. Please advise.</p> <p>Skanska acknowledges the response to SK RFI 004.1 (T-0738) and 004.2 (T-0738.1). Following these RFIs, Skanska increased shear plate spacing to give a 1/8" gap on the inside of each shear plate for erection clearance. Even had this gap not been added, Skanska would still flag this issue for designers review as 1/8" still does not allow for as-cast tolerances at these locations.</p> |  | <p><b>SUGGESTION:</b></p> |  | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>The information provided in the RFI is not sufficient to provide a single solution at this time. Consider following solutions, which depend on the actual size of the pad:</p> <p>1-) If the as cast dimensions of the pad allow the shear plate to land on the pad, no action needed. Since the contractor has opted to machine the pads, the rounded edges of the pads will likely be removed to create a wider weldable pad surface.</p> <p>2-) Once the as cast dimensions of the pad are determined and if the plates do not fit in the pad, the ends of the plates can be tapered 0.25" with 1:2.5 ratio (e.g., 0.25"x 0.625" taper) at the outside faces of the plates.</p> <p>Lastly, the contractor plans to use 1/8" gap on each side of the shear plate per the RFI. Considering that these are slip critical connections, a smaller gap might be considered by the contractor which can decrease the out to out connection width. To achieve slip critical, shim plates are needed if there is a 1/8" gap between the connection plate and beam web.</p> |                      |                    |                          |

| <b>REQUEST:</b><br>At grid C3 the BU perimeter beam butts into the transfer girder TR3. The deck support angle in the web of the BU beam stops back 4' 9-5/16" from the center of the girder. This results in a region of about 4'-4" without deck support at an end bearing.<br><br>Design drawings do not provide a specific detail for this condition. Deck support at column detail 1/S1-5001 should not be used as this detail typically only supports one or two flutes of deck. The condition described above has 4 1/2 unsupported flutes in an end bearing condition with 10" of  |  | <b>SUGGESTION:</b><br>A 4x4x3/8" steel angle can be field welded from the perimeter beam deck angle to the transfer girder deck angle to span the unsupported deck or provide an alternative detail. See SK1 for clarification. This condition also applies at line G. |   | <b>ANSWER:</b> Deck support is a "means and methods issue" and we disagree with the cost increase claim. Deck support angles proposed in the RFI and as shown on SK1 in the RFI are acceptable at the two locations on GL 3. |                      |                    | <b>Accept Suggestion:</b> <input type="checkbox"/> |

**From:** Webcor Construction LP Claude Titcher **To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Shimmick Construction Company, Inc. Sylvia Hartanto

**REQUEST:**

The current design indicates the top of the # 11 vertical wall reinforcing terminating with a terminator maintaining 2" concrete clear cover above the bar as seen in Section 1 on S-3201 .

A # 11 555 t-head is 11/ 16" thick and a #11 Lenton Terminator is 11/16" thick. The Ground Moment Frame Beams appear in Section 5 of S1-3600. The concrete clear cover indicated over the stirrup is 2 3/4".

Due to the designed concrete clear cover called for, the thicknesses of the different terminator products and the allowable tolerance in fabrication and placement per ACI a conflict with the two interfacing componets is expected to occur at the top bars of the MFB.

Please confirm if the tenninator on the vertical bar can terminate below the ground level MFB top bars to avoid the expected conflict similiar to that allowed between the column and concourse MFB as indicated within RFI T-0917.

Should this proposed solution not be acceptable please provide direction how to proceed.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Confirmed, provided that the resulting clear cover to the Foundation Wall Vertical Reinforcing Terminator is within the parameters of the RFI T-1622 response including the supplemental U-bars. We disagree that a potential clash is anything other than insufficient means and methods.

George Metzger</p>  |                     |                      |                      |                    |                          |
| <p><b>REQUEST:</b><br/>See attached marked up contract drawings.</p> <p>The TG0600 rebar subcontractor is using HRC 420 friction welded standard couplers at the top end of the 3rd lift foundation walls and embedded columns C21, C33, C34 vertical bars. The inner set of embedded column vertical bars are indicated in sections as having a 90 degree SH tail at the top of bar. It isn't possible to install the bar with the 90 tail into the 3rd lift HRC 420 standard coupler as the tail of the bar needs to spin circular to engage the threads into the coupler with the final tail orientation dictated by torquing of the bar into the coupler. A possible solution to this issue is to utilize the HRC 555 Forged head in lieu of the 90 degree tail. The top of the inner vertical bar 555 head could be held 4" below the top of the outer vertical bar 555 head for concrete encapsulation.</p> <p>Please confirm that the proposed solution is acceptable for the typical embedded column in foundation walls.</p> |   | <p><b>SUGGESTION:</b></p> <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Proposed solution is acceptable for Embedded Columns C21, C33, C34 and C23. Coordinate head elevation with requirements of framing coming into the joint. Indicate target head elevations on submittals for review.</p> <p>REVISED RESPONSE:</p> <p>Proposed solution is not acceptable, hooks shall be provided as shown in construction drawings. This is a means and methods issue. The work between the two sub-contractors shall be coordinated by the general contractor.</p> |                     |                      |                      |                    |                          |

Please provide dimensions for CMU walls near Gridline 20-H. See attached marked-up contract drawings for the dimensions needed.

For dimensions to CMU wall/pier adjacent to Door B1560B, refer to SKA-4032.

For dimension to the CMU wall at the south of the Main Switchgear Room B1560, it is confirmed that south face of CMU wall is aligned with Gridline H.

**From:** Webcor Construction LP Claude Titcher **To:** Turner Construction Company Phil Militello

**Answered By:** Webcor Construction LP Adib Sassine

**Co-Author:** Shimmick Construction Company, Inc. Sylvia Hartanto

**REQUEST:**

Column 101E and 101F was poured 1 ft below shoring elevation.

Is it acceptable to use concourse slab concrete mix 1558218 to pour back the remaining top foot concurrently with concourse deck D201?

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Proposed using concourse slab mix to pour back both columns is unacceptable. Pour the remaining 1 ft of concrete at both columns 101E and 101F the same mix as the concrete columns with the following options as discussed with Sean McNeil:

- Option 1: Pour both columns separately under separate IR.
- Option 2: Or pour both columns at the same time as the concrete deck D201 provided you allow 2 hours for the concrete to set and then you pour the deck with the scheduled concrete mix. This will require a separate IR to track this condition at both columns. Include special instruction in the IR to ensure consolidation of both columns are inspected separately as well as paying close attention not to disturb the concrete of poured column sections when consolidating. Prep the top of concrete column surface to achieve the required amplitude as required per previous column pour cold joint condition.

| T-1627   | SCS - Bridge Blockout CIDH Piles | Closed        | 08/21/2014  | 08/31/2014           | 09/05/2014           | Potentially        | <input type="checkbox"/> |
| <b>From:</b> Webcor Construction LP      Claude Titcher<br><b>To:</b> Turner Construction Company Phil Militello |                                  |               | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |                      |                      |                    |                          |

**Co-Author:**

**REQUEST:**

Please provide details for blockout(s) at the concrete roadway section as shown in the attached sketch. A Blockout will be necessary to allow the CIDH pier(s) to be removed from the ground level, pulled up through the deck, after the concrete bridge(s) section has reached design strength. Once the CIDH piers have been removed the circular section will need to have rebar installed, concrete poured back, and waterproofing repaired prior to receiving infill pursuant to contract documents; 10 sets of CIDH piers, per temporary structure, will require Blockouts at First, Fremont, and Beal street.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

1. Reference RFI T-0470 and RFI T-0807. Temporary blockouts are the contractor's responsibility. Refer to General Notes GR-4, GR-5, and GR-9.
2. Refer to attached conceptual detail representing an acceptable method of restoring a temporary opening to contract final condition at the roadway slabs. It does not relieve the contractor from the obligation of verifying the suitability of the detail to actual field conditions and construction loading.
3. Should the contractor elect not to shore the temporary condition, the contractor shall submit a statement or supporting calculations justifying the unshored condition under construction loads signed by a licensed professional engineer. Should the contractor elect to use conceptually different detailing, the detailing and any required supporting calculations shall be submitted for review.
4. The final choice of detailing shall be explicitly indicated on the deck reinforcing submittals for each unique blockout case for coordination with surrounding reinforcing.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

- See SK-1 attached
- 1) Ref.: 3/S1-4357 Confirm no weld at 1-inch plate to web as shown
  - 2) Ref.: 3/S1-4357 Confirm no weld at 2-inch plate to TG-33.2 inside of pipe column as shown
  - 3) Ref.: 3/S1-4357 Cannot back gouge weld as shown - access is not provided please resolve
  - 4) Ref.: 4/S1-4357 Clarify 5/16 fillet weld shown - provide complete extents for all-around weld. No weld show for WF flange to TG-33.2 shown please confirm
  - 5) Ref. S1-4357 Suggest use of base plate to resolve

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Refer to attached sketch SKS-0415, which provides a simplified connection at the locations indicated the RFI.

We disagree with the reason for RFI request "Engineering Conflict". We categorize this as "clarification for issues on means and methods" and "change to be issued in a future bulletin".

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

- See attached CD RFI # 555 SK1 for items 1 to 9:
- 1) Supply/confirm all clouded dimensions (9 clouds total).
  - 2) Verify dimension.
  - 3) Connection per 9/S1-5028 will not work at the noted location. Supply an alternate detail.
  - 4) Confirm off-center connection per 9/S1-5028 is acceptable or supply an alternate detail.
  - 5) Confirm the noted dimensions may vary to match the W-3 supporting beam locations above.
  - 6) Confirm the orientation for the MC4.
  - 7) Confirm the vertical hanger is interrupted at the upper beam. Please clarify.
  - 8) Clarify where the MC4x13.8 is located and supply a connection to the W12 & CMU wall.
  - 9) Supply the elevation for the W12x40 at the landing and depending on the elevation, supply a connection detail at each end.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. See attached sketch SKS-0406 for requested dimensions and for updated slab edge drawing, refer to SKA-4081 and 6/A1-7011 issued with ASI-118.
2. Confirmed.
3. Move the W12x40 beam northwards so that the 2L6x6 clears the W33x118 flange by 1". The EOS of the mezzanine floor will also move with W12x40.
4. Move the W12x40 beam so that it aligns with the W44x230 beam above. The EOS of the mezzanine floor will also move with W12x40.
5. Confirmed.
6. Confirmed.
7. Provide 1 hanger on each side of the slab step on both sides of the slab as shown in attached sketches SKS-0404 and SKS-0405.
8. The MC4x13.8 channel may be waived at the highlighted location. In lieu of the MC4x13.8, provide a W12x40 beam as shown in sketch SKS-0405
9. Provide a W6x25 beam in lieu of the W12x40 beam at the upper slab as shown in sketch SKS-0405.

- See attached CD RFI # 561 SK1 to SK4 for items 1 to 20:
- 1) Confirm all dimensions shown in a green rectangle box.
  - 2) The noted W12x40 appears to be shown as one continuous beam from west of Grid 22 to east of grid 24. Supply splice locations and a splice detail.
  - 3) Confirm the CMU wall aligns with the west edge of the slab opening or supply more information.
  - 4) Confirm it is acceptable to locate the MC4's 1" from edge of slab openings.
  - 5) It is not clear where the MC4 is located. Is it backed against the CMU wall? Please provide more information and connection details.
  - 6) The location of the hangers are not correct at the locations noted as a red rectangle box based on the concrete beam locations per RFI T-1010 (SK 287, CD 230). Confirm the updated dimensions are correct.
  - 7) Confirm connection is per 9/S1-5028.
  - 8) Supply a connection detail.
  - 9) Supply a connection detail for MC4 to MC4.
  - 10) Confirm all W12x40's and all MC4x13.8's are located vertically per 4/S1-5032 (SK3). If not, supply more information.
  - 11) The location of the hangers are not correct at the locations noted as a red rectangle box based on the concrete beam locations per RFI T-1010 (SK 287, CD 230). Confirm the updated dimensions are correct.
  - 12) Confirm the CMU wall aligns with the east edge of the slab opening or supply more information.
  - 13) Confirm dimension to edge of slab.
  - 14) Confirm MC4 is located 1" west from the edge of slab or supply more information.
  - 15) Confirm the underside of the slab is typically at the top of the bottom flange of the W12x40's or supply more information.
  - 16) Supply a connection detail for the MC4 to the W12x40.
  - 17) Supply a connection detail for the MC4 to the CMU wall.
  - 18) Please supply dimensions for hooked deformed bars.
  - 19) Confirm stud spacing to avoid the bending radius.
  - 20) Confirm 1 1/4" I/S cold bending radius.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. For confirmation of dimensions highlighted in green on CD RFI 561 SK1, A1-2854 should be read in conjunction with A1-3020, A1-7010 and structural details.
  - a. 12'-0" is confirmed
  - b. 2'-8 5/8" - should be 2'-0 5/8", refer to A1-2854 issued with ASI-118.
  - c. 11'-6" - should be 11'-2", refer to A1-2854 issued with ASI 118.
  - d. 11 5/8" is confirmed.
  - e. 19'5 3/4" - is acceptable
2. Refer to response to RFI T-1073 for clarification on W12 beam splice locations and detail.
3. Wall below is 3" offset from EOS. Refer to Detail 5/A-0024.
4. MC4s shall be 2" (clear) away from the slab openings.
5. The MC4 channel may be waived at the highlighted locations.
6. Confirmed.
7. Confirmed.
8. Move the W12x40 and 2L6x6 hanger northwards so that the W12x40 beam is 1" offset from the W40 beam at the ground level.
9. Refer to response to RFI T-1073 for MC4 to MC4 connection detail clarification.
10. Confirmed.
11. See attached sketch SKS-0414 for correct hanger locations.

| <b>REQUEST:</b><br>Partition walls taller than 24'-0", as indicated in Section 3/S1-9050, have vertical reinforcing of #7 bars @12" centers. Section 4/S -9051 indicates that the vertical bars will have a 90 degree tail at the top end of the bar. The standard tail length for #7 bars is 14" and will not fit within the 12" thick walls. Rotating the #7 bar tails to clear the concrete face by 1 1/2" clash with one another. Harris Rebar requests permission to utilize #7 straight vertical bars with a #5 'U' shaped cap with 30" lap@ 6" centers at the top of walls. Is this acceptable?<br><br>In order to minimize multiple varying lengths of the #7 vertical wall bars, the #7 threaded vertical dowel bar length will be increased from 49" to 56". The #7 wall vertical bar will be held up to the top of wall elevation, less clear cover, and maintain a minimum 49" lap splice at the Concourse Level. Is this acceptable? |  | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Confirmed, it is acceptable to use #5 "u" bars with splice length of 30" at 6" OC in lieu of standard hooks for #7 vertical partition wall reinforcement. At contractor's option it is also acceptable to provide a reduced-dimension hook length at wall ends for the #7 vertical partition wall reinforcement. A hook length of 9" is acceptable.<br><br>Confirmed, 49" lap splice for #7 vertical wall reinforcement is acceptable. |                      |                    |                          |

|  |   |  |   |   |                      | 2) Embed Angle A9516 is noted in two locations, 3 on Train Platform (drawing EM46) & 2 on Bus Deck Levels (drawing EM47). The Corrected dimension applies to embeds at the Train Platform level (see drawing EM46). Skanska to confirm if Embed A9516 is designed for both levels. |                          |
| <b>T-1650</b>  | <b>SCS - Requesting Approval for Precast Panels in Lieu of Cast-In-Place</b>  | <b>Closed</b>                          | <b>08/27/2014</b>   | <b>09/06/2014</b>   | <b>09/15/2014</b>    | <b>Potentially</b>   | <input type="checkbox"/> |
| <b>From:</b> Webcor Construction LP  | Claude Titché   | <b>To:</b> Turner Construction Company | Phil Militello  | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |                      |  |                          |
| <b>Co-Author:</b> Shimmick Construction Company, Inc.  | Henry Chiang  |  |   |   |                      |  |                          |
| <b>REQUEST:</b>  | See attached Exhibits A through D as a possible means of precast installation method. Using a precast yard facility in lieu of concrete cast in place will reduce the construction duration for the scallop, perimeter, and sky light elliptical wall operations since production can start prior to the construction start date. Precasting concrete elements also results in a better final product. Quality advantages of using a precast yard facility over cast in place methods are improved formwork design, curing procedures, temperature control, and form striping methods since work space, formwork weight, formwork relocation and reassembly, and hoisting equipment restrictions are greatly reduced if not eliminated. | <b>SUGGESTION:</b>                     |   |   |                      |  |                          |
| shimmick requests approval from the engineer to allow precast manufactured panels in lieu of the cast in place walls shown on S1-2752 & S1-3282 scallop walls, S1-2602 stair well, S1-2603 elliptical skylight, S1-2604 light column opening, S1-2606 stair shaft, and S1-2607 elevator shaft. |   |  | <b>ANSWER:</b> <input type="checkbox"/> <b>Accept Suggestion:</b> <input type="checkbox"/>  |   |                      |  |                          |
| Please confirm that the concept drawing is acceptable as well.   |   |  | In concept, the proposed P/C scheme will work structurally. However, we would point out that the support of the panel on the steel beam shall be detailed to allow for in/out and up/down adjustments. The detail shall also accommodate the nature camber in the steel beam. Structural calculations and shop drawings shall be submitted for review. The calculations and shop drawings shall be stamped and sealed by a California Structural Engineer.  |   |                      |  |                          |
|  |   |  | In concept, the proposed P/C scheme will work visually for the architectural team. However, without an existing precast concrete specification and drawings that outline visual and quality control issues there may be some details that require a joint agreement on what is to be provided between the Contractor, TJPA, and the TJPA Representatives. Submit a draft design package including specification, confirmation on waterproofing details, and more developed design drawings to the TJPA Representative for review prior to final agreement on this substitution. |   |                      |  |                          |

|               | <p><b>REQUEST:</b></p> <p>Candraft have identified several dimensional discrepancies between the Structural Engineer's certified Tekla model and the cast node shop drawings. Please verify correct dimensions queried in attached sketches</p>  |               |                     |                      |                      |                    |                          |
|               | <p><b>SUGGESTION:</b></p>  |               |                     |                      |                      |                    |                          |
|               | <p><b>ANSWER:</b></p> <p>TT confirms that the dimensions per Tekla model are accurate. Cast Connex looked into the discrepancy between the dimensions from the Tekla model and in cast node shop drawings and it was not entirely clear where the discrepancy is coming from.</p> <p>The discrepancy only effects the angular position of the pad; the worst case discrepancy was determined to be 0.0107 degrees which is far less than the allowable angular tolerance on this as-cast feature, therefore the discrepancy is not significant from constructability perspective and can be ignored in detailing the light column.</p> |               |                     |                      |                      |                    |                          |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**REQUEST:**

The contract drawings do not provide a section view for the foundation wall at Stair Tower 201. S1-2302 calls out the foundation wall as a uniform 3' thickness. S1-3201 provides a typical foundation wall section, shown with uniform thickness. Shimmick has been provided with updated sketches that call out a thickened foundation wall of 4' 3 1/2" at Stair Tower 201 as opposed to the uniform 3' thickness.

- 1) Please confirm that, at Stair Tower 201 between Grid Line D and E.6, the foundation wall will be thickened to 4' 3 1/2" per the sketches provided.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Per Section 2/SKS-0401 the very top of the foundation wall is integral with a haunch that supports the stair floor slab and HSS stair column. Below the South Wx column, a rectangular pilaster of the same thickness as the corbel extends down to the top of the grade beam as shown in Sections 3/SKS-400. Below the north Wx column, the bottom of corbel is below the grade beam resulting in a short similar pilaster. The extent of the corbel, the required elevations, and the south Wx pilaster are shown in Section 1/SKS-401. The western face of the pilaster is located at 3'-3-1/2" west of Grid 1 as shown on SKS-0398.

| <b>Answered By:</b> Adamson Associates, Inc. George Metzger        |   |  |                   |                   |                   |                    |                          |

**REQUEST:**

Shimmick has been provided with sketches, namely SKS-0398, calling out thickness of the walls at the foundation of Stair Tower 201. The wall thickness called out in the sketches do not match the thickness provided in the contract drawing A1-2960 nor SKA-2991 as provided in Bid Addendum 3.

- 1) Please confirm which set of drawing wall thickness dimensions are correct.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

SKS-0398 calls out the correct thickness of the foundation walls. See attached SKA-4052 (based on A1-2960) now matching structural information.

Please confirm the Pier and Opening Sizes for Lower Concourse Decks D220 to D236 are per the attached drawings as the specific sizes and wall heights are not shown in the Contract drawings. (Reference RFI T-1461)

Pier and opening sizes without mark ups for Deck D220 to D236 are confirmed. Refer to attached PDF (AAI Response) for AAI notes and mark ups.

Reason for RFI Request appears appropriate.

**From:** Webcor Construction LP Claude Titche

**To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Shimmick Construction Company, Inc. Sylvia Hartanto

**REQUEST:**

Please see attached S1-2210 and S1-3204 D4.

**SUGGESTION:**

SCCI inadvertently poured the Shear Wall against the Knock-out Wall without any blockout for West Spandrel Beam B20, as shown in S1-2210 and S1-3204.

**ANSWER:** **Accept Suggestion:**

Confirmed.

Please confirm the following remedy is acceptable:

1. The affected #7 bars are drilled and bonded to supports (Shear Walls) with standard embedment per approved epoxy manufacturers recommendation.
2. Tie spacing, which is presently at 12". Will be reduced to 8"; Tie size will remain #4 rebar.
3. Contact surface not to receive ¼" X 8" continuous neoprene pad, will be roughened to 1/4" amplitude.

| <b>REQUEST:</b><br>Please reference drawing S1-3001.<br><br>See attached marked up drawing 4/S1-3207 details typical wall opening reinforcement, noting to use additional bars for 10" to 30" wall openings with lengths $LTS + W$ . The typical vertical bars used for the foundation walls are #11 rebar and the added bar length is 19'-6" ( $LTS + W + W + LTS + W = 102" + 10" + 10 + 102" + 10"$ ). Depending on the location of the penetration, the added bar would have to extend $LTS + W$ beyond the opening, which in the 10" opening case is 9'-4" ( $102" + 10"$ ). This is not possible considering the foundation walls under TG07.2 scope of work are between 8' to 12'.<br><br>Additionally these additional vertical bars will potentially conflict with moment frame beam rebar at ground level by adding to the rebar congestion. See attached marked up drawings for example conflict.<br><br>1. Please provide an alternative to the current wall opening detail for the foundation wall.<br>2. Please provide an alternative detail for cases where additional vertical bars conflicting with moment frame beam rebar. |  | <b>SUGGESTION:</b>  |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Coordination between trade packages in the responsibility of the contractor. Details shown on S1-3207 stand. Calculation of development length in the RFI is incorrect, vertical bars are not considered Top Bars. Where the opening occurs high in a wall and the calculated length of additional reinforcing exceeds the wall height, additional reinforcing may be terminated with a hook or a head. In order to avoid congestion and potential conflict with intersecting elements, the additional vertical reinforcing may be placed in an interior layer and aligned with the uninterrupted vertical bars. |                      |                    |                          |

George Metzger |   |                      |                    |                          |  |
| <b>REQUEST:</b><br>Please refer to beams highlighted in S1-2503 (attached) and work with this RFI.<br><br>The 7" cope shown in 2/S1-5017 is not sufficient for erection clearance. The connections on the other end of these beams dictate that the beams cannot be dropped vertically into position during erection (Please refer to attached SK RFI 813 SK1 and SK RFI 813 SK2). Beams have either a gravity moment connection (per 1/S1-8003) at odd gridlines or a shear plate connection (per 1/S1-8000) at even gridlines. These beams connect into the bus deck perimeter beams which must be installed first in our erection sequence due to the constraints of knife/pin connections at either end at the bus deck level cast nodes.<br><br>Please advise.  |   | <b>SUGGESTION:</b><br>We propose increasing the 7" bottom flange cope to 9.5" for both scenarios. We have modelled both cases and can erect the beams with a cope of this size. |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Suggestion acceptable.   |                      |                    |                          |  |

the statistics prior to accepting any specific welder reduction request. The QA Special Inspectors are only authorized to reduce the NDT of those specific welders and the QA Special Inspectors only are authorized to rescind this.

NOTE: Regarding any proposed "Reduction of Rate of Ultrasonic Testing" specified in AISC 341-10 (J6.2g) compared to 341-05 (Q5.2 g). This exempts Demand Critical Welds from any reduction in UT testing. Any reduction of NDT is at the discretion of the EOR and AHJ.

Regarding these moment frame column Complete Joint Penetration (CJP) welds and specification section 05-12-10 Structural Steel Additional Seismic Requirements, Table 2-1, and AISC as noted above, any reduction of NDT is at the discretion of the EOR and AHJ. The EOR and the AHJ must be assured of the confidence QA Special Inspectors and the welding integrity. Four of Four (4 out of 4) welds will receive QA Special Inspectors AWS Code visual welding inspection with some reduction in MT inspection only at the discretion of the QA Special Inspectors who are only authorized to reduce the NDT to 25% for those individual welders whose reject rates do not exceed 5%. The QA Special Inspectors only are also authorized to rescind this.

Shimmick is requesting the engineer to provide the amount of vertical tolerance that should be anticipated in the perimeter beams BU-40-28x1x2.25 at the connection points.

Shimmick is requesting the engineer to provide the amount of vertical tolerance that will be acceptable for the roof top perimeter walls.

See attached Exhibit A for visual aid.

than 1/4" under full load.

2.) For concrete construction tolerances refer to ACI 117, as indicated in specifications 03 30 02 and 03 20 02.

3.) The question on the amount of vertical tolerance that should be anticipated in the roof perimeter beams is unclear. This is a continuous beam as indicated in construction drawings. Also refer to our response to first item for additional information.

**Co-Author:** Shimmick Construction Company, Inc. Henry Chiang

**REQUEST:**

Per specification section 03 10 01 Part 2 - Products 7. H. Snap-Off Ties: Use for concrete walls below grade and walls which will not remain exposed to view and are not scheduled for architectural finishes.

Drawing A 1-8608 shows the scallop and perimeter walls and A 1-8402 shows the skylight walls not being visible from the sides because of the fascia details and the earth backfill. These walls are not called out as architectural walls on the architectural drawings.

Please confirm that typical snap ties are acceptable at perimeter wall, scallop wall, and sky light wall locations.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

The Design Team does not object to the use of Snap-Off ties only at skylight wall locations. At Roof Park level perimeter parapet wall including Scallop walls, removable form ties may be used, provided they comply with 03 10 01 2.2 B.7.g - "Removable Ties". Perimeter wall and scallop concrete walls shall be prepared TO receive elastomeric coating finish.

**T-1698**                      **SCS - Wall Opening Detail Conflicts for Horizontal and Diagonal Bars**                      **Closed**

**From:** Webcor Construction LP                      Claude Titcher

**To:** Turner Construction Company Phil Militello

**09/15/2014**    **09/25/2014**    **09/18/2014**    **Potentially**

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Shimmick Construction Company, Inc. Henry Chiang

**REQUEST:**

Please reference detail 4/S1-3207 and RFI T-1666 about foundation wall opening conflicts. Since submitting RFI T-1666, more concerns regarding 4/S1-3207 have been brought to our attention.

One of the concerns mentioned in RFI T-1666 was the case of additional vertical bars potentially conflicting with moment frame beam rebar. This issue can also occur with the diagonal cross bars and additional horizontal rebar.

1. Please provide an alternative detail for cases where either additional horizontal bars and diagonal cross bars conflict with moment frame beam rebar.

Due to the length of additional horizontal bars, wall openings near foundation wall CJs will cause the constructability issue of requiring rebar to be built out further to proceed with concrete pours.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Per General Note GR-11, the contractor shall apply contract details to similar conditions. It is acceptable for review of contractor's adaption of details to similar conditions to occur in submittal review or through the RFI process. Note that this RFI does not make reference to any specific condition where the typical detail cannot be similarly applied. Neither, does it contain suggestions for application of the detail to the conditions the contractor may have in mind.

Responding to the RFI in a general sense, the first issue raised is the potential for diagonal trim bars to conflict with MFB reinforcing. As with openings near the tops of walls, typically trim reinforcing is bent parallel with the top of the wall or trim reinforcing on either side of the top of the opening is combined in one piece of reinforcing. Either approach is acceptable when necessary to avoid the MFB's or tops of walls.

The second issue raised is the potential for horizontal

| T-1699   | SSS - Drag Beam Web Stiffener Plate Connection Clarification | Closed  | 09/15/2014          | 09/25/2014           | 09/26/2014           | Potentially        | <input type="checkbox"/> |
| <p><b>From:</b> Webcor Construction LP Gregory Kemerer <b>To:</b> Turner Construction Company Phil Militello</p> <p><b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton</p> <p><b>REQUEST:</b><br/>See attached CD RFI # 572 SK1:<br/>Confirm it is acceptable to end the web stiffener plate as shown to avoid fouling the shear plate for the beam connection.</p> <p><b>SUGGESTION:</b></p> |  | <p>additional reinforcing to interfere with the MFB's. The horizontal reinforcing is a smaller diameter than the MFB longitudinal reinforcing and the conflict is not obvious to us. If the contractor encounters a conflict, the spacing requirements of Detail 4/S1-3207 may waived in favor of providing the number of required bars over the specified spacing. It is also permissible for added horizontal bars to be placed in interior layers where the previous method is not achievable.</p> <p>The third issue raised is that additional horizontal bars may extend past Foundation Wall CJ's. This is no different than typical wall horizontal reinforcing. The contractor shall either build their forms around the required added reinforcing, as with typical horizontal wall bars or they may request the use the Type 2 couplers. Where additional horizontal reinforcing bars would extend past a corner, the bar may be terminated with a standard hook at the far face of the corner.</p> <p>Lastly, the RFI requests that RFI T-1666 response be applied. RFI T-1666 and T-1698 are to be applied separately to the respective bars they address.</p> <p>Reason for request is "Other" - agreed.</p> <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Confirmed.</p> <p>TT: We disagree with the reason for RFI request "Engineering Conflict", agree with others. | T-1702   | SSS - Weld Terminations on Moment Frame Column Shafts | Closed             | 09/15/2014  | 09/25/2014   | 09/26/2014    | Potentially | <input type="checkbox"/> |  |
| <b>From:</b> Webcor Construction LP Gregory Kemerer<br><b>To:</b> Turner Construction Company Phil Militello<br><b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton  |   |                    | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |  |               |             |                          |  |
| <b>REQUEST:</b><br>Please see Section 5.17.1- Figure 5.2 from the AWS D1.1 Structural Welding Code (See SK1). In the sketch, proper terminations are shown for both a CJP weld and fillet weld as they approach an access hole.<br><br>The moment frame column shafts have been designed with a varying thickness of web. These web splice locations require an access hole to account for the different weld details between the web and flange, with generally a CJP weld being performed on one side and a fillet on the other (See SK2).<br><br>The shaft drawings that have been detailed show an access hole that conforms to 5.17.1 - Figure 5.2. Note, however the shaft drawings do not show the weld termination detail. It is industry standard for the modeler to exclude these details as it is up to the fabricator/inspector to understand that welds should always be terminated as per the section of the AWS code they fall under, unless the design engineer specifies otherwise.<br><br>Currently, the TJPA shop inspection staff has directed our fabricator to terminate both the CJP & fillet welds similarly - as shown for a fillet weld (See SK3). Please confirm that this is acceptable as currently shown.<br><br>Please also confirm that the weld terminations should be completed as per AWS D1.1 - Section 5.17.1- Figure 5.2 for all columns fabricated in the future. Terminating CJP welds, as currently directed by the inspection staff to be flush with the end of the access hole will result in additional costs to our fabricator. |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>1.) First question is not entirely clear since CJP and fillet welds are not terminated similarly per AWS D1.1. Per Figure 5.17 of AWS D1.1, fillet welds are not returned whereas CJP welds are terminated smoothly within the weld access hole envelope and shall not create any stress risers.<br><br>2.) For weld access holes in the SFRS, refer to specification 05 12 10, section 2.2.C.c, which requires compliance with ANSI/AISC 360 as a minimum, which is compatible with AWS D1.1, Section 5.17.<br><br>TT: We disagree with the reason for RFI request "Engineering Conflict". We categorize this RFI as called out in contract documents.<br><br>Jack Adams<br>9/26/2014<br><b>RESPONSE:</b><br>Contrary to the RFI question, the TJPA shop inspection staff does not direct fabricators. These NDE Inspectors either accept or reject welds based on AWS Code. In this case the EOR has provided the answer that weld terminations should be completed as per AWS D1.1 - for all columns fabricated. Terminating CJP welds, as per AWS Code to be flush with the end of the access hole if there are any additional costs are solely the responsibility of the Contractor, not TJPA. |               |             |                          |  |

| <b>From:</b> Webcor Construction LP      Stephanie Azzolino <b>To:</b> Turner Construction Company Phil Militello  |  |                    | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |   |                      |                    |                          |
| <b>Co-Author:</b> Shimmick Construction Company, Inc. Henry Chiang   |  |                    |   |   |                      |                    |                          |
| <b>REQUEST:</b>  |  | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>   |                      |                    |                          |
| Per drawing SI-3282 detail 4 and 5 the base of the scallop wall requires a chamfered starter wall that transitions from a 1 to 1 angle, 3 to 2 angle, and a 4 to 1 angle throughout the geometry of the scallops. Shimmick requests approval to relocate the construction joint from the wall to the deck and pour the full height of the wall including the deck beneath. See attachment "A" for clarification. This change would only occur at the scallops and detail 2 "Typical walls at the roof north & south edges" would not change.   |  |                    |   | Contractor's proposal is acceptable in concept however moving the construction joint to the slab will result in long rebar dowels which will likely require splicing via laps or form saver couplers. The contractor should consider those detailing issues and submit the modified rebar detailing via shop drawings for review. |                      |                    |                          |
| Please confirm the joint location is acceptable.   |  |                    |   |   |                      |                    |                          |

| <b>From:</b> Webcor Construction LP      Stephanie Azzolino <b>To:</b> Turner Construction Company Phil Militello  |  |                    | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |   |                      |                    |                          |
| <b>Co-Author:</b> Shimmick Construction Company, Inc. Henry Chiang   |  |                    |   |   |                      |                    |                          |
| <b>REQUEST:</b>  |  | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>   |                      |                    |                          |
| Per S1-3282 detail 9 "SHEAR KEY AT ROOF" calls for vertical #4 rebar dowels to be cast with the structural deck. Per S1-3281 detail 7 "SIGNAGE PYLON FOOTING DETAIL" calls for vertical #5 rebar dowels to be cast with structural deck. For constructability reasons it is essential that Shimmick's operations maintain open access for roof top small cranes and man lifts for all trades. Per specification section 03 20 02 Part 2.3 F. 3. Adhesive for dowels in existing concrete b. HIT-RE 500_SD injectable adhesive by HIL TI, Inc., is an approved method. The minimum embedment depth requirement for #4 rebar is 2.75 inches and the concrete thickness requirement is 4 inches at the shear keys. The minimum embedment depth requirement for #5 rebar is 3.125 inches and the concrete thickness requirement is 4.375 inches for the signage pylon. The roof deck is 7" with 3" tall flutes leaving a clear space of 4 inches. Shimmick's solution for the 4.375 inch concrete thickness requirement is to pour an additional .5 inches of concrete at the concrete deck where the pylons will be installed. See drawing attachment "A" and product data attachment "B" on page 4 for rebar drill and epoxy requirements. |  |                    |   | Request not acceptable, follow the details provided in the construction drawings. Alternatively, contractor may consider using form saver couplers at no cost to the owner.   |                      |                    |                          |
| Shimmick requests approval for the shear keys and the  |  |                    |   |   |                      |                    |                          |

|---------------|--|---------------|---------------------|----------------------|---|--------------------|----------------|--------------------------------------|
|               | <p><b>From:</b> Webcor Construction LP Claude Titcher</p> <p><b>To:</b> Turner Construction Company Phil Militello</p> <p><b>Co-Author:</b> Shimmick Construction Company, Inc. Henry Chiang</p> <p><b>REQUEST:</b></p> <p>The answer to QBD 18 for the TG07.2 Trade Package, which asked if the "slab and beam mix can be used for the fourth wall lift", was "Confirmed. The slab and beam mix can be used for the fourth wall lift." Submittal TG0702-118 submitted the slab and beam mix and included the foundation wall as one of the usage locations. The review comment stated "Mix design for Foundations Walls shall be as approved in Submittal TG0600-203.1. Omission of SRA is not acceptable" which is the Foundation Wall mix.</p> <p>Please confirm if the Submittal Response to use the Foundation Wall Mix is superseding the answer to QBD 18 which confirmed the use of the Slab and Beam Mix design on the fourth lift foundation wall.</p> |               |                     |                      |   |                    |                |                                      |
|               |  |               |                     |                      | <p><b>Answered By:</b> Adamson Associates, Inc. George Metzger</p> <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>The number of Foundation Wall lifts changes with the contractor's means and methods. See RFI T-1467, issued after QBD 18, which increases the number of Foundation Wall lifts by one. In as far as QBD 18 confirms that it is acceptable to pour the Ground Floor slab and beams with the topmost Foundation Wall lift using the approved slab and beam mix, the QBD 18 response remains accurate.</p> <p>Similarly, it remains unchanged that the approved Foundation Wall mix design shall continue to be used below the topmost wall construction joint.</p> <p>Regarding reviewer comments on Submittal TG0600-203.1: Submittal makes no reference to lift numbers and simply states "Foundation Wall", for which an approved submittal already exists and for which the present submittal could not replace and meet Specification.</p> |                    |                |                                      |
| T-1716        | <p><b>SSS - Field Weld Shear Plate Detail</b></p> <p><b>From:</b> Webcor Construction LP Gregory Kemerer</p> <p><b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton</p> <p><b>REQUEST:</b></p> <p>Detail 3/S1-7632 requires a field fillet weld for the shear plate to beam connection. Positioning an electrode or gooseneck to achieve the 7/16" weld on the back side will not be possible in the field due to the limited gap between the weld and vertical HSS member.</p> <p>Please confirm it is acceptable to weld the shear plate to beam web on three sides on the near side and omit the far side weld. See attached SK1 for clarification.</p>   | Closed        |                     |                      | 09/22/2014  | 10/02/2014         | 10/03/2014     | Potentially <input type="checkbox"/> |
|               |  |               |                     |                      | <p><b>To:</b> Turner Construction Company Phil Militello</p> <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>It is not clear to us why this weld cannot be made. We understand the access is relatively limited but the same detail was used successfully in many other projects. If the concern is formation of unequal weld legs, that is acceptable as long as minimum weld size is satisfied and approved by the inspector.</p> <p>TT: The reason for RFI is listed as "Alternate proposal". We categorize this RFI as request for substitution.</p>  |                    |                |                                      |

| <p><b>REQUEST:</b></p> <p>Specification Section 03 33 00 - 3.4 A. "Install joints...., at locations indicated on Drawings or as approved by TJPA Representative." Construction joints are not called out on A1-2603, A1-8645, or S1-2603.</p> <p>Please confirm there is no restriction for the maximum construction joint spacing for architectural wall, otherwise provide a maximum allowable length for architectural wall pours.</p> |   |               | <p><b>SUGGESTION:</b></p> <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>George Metzger 10/10/2014:</p> <p>In general, maintain a maximum concrete construction joint spacing of 60 feet. Per specification 03 33 00 3.4 and drawings, construction joints should occur at wall reveal design pattern layout only. Please see enclosed SKA-3795-R1.</p> |                      |                      |                    |                          |

plywood sheets bolder than what is created by plywood alone. Specification Section 03 33 00 - 2.2 B Chamfer Strips: calls for 3/4" chamfer to be "used for horizontal joints between pours" Shimmick is assuming that the vertical lines are chamfer strips as well. Vertical chamfer strips would provide a weakened plane and help confine any vertical shrinkage cracks to the chamfer location.

1. Please confirm only vertical 3/4" chamfer strips at the plywood joints is being depicted by the wall elevations on A1-8645.
2. Please provide additional direction if anything is required at the vertical and horizontal joints.

joints are shown in detail 1/A1-8645 is incorrect. The cast-in-place architectural concrete wall layout shown in detail 1 on A1-8645 clearly shows both horizontal and vertical joints. Typical formwork details are indicated in 1/A1-8645, which is detail 5/A1-8648 showing the panel joints, reveal and tie hole concept.

Use drawing chamfer strips dimension in lieu of sizes in Specification Section 03 33 00 2.2 B.

**REQUEST:**

Please reference specification section 03 30 02 3.2.A.3, RFI #T-1104, and rejected submittal number TG0702-503.0, in reference to Ground Level CJ layout.

The specification calls out 60' maximum CJ spacing in the ground floor concrete slab. RFI #T-1104 permitted TG 06.0 to use a maximum CJ spacing of 96'. The rejected submittal includes comments suggesting to reduce the number of pours in Comment #2 on Sheet CJ-000, specifically in the metal deck section. Further comments would require a 97' 6" span at First and Fremont Streets and a potential 120' span between GL 19 and Wall 421. In order to match both suggestions, TG 07.2 would need to also increase CJ spacing beyond the specified 60', similar to TG 06.0.

- 1) Please confirm the ground floor 60' CJ spacing requirement only applies to the formed MFB/slab section and not the metal deck section.
- 2) Shimmick requests permission to increase CJ spacing in the formed MFB/slab sections beyond the specified 60' to 120' to allow for CJs per the submittal's comments. If this proposed limit is unacceptable, please provide a maximum for use at Ground Level.
- 3) Please confirm there is no maximum construction joint spacing for slabs on metal deck.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

- 1) Confirmed
- 2) Confirmed to allow submittal comments
- 3) Confirmed

**REQUEST:**

Please reference Sheets S1-2302 through S1-2307, Spec Section 03 30 02 2.1.

Between any single set of grid lines, the ground level features multiple mix designs. The ground level pandecking slabs S1, S3, and S10 have a 4,000 psi mix design. Between grid lines 16-17, 24-25, and 27-29, the pandecking slabs S11 and S12 have a 8,000 psi mix. Formed MFB/slab decks RCS 2 and RCS 16 have a 5,000 psi mix design. Currently each mix design would require separation by CJs. Shimmick plans to pour a continuous deck from north foundation wall to south foundation wall.

1) Typical: Shimmick suggests to replace all the 4,000 psi pandecking mix on the ground level with the 5000 psi RCS mix to match the formed MFB/slab deck. Please confirm this is acceptable.

2) Shimmick suggests to replace the 5,000 psi RCS mix on the ground level formed MFB/slab deck between GL 16-17, 24-25, and 27-29 with the 8,000 psi S11/S12 mix to match the pandeck. Please confirm this is acceptable.

An attachment demonstrates the change in the mix layout on ground level. Final CJ location is pending submittal approval.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1) Contractor proposed increase in concrete strength acceptable at the locations indicated.

2) Contractor proposed increase in concrete strength acceptable at the locations indicated.

Incorporate changes to corresponding CJ submittal.

**REQUEST:**

Please see attached SKA-4052 (per RFI #T-1661), SKS-0398 & SKS-0400 (confirmed in RFI #T-1661 and 1658), and Markup A1-2960A (per email from TT on 8/8). SKS-0400 visually shows the grade beams sloping but does not provide the exact percent of slope. Cross referencing the available sheets provides conflicting slopes for each beam.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1) Slopes of GB1 and GB2 are the same as that of the RCS3 slab which is 1.2%. GB3 and GB4 shall have a slope of 28%.

2) T/beam at the west ends for GB1 and GB2 shall be 19'-2". T/beam for GB2 on 1/S1-7001 will be updated in a future ASI.

3) Grade break for GB3 and GB4 occurs at the east face of the foundation wall.

The grade beams GB1 and GB2 (see SKS-0398 for naming) are indicated on Mark up A1-2960A as "Constant

|                 | <p><b>REQUEST:</b><br/>                     See attached CD RFI # 627.1 SK1:<br/>                     The horizontal connection angle for the HSS18x6x5/8 per SKS-0418 is inside the elevator opening, typical 4 locations. Confirm that is the intent or supply a solution.</p>   |  |   |                      |                      |                    |   |  |
|                 | <p><b>SUGGESTION:</b></p>  |  |   |                      |                      |                    |   |  |
|                 | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>The connection angle encroach into the opening shall be prevented as follows: Connect the HSS18x6 posts to the W16x26 beams per original design intent and as shown on SK1 in RFI T-1743. Cope bottom flange of the W30x90 beam partially at the HSS18x6 posts so that there is 1/2" clearance around the posts. Cut the horizontal leg of the L8x4 angle so that it clears the W30x90 beam web by 1/2". Weld the horizontal leg of the L8x4 angle to bottom flange of the W16 beam from top.</p> <p>TT: We disagree with the reason for request: Engineering Conflict, agree with Verification. We categorize this RFI as no cost clarification.</p> |  |   |                      |                      |                    |   |  |

| T-1747        | <p>SSS - ST201A Approval Comment Clarification at Bus Deck Level</p> <p><b>From:</b> Webcor Construction LP Gregory Kemerer<br/> <b>To:</b> Turner Construction Company Phil Militello<br/> <b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton</p> <p><b>REQUEST:</b><br/>                     See attached CD RFI # 630 SK1:<br/>                     The note on S1-2502 states "SEE 1/S1-5010 (SIM) FOR CONNECTION". This is insufficient information to detail these connections as detail 1/S1-5010 does not show a double angle connection inside the column profile. The beam will not be erectable and the bolts thru the beam web will not be accessible inside the column profile. The current connection is per typical detail 2/S1-5012.</p> <p>Confirm the connections at the noted locations are acceptable or supply a new detail.</p> | Closed        | 09/26/2014          | 10/06/2014           | 10/02/2014  | Potentially        | <input type="checkbox"/> |
|               | <p><b>SUGGESTION:</b></p>  |               |                     |                      | <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Provide connection similar to 4/S1-5033 at the two locations, except, the 1 3/4" web doubler plates are not required.</p> |                    |                          |

As demonstrated in the attached picture, at the intersection of GL-3, GL-G, and GL-X, the 1 1/2" - 2" clear cover is not attainable due to layering issues with intersection beams.

to 2" clear is incorrect as is the detail referenced. The specified bar clearance for MFB-3 is 2-1/2" and is not a minimum. Design intent for the MFB-X splice bars passing through the joint is for these bars to pass below ALL of the MFB-3 top bars, including MFB-3 add bars. Field observation indicates that the splice bars only pass beneath the MFB-3 topmost bars, above the MFB-3 add bars. The field layering configuration will only increase the specified 2-1/2" clearance marginally (within placement tolerance) and will be acceptable when all MFB top bars are brought to their highest elevation by crane or other means and subsequently secured.

| <b>REQUEST:</b><br>Upper basket column pipes located at gridline 1/G and 1/C are shown to be concrete filled to top of pipe in S1-4018 Rev 4. Details shown in B/S1-4018 require a 2" diameter vent hole in the roof level cast nodes. Roof level cast nodes at these locations are 72-36 and 72-37 and according to machining drawing CN-0127 Rev 4 (issued 12/19/13), neither of these cast nodes have vent or grout holes.<br><br>Currently, pipes are detailed with (2) - 5/8" vent holes approx. 7" from the top of the pipe so the pipes could be filled to this point. Please confirm currently detailed pipe vent holes can remain as is or provide new vent hole details for the pipe and/or cast nodes.<br><br>Please note cast nodes 72-36 and 72-37 have already been released to Oregon Iron Works by Bradken. |  | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Bus Deck Level Basket Column pipes at Gridlines G/1, C/1, F.7/33.5 and C.3/33.5 do not require concrete infill or vent holes for fire protection nor structural purposes.  |                      |                    |                          |  |

| <b>REQUEST:</b>  |  | <b>SUGGESTION:</b> |  | <b>ANSWER:</b>   |            |             |                          |
| Section 05.12.10 Structural Steel - Additional Seismic Requirements, 2.2 Fabrication Section C.2.A.1 (See SK1) states, "connections in which backing is not removed: backing shall be attached to the member or plate that does not have its surface prepared for the groove weld. Attachment shall be by either a 5/16" fillet weld or 3/16" groove weld along the complete bar length on the side of the bar opposite the groove weld"<br><br>On shop drawing A1723 (See SK 2, SK3), section cut B & C show two continuity plates that are with-in approx. 2 1/2" of each other with a CJP DCW marked as the weld detail. In these conditions there is insufficient access to provide a continuous weld along the backside of the backing bar.<br><br>Please confirm that in situations where there is insufficient access between the two continuity plates, the backing bar can be tac welded within the weld zone and left in place on one of the plates. The other plate will have the backing bar attached as per the aforementioned specification.<br><br>However, on CS1 columns A1723, A1731, A1759 and A1760 the backing bar was tact welded within the weld zone in cases where the continuity plates were in close proximity. Please confirm these columns are acceptable.<br>*Note - the typical continuity plates that are spaced |  |                    |  | <b>Accept Suggestion:</b> <input type="checkbox"/><br>The moment frame beam continuity plates are per detail 5/S1-4202. At the contractor's request, a double sided CJP welded was accepted (see RFI T-0959) in lieu of the welding shown in this detail. Therefore, the continuity plate that lines up with the moment frame beam flange shall follow this detail, with or without a nearby second continuity plate. Where there is a second continuity plate nearby and there is insufficient access to it, it is acceptable to weld the its backing bar using tac welding and leave it in place as proposed in the RFI. Note that the spec section referred in the RFI is triggered when backing bar is not removed and does not apply to the seismic moment frame condition since the standard detail require backgouging and reinforcing fillet weld, or alternatively, double sided CJP welding.<br><br>Provide additional information for the CS1 columns listed in the RFI. It is not clear if a) backing bars for both continuity plates were tac welded, or b) one was tac welded and the other one was fabricated per Specification Section 2.2.C.2.A.1, or c) one was tac welded and the other was fabricated with double sided CJP. |            |             |                          |

**REQUEST:**

Please see the attached clouded drawings, S1-9050, S1-9002, and S1-9001. Note 5 on detail 9/S1-9050 refers to detail 1/S1-9002 for the typical top of pier bracing details. Detail 3/S1-9001 depicts the bracing of an interior CMU/Concrete Pier below a metal deck. There are no other details shown on the contract drawings that depict bracing of interior CMU/Concrete pier below concrete concourse deck. Please confirm it is acceptable to omit the 3/8" thick plate on Detail 3/S1-9001 for bracing below concrete concourse deck. Otherwise, please provide a detail for bracing the top of an interior concrete pier to the concrete deck.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

As-built survey of Anchor Bolts (see transmittal 140-11479 on Constructware) identified 39 AB groups out of AISC tolerance between grid lines 7 - 18. There are three typical conditions that should be corrected in the shop prior to start of erection as follows:

1. AB rod clashes with the base plate hole. Proposed solution: enlarge hole as indicated in the attached sketches.
2. Due to out of position anchor rods the plate washer clashes with the fillet weld. Proposed solution: reduce size of the washer to avoid conflict with the fillet weld.
3. For larger rod diameters the nut underneath the base plate clashes with the fillet weld. Note: nuts in these locations do not come with a plate washer per design. Proposed solution: Add 1/4" washers (shims) underneath the nut to clear the fillet weld. Attached sketches provide locations and details for the above. Please confirm the above corrections are acceptable.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

- 1). For the case that anchor rod clashes with base plate hole, enlarging the hole as proposed is acceptable.
- 2). For the case that plate washer clashes with the fillet welds, clarify where the clash occurs as there is no washer above the base plate and below the 2" horizontal bearing plate. Washers are only used at the top of the horizontal bearing plate.
- 3). For the case that nut underneath the base plate clashes with the fillet welds, clarify the location of the fillet welds as there is no fillet weld at the bottom of the base plate. The only weld at the bottom of the base plate is the complete penetration weld of the shear key.

The reason for the RFI is noted as Field Conflict. We categorize this as Request for corrective field work.

This RFI has been re-written by W/O for clarification.

| <b>REQUEST:</b><br>This is a confirming RFI following our October 9, 2014 structural coordination meeting. The following items / actions were discussed:<br><br>1. For anchor bolts that do not clash with the column base plates but are out of AISC tolerance thus limiting the ability to adjust for structural steel fabrication and erection tolerances, the EOR takes no exception to modifying the base plate holes in the shop or field to suit the as-built anchor bolt position.<br><br>2. The EOR takes no exception to reducing the size of the plate washers above and below the horizontal stiffener/anchor plate in the column. This will be done to clear the fillet weld for the vertical stiffener below the horizontal anchor plate and to allow for consistent plate washer sizes. The plate washers will be larger than the major diameter of the anchor nuts. The attached spreadsheet details the sizes we will use at each location.<br><br>3. The EOR takes no exception to adding a spacer plate below the horizontal anchor plate and above the nut at the 2-1/2" anchor rod locations where necessary. This is necessary to accommodate out of tolerance anchor bolts so that the nut can clear the fillet weld between the horizontal anchor plate and the vertical stiffener below. |  | <b>SUGGESTION:</b>  |                   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>1). Confirmed.<br>2). Confirmed.<br>3). Confirmed.<br>Reason for RFI: We agree with the reason "Field Conflict" noted in the RFI, but disagree with probably cost increase and time increase noted. TT categorize this as "request for corrective field work". |                   |                    |                          |

**REQUEST:**

Refer to sheets A1-7401 and C1-5007.

Based on workpoint elevations shown in Sheet A1-7401 the horizontal bearing edge of the vehicle and bicycle ramps appear to slope down gradually from West to East: 22.0' to 19.66' for the vehicle ramp and 17.96' to 15.66 for the bicycle ramp.

However, the ramp section on Civil detail 7/C1-5007 shows one elevation of 19.00' for the section cut through the vehicle ramp and no cut through the bicycle ramp.

Please confirm if the foundation wall corbels elevations are as shown on A1-7401 or if they are to be level as appears to be detailed in Civil drawings.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Arup's response:

The foundation wall corbels which support the vehicle and bicycle ramps shall be level. Please see attached SK-C-0003, SK-C-0004, SK-C-0005, SK-C-0006 and SK-C-0007 for elevations and extent of corbels.

TT's response:

Corbel elevations and extent along foundation wall per updated civil and architectural drawings.

Concrete Beam below ramp slab as called out on S1/S1-2251, to be updated to 36"x58". Provide reinforcement as called out on 1/S1-2251 (7-#10 top and bottom).

AAI's response:

Refer to attached SKA-4271 for updated information related to the concrete corbel elevation for the Vehicle and Bicycle Ramp.

**REQUEST:**

During installation of Formsavers at LC Deck D211 and D212, SCCI was directed by Carl Keim to remove two(2) pilasters at GL 11 between GL Band C as they were not required. (See attached photo).

Please confirm this as built condition is acceptable.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Omission of the pilaster immediately south of the north door opening on Grid 11 was not directed by design team field representatives. Such direction was given for a second pilaster located further south along the same wall, as shown in RFI attachment A1-2203 Delta 0. The pilaster located further south is not required because there is no door for which one would be required, as shown in RFI attachment A1-2203 Delta 3. It is not acceptable for the northern pilaster to be omitted; however, the thickness of the pilaster is acceptable at 12". The pilaster shall be reinforced as a 1'-4"x12" pilaster per Detail 9/S1-9050.

| Steel erection begins in Area C01, which is between gridlines 10-11.   |   |                    |   |  |            |             |                          |
| 1) The construction Joints in the trainbox walls do not line up with gridlines. Is it acceptable to align the fourth lift foundation wall construction joints with gridlines? Note that ground level slabs will also follow this layout as shown in the attached sketch.<br>2) WOJV believes that the formed and metal deck concrete at ground level GL 10-11 needs to be placed before pouring any other metal decks above this level. Please confirm this is correct. If required to place more east/west concrete at ground level prior to placing decks above, please provide requirements.<br>3) Please provide the required cure time of ground floor concrete before the placing of concrete in metal decks above ground level can be poured.<br>4) Once the ground level concrete reaches required strength is it acceptable to pour the 2nd level, bus deck   |   |                    |   |  |            |             |                          |
| 1) Foundation walls below the topmost horizontal construction joint that are cast with the approved foundation wall mix in accordance with RFI T-1715 response shall have aligned vertical joints. The foundation wall within the projection of, and poured with, the Ground Floor slab and beams above this joint utilizing the slab and beam mix design need not have joints aligning with the foundation wall below. Note that many formed Ground Floor concrete construction joints cannot be located on the Gridlines due to MFB's. In the West Throat, construction joint location will be governed by where it would fall across intersecting formed framing members. Also refer to RFI-T-1740, T-1584, and Submittal TG0702-503 comments.<br>2) It is recommended that the entire ground floor slab for each wing be casted before pouring the above grade floor slab. It is to ensure that the ground floor slab can act as a floor diaphragm to distribute the seismic force induced from the upper floors (transmitted thru the longitudinal BRB frames and |   |                    |   |  |            |             |                          |

| <p><b>REQUEST:</b></p> <p>The PJP for the cast node base to girder intermediate flange runs over the radius of the slotted flange. Please confirm it is acceptable to use a 3/8" run off tab fitted into the slot to allow the PJP to continue around the node as required.<br/>                     See SK1 &amp; SK2 for clarification.</p> |                                      | <p><b>SUGGESTION:</b></p>       |                     | <p>level (1st 10" thick slab only), and roof level consecutively with no cure time requirement between deck pours?</p> <p>basket column frames) to the train box walls.</p> <p>3). It depends on how soon the floor is poured and how much risk (for seismic event) is tolerable. Each wing works as an independent structure (because they are separated by seismic joints) and its longitudinal seismic force will need to be transferred to the train box wall at the ground level. Without a complete load path, structural failure might occur in an earthquake event. It is recommended that the construction team to discuss this with TJPA and propose a construction sequence for us to review.</p> <p>4). See response to item 3).</p> |                      |                    |                          |

**REQUEST:**

This RFI addresses the information requested and the response given to SK RFI 867 (T-1790). To clarify the applicability of the reference code, Skanska's fabricator has provided details on the fabrication of the column assemblies:

- The web welds (splices) are welded first and NDT is performed- no access holes needed at ends of welds.
- Web plates are fit/assembled to flanges.
- Flange to web welds are made - again, no access holes are required.
- There is no welding being performed through access holes for these conditions.

There is no code or project requirement to install weld access holes given the order of operations. AWS D1.1, Section 2.8.2 addresses weld transition from full penetration to fillet welds as required on these flange to web welds.

Given that the three welds are not done concurrently, please confirm that it is acceptable to eliminate unnecessary access holes.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

It is acceptable to omit the weld access holes indicated in the RFI (at web transitions). Comply with AWS D1.1 for CJP to fillet weld transitions.

TT: We agree with the reason for request: Alternate Proposal. We categorize this RFI as clarification on means and methods.

| T-1808        | SCS - Bottom Bars Per 4/S1-5022<br>From: Webcor Construction LP Claude Titcher<br>Co-Author: Shimmick Construction Company, Inc. Henry Chiang  | Closed             | 10/13/2014                  | 10/23/2014   | 10/14/2014  | Potentially        | <input type="checkbox"/> |
|               | <b>REQUEST:</b><br>Refer to 4/S1-5022 for welded bars at the bottom flange of steel beam. Detail 'A' requires the "rebars to match the number and size of beam top bars". Detail 'B' requires the "rebars to match the number and size of beam bottom bars". Per S1-3600, moment frame beams can have two sets of bottom reinforcement, B 1 and B2. 4/S1-5022 does not reference whether B1, B2, or both sets of bars are required.<br><br>Per conference call with Thornton Tomasetti on 10/9/14, for both details, bars on the top to match the top bar and bars on the beam's bottom flange are to match the quantity of B1 bottom bars only. No B2 bars need be welded to the flange.<br><br>Please confirm. | <b>SUGGESTION:</b> | <b>ANSWER:</b><br>Confirmed | <b>Accept Suggestion:</b> <input type="checkbox"/> | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |                    |                          |
|               |  |                    |                             |  |   |                    |                          |

RFI #T-1710 Shimmick requested approval to relocate the construction joint from the wall to the deck and pour the chamfer with the scallop wall.

Shimmick requests confirmation that this is acceptable for the entire perimeter and not just the scallop locations. Refer to perimeter wall detail 2 on S1-3282.

See the response to RFI T-1710. The 135 deg. leg of the bent #5 at the construction joint shall extend past the construction joint with a lap length per 1/S1-3001.

|               | SI-2205 shows a B5A beam to the east of the escalator pit near Gridline 21-C.5, but not at the escalator pit near Gridline 21-F.5. Per discussion with TT please confirm that the escalator pit near Gridline 21-F.5 will require the addition of a B5A beam per attached layout, similar to the escalator pit at Gridline 21 -C.5.  |   |   |  |   |                    |                          |

| <b>REQUEST:</b>   |  |               | <b>SUGGESTION:</b>  |                      |                      | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/> |                          |
| <p>The configuration of welded reinforcing on the train box side of the seismic joint is installed as if there were an adjacent horizontal trough similar to the horizontal leg of the joint at the mat slab. There is no such trough on the walls. To accommodate the existing vertical west embed please see the following:</p> <ol style="list-style-type: none"> <li>1. An additional #7 hook will be added to the foundation wall that will engage the welded angled bar and the welded deformed anchor - See Sketch #1</li> <li>2. As necessary to provide 2" clear to the waterproofing or as is required to place foundation wall reinforcing, the welded angled hook may be field bent. Bending will be controlled as to not stress the bar end weld and bend radius will not be less than ACI minimum. See Sketch #1</li> <li>3. Termination of north and south foundation wall horizontal reinforcing shall be hooked. Hooks shall be oriented per the attached sketch. See Sketch # 1.</li> <li>4. The interior leg of 5/8" plate terminating at Grid A may be omitted and replaced with a formed edge-See Sketch # 1, reference AI-8881 detail 5.</li> <li>5. Please confirm that the South East Termination Bars can be installed per attached Sketch #2 .</li> <li>6. Please confirm that the North East Comer of the East Wall: Within the projection of the seismic joint toward the eastern CDSM wall, the interior foundation wall cross ties were not installed. Please confirm that this field condition is acceptable and that a uniformly detailed east foundation wall will resume in the second lift per the attached sketch #3.</li> </ol> <p>S1-3010 does not depict detail of terminated horizontal bars along North and South wall and Seismic Joint embed. Please approve the following sketches.</p> |  |               | <p>Subsequent segments of the trainbox side of the seismic joint shall have welded reinforcing that mirrors that of the east side, except it will be permitted to have 48" long straight welded bars in lieu of hooks per Sketch #1.</p> <p>The contractor has omitted the last leg of joint plate terminating at Grid A on the western edge of the joint in the first vertical segment. This is acceptable. The contractor may include this plate in subsequent segments or omit and form at their discretion.</p> |                      |                      | <p>Items 1-6 and sketches are confirmed.</p>                      |                          |

| Skanska and their construction engineer, Hassett have evaluated several options for setting and securing the train box columns in position until the grouting operation has been complete. Based on Hassett's calculations the only feasible option to adequately stabilize the column is to utilize shim packs at each corner of the base plate.<br><br>Due to the congestion of rebar at the base plate block-out, there is currently insufficient room to set shim packs on a flat surface, therefore Skanska propose to pour 10"x10" grout pads at each corner to achieve the required uniformed surface for shim packs, see attached SK-5.0 for clarification.<br><br>Skanska propose to use TG07.2's Dayton Superior grout, previously approved in submittal TG0702-500.  |  | Webcor expects Skanska to have these pads poured by early next week to allow the grout to be cured and achieve 8,000 PSI at 7 day break. |   | <b>Accept Suggestion:</b> <input type="checkbox"/><br>The proposed procedure is acceptable in concept. Contractor and Sub-contractor, WOJV, Skanska and their construction engineer, shall confirm the grout pad is adequate for supporting the construction loads imposed and confirm that this meets all safety regulations.<br><br>Reasons for RFI: Verification for issues on means and methods. |                      |                    |                          |

**REQUEST:**

Further to last Monday's (10/13/14) meeting with TJPA, Arup, Turner and WOJV where the removal sequence of the internal bracing system within the Zone 4 East end Diaphragm was discussed, please confirm the following is acceptable:

## Sequence:

- 1) Remove level C, B and A struts and walers from within the green clouded area up to GL- 32.2 once the the associated concrete slab or wall section has reached adequate strength and been rebraced.
- 2) Remove level C, B and A struts and walers within the Blue clouded area STD-65 to 74, 82 & 83 once the the associated concrete slab or wall section has reached adequate strength and been rebraced.
- 3) The sequence for de-stressing will be the diagonals struts should be all de-stressed prior to the 4 remaining cross lot struts (STD-65,66,67 & 68).

## Monitoring:

Remove the walers sections (continuous waler is actually friction connected together) in a sequence referred to as the observation method where one waler on the north and one on the south as well as the two integral cross lot struts attached to the walers would be de-stressed and removed at any one time.

Once the first pair of cross lot struts have been de-stressed and removed, the WOJV installed survey points (targets) on the inside face of the soldier beams of the CDSM shoring wall, the Global Analyzer and Arup inclinometers would measure internal bracing performance over the following 24 hours after de-stressing. If little or no movement has been recorded, the contractor can then proceed and begin de-stressing and removing the next pair of walers and struts to the east. This removal method would then be repeated until only four cross lot struts at that particular level remain; which are numbers ST-65 to 68.

Contract Specification 31-09-13 would be followed in case of movement, and the work would stop and the MRP Movement Review Panel would be convened.

Please note the following:

- 1) The east end rebracing sequence indicated in this RFI is the same rebracing sequence that has previously been

**SUGGESTION:****ANSWER:**Accept Suggestion:

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

implemented in Zone 4 for Level D bracing removal as described in RFI T 1558.  
 2) The east end rebracing sequence is also the sequence performed successfully in west end of the transit center excavation Zone 1.  
 3) The east end rebracing will have raker bracing similar to the west end, the east end does again have additional reinforcing bar in structural concrete walls where rebracing rakers are supported per details on sheet SH-5301 in Submittal TG0300-553.  
 4) The east end rebracing cross-lot or perpendicular sections are in accordance with submittal TG0300-553 and as has previously and successfully re-braced in zones 1, 2, and 3.

If acceptable, please specify 1) the movement tolerance for a given waler removed, 2) the observation period for analyzing movement, and 3) the acceptable means for monitoring for movement (survey, inclinometer, or both).

**Co-Author:**

**REQUEST:**

Sequence:  
 1) Remove level A, B, and C struts and walers (two struts at a time, following discussion present in "monitoring" section below) area up to gridline 31.2 once the concrete has reached adequate strength.  
 2) Remove level A, B, and C struts within area (ST-65 to 74, 82, and 83) and all corresponding walers. once the concrete has reached adequate strength. The diagonal struts should all be de-stressed prior to the four remaining cross lot struts (ST 65, 66, 67, and 68).

**Monitoring:**

Remove the walers sections (continuous waler is actually friction connected together) in a sequence referred to as the observation method where one waler on the north and one on the south as well as the two integral cross lot struts

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Arup's response:

We take no exceptions.

The movement tolerances are those in the specifications.

We take no exceptions to the proposed monitoring duration.

Arup can produce manual inclinometer readings after each waler segment is distressed. Installation of targets on the inside face of the shoring wall and monitoring these targets during this activity is recommended.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**REQUEST:**

The AWS D1.8 Structural Welding Code - Seismic Supplement, and the Contract specifications, require that either:

- 1) Each lot of weld electrodes (filler metals) used to make demand critical welds (DCW) must be tested in accordance with AWS D1.8 Annex A
  - 2) Filler metals may be exempt from individual lot testing, provided the electrode manufacture perform three (3) separate lot tests in accordance with Section 6.3.8.1
- Additionally, the testing specified shall be not less than the Lowest Anticipated Service Temperature (L.A.S.T.) plus 20 degrees F (AWS D1.8 Section 6.3.6).

Bradken has made repairs to the ground node castings utilizing Hobart Brothers weld electrode in one, or both, types, of TM-771 and FabCO RXR (data and test reports attached). The weld repair(s) were not considered DCW welds, and were made in accordance with an approved repair procedure in conformance to the contract specifications.

The attachment of the Ground Node to the Transfer Girder is specified in the drawing at the girder flange/web to casting interface to be a DCW. The required weld will intersect with this previously repaired weld metal. The Fabricator has qualified a welding procedure for the specified base metal combination (ASTM A572-50 to ASTM A216WCC). It is the understanding of the Code that this additional weld filler metal of the casting repair to be included in the final girder to casting weld must comply with the AWS D1.8 Seismic requirements in order to be in conformance to the Code provisions.

The manufacturer has lot tested three (3) individual lots for each respective type in accordance with the AWS D1.8 requirements. (documents attached). However, the testing temperature was 70 degrees F, not at the Contract required L.A.S.T. of 25 degrees F plus 20 degrees F (45 degrees F).

Please confirm that the three (3) ASW D1.8 Lot Tests for the TM-771 and the FabCO RXR weld electrode performed at a L.A.S.T. temperature of 70 degrees F, in lieu of the required 45 degree F, for the weld repair are acceptable:

additional weld filler metal of the casting repair to be included in the final girder to casting weld must comply with the AWS D1.8 Seismic requirements in order to be in conformance to the Code provisions.

The manufacturer has lot tested three (3) individual lots for each respective type in accordance with the AWS D1.8 requirements. (documents attached). However, the testing temperature was 70 degrees F, not at the Contract required L.A.S.T. of 25 degrees F plus 20 degrees F (45 degrees F).

Please confirm that the three (3) ASW D1.8 Lot Tests for the TM-771 and the FabCO RXR weld electrode performed at a L.A.S.T. temperature of 70 degrees F, in lieu of the required 45 degree F, for the weld repair are acceptable:  
 1) Specifically to Ground Cast Node 5-02  
 And  
 2) To any future repairs in the DCW weld zone of the ground cast nodes

In contrast, cast steel is an isotropic, highly ductile material. Also, castings are stress relieved following repair welding, which relieves the majority of residual stresses in the repair welds and brings the mechanical properties of the repair weld to within the requirements of those of the base metal. As such, castings are effectively homogenous from a mechanical properties perspective, and weld repaired areas of the casting are effectively part of the casting base metal.

We are therefore of the opinion that it not necessary to apply the CVN requirements for welds (demand critical or otherwise) to casting weld repairs, the latter of which would more appropriately be regarded and treated in the same way as base metal.

It is noteworthy, however, that while the mechanical properties of the stress relieved weld repaired areas of the castings match or exceed those of the virgin cast steel base metal, the chemistry of the casting local to the weld repair will be slightly outside of the ASTM standard for the cast steel base metal.

Bradken has made repairs to the ground node casting 5-02 utilizing Hobart Brothers weld electrode in TM-771 (data and test reports attached). The weld repair(s) were not considered DCW welds, and were made in accordance with an approved repair procedure in conformance to the contract specifications.

The attachment of the Ground Node to the Transfer Girder is specified in the drawing at the girder flange/web to casting interface to be a DCW. The required weld will intersect with this previously repaired weld metal. The Fabricator has qualified a welding procedure for the specified base metal combination (ASTM A572-50 to ASTM A216WCC). It is the understanding of the Code that this additional weld filler metal of the casting repair to be included in the final girder to casting weld must comply with the AWS D1.8 Seismic requirements in order to be in conformance to the Code provisions.

The manufacturer has lot tested three (3) individual lots of TM-771 in accordance with the AWS D1.8 requirements. (documents attached). In addition to the test results provided at 70 degrees F, Hobart has provided additional test data from three (3) lots at 0 degrees F. These additional test results exceed the contract required L.A.S.T. of 25 degrees F plus 20 degrees F (45 degrees F).

Please confirm that the three (3) ASW D1.8 Lot Tests for the TM-771 weld electrode performed at a L.A.S.T. temperature of 0 degrees F for the weld repair are acceptable:

1) Specifically to Ground Cast Node 5-02

And

2) To any future repairs in the DCW weld zone of the ground cast nodes

Note: Additional test results for Fabco RXR weld electrodes will be provided when they are available.

**From:** Webcor Construction LP Claude Titcher  
**Co-Author:** Shimmick Construction Company, Inc. Sylvia Hartanto

**To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**REQUEST:**

Please confirm it is acceptable to substitute HRC-555 T-Heads in lieu of standard hooks at 4-ft deep East-West Beams where they frame into Moment Frame Beams in Areas 11-16. Please reference the attached drawing for example.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

1. HRC 555 T-Heads may be used for beam long bottom bar end conditions in lieu of hooks where beam long bottom bars are placed above the bottom bars of the supporting member.
2. HRC 555 T-Heads shall be staggered.
3. HRC 555 T-Head bars may be spliced to beam long bottom bars where the detailer has verified, on a case by case basis, that the resulting clear spacing does not violate ACI clear spacing requirements and does not hinder concrete placement and consolidation. In this determination, consideration shall be given to the presence of beam short bottom bars. As a reduction in clear spacing will occur with the introduction of splices, the detailer will verify the clear spacing and determine the appropriate splice category per Detail 1/S3001.
4. Splices, when used, shall begin at the face of the supporting member.
5. Splices, when used, shall be alternated in single spans.
6. Splices shall not be used in continuous spans.
7. Splices shall not be used that overlap bundled bars.
8. RFI response may be used in beams other than 48" deep beams.
9. Contractor is responsible for evaluation and the selective implementation of the proposal for conformance with ACI and contract document clear spacing and lap requirements.

**Co-Author:** Olson and Co. Steel                      Avel Solomon

**REQUEST:**

- 1) There does not appear to be any specific detailing that allows for transverse drift to occur, without inducing loads in the stairs themselves. Is there an expectation that the stairs can handle this displacement-induced load demand?
- 2) We would like to modify the base detail of the typical stairs in order to add a second base plate with a horizontal slot in the transverse direction, in order to accommodate transverse drift without inducing load on the stairs. Do you have any issues or concerns with that?
- 3) We would like to ensure that there are adequate seismic gaps at the perimeter of the stair framing, in order to avoid inducing any horizontal seismic loading on the building framing members at the stair perimeter. In the process of accomplishing this, we may need to reduce slightly the overall widths or lengths of the stairs themselves, possibly by one or several inches. Are there any specific reasons that this could not be done? Would this be acceptable to the design team?
- 4) We will list the vertical and horizontal stair reactions at the perimeter of the stair framing. Do you have any specific format that we should attempt to use for this effort?
- 5) We understand that the review of the stair drawings and calculations will not proceed through the City and County of San Francisco, but instead has been delegated to the design team. Is this correct? Please elaborate.
- 6) Please let us know the best persons to coordinate our efforts with, both at Thornton Tomasetti and at Pelli Clarke Pelli Architects.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

1. The subcontractor shall design and detail the stair framing in accordance with the seismic design criteria specified in the General Note CD-6.
2. See the response #1.
3. Widths and lengths of the stairs cannot be reduced because their egress capacity is fixed to the given dimensions.
4. The reactions shall be tabulated in sufficient clarity that can be understood by the EOR without further back and forth clarification. Each load case and load combination shall be clearly identified.
5. Your statement is not correct. The Contractor shall obtain all approvals required by the Authorities Having Jurisdiction for the work designed and engineered by the Contractor. Contractor should contact TJPA and Authority Having Jurisdiction to determine what is required related to approvals by the Authorities Having Jurisdiction (Permitting Authorities). See Contract Document specifications for shop drawing submittal requirements. Design Team will NOT be performing a Peer Review or replacing the responsibilities of the Authorities Having Jurisdiction.
6. If W/O agrees, the Design Team - TJPA Representatives may participate in the coordination sessions. However, the communication between Subcontractor and the Design Team - TJPA Representatives must be through General Contractor.

**T-1849.1**                      **SST - Coffman Engineers Stair Design Questions for SEOR**                      **Closed**

**Co-Author:** Shimmick Construction Company, Inc. Henry Chiang

**REQUEST:**

Due to the North to South shoring along the Lower Concourse Level, the concrete partition walls cannot be built until the Ground Level is poured and struts have been removed. Since the Ground Level will be completed before the partition walls are built, SCCI proposes installing blockouts in the Ground Level above the walls in order to complete the concrete pours and vibrate for the partition walls in GL 10 to GL 13. The blockouts will be 8" diameter circle, the rebar detail will be the one shown at 9/S1-5003. The blockouts will not be farther than 5' O.C. or closer than 2' 6" O.C. See the attached drawing for blockouts layout. Please confirm this is acceptable.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

TT response:

In concept, blockouts in formed concrete and fill-on-metal-deck are acceptable for the purpose of pouring partition walls. Please provide specific details for each case for design team to review. The referenced Detail 9/S1-5003 is not applicable to formed concrete and does not meet requirements stated below.

Structural Requirements for Formed Concrete:

1. Blockouts shall only be made in concrete slabs and not in beams.
2. The pourback shall be secured to the blockout.
3. Pourback shall not impinge on 1 1/2" minimum clear gap between soffit and top of partition.
4. Blockout shall not be larger than reinforcing spacing.
5. Reinforcing shall not be cut.

Structural Requirements or Fill on Metal Deck:

1. Blockouts shall permit patching of metal deck prior to pourback with same gage sheet metal or matching metal deck.
2. Reinforcing shall not be relocated or cut.

Details shall address waterproofing of cold joint in penetrations located outside of building envelope.

AAI response:

Further to TT's response, WOJV have indicated that the slab penetrations will be poured back before the slab is waterproofed.

Contractor to clarify and describe how 1 1/2" minimum clear gap between soffit and top of partition will be maintained during pour and firestopped after.

**ANSWER:** **Accept Suggestion:**   
 Size and location of grout holes is part of means-and-methods of contractor.  
  
 Reason for RFI: We classify this as a no cost clarification.

**ANSWER:** **Accept Suggestion:**   
 Confirmed.  
 TT: We agree with the reason for request verification. We categorize this RFI as clarification for issues on means and methods.

**ANSWER:** **Accept Suggestion:**   
 Refer to Sheet notes S1-2302, S1-2402, S1-2502 and S1-2602 which states superstructure transverse seismic frame elevations are in Sheets S1-4101 through S1-4116. See also response to RFI T-0787 where same point was clarified to the contractor.  
  
 TT: We disagree with the reason for request: Insufficient information. We categorize this RFI as called out in contract documents and previously answered.

| <b>REQUEST:</b><br>Please reference S1-3660 through 3663, and TG03 Balfour Beatty Bridge submittal TG0300-201.<br><br>Shimmick is proposing a rebar detail change at the ground level roadway upturned beams to facilitate rebar placement. Per BBII's detail 6/SH-5101, the upturned beam's vertical clearance is 7"-12" to the W18 steel, and the horizontal beam clearance to the cap beam is 19.5".<br><br>Details S1-3660 to 3663 show the ground level upturned beam rebar detail with closed stirrups at every beam. In lieu of the closed stirrup, Shimmick proposes to use an open stirrup and a cap (similar to Detail 2/S1-3600), with the opening and cap placed on the side of the beam.<br><br>Please confirm that the proposed open stirrup and cap in lieu of the closed stirrup is acceptable. |   | <b>SUGGESTION:</b>  |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Proposed reinforcing detail is acceptable with one modification: provide 135 hooks at both ends of the cap tie.   |                      |                    |                          |

| <b>From:</b> Webcor Construction LP Claude Titche<br><b>To:</b> Turner Construction Company Phil Militello<br><b>Co-Author:</b> Shimmick Construction Company, Inc. Henry Chiang  |   | <b>ANSWERED BY:</b> Adamson Associates, Inc. George Metzger |                     |  |                      |                    |                          |
| <b>REQUEST:</b><br>Per drawing S1-8008 detail 4 the deck at the sky light overhangs the beams on a bent plate and the distance of the overhang varies. Please see attached drawing for further explanation.<br><br>Shimmick requests approval for the following:<br>1. To relocate the construction joint from above the bent plate to the top of the slab elevation.<br>2. To cut a 1" diameter hole roughly 2 feet on center through the bent plate to allow the use of embedded wall form supports to support the inside wall panel after the deck pour.<br>3. Please confirm that the skylight over hang bent plate will support the wet concrete deck weight.  |   | <b>SUGGESTION:</b>  |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>1) Relocating the construction joint to the top of slab elevation is acceptable.<br><br>2) Cutting holes through the bent plate is acceptable in concept. Final review will be performed when more detailed information is submitted with formwork shop drawings.<br><br>3) Confirmed that the bent plate shown is to support the wet concrete weight (for the deck only). Verify location and dimensions of the bent plate with steel shop drawings. |                      |                    |                          |

| <p><b>From:</b> Webcor Construction LP Andrew Kitchen<br/> <b>To:</b> Turner Construction Company Phil Militello<br/> <b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton</p> <p><b>REQUEST:</b><br/>                     Contract Doc Ref: T-1875, S1-2304 (ASI 128)<br/>                     Location: GL 15-16<br/>                     Add'l Doc Ref: CD RFI 672.1 SK1</p> <p>The noted W33 beams were located 9" from the edge of slab opening. ASI-127 revised the dimensions from the edge of opening to the W33's as shown. RFI T-1875 confirmed that the beams may remain where they were prior to ASI-127 but the edge plates are to be moved to suit ASI-127. That will result in the slab opening dimensions changing to what is shown in blue.</p> <p>Confirm that is the intent.</p>   | <p><b>SUGGESTION:</b></p>   | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>There is to be no change to the Architectural edge of slab. The beams and bent plates are to be located and sized as per the Architectural Edge of slab drawings submitted in ASI-0128.</p>  |                     |                      |                      |                    |                          |
| <p><b>T-1875.2</b></p> <p><b>From:</b> Webcor Construction LP Quang Le<br/> <b>To:</b> Turner Construction Company Phil Militello<br/> <b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton</p> <p><b>REQUEST:</b><br/>                     Contract Doc Ref: T-1875.1, T-1875, S1-2304 (ASI 128), S1-2304 (ASI 127)<br/>                     Location: Zone 2, Ground Level, GL 15-16<br/>                     Add'l Doc Ref's: CD RFI 672.2 SK1</p> <p>This is a follow-up RFI to RFI T-1875.1.</p> <p>The noted dimensions were revised on S1-2304 in ASI-127 from 9" to 11" on the north side and from 9" to 8 1/5" on the south side. Since moving the steel to suit these revised off-set dimensions would be substantial, RFI T-1875 confirmed that the steel could remain where it was and the edge plates could be moved to suit these revised off-set dimensions. The result of the response in T-1875 was that the architectural slab opening changed as shown on the left side.</p> <p>The response in RFI T-1875.1 now states that the architectural slab opening cannot be changed and must match A1-2864.</p> <p>Which RFI response is correct? Please note that the field work drawings to revise the edge plates to suit ASI-127</p> | <p><b>SSS - ST401 Slab Opening Dimension Clarifications</b></p> <p><b>SUGGESTION:</b></p> | <p><b>ANSWER:</b>      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>The opening dimensions and architectural edge of slab on A1-2864 did not change in ASI-0127. Opening size was updated in the structural drawings in ASI-0127 to match architectural. This changed the edge distances to the W33 beams north and south of the opening which remained in their place. So responses to both RFIs T-1875 and T-1875.1 are correct. Contractor to provide revised bent plates per new edge distances shown on structural drawings.</p> <p>Reason for RFI (TT): We disagree with the reason for RFI: Insufficient Information. We categorize this RFI as previously answered.<br/>                     Due to a difference in calendar month between date answered and date received, there was a delay in posting this RFI.</p> | 02/13/2015          | 02/23/2015           | 02/23/2015           | Potentially        | <input type="checkbox"/> |

| <p><b>REQUEST:</b><br/>                 Please Reference RFI's T-1042 and T-1179<br/><br/>                 As shown in the attached mark up, the geothermal manifolds penetrate the 4th lift walls. RFI's T-1042 &amp; T-1179 confirmed elevations for the geothermal manifolds at GL 17.5 (Field 7 &amp; 8) and GL 26.5 (Field 11).<br/><br/>                 Per the confirmed manifold elevations, the upper sleeves at both locations enter the 32" roadway slab.<br/><br/>                 Please provide the designers' intent for these manifolds to enter the roadway slab at only these locations.<br/>                 Please provide direction.</p> |  |               | <p><b>SUGGESTION:</b></p>  |                      |                      | <p><b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>The configuration shown in RFI T-1882 does not comply with the Design Team response for RFI T-1042.</p> <p>Response to RFI T-1042 stated: "Riser penetrations into the building must occur within the beam space of the ceiling of the lower concourse level. The elevations shown on the sketches fall below the beam pockets and conflict with future emergency ventilation ducts within the building. Elevations shall be modified and resubmitted to verify that the pipes enter the building within the beam space. Risers 7 &amp; 8 may be greater than 14'-0" below finished grade and should be reviewed by ARUP for confirmation."</p> <p>RFI T-1179, it's related sketches and the mentioned discussions, were entirely regarding the piping installation passing underneath future ductwork. It was not related to the sleeve heights which had already been dealt with in RFI T-1042.</p> <p>There is no design intention, nor any confirmation, for the geothermal piping to enter the roadway slab at these locations.</p> <p>The geothermal manifold pipe penetrations are to be lowered to avoid interference with the roadways slabs. Please submit modified pipe elevations, avoiding interference, as requested previously in RFI T-1042, together with a corrective action plan for review by the Design Team.</p> |                          |

**REQUEST:**

RFI T-1655 SCS -0013 Response provided the following:  
 A. Confirmed notching depths with an updated sketch.  
 B. Referenced ASI 123 roadway at curb (low point) elevations to be used to calculate notching elevation.  
 Shimmick was the able to determine cut elevations for Minna Street from grid line 1 to grid line 18. CI-2001 shows extent of below grade train box and shoring wall at STA: 2+30.85. Using the same reference point on CI-4001 to determine the North West corner of the shoring wall in relation to roadway stationing Shimmick was then able to follow the south flow line proposed grade profile as the bottom of curb elevation for the south side of Minna Street elevations.  
 1. Please confirm that GL 1 correlates with STA: 2+32.85.  
 2. There isn't an equivalent elevation for Natoma Street (south shoring wall), Shimmick requests that reference point with stationing be provided and added to the C 1-4004 drawing.  
 Some areas lack a CI Flow Line Profile. Shimmick requests that a different reference point, such as top of ground level deck, be provided for  
 3. the west shoring wall from grid line A to X,  
 4. the south shoring wall from grid line X to start of CI-4004 which is the first drawing sheet for Natoma Street, and  
 5. First street to Fremont for the south shoring wall.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 See attached sketch for notching elevations.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

**REQUEST:**

Please see attached references: S1-3701, SSS 051000 0561.1Sheet 674AC, and S1-3400. Detail 11/S1-3701 shows B88 framing into MFB 6 near GL G/9.9. TR9.9 has 3" diameter holes placed to allow for B88's bottom bars to pass through the web and terminate inside the concrete MFB.

The locations of the holes per steel shop drawings are too low to permit the noted lap splice based on the clear requirements set by S1-3400. The holes effectively align with the bottom of B88.

Shimmick proposes that (1) B88's elevation be adjusted to match TR9.9's rebar penetration to tie the concrete into the steel, or (2) new holes be placed on TR 9.9 to facilitate rebar penetration in S1-3701.

Please approve one of the above changes to facilitate rebar placement at TR 9.9, or provide an alternate detail to resolve the conflict.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The contractor mis-read the drawing. The top of slab shall be @19.62, while 19.96 is the top of concrete pad over beam. However, the existing holes are still slightly too low (say around 2.5"). Shimmick shall increase the B22 depth slightly to allow proper cover for the 5-#10. Do not adjust the top of B88 elevation.

**From:** Webcor Construction LP Claude Titcher

**To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Shimmick Construction Company, Inc. Henry Chiang

**REQUEST:**

Please reference RFI T-1625 regarding column vertical bar constructability.

See attached Bartec splicing system product data.

In the revised response to RFI T-1625, it is stated that hooks shall be provided as shown in construction drawings. This detail is not constructible with to the HRC 420 couplers at the top of the 3rd lift. SCCI proposes to utilize a position splice coupler from Bartec in lieu of the HRC 400 series on the rebar with hook. The Bartec coupler complies with Specification Section 03 20 02 - 2.3 - B.3 for type 2 couplers.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

For the purpose of splicing foundation wall embedded column hooked vertical reinforcing, the proposal is acceptable.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 686 SK1 & SK2 for items 1 to 6:  
 The design intent in this revised connection for the W40 beams east of Grid 26 is not clear as it contradict various other details as listed below. The noted beams are currently connected to the perimeter beams per S1-8003. Please review and confirm for items 1 to 5:

- 1) Indicates W40 beam supported by perimeter beam and W30 at the opposite end.
  - a) Confirm the connection to the perimeter beam is per 1/S1-8003 at the CP5 location.
  - b) Confirm the other end of the W40 may be connected to the W30 per 1/S1-5011 except with a full depth shear plate and 7 bolts as there is insufficient room for a double angle connection per S1-5010. See enlarged typical detail on SK1
- 2) Confirm the connection for the W40 to the perimeter beam is per 1 & 1B/S1-8003 at the CP5 location.
- 3) Indicates W40 beam supported by perimeter beam and BU-40 at the opposite end.
  - a) Confirm the connection to the perimeter beam is per 1/S1-8003 at the CP5 location.
  - b) Confirm the other end of the W40 may be connected to the BU-40 per 1/S1-5011 except with a full depth shear plate and 11 bolts.
- 4) Indicates W40 beam supported by perimeter beam and W24 at the opposite end.
  - a) Confirm the connection to the perimeter beam is per 1/S1-8003 at the CP5 location.
  - b) Confirm the other end of the W40 may be connected to the W24 per 1/S1-5011 except with a full depth shear plate and 6 bolts.
- 5) Indicates W40 beam supported by perimeter beam and W40 at the opposite end.
  - a) Confirm the connection to the perimeter beam is per 2/S1-8003 at the CP6 location with the brace omitted and the W40 connected to the 1 1/2" thick plate with 11 bolts per 1/S1-5011.
  - b) Confirm the other end of the W40 may be connected to the W40 per 1/S1-5011 except with a full depth shear plate and 11 bolts.
- 6) If the noted connections are to be revised to suit S1-

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

- 1a) Confirmed.
- 1b) Confirmed.
- 2) Connection at the noted beams is per 1 and 1B/S1-8003, except, that the number of bolts, bolt sizes, bolt spacing and edge distances shall be 1/S1-8000.
- 3a) Confirmed.
- 3b) Confirmed.
- 4a) Confirmed.
- 4b) Confirmed.
- 5a) Confirmed.
- 5b) Confirmed.
- 6) The intent of the revision to detail 1/S1-8000 was to revise connections (bolt size and configuration) for beams along moment frame lines only (shorter beams in between not affected). Detail 1/S1-8000 will be updated to clarify this intent. LEV may be changed to 4" to fit the bolts within the available connection length.

TT: We disagree with the reasons for request: Engineering Conflict and Insufficient Information, agree with Verification . We categorize this RFI as no cost clarification.

| Attached are drawings A1-7511 and A1-7512 regarding the details for the stainless steel risers at the terrazzo stair treads (affected stairs are 205, 307, 308 and 309). Need clarification on the following items:<br><br>Stair 307 specifies etched risers, while stairs 205, 308 and 309 are to be perforated. Please clarify the desired "etch". Do the risers on stair 307 have the same hole-pattern as stairs 205, 308 and 309? Is the etch an alternate finish? Please clarify design intent.<br><br>With regard to the hole pattern, there is not enough information for the desired stagger or border (if required). Please clarify design intent.<br><br>Olson Steel priced all of the risers as grade 304 stainless steel. Please confirm this is the desired grade versus grade 304L, 316,316L etc.<br><br>Olson Steel priced all of the risers with a mill finish. |  |   |                   | 1. Confirmed, the etch-pattern for stair 307 is the same as hole-pattern for stair 205,308, & 309. The etch is not an alternate finish. Refer to SKA-4301<br><br>2. The etch-pattern and perforated-pattern are to use 3/4"Ø circle. The pattern is to start at the center on the plate and have a minimum of 1" side border. Refer to SKA-4302 for updated information.<br><br>3. Provide 316 or 316L Stainless Steel are preferred.<br><br>4. Confirmed, #4 brush |                   |                    |                          |

George Metzger   |                      |                      |                    |                          |
| <b>REQUEST:</b><br>Q1. From the General Structural Notes note CD-13 on sheet S-0006, it is our understanding that the stair structure should not impose torsion on the superstructure members. However, for Stair 401 sheet A1-7111 shows the stair columns located eccentrically from the centerlines of the superstructure beams. In addition, Structural sheet S1-2404 calls out detail 9/S1-5027 which shows the superstructure beam supporting the stair column eccentrically. Is it acceptable to detail this connection as shown in 9/S1-5027 even though it applies torsion to the beam?<br><br>Q2. Should the 3/8" side plate shown in detail 9/S1-5027 be installed for the full length of the beam?      |   | <b>SUGGESTION:</b>                                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>1) Structural beam shown in detail 9/S1-5027 is designed considering the torsion induced by the eccentric stair post. Similarly, in detail 1/S1-7600 kicker braces have been provided at the structural beam to take torsion induced due to eccentric posts. General Note CD-13 applies where structural details do not show any kicker braces, stiffeners or side plates at the support beam or in cases where the eccentricity per contractor's design exceeds those shown in the structural details. Another example where General Note CD-13 would be applicable is elevator machine beams. Per detail 8/S1-5004 elevator machine equipment needs to provide bearing over full width of the beam flange to prevent torsion in the machine support beams.<br><br>2) Length of side plate to match length of opening per note 2 in detail 9/S1-5027.<br><br>TT: We categorize this RFI as no cost clarification. |                      |                      |                    |                          |

|               | <p><b>REQUEST:</b></p> <p>See attached markup of S1-3500 including detail 1/S1-3001 showing the rebar splice schedule. S1-3500 has been marked up with dimensions showing typical MFB span (6 eq spans in between 42' 6" grids). CJs will be placed in the span west of each grid. The requirements for rebar splices and CJ placement are shown. Two conflicts are noted below, involving the RCS 2 slab's #5 top layer of rebar.</p> <p>1) Midspan LCS of 1' 7" is greater than the available 1/3rd span (per spec) for CJs of 1' 6 1/4". Please confirm it is acceptable for the splice length to exceed the central third of the slab's span.</p> <p>2) Reference CAD mock up combining CJ spec requirements and S1-3500 splice requirements. Splice length of 1'7" conflicts with required 0.3LN spacing intended to center the splice. Please confirm it is acceptable for the LCS to extend into the 0.3LN span.</p> |  |                     |                      |                      |  |                          |
|               | <p><b>SUGGESTION:</b></p>   |  |                     |                      |                      |  |                          |
|               | <p><b>ANSWER:</b></p> <p>There is no requirement for the slab top reinforcing compression lap splice to be contained completely within the central third of the span only that the splice be located at midspan. At short RCS-2 spans, where a centrally located splice would overlap a construction joint placed at the third span, the compression splice may be moved away from the construction joint or the construction joint may be moved into the non-central third span. SEOR will not object to small movements. Approval of final locations of splices and construction joints will occur in submittal review. The detailers are asked to cloud such deviations to facilitate review.</p>  |  |                     |                      |                      |  |                          |

| T-1910        | <b>BGP - As-Built Condition of Rebar Dowels for Shear Walls W390B and W390D</b> | <b>Closed</b> | 11/14/2014          | 11/24/2014           | 11/17/2014           | <b>Potentially</b> | <input type="checkbox"/> |

**From:** Webcor Construction LP Claude Titcher **To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Shimmick Construction Company, Inc. Sylvia Hartanto

**REQUEST:**

SCCI recently performed an as-built survey of the western-most Shear Wall rebar dowels for the 3rd Lift that were cast into the 2nd Lift Shear Walls and Lower Concourse. These dowels dictate the western face of the 3rd Lift Shear Walls as well as a couple of columns on the West Throat Slab and a B130/B131 Beam alignment. Out of the walls that were surveyed, two of the walls had rebar dowels that were several inches to the west of where they should have been. Based on the results shown in the attached drawings, please confirm that the resulting as-built conditions are acceptable for construction:

1. Encroachment of the western faces of W390B and W390D into the adjacent corridor.
2. New location of C19 Column above W390B (roughly 8" to the southwest in alignment with the western face of W390B below).
3. New alignment of B130/B131 Beam below the Vehicle Ramp as a result of the new C19 Column location above W390B

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

The minor encroachment of shear walls into South West service corridor, location of C19 column above the shear wall and beam alignment below the vehicle ramp, resulting from the as-built location of the rebars, as described in this RFI, are acceptable.

|        |   |               |            |            |            |                    |                          |

**From:** Webcor Construction LP Claude Titcher **To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Shimmick Construction Company, Inc. Sylvia Hartanto

**REQUEST:**

Please confirm the following items related to the Foundation Wall/Corbel below the Vehicle and Bike Ramp and the response to RFI T-1850:

1. The corbel supporting the slab for the Communication Vault Room between the Vehicle and Bike Ramp is level and the top of the corbel remains at EL+ 14.0' per Detail 5 on A1-7413 even though it is not indicated on SKA-4289 (A1-7401).
2. The corbels below the Vehicle and Bike Ramps extend to the outside faces of the walls for each ramp and the corbel supporting the slab for the Communication Vault Room spans the entire distance between the corbels under the Vehicle and Bike Ramp.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

AA Response to questions 1 and 2 follows:

- 1) Refer to attached sketches SKA-4308 to 4312 for updated architectural drawings related to foundation wall/corbels. There is no concrete corbel spanning the foundation wall directly below the Communications Vault Room. Refer to SKA-4309 (based on A1-7413) for updated Detail 5.
- 2) Refer to SKA-4308 (based on A1-7401) showing the extent of Vehicle Ramp Corbel and Bicycle Ramp Corbel and Top of corbel elevations. Refer also to ARUP and TT drawings.

Arup Response to questions 1 and 2 follows:

| <u>Number</u> | <u>Subject</u> | <u>Status</u> | <u>Date Created</u> | <u>Date Required</u> | <u>Date Answered</u> | <u>Cost Impact</u> | <u>Proceed</u> |
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

3. S1-2251 shows the extent of the 4th Lift Foundation Walls that is included in TG06's scope in order to support the Vehicle and Bike Ramp. The western extent of the 4th Lift Foundation Wall is shown where the inside face of the foundation wall intersects with the outside face of the Vehicle Ramp Wall. The eastern extent of the 4th Lift Foundation Wall is shown to extend roughly 9 feet past the outside face of the Bike Ramp Wall to Gridline W. Additionally, the only elevation information for the portion of TG06's 4th Lift Foundation Wall is "TG0600 Foundation Wall=3/4" Below Bike Ramp (Varies)." Please confirm the eastern extent of the 4th Lift Foundation Wall as described above (per S1-2251) is correct. If it is correct, please provide a top elevation for the foundation wall that extends out past the Bike Ramp to Gridline W.

4. SCCI intends to pour the section of TG06's 4th Lift Foundation Wall in 3 different pours (see attached markup of S1-2251 for SCCI's proposed construction joint layout). Please note that these construction joints do not match up with the construction joints below in the 3rd Lift Foundation Walls. However, SCCI assumes that a similar condition to the 3rd Lift Foundation Walls above the Knockout Walls (see RFI T-1569) exists due to the West Throat Slab separating the 3rd and 4th Lift Foundation Walls below the ramp.

1) There is no corbel at the Communication Vault Room between the Vehicle and Bike Ramp.

2) Refer to SK-C-0003 and SK-C-0004 issued in response to RFI T-1774 for extent and length of corbels and slide bearing plate locations.

TT responses to questions 3 and 4 follows:

3) The information provided on Sheets S1-2310 in conjunction with A1-2870 include correct information regarding top of wall elevation change at the ground level. Refer to attached sketch SKS-433 for updated Detail 1/S1-2251, which will be issued as part of ASI 128, showing concrete corbel configuration.

4) TT does not take exception to the construction joints shown in item 4 of this RFI.

**REQUEST:**

This question impacts stair 403 between concourse and ground level.

1. Per the attached comments on SK-RFI-12A, the stair is currently setup to agree with 5/A1A7011 and the structural steel locations noted by ASI-027. The new dimensions noted in ASI-127 will revise the edge of slab, thus revising the width of the stair well and the widths of the stairs inside it. Please furnish a revised detail.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

1) The revised edge of slab on structural drawing in ASI0127 was to match the edge of slab shown in the Architectural Drawings. The architectural edge of slab has been designed and dimensioned to match stair design on A1-7011 and did not change in the architectural drawings issued in ASI0127. The stair widths have not changed.

2) The proposed stair widths are not needed, these

**From:** Webcor Construction LP Gregory Kemerer **To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

See attached CD RFI # 493.3 SK1 & SK2:  
 The response to RFI T-1692 (SK 681, CD 493) re the HSS6x6 to be continuous was implemented in the model and the Mill Order has been revised to maintain current submittal schedules as shown on attached SK2. The response in RFI T 1692.1 (SK 681.1, CD 493.1) confused this direction.  
 At this time, for Skanska to move forward, they require a splice location and splice weld for the continuous HSS6x6x1/4 column. Confirm the proposed splice location and weld as shown on SK2 are acceptable.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

In response to RFI T-1692, TT requested the contractor to make the HSS6x6 column at the north-east corner of PE201 continuous. That said, the beam to connection issue highlighted in the RFI could have been resolved even with the column remaining discontinuous. The top angle per typical detail 8/S1-7604 would be connected to the HSS 8x8x5/8 and the bottom angle would be connected to the HSS6x6 column. Although making the column continuous can be considered a minor change, the intent was to facilitate easier detailing and erection. Then we received RFI T-1692.1 stating that the change requires revisions to the model and material order. Our position in response to that RFI was that if the contractor is planning to send a bill to the owner for something of this nature, we'd prefer going back to the contract drawings, i.e., a discontinuous column per 12/S1-7604 at that location. The current RFI (RFI T-1914) states that the change was already made in the model and mill order has already been revised to maintain current submittal schedules. We note that the shop drawings for this area has not been submitted yet and it is not clear how the mill order would be affected from a minor modification such as this one. We suggest that this item to be added to next weekly meetings agenda for further discussion and final resolution.

TT: We disagree with reason for request "insufficient information". We categorize this RFI as "other".

**REQUEST:**

See attached CD RFI # 684.1 SK1 to SK2 for follow up on items 1, 2, 5, 6 and 9 :

- 1) The response to item 1 in T-1929 SKA-4323 has provided dimensions to locate the stair posts on the Second Level (4/S1-7012) but it remains unclear where the post locations are in details 5 & 6/S1-7012. Where do the dimensions in 4/SKA-4323 apply? Note dimensions of nearest HSS 12x6x5/8" from GL 30 in detail 2 and 4 are not consistent (13'-5" from Detail 4 and 13'-10 1/4" from detail 2. Please clarify.
- 2) Braces are indicated on plan (orange lines) but connection details are missing. Supply connection details for each end of each brace.
- 3) Previous response is complete
- 4) Previous response is complete
- 5) SKA-4324 provides revised east/west locations for the hangers below the second level. Confirm the north/south dimensions in 3/S1-7012 are correct.
- 6) The post to beam connection per 1/S1-7600 does not work at the double posts. Supply a new connection detail.
- 7) Previous response is complete
- 8) Previous response is complete
- 9) The response is not clear please provide a revised structural plan
- 10) Previous response is complete

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1) Dimensions provided on 4/SKA-4323 locate hangers that support stair landings at elevations EL 31' - 1 1/4" and EL 29' - 10 7/8". These hangers are shown on 3/S1-7012. The HSS12x6x5/8 posts shown in details 2 and 4/S1-7012 and noted in the RFI are two different posts. HSS12x6 in detail 2 is above the 2nd floor level, where HSS12x6 shown in detail 4 hangs below the 2nd floor.

2) Per section 1.5C of specification 05 51 00 STEEL STAIRS AND RAILINGS, connection details for brace and hangers at the stair shall be designed by the contractor's engineer. Note that if the stair landing needs to be laterally braced, lateral bracing shall be designed such that it does not penetrate the W-16 system wall shown on A1-7020.

5) North-South dimensions to locate the hangers were provided in 4/SKA-4323 submitted with RFI T-1929.

6) Connection at the top of the double posts may be provided per attached sketch SKS-0455 which is similar to 1/S1-7600.

9) The 4 corner HSS posts shown on 2/SKA-4324 (2/A1-7509) are HSS hangers that support the landing at EL 29' - 10 7/8" and are shown on 3/S1-7012. These HSS posts hang from W18x119 beams shown on 4/S1-7012. The middle two steel sections shown on 2/SKA-4324 are HSS braces between the corner hangers.

Reason for RFI (TT): We disagree with the reason for request: Insufficient Information. We categorize this RFI as no cost clarification.

Confirm 3/4" thick is acceptable or supply thickness.</p>   |                           | <p>1) Acceptable, except, flip the horizontal leg of the L8x4 angle that is on the stair side to minimize projection into the stair opening.</p> <p>2) Confirmed.<br/>                     Due to a difference in calendar month between date answered and date received, there was a delay in posting this RFI</p> |                     |  |                      |                    |                          |
| <p><b>From:</b> Webcor Construction LP Gregory Kemerer<br/> <b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton</p> <p><b>REQUEST:</b><br/>                     Please reference detail 1/S1-5000, Typical Headed Stud Spacing Detail. Note #4 indicates the maximum number of studs permitted per individual metal deck rib is 3. Also provided in this detail is a plan view titled "Beams Perpendicular to Deck" where the plan shows a three stud per rib condition. Skanska note the three studs are spaced 2-5/8" in one direction and 3" in the other which nets a diagonal spacing of 3". Skanska is running into conditions where the number of studs versus the number of available ribs will exceed 3 studs per rib, particularly at the bus deck level. See below for 2 examples:</p> <p>1. Sheet S1-2507, near the south east corner a W30x99 beam with 68 studs. The bay width is 16' wide and when you subtract the width of the support girders and the ribs lost by the drag plates we only have 11 available ribs. This results in 6 to 7 studs per rib.</p> <p>2. In the same general area are diagonal beams with 10 studs noted. Again due to the relatively short length of beam and long drag plates we may only have one full rib and a partial rib in which to fit 10 studs. Net result is 6 to 7 studs per flute.</p> <p>Please confirm the following is acceptable: Where the</p> |                           | <p><b>To:</b> Turner Construction Company Phil Militello</p> <p><b>SUGGESTION:</b></p>  |                     | <p><b>ANSWERED BY:</b> Adamson Associates, Inc. George Metzger</p> <p><b>ANSWER:</b> <input type="checkbox"/> <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>1. Number of studs in the W30x99 beam may be reduced to 33 from 68 so that there are 3 studs per rib.</p> <p>2. For the short diagonal W40 beams with Type 3 flange plate connections, provide number of studs as indicated on contract documents. Stud placement shall be as follows:</p> <p>a) Provide studs at a maximum spacing of 1 stud per foot for entire length of the beam top flange.</p> <p>b) If more studs that can be fit by (a) is specified on the drawings, place remaining studs at the same spacing as (a) starting from the beam ends.</p> <p>c) At locations where there is no rib over the beam due to flange plates, studs shall be welded to the flange plate and centered on the beam web.</p> <p>d) If there are 2 studs at a location, spacing between the two studs shall be 3" with the studs aligned in a direction perpendicular (parallel) to the flange plates (ribs).</p> |                      |                    |                          |

PROJECT MANAGEMENT - REQUEST AND ANSWERS LOG

30100 - Transbay Transit Center Project

Table header with columns: Number, Subject, Status, Date Created, Date Required, Date Answered, Cost Impact, Proceed

Co-Author: Skanska USA Civil West California DisRyan Clayton

REQUEST:

See attached CD RFI # 707 SK1 for items 1 to 3:
1) A 1/16" gap remains between the beam flanges when they are centered under the curbs. Confirm this is the design intent or supply revised beam locations.
2) The double angle connections per 1/S1-5010 will not fit at the noted locations. Confirm it is acceptable to supply shear plate connections per 1/S1-5011 except they will be welded to the web stiffeners and the underside of the beam flange. If not, supply a new connection detail.
3) Confirm a shear plate per 1/S1-5011 may be used at the noted locations as 1/S1-5010 will not work opposite the connection per 9/S1-5032. If not, supply a new connection detail.

SUGGESTION:

ANSWER:

Accept Suggestion: [ ]

- 1) The short W27 beam may be moved towards GL F slightly so that there is 1/2" clearance between the beam flanges.
2) Provide shear plate connections at the noted W24 and W27 beams similar to that shown in SKS-0421 submitted with RFI T-1553.3. Number of bolts at the connection shall be per 1/S1-5011.
3) Confirmed.

Reason for RFI (TT): We disagree with reason for request: Engineering Conflict, agree with Verification. We categorize this RFI as no cost clarification.

T-1944 SSS - Dimension Discrepancy at Glass Floor GL 20.1-21 Closed

From: Webcor Construction LP Gregory Kemerer To: Turner Construction Company Phil Militello

12/01/2014 12/11/2014 12/02/2014 Potentially [ ]

Answered By: Adamson Associates, Inc. George Metzger

Co-Author: Skanska USA Civil West California DisRyan Clayton

REQUEST:

See attached CD RFI # 648 SK1:
19'-11 3/4 x 4 = 47'-3.
Please clarify the discrepancy as shown on SK1. This impacts the post locations per 1/S1-8016.

SUGGESTION:

ANSWER:

Accept Suggestion: [ ]

Locate the workpoints in 4 equal divisions of 47'-3 1/4" as noted in the dimension string.

| <b>REQUEST:</b><br>Please reference RFI T-1625 & T-1894<br><br>See attached marked up drawing of detail 4/S1-3206. Similar to the embedded column detail mentioned in RFI T-1625 & T-1894, detail 4/S1-3206 is not constructible with HRC 420 couplers. SCCI proposes to utilize the method approved for embedded columns in RFI T-1894, using Bartee position couplers in lieu of the HRC 400 series on the rebar with hook. As before, note that Bartee is not listed in spec section 03 20 02 acceptable products, but is an or equal.<br><br>Please confirm if Bartee couplers are acceptable to be used at detail 4/S1-3206 to allow hook installation. |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Confirmed. At contractor's option, it is also acceptable to keep the HRC couplers and replace the top-of-wall hook with a head similar to that shown on Section 1/S1-3201.   |                      |                    |                          |

|               | <p>Please reference attached photo (1 page) and sketches (3 pages). Due to missing #10 column vert's in Throat Wall 391 at GL V/H, SCCI proposes the following corrective actions:</p> <p>1. In Throat Wall 391:<br/>                     - Add #10 dowels with approved HRC couplers, drill and epoxied into concourse deck below per sketches attached, using approved HILTI RE-500 SD Epoxy.<br/>                     - Add additional ties and salvage existing ties per sketches attached.<br/>                     - Pull horizontal bars into western most end of Throat Wall boundary while maintaining a minimum 81" lap splice.<br/>                     - Cast additional #10 column verts into Throat Wall which dowel into column above per contract plans and sketch attached.</p> <p>2. In column above:<br/>                     - Abandon the three (3) eastern most #10 column verts as shown on sketch.<br/>                     - All other bars installed per contract plans and/or sketches attached.</p> <p>Please confirm this is acceptable.</p> | Confirmed.    |                     |                      |                      |  |                          |

| Due to CDSM Encroachment, the thickness of the West Foundation Walls in the North direction in Area 3 was increased by 3 118" per RFI T-0576. During the Lower Concourse Deck D201/202 as-built survey, SCCI discovered that the CDSM encroachment was inadvertently taken into account twice. The result is that the starter wall and the corresponding 3rd Wall Lift Foundation Wall Rebar is approximately 3" thicker than planned(see attached drawing).<br><br>Please confirm the as-built condition of the North West Foundation Wall is acceptable and the wall alignment may be offset into the structure. The proposed inside face of the West Wall for the 3rd Wall Lift ONLY on the North Side is 1'-6 1/4." East of GL 1. |  |               |   |                      |                      | <b>Accept Suggestion:</b> <input type="checkbox"/><br>AAI's response:<br><br>Architecturally there no objection to the slightly increased wall thickness at the one location described in this RFI. Please refer to TT's response.<br><br>TT's response:<br><br>Condition is structurally acceptable below grade. At grade, plain concrete (excessive cover) between outside face of foundation wall reinforcing and planned building line will not be allowed. Contractor shall propose method of providing reinforced concrete with specified cover at grade to make up any distance between offset wall and planned building line. |                          |

|--|---|---|--|---|--|--------------------|----------------|
| <p><b>REQUEST:</b><br/>           Contract Doc Ref: T-1985, 9/S1-5032<br/>           Location: GL 4<br/>           Add'l Doc Ref: Attached CD RFI 717.1 SK1</p> <p>See attached CD RFI 717.1 SK1. Stopping the W16 short to avoid fouling the bolts is a partial solution but the shear plate also fouls the 1 1/2" diameter bolts per 9/S1-5032 as shown and cannot be welded to the web of the BU-60. Please provide a workable alternate connection detail.</p>   | <p><b>SUGGESTION:</b></p>   | <p><b>ANSWER:</b>     <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>As stated in response to RFI T-1985, the shear plate shall be connected from the east side of the beam web. A groove weld with an effective size of 1/4" may be provided from one side at the shear plate in lieu of the double sided fillet weld as shown on SKS-0441 submitted with response to RFI T-1985. If needed, shim plate may also be provided between the shear plate and the beam web so that the shear plate clears the bolts.</p>                   |  |   |  |                    |                |
| <p><b>T-1986</b></p> <p><b>From:</b> Webcor Construction LP                      Gregory Kemerer</p> <p><b>Co-Author:</b> Skanska USA Civil West California DisRyan Clayton</p> <p><b>REQUEST:</b><br/>           Contract Doc Ref: S1-2701<br/>           Location: Zone 1, Roof<br/>           Grid Line: D &amp; 4<br/>           Add'l Doc Ref's: CD RFI # 719 SK1</p> <p>Drawing S1-2701 shows a W12x19 member connection to a W16x36 near grid line D &amp; 4.</p> <p>The post shown at this location appears to rest on the beam to beam connection.</p> <p>Confirm the beam to beam connection is per 1/S1-5010. If yes, supply a connection detail for the post to clear the beam to beam connection.</p> | <p><b>SSS - FO 34 Missing Connection Detail at HSS Post GL 4</b></p> <p><b>To:</b> Turner Construction Company Phil Militello</p> <p><b>SUGGESTION:</b></p> | <p><b>ANSWER:</b>     <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>Confirmed. It is not clear what the conflict is from the sketch provided on SK1. If the beam stiffeners centered on the post and as shown on SKS-0434 submitted with RFI T-1923 are fouling the double angles, the stiffener plates may me moved slightly to clear the angles.</p> <p>Reason for RFI (TT): We disagree with reason for request: Insufficient Information agree with Verification. We categorize this RFI as called out on contract documents.</p> | <p style="text-align: center;"><b>Closed</b></p> | <p>12/09/2014    12/19/2014    12/20/2014</p> | <p>Potentially <input type="checkbox"/></p> <p><b>Answered By:</b> Adamson Associates, Inc. **REQUEST:**

Please reference detail 4/S1-3207 and RFI T-1666 about foundation wall opening conflicts. Since submitting RFI T-1666, more concerns regarding 4/S1-3207 have been brought to our attention.

One of the concerns mentioned in RFI T-1666 was the case of additional vertical bars potentially conflicting with moment frame beam rebar. This issue can also occur with the diagonal cross bars and additional horizontal rebar.

1. Please provide an alternative detail for cases where either additional horizontal bars and diagonal cross bars conflict with moment frame beam rebar.

Due to the length of additional horizontal bars, wall openings near foundation wall CJs will cause the constructability issue of requiring rebar to be built out further to proceed with concrete pours.

2. Please confirm that the alternate wall opening detail (requested in RFI T-1666) for additional vertical bar lengths can also be applied to additional horizontal bars.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

**To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Contract Doc Ref: S1-2701  
 Location: Zone 1, Roof  
 Grid Line: F & 5  
 Add'l Doc Ref's: CD RFI # 735 SK1

Drawing S1-2701 shows a W12 beam near grid lines F & 5.

The added W12x19 in FO 34 fouls the existing connection per 2/S1-5018.

**SUGGESTION:**

**ANSWER:**

Accept Suggestion:

Provide a shear plate connection at the W-12 beam similar to that shown in SKS-0421 submitted with RFI T-1553.3.

Reason for RFI (TT): We disagree with reason for request: Engineering Conflict. We categorize this RFI as no cost clarification.

| <p>RFI #T-1872 Question 3. Please confirm that the skylight over hang bent plate will support the wet concrete deck weight. Answer 3. "Confirmed that the bent plate shown is to support the wet concrete weight (for the deck only). Verify location and dimensions of the bent plate with steel shop drawings." In response to answer 3 please see attached Skanska submittal 051000-0563 .1 shop drawings. The shop drawings show the sky light bent plate exceeding 2' in length without being supported by an angle brace required by contract drawing SI-5000 detail 9. Shimmick plans to pour the roof deck first and once the concrete has reached sufficient strength then pour the sky light wall on the concrete deck.</p> <p>1. Please confirm that Skanska will be installing an angle brace per S1-5000 detail 9 for bent plate over hang distances greater than 2 feet at the sky light opening.</p> <p>2. Please confirm whether or not Skanska will fill in gaps between bent plates as shown in the attached photo.</p> |   |   |                     | <p><b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>1. The bent plate at the skylight opening will be installed per detail 1/S1-8008, no angle brace included.</p> <p>2. Bent plate will be installed continuously around skylight opening, as shown on S1-2603.</p> |                      |                    |                          |

|--|---------------------------|---|

With regards to the treatment of the perforated metal panels, are the loads shown in figures 4 and 5 of the RWDI report to be applied to the solid area of the panel, or to the entire area of the panel (solid area and perforations?)

RWDI's response was - For the wind pressures on the W-1 awning panels, you can use the wind pressures presented in our June 7, 2013 report on the solid areas of the panel. This is based on the porosity of the W-1 panel being 35-40% open and the guidance given in Figure 6-22 for open signs and lattice framework from ASCE 7-05.

Please confirm that RWDI's response is acceptable.

Add'l Doc Ref's:  
 UL Design Listings (Design No. X674)

Per the Fire Protection Matrix & Schedule/A1-8662, the UL Design Listing referenced for IFRM-2 is X674.

Per Detail A/A1-8662, IFRM-2 is to be applied to the light column cast pipe members.

Per Detail A/S1-6005, the light column cast pipe sizes are 32"x2.36", 30"x2", 28"x1.57", and 30"x1.57".

The specific member sizes required by the contract documents are not identified within UL Design Listing X674 as tested assemblies.

Please provide direction as to how UL Listing X674 is to be applied to the light column members, or provide a standard to be used for installation of IFRM-2 at the members not listed within UL X674.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

The contractor is to follow manufacturer's rating formulas for calculating the thickness of the intumescent coating to meet the UL requirements. Refer to Specification Section 07 81 23 1.5 E for compliance requirements.

|               |  |               |                     |                      | 1.) RESPONSE: The moment frame column NDT requirements on all weld configurations have been provided in specification section 05-12-10 and Structural Steel Additional Seismic Requirements, Table 2-1. This response has been coordinated with the EOR.  |   |                          |
|               |  |               |                     |                      | Any decision to reduce the level of NDT must consider the criticality, redundancy, loading types, peak loads and other information in the domain of the EOR, in addition to weld reject rates, etc. This means that any allowable reduction in NDT is an EOR prerogative, and not a mandatory requirement. The EOR has agreed to allow such reductions per Note 2 below Table 2-1 which references AISC 341. However; AISC 341 (-05 & -10) stipulates that any reduction in NDT is for individual welders based on their reject rate. There is nothing in the AISC provisions (or in the project specifications) that suggest that any reduction in NDT |   |                          |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

Appendix Q5.2. Please see attached SK1 that highlights the testing requirements, as understood by Skanska, for the moment frame columns and confirm this is correct.

If this is not accurate, please supply the NDT requirements for the Moment Frame Columns.

2) Please clarify the Table 2-1 remark under welds not described below, "MT 25% of joints, full length". It is our understanding that 1 out of every 4 joints will receive full length MT inspection and the next 3 joints will not receive MT. Please confirm.

be approved for a facility, only for individual welders whose reject rates do not exceed 5%. This RFI does not (in keeping with the AISC provisions) provide a blanket reduction for the facility.

EOR has allowed for QA Special Inspectors to reduce the NDT of those welds on the moment frame columns (Non-demand critical welds and Non-butt joints in the column splices) to MT on 25% of the joints and UT based on the AISC provisions. However, this will require Skanska and QA Special Inspectors to verify statistically the acceptance/rejection rates of each welder or welding operator proposed for reduction with a request in writing from Webcor-Obayashi/Skanska. The statistics should include the number of 'welds' made, the number of 'welds' examined by MT and UT, and the number of 'welds' rejected by MT and UT to comply with the AISC provisions. QA Special Inspectors would then review the statistics prior to accepting any specific welder NDT reduction request. The QA Special Inspectors only are authorized to reduce the NDT of those specific welders and the QA Special Inspectors only are also authorized to rescind this.

NOTE: Regarding any proposed "Reduction of Rate of Ultrasonic Testing" specified in AISC 341-10 (J6.2g) compared to 341-05 (Q5.2 g). This exempts Demand Critical Welds from any reduction in UT testing. UT Testing shall remain as per specification section 05-12-10 Structural Steel Additional Seismic Requirements, Table 2-1.

2.) RESPONSE: Any decision to reduce the level of NDT to 25% for moment frame column Complete Joint Penetration (CJP) welds and per specification section 05-12-10 Structural Steel Additional Seismic Requirements, Table 2-1, and AISC as noted above, Four of Four (4 out of 4) welds will receive QA Special Inspectors AWS Code visual welding inspection with some reduction in MT inspection only at the discretion of the QA Special Inspectors who are only authorized to reduce the NDT to 25% for those individual welders whose reject rates do not exceed 5% as described above. The QA Special Inspectors only are also

|               |                |               |                     |                      |                      |                    |                |
|               |                |               |                     |                      |                      |                    |                |

movement joint alignment. Extend parapet wall over foundation wall.

3. Refer to SKS-0451, SKA-4402 and SKA-4403 for west movement joint alignment and parapet wall at south foundation wall extension. The southernmost parapet wall is monolithic with the ramp. Where the parapet crosses the southwest foundation wall, a movement joint separates the ramp supported wall and the ground supported wall. This joint continues at ramp level down the ramp.

4. Refer to SKS-0452, SKA-4401, and SKA-4403. Locally deepen the ground floor edge beam so that the separation gap may change abruptly and still have concrete support for joint fill material. The minimum height for wall built integrally with slab south of the joint transition is 6".

5. Refer to SKS-0453. Reconfigure joint such that B141 is the girder connecting to column C19. All other beams will frame into this girder.

6. It is not necessary for B124 to widen toward the intersection. The wall atop the vehicle ramp can have hooked starter bars within the slab.

7. Confirmed that beam is straight. Refer to SKA-4402 for beam work point and angle.

8. Refer to SKS-0453. B141 is tapered at 3:1 to Beam B125 (down) rather than B142 (up).

9. Refer to SKS-0451 for beam offsets from foundation wall.

10. Extent of thickened slab to run from entire width of ramp, beam to beam. Soffit of drop is sloped with the ramp. Termination of reinforcing shown perpendicular to detail 4/S1-3501 to be same as typical slab top or bottom bars. For extent of trench and dimensions, refer to shop drawing TG0600-131.1 and A1-2250 issued with ASI-128.

Please see attached slab edge plan drawings with markups of slab opening curbs.

On Drawings A1-2864 - A1-2866, Air Vent opening Top of curb elevations are provided on the slab edge plan. Elevations are not provided for the Northern Air Vent opening curbs on A1-2865. SCCI requires confirmation on curb elevations in order to appropriately plan for construction of openings on the ground level.

Please confirm Air Vent opening Top of Curb elevations noted in attached slab edge plan and provide elevations for Air vent curbs without Top of Curb elevations.

**Co-Author:** Shimmick Construction Company, Inc. Henry Chiang

**REQUEST:**  
 Contract Doc Ref: A1-2862, A1-2864, A1-2867  
 Location: Zone 1 to 4, Ground Level  
 Gridline: B/1.4-2, B/15-16, C.3&F.7/33-34  
 Add'l Doc Ref: N/A

**SUGGESTION:**

The elevations are not provided for the curbs around the following openings:

- North and South Service Vault openings noted on Drawing AI-2867
- Diesel Fuel Fill openings on Drawings AI-2862, AI-2864

**ANSWER:** **Accept Suggestion:**

Curb elevations are per attached sketches SKA-4380, 4381 and 4382. For Diesel fuel fill opening curb elevations, refer also to typical detail 9/A1-8717 where curbs are 9" below paved surface. Coordinate with finish elevations indicated on Landscaping drawings. For Manhole opening curbs at service vaults, refer to details 1&2/A1-9251 where curbs are 10" below paved surface. For pull box curbs at service vaults, refer to 3/A1-9251 where stepped curbs are 5" and 10" below street paving. Refer to current Civil drawings in ASI 128 and coordinate with Landscape finish elevation.

Please see attached slab edge plan drawings with markups of slab opening curbs.

SCCI requires confirmation on curb elevations in order to appropriately plan for construction of openings on the

**Co-Author:**

**REQUEST:**

Contract Doc Ref: (ASI 128 dated 12/16/14)  
 Specification Section 13 34 24  
 Sheet E1-2310  
 Sheet E1-2306  
 Sheet E1-2502

Location:  
 Ground Level  
 Bus Deck Level

Add'l Doc Ref's: N/A

Per Specification Section 13 34 24 (2.3) N.1 Prefabricated Guard Booths, "booth shall be delivered prewired and ready for site power connections by the booth contractor", referencing Sheet E1-2310, E1-2306, and E1-2502 for booth type 1, 2 and 3, respectively.

- 1.) Note 4 of Numbered Notes on Sheet E1-2310 states, "Equipment and devices will be provided with prefab booth." However, Note 4 on Sheet E1-2310 at Prefab Guardhouse 01960 states that it is "NIC".
- 2.) Note 6 of Numbered Notes on Sheet E1-2306 states, "Equipment and devices will be provided with prefab booth." However, Note 6 on Sheet E1-2310 at GGT Supervisor Booth 01622 states that it is "NIC".
- 3.) Note 5 of Numbered Notes on Sheet E1-2502 states, "Equipment and devices will be provided with prefab booth." However, Note 5 on Sheet E1-2502 at Bus Deck Superintendent Station 03260 states that it is "NIC".

Please confirm that all electrical equipment, devices, and

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

This question is not a bid question. WOJV to confirm the following proposed response in relation to their division of work between trade packages.:

All electrical equipment, devices, and site power connections for prefabricated booths are to be furnished and installed under the TG16.9 bid package. This equipment is noted as 'NIC' on electrical drawings because it is not under the electrical TG10.4 bid package. 'NIC' indicates work that is not in contract for this bid package. Refer to sheet note 'I' on electrical sheet E-0005.

**REQUEST:**

Contract Doc Ref: S1-2607, 2/S1-4205  
 Location: Roof Level Zone 4  
 Gridline: B&H/33.2  
 Add'l Doc Ref's: Attached sketch

Drawing S1-2607 shows a W40x503 beam on GL 33.2 connecting to the perimeter beams at GL B & H. These perimeter beams have stiffeners per 2/S1-4205.

With the perimeter beam stiffeners shop welded, the W40x503 will not be erectable.

Please confirm it is acceptable to ship the stiffener loose, to be field welded as shown in the attached sketch, or supply an alternate solution.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Shipping the stiffener loose as indicated in the RFI is acceptable. Proposed welding is acceptable given that welding is "Demand Critical (DCW)" per the contract drawings. Proposed location for the stiffener (12" from beam CL) is also acceptable.

Reason for RFI (TT): Substitution request.

**REQUEST:**

Contract Doc Ref: S1-2506, 1C/S1-5018  
 Location: Bus Deck, Zone 4  
 Gridline: B/27.1 & H/27.1  
 Add'l Doc Ref's: RFI T-1815, attached sketch

Drawing S1-2506 shows beam connections near B/27.1 & H/27.1. Per 1C/S1-5018, these connections should have 10 bolts in each row.

Due to the cut of the beam bottom flange it is not possible to fit the required 10 bolts in each row.

Confirm it is acceptable to supply a total of 15 bolts at the bottom flange as shown similar to RFI T-1815 (SK 878, CD 653).

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Confirmed.

**REQUEST:**

Contract Doc Ref: ASI 128 - L1-5627, 01 10 30/APE -  
 Schedule of Alternates for Main Package  
 Location: Roof Park  
 Closest Column Line Intersection: N/A  
 Add'l Doc Ref's: N/A

In ASI 128 specification 01 10 30/APE Schedule of Alternates for Main Package, all alternates for the Roof Park have been removed. L1-5627 still references Alternate No. 16 regarding deletion of the greywater system.

Please confirm that Alternate 16 is no longer applicable and reference to it should be removed from L1-5627.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

See attached sketch SKLA 358. Reference to Alternate 16 from L1-5627 is deleted.

**REQUEST:**

Contract Doc Ref: ASI 128 - L1-2633, 01 10 30/APE -  
 Schedule of Alternates for Main Package  
 Location: Roof Park  
 Closest Column Line Intersection: N/A  
 Add'l Doc Ref's: N/A

In ASI 128 specification 01 10 30/APE Schedule of Alternates for Main Package, all alternates for the Roof Park have been removed. L1-2633 still references and calls out an Area of Alternate Deduct at the W-20 Roof Park Cafe.

Please confirm that reference to this Area of Alternate Deduct at the W-20 Roof Park Cafe is no longer applicable and reference to it should be removed from L1-2633.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

See attached SKLA-357. "Area of Alternate Deduct" callout has been omitted.

| <b>From:</b> Webcor Construction LP      Claude Titcher<br><b>To:</b> Turner Construction Company Phil Militello<br><b>Co-Author:</b> Shimmick Construction Company, Inc. Sylvia Hartanto   |  |               | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |                      |  |                    |                          |
| <b>REQUEST:</b><br>Contract Doc Ref: S1-2251<br>Location: Bike Ramp Z1<br>Grid Line: N/A<br>Add'l Doc Ref's: Attached.<br><br>Please confirm it is the Engineer and Designer intent to install the Chord Bars at the Vehicle and Bike Ramp per the attached TT sketch and NOT per the Contract Drawings or Shop Drawings(Submittal TG0600-331.1) which were returned "Approved As Noted." |  |               | <b>SUGGESTION:</b>  |                      | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>Regarding the permanent blockout at Grid 5: S1-2202 shows that chord reinforcing passes continuously south of the column. Submittal TG0600-331.1 is incorrect if the submittal implies that the chord reinforcing is not continuous. The chord reinforcing shall be continuous as shown schematically in the sketch included in the RFI. This issue is being tracked as BIM360 ID 000943 and shall be resolved prior to final rebar inspection.<br><br>Regarding the temporary blockouts: Per S-0005, GR-4, Gr-5, and Gr-9, the contractor is responsible for the design of temporary blockouts. In order to avoid having to splice chord reinforcing within the temporary blockouts, the chords may be realigned similar to what is shown in the sketch included in the RFI. Note that the length of overlap of offset chords exceeds that of a typical lap splice and requires engineering design. The structural field representative will assist the contractor in determining required length and layout, should the contractor opt to offset the chords.<br><br>Regarding chord reinforcing size and number: The chord reinforcing size and number is correctly indicated on the sketch included in the RFI.<br><br>Design team is not requesting that the contractor do anything other than what is shown on the contract drawings; however, should the contractor wish to avoid coupling chord reinforcing within temporary blockouts, layout deviations similar to what is shown in the attached RFI will be acceptable after review by the design team. Any such modification is for the contractor's convenience and shall be at no cost to the owner. |                    |                          |

|               | <p><b>REQUEST:</b><br/>                     Contract Doc Ref: S-0007, 03 30 02 2.1A.1, 03 20 02 2.3G<br/>                     Location: N/A<br/>                     Grid Line: N/A<br/>                     Add'l Doc Ref's: TG0702-514, Attached.</p> <p>Please reference submittal #TG0702-514, Specification 03 30 02 2.1.A.1, Specification 03 20 02 2.3.G, and General Notes on S-0007.</p> <p>The requirements for these welded bars conflict. ASTM A 706 is required per General Notes and Specification 03 30 02 2.1.A.1, but ASTM A108 is required per Specification 03 20 02 2.3.G and submittal response to #TG0702-514. Each specification section references the same items.</p> <p>All welded bars, including those called out as Deformed Bar Anchors, will be fabricated per ASTM A496, which surpasses both A108 and A 706 requirements set by the specifications above. Please see attached letter from manufacturer.</p> <p>Please confirm that providing bars per ASTM A496 in lieu of either A706 or A108 is acceptable.</p> |               |                     |                      |  |  |                          |
|               |  |               |                     |                      | <b>SUGGESTION:</b>   |  |                          |
|               |  |               |                     |                      | <b>ANSWER:</b>   | <b>Accept Suggestion:</b> <input type="checkbox"/> |                          |
|               |  |               |                     |                      | <p>The RFI seems to conflict with the attached letter from the manufacturer. There is no need to replace ASTM A108. As indicated in the manufacturer letter and also in contract specification 03 30 02, Section 2.3.G; ASTM 108 is a broad material specification and all the deformed bar anchors shall also comply with ASTM A496. Our understanding is these two ASTMs do not conflict each other.</p> <p>Secondly, Section 2.1.A.1 of the same specification and the term "weldable deformed bars" in General Notes Section RE-2 refer to welding of standard deformed reinforcement, i.e., when standard reinforcement needs to be welded (for whatever reason, by design or could be as part of a corrective action) it needs to be ASTM A706. This spec section and the general note section do not refer to deformed bar anchors.</p> <p>To summarize, where drawings call out deformed bar anchors the material should comply with specification 03 30 02 Section 2.3.G, and where reinforcement needs to be welded at other locations it needs to be ASTM A706. Note that DBAs are available up to 3/4 inch diameter whereas ASTM A706 can be available with much larger sizes.</p> |  |                          |

George Metzger</p>  |                     |                      |                      |                    |                          |
| <p><b>REQUEST:</b></p> <p>Contract Doc Ref: S1-5022<br/>                     Location: Ground Level<br/>                     Grid Line: C and G<br/>                     Add'l Doc Ref's: Attached</p> <p>Please reference Sheet S 1-5022 showing the typical steel to concrete connection at the ground level. Note the 1:1 slope from bottom of beam to bottom of flange in Detail 1B and 4A. Insufficient rebar details are available in this 1:1 slope in SI-5022. The details direct to the SI-37XX series for further rebar details. Sections are taken at various GLs at N/S Transfer Girders, but not between GLs at the E/W perimeter steel. The bottom bar embedment varies: 90 degree, 45 degree, and terminator ends are all used.</p> <p>Shimmick requires further rebar details in the 1:1 sloped region of the MFBs between GLs at the E/W perimeter steel along GL C and G to produce shop drawings. This RFI affects Submittal TG0702-076 for Ground Level 13-19 Rebar and has potential changes for Submittal TG0702-075 for Ground Level 10-13.</p> <p>1. Please provide a new rebar detail applicable to all MFB between grid lines, one each for GL C and GL G. Please include bent bottom bar requirements and stirrup requirements as applicable.</p> <p>2. Are bent bars, similar to those shown in the SI-37XX markups, required in the 1:1 sloped region of the MFBs between TRs along GL C and G?</p> <p>3. If bent bars are required per #2, please provide criteria</p> |   | <p><b>SUGGESTION:</b></p> <p><b>ANSWER:</b>                      <b>Accept Suggestion:</b> <input type="checkbox"/></p> <p>1). The intent of the bent bars was shown in many details in S1-37xx series details, e.g., Detail 7/S1-37-1, 10/S1-3703, 2 &amp; 4/S1-3705. The 45 deg bent shall be placed as close as possible to the flange of the supporting steel spandrel beam and the vertical leg shall have a length equal to standard hook length. Please also see the response #3).</p> <p>2). Confirmed.</p> <p>3). Bent bars are to be used where the bottom of the beam has a 45 deg slope. Beam bottom flange slope is required where the bottom of the concrete beam is lower than the supporting steel beam.</p> <p>4). Confirmed that splicing the bent bar is acceptable. Please refer to detail 10/S1-3703 for splice detail.</p> <p>5). Where the concrete beam is supported by a spandrel beam at Grid C or G, the stirrup shall be placed starting from the face of supporting beam flange. Where the concrete beam is supported by a transfer girder, the stirrups shall start when there is a hole in the transfer girder that allow the placement of the stirrups.</p> <p>6). See response to item 3).</p> |                     |                      |                      |                    |                          |

|               | <p>on when to apply each of the following bottom bar end conditions: 90 degree, 45 degree, and terminator ends. Shimmick would propose the criteria as the size of the 1:1 slope region.</p> <p>4. If bent bars are required per #2, Shimmick proposes that the bottom bent bars are added with a splice to facilitate placing the bar. Propose (a) splice length per splice schedule on S1-3001, to extend from start of 1:1 toward foundation wall, (b) to reduce bent bar size from matching MFB to a #5, (c) splice length per larger bar size.</p> <p>5. Please provide a distance from the GL G and C at which to stop stirrups. Alternatively, please confirm it is acceptable for stirrups to end when the MFB 1:1 slope begins.</p> <p>6. Does the 1:1 slope occur at the built up drag beams along GL C and G? Does the bottom of beam (a) slope to middle flange or (b) run straight into the steel web?</p> |               |                     |                      |                      |  |                          |

| T-2106  | <b>SCS - Conflict Between TR Girder Stirrup Holes and Concrete Beams</b> | <b>Closed</b> | 01/16/2015  | 01/26/2015           | 01/27/2015           | Potentially        | <input type="checkbox"/> |
| <b>From:</b> Webcor Construction LP Claude Titcher<br><b>To:</b> Turner Construction Company Phil Militello<br><b>Co-Author:</b> Shimmick Construction Company, Inc. Henry Chiang |  |               | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |                      |                      |                    |                          |

**REQUEST:**

Contract Doc Ref: S1-3705  
 Location: Ground Level  
 Grid Line: N/A  
 Add'l Doc Ref's: Attached.

Please reference SI-3705, Sheet 631AC from SSS TG0701-074, and Sheet GN02F from SCS TG0702-075. All sheets are in reference to the concrete MFB framing into TR 12 at GL C as an example.

SI-3705 shows 2" holes penetrating TR 12 at top and bottom of web for placement of stirrups. The steel shop drawing for TR 12 shows the hole layout. However, when detailing the MFB/TR connection at C/12, the stirrup holes fall outside the concrete beam bottom due to the 1:1 sloped region of the concrete beam (shown in SI-3705). The conflict is reflected in the rebar shop drawing. This results in exposed stirrups.

Shimmick proposes that stirrups be eliminated when transfer girder stirrup holes fall outside the concrete limits. Please confirm this is acceptable. If this is not acceptable, Shimmick proposes to provide hanger bars through only the top holes in the web, with size to match original stirrups and fit concrete limits.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Detail 3/S1-3705 shows that the concrete beam is framed into TR12, with bottom of the beam bearing on the TR12 bottom flange. The concrete beam bottom does not have 1:1 slope as stated in this RFI, so we cannot see problem in installing the stirrups per contract documents.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Contract Doc: S1-2303, S1-2304  
 Location: Zone 2, Ground Level  
 Gridline: 10.1-12/C & G  
 Add'l Doc Ref's: Shop Drawings from TG0701-073.1, SK RFI 1011 SK1-SK5

The following condition occurs at 4 locations as can be seen in the attached SK1 to SK5.

The transfer girder wing plate to perimeter beam connection at GL11 has several misaligned holes where the web extension plates are CJP welded to the BU beam. Misalignments range from 1/8" to 5/16".

Please confirm it is acceptable to ream 36 of the 90 holes in this slip critical connection. AISC 16.1-121, allows short slotted holes in any or all plies of slip critical connections.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

It is acceptable to ream only those holes that do not fall within the lower 5x6 bolt group. Misaligned holes within the lower 5x6 bolt group occur at the southwest connection and the northeast connection. At these two locations, a welded cover plate with properly aligned holes relative to the node gusset shall be provided. The cover plate shall develop into the WT via welds to the WT and drag beam flanges. Within the lower 5x6 bolt group where the cover plate is provided, neither the cover plate holes nor the existing node gusset holes may be modified. Modification may only occur on the existing WT side of the connection.

Contractor to submit details of cover plate and welds for design team review.

The governing code section for this connection is AISC 341, Section 7.2. This section does not allow slotted holes loaded parallel to the direction of force, which would be the case in this instance.

Reason for RFI (TT): "Request for corrective field work".

 Add'l Doc Ref's: SK1, Shop Drawings 9553 and 9551

Per the response to RFI T-2123, please confirm the attached cover plate and weld designation is acceptable for the 5x6 hole pattern.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Confirmed for locations described in RFI T-2123 response.

Reason for RFI (TT): " request for corrective field work "

**Co-Author:**

**REQUEST:**  
 Subject: Roof Park Restaurant Dumbwaiter (ASI # 128)  
 Location: Grid 5 Roof Park  
 Add'l Doc : N/A

During Pre-Construction scope discussions regarding the Roof Park Restaurant, it was understood a dumbwaiter was to be included in ASI # 128. However, ASI # 128 Drawings and Specifications do not indicate a dumbwaiter requirement. Please advise if:

1.) Is Webcor/Obayashi to include the new Roof Park Restaurant dumbwaiter within its ASI # 128 pricing?  
 2.) If so, are there new specifications, drawings and details with which to price a dumbwaiter?

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

1.) No - Webcor/Obayashi IS NOT to include the new Roof Park Restaurant dumbwaiter within its ASI-0128 pricing.

2.) There will not be specifications, drawings and details issued for this work, as this is work by the Tenant in a future Tenant fit out package.

**REQUEST:**

As discussed in Olson Steel's QA-QC Meeting of Mutual Understanding on 12/23/14 with Turner/WOJV, and again in Olson's Preparatory and Initial DFOV meetings on 1/5/15, it was agreed that the Stair and Tailing Mock-up (One complete floor to floor exit stair mock-up complete with landing and railing per 05 51 00, 1.8 Quality Control, Part C) will encompass the Stair #403 stringers and landings from the Train Platform EL.-20'-0" to EL -18'-7 1/8". Olson Steel is currently fabricating this mock-up, and as agreed with Turner/WOJV, the mock-up will be fully assembled in Olson's San Leandro shop for the Design Team to review. This RFI is being submitted for record to revise the location of the mock-up to Olson's fabrication shop in San Leandro, CA. Since the mock-up is an actual portion of Stair #402, a secondary review can take place if needed once the stair is installed onsite.

Please confirm this is acceptable.

**SUGGESTION:**

**ANSWER:** Confirmed.  
**Accept Suggestion:**

Closest Column Line Intersection: N/A

Add'l Doc Ref's: N/A

Details 2 & 4/A1-9585 feature the expansion joints identified on the A1-95XX Series. Specification Section 03 20 02 (3.1) D.1 Concrete Reinforcement and Embedded Assemblies indicates rebar and WWF are not to be continuous between expansion joints.

Details 2 & 4/A1-9585 do not call out for dowels at the expansion joints to prevent the slab edges from curling away from each other.

Please confirm no dowels are required at the polished concrete topping slab expansion joints.

**From:** Webcor Construction LP      Tram Nguyen      **To:** Turner Construction Company Phil Militello  
**Answered By:** Webcor Construction LP    Tram Nguyen

**Co-Author:**

**REQUEST:**

Contract Doc Ref: (ASI 128 dated 12/16/14)  
 Detail 1/A1-7572

Location: N/A

Closest Column Line Intersection: N/A

Add'l Doc Ref's: N/A

Detail 1/A1-7572 appears to show a bolted connection between the edge of permanent terrazzo covered topping slab and the knock out panel topping slabs.

No detailed information is given on the assembly (angle size, bolt size, how often does the bolted connection occur, what is the solid grey color, is this a typical detail at all edges of all knock out panels, etc.).

Please provide the full detailing on the permanent topping

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Please refer to SKA-4431 for a typical detail for the knock out slab at the grand hall.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**  
 Contract Doc: S1-2304, S1-2305  
 Location: Zone 2, Ground Level  
 Gridline: F.7/16  
 Add'l Doc Ref's: TG0701-78.1, Shop drawing No. A603AC

Six additional holes were accidentally drilled in the web plate for transfer girder A603 at gridline 16.

The holes are located at running dimensions of 28'-2 11/16" & 28' 9 1/4" just below the set of holes that are detailed, and have a 3" spacing consistent with the rest of the group.

Please confirm it is acceptable to:  
 (a) Leave as is or,  
 (b) Install 6 A325 type 1 bolts in the mis-drilled holes.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Option b is acceptable.

Reason for RFI (TT): We categorize this RFI as request for corrective field work.

**Co-Author:**

**REQUEST:**  
 Specification 07 42 13 Section 1.9K

Specification calls for mockups to be sized at a minimum span of 2 panel joints in each direction (approximately 20 feet x 20 feet).

The documents do not state specifically where onsite (gridline, etc.) the mockups are to be located, and if they will be left in place once approved.

Please provide location for each of the required system mockups and confirm that approved mockups will be left in place.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

| <b>REQUEST:</b><br>Contract Doc: S1-6005, S1-6006<br>Location: Light Column<br>Gridline: N/A<br>Add'l Doc Ref's: SK RFI 1015 SK1 & SK2<br><br>Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. Pipe has been ordered and delivered in conformance with this specification.<br><br>Detail 6/S1-6006 shows the intended fit between the vertical pipe legs and the cast nodes. The castings have a machined feature on each nozzle end that is intended to slide into the pipe ends and act as a backing ring. The corresponding weld between these two components is called out as a complete joint penetration weld in the same detail. In accordance with AWS D1.1 Section 5.22.1.1, the separation between faying surfaces of butt joints landing on a backing shall not exceed 1/16".<br><br>The allowable tolerances for API 5L Grade X52 pipe do not require concentricity (between internal and external bores) or even a constant wall thickness that would be required by AWS D1.1 to provide a complete joint penetration weld. Further, there is no requirement in the contract documents for additional machining to the internal bores of the pipe ends as would be required by AISC Code of Standard Practice.<br><br>As a result our fabricator has encountered the following conditions:<br><br>1. Pipe does not fit over the machined backing ring at the cast node nozzle end as intended without additional grinding and/or machining<br><br>2. Pipe fits over cast node backing ring; however, pipe ID is not circular or concentric, resulting in excessive gaps that exceed fit tolerance requirements for a complete joint penetration weld. Further, the lack of concentricity may result in misalignment of the pipe and cast nodes in the vertical legs.<br><br>3. Ring pipe segments will be made from different pipe sections. Pipe ends from such sections will have varying |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br><br>Response Dated 2.12.15:<br>We see this as a means and methods of construction issue, as the fabricator and contractor are responsible for the coordination between structural steel and cast steel. Drawing 6/S1-6006 shows the required fit between the vertical pipe legs and the cast nodes. A CJP is necessary between the pipe and cast node, the fabricator's chosen solution must facilitate this.<br><br>SBP disagrees with the stated reason for the RFI (engineering conflict), we classify this as alternate proposal submitted for approval.<br><br>Revised Response Dated 3.9.15:<br><br>For the ring splices of the horizontal rings located at elevation +12'-0" and +90'-11", it is acceptable to use PJP welds with a 2-inch effective throat depth. The NDT inspection requirements for CJP welds as per the contract document must be followed.<br><br>For the cast node to cast node splices, located at the cast node ring at the lower concourse level (elev. - 8'-2"), the weld requirement was changed from a CJP in our response to RFI T-2062 dated 01/14/15. It was agreed that PJP welds with a 2-inch effective throat depth were acceptable to be used, with the NDT inspection requirements for CJP welds as per the contract document to be followed.<br><br>For the remaining horizontal ring splices CJP welds must be used.<br><br>For the vertical pipe splices, including pipe to pipe and cast node to pipe splices, CJP welds must be used. |                      |                    |                          |

|               | <p>and unmatched IDs again inhibiting the installation of a tight fitting backing ring required to complete a CJP.</p> <p>For demonstration please refer to attached SK RFI 1015 SK 1 and SK 2 which shows actual dimensions for the first pipe section cut by our fabricator (p16056) and corresponding measurements from cast nodes 702-01 and 702-02 machined backing ring (see attached sketches). The sketches compare the measured pipe ID to the cast node backing ring OD. This piece does not fit against either of the cast nodes</p> <p>To resolve these issues we see the following options / solutions:</p> <ol style="list-style-type: none"> <li>1. Grind internal bores of pipe ends to allow fit against castings. This option would not permit the completion of complete joint penetration welds so the CJP weld designation requirement would have to be modified to a PJP by the design team. Gaps exceeding PJP allowances would have to be built up with weld metal. Please note; however, that this option does not ensure a correct alignment between the vertical pipe and cast nodes.</li> <li>2. Machine internal bores of pipe ends to ensure a tight fit against the castings and correct alignment between the pipe and castings. The actual machining work to achieve this would be minimal; however, building machining fixtures and set up time for each pipe end would be significant.</li> <li>3. For pipe to pipe welds in the ring sections, we suggest removing the CJP weld designation.</li> </ol> <p>Please advise or provide a solution as the above options have cost and schedule impacts.</p> |               |                     |                      |                      |                    |                |

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Contract Doc Ref: S1-6005, S1-6006  
 Location: GL 23  
 Add'l Doc Ref: AWS D1.1

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**

Pipe for the light column structure is specified on structural contract drawings S1-6005 and S1-6006 as API 5L Grade X52. Pipe has been ordered and delivered in conformance with this specification. Detail 6/S1-6006 shows the intended fit between the vertical pipe legs and the cast nodes. The castings have a machined feature on each nozzle end that is intended to slide into the pipe ends and act as a backing ring. The corresponding weld between these two components is called out as a complete joint penetration weld in the same detail. In accordance with AWS D1.1 Section 5.22.1.1, the separation between faying surfaces of butt joints landing on a backing shall not exceed 1/16". The allowable tolerances for API 5L Grade X52 pipe do not require concentricity (between internal and external bores) or even a constant wall thickness that would be required by AWS D1.1 to provide a complete joint penetration weld. Further, there is no requirement in the contract documents for additional machining to the internal bores of the pipe ends as would be required by AISC Code of Standard Practice.

As a result our fabricator has encountered the following conditions;

1. Pipe does not fit over the machined backing ring at the cast node nozzle end as intended without additional grinding and/or machining
2. Pipe fits over cast node backing ring; however, pipe ID is not circular or concentric, resulting in excessive gaps that exceed fit tolerance requirements for a complete joint penetration weld. Further, the lack of concentricity may result in misalignment of the pipe and cast nodes in the vertical legs.
3. Ring pipe segments will be made from different pipe sections. Pipe ends from such sections will have varying and unmatched IDs again inhibiting the installation of a tight fitting backing ring required to complete a CJP.

For demonstration please refer to attached SK RFI 1015 SK 1 and SK 2 which shows actual dimensions for the first pipe section cut by our fabricator (p16056) and corresponding measurements from cast nodes 702-01 and

|               | <p>702-02 machined backing ring (see attached sketches). The sketches compare the measured pipe ID to the cast node backing ring OD. This piece does not fit against either of the cast nodes.</p> <p>To resolve these issues we see the following options / solutions;</p> <ol style="list-style-type: none"> <li>1. Grind internal bores of pipe ends to allow fit against castings. This option would not permit the completion of complete joint penetration welds so the CJP weld designation requirement would have to be modified to a PJP by the design team. Gaps exceeding PJP allowances would have to be built up with weld metal. Please note; however, that this option does not ensure a correct alignment between the vertical pipe and cast nodes.</li> <li>2. Machine internal bores of pipe ends to ensure a tight fit against the castings and correct alignment between the pipe and castings. The actual machining work to achieve this would be minimal; however, building machining fixtures and set up time for each pipe end would be significant</li> <li>3. For pipe to pipe welds in the ring sections, we suggest removing the CJP weld designation.</li> </ol> <p>Please advise or provide a solution as the above options have cost and schedule impacts.</p> |               |                     |                      |                      |                    |                |

**Co-Author:**

**REQUEST:**

Contract Doc Ref: (ASI 128 dated 12/16/14)  
 Specification Section 09 66 23

Location: N/A

Closest Column Line Intersection: N/A

Add'l Doc Ref's: N/A

Specification Section 09 66 23 (1.3) C Epoxy Terrazzo Flooring requires any space receiving terrazzo flooring to be completely enclosed.

Some areas receiving terrazzo are open air spaces (Public Lobby 02249, for example) and will require temporary enclosure. (Note: If the "W" system at the Grand Hall is not in place at the time of the terrazzo installation, it will also require temporary enclosure.)

Please confirm environmental conditions required by the manufacturer's written installation are to be followed, and enclosure is not necessary unless required by the manufacturer.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Enclosure Requirements in Section 09 66 23 have been updated to meet manufacturer and installer recommendations. See attached mark-up of Specification Section 09 66 23.

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**

Contract Doc Ref: S1-4350 - S1-4356  
 Add'l Doc Ref: Attached sketch SK2 - SK4

Based on previous discussions regarding cracks and lamellar tearing experienced by one of our fabricators we propose making the following modifications to minimize reoccurrence;

1. Revise weld access holes in transfer girder web at interface with intermediate flange. See attached SK1
2. Replace vertical stiffeners at transfer girder ends beneath castings to a single continuous end plate. The web and flanges will be CJP'd to the end plate. See attached SK2

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

| <u>Number</u> | <u>Subject</u> | <u>Status</u> | <u>Date Created</u> | <u>Date Required</u> | <u>Date Answered</u> | <u>Cost Impact</u> | <u>Proceed</u> |
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

- 3. Replace top horizontal plates at back of cast nodes to a single continuous plate and also remove 3" length of vertical weld at flange edge. Access hole would be extended/enlarged as shown. See SK3
- 4. Revise wing plate to bottom flange detail as shown in SK4

Note: All detail modifications proposed would be typical for transfer girders with ground level cast nodes only

Please advise.

| Contract Doc Ref: P1-2003 & P1-2004<br>Location: Ground Level & 2nd Level Throughout<br>Closest Column Line: N/A<br>Add'l Doc Ref's: N/A<br><br>P1-2003 & P1-2004 show the Zone boundaries for the project. The Zoning plan for the 2nd Level shown on P1-2004 includes large areas of the building that protect the Ground Floor Level (See dark blue areas on attached P1-2003). In our experience, the Fire Department requires a sprinkler system be zoned from the floor level it protects. Please confirm that the areas of the 2nd level protecting the Ground Floor should be zoned from the Ground Floor. |  |                    |                     | There are other two story high spaces controlled by second level zone valves, for example Shaw alley and the passage at grid line 3. We considered the issue zoning and of zone control valve locations early on and what we currently show on our drawings was determined to be the most practical and consistent solution.<br><br>The grand hall which is the largest two story space is supplied by four zone control valves that are not even located in this sector, two zone control valves are located on second level in Sector B and two zone control valves are located on second level in Sector D. |                      |                    |                          |

**REQUEST:**

Contract Doc Ref: S1-2303, 8/S1-3701  
 Location: Ground Level  
 Grid Line: GL9-H  
 Add'l Doc Ref's: Attached

Reference sheet SI-2303 and Section 8/S1-3701 for Concrete beam B78 located along GL 9 between GLG and H.

S1-2303 shows B78 terminating at the face of concrete beams B87 and B88. Section 8/S1-3701 shows B78 bearing on the steel transfer beam and extending past B87 and B88.

1. Please confirm whether B78 terminates or extends past B87 and B88.
2. If the beam extends past B87/88 per Section 8/S1-3701, please provide the distance to which B78 extends, from south side of B87/88 to end of beam.
3. If the beam terminates at B87 and B88, please revise Section 8/S1-3701 rebar details to match the new limits.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

- 1). B78 terminate at the south edge of B87\_B88.
- 2). See #1
- 3). Change to rebars shown in Section 8/S1-3701 will be provided in ASI 130.

**From:** Webcor Construction LP      Claude Titche

**To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:** Shimmick Construction Company, Inc. Henry Chiang

**REQUEST:**

Contract Doc Ref: S1-3500  
 Location: N/A  
 Grid Line: N/A  
 Add'l Doc Ref's: Attached

Please refer to the Shrinkage and Temperature Bars (S&T Bars) in details 1&2/S1-3500. There are no lap location instructions, i.e. to stagger or not to stagger, given for the S&T Bars.

Please confirm that no stagger is required in the top/bottom S&T bars. If a stagger is required, please

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

Confirmed that S&T rebar in one-way slab do not need stagger at lap splice.

| T-2215   | ELV - Low and Line Voltage Floor Box layout Relative to Finish Floor Pattern | Closed  | 02/10/2015 | 02/20/2015 | 02/23/2015 | Potentially | <input type="checkbox"/> |
| <b>From:</b> Webcor Construction LP                      Aseem Goyal <b>To:</b> Turner Construction Company Phil Militello |  | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |            |            |            |             |                          |

**Co-Author:**

**REQUEST:**

Ref: ASI # 128 Sheet A1-9545, E1-2305 & TE1-2305 dated 12/16/14  
 Location: Grand Hall (Floor Finish - Terrazzo)  
 Closest Column Line: N/A  
 Add'l Doc Ref's : N/A

**SUGGESTION:**

The TG10.4 package is currently in shop drawing production and will shortly begin ground floor detailing of the Grand Hall. Relative to the finish terrazzo floor design, are there any other spatial/dimensional requirements or floor box finish/trim requirements for Electrical, Telecommunication or Security floor boxes beyond that shown and/or specified in ASI # 128 Documents? Additionally, A1-9545 does not reflect all require floor box locations (see grid Line 19.4 on E1-2305 & TE1-2305). Please provide updated A1-9545 that reflects all Low and Line voltage floor box locations required per ASI # 128.

**ANSWER:**

**Accept Suggestion:**

Drawings TE1-2305, E1-2305 and Specification Section 26 27 26 Wiring Devices in ASI-0128 submission provide the required information floor outlet types. Additionally, please refer to enclosed sketches SKA-4440 and SK-4441 for dimensioned outlet locations and floor outlets added to the floor finish layout at the Grand Hall

**From:** Webcor Construction LP      Tram Nguyen      **To:** Turner Construction Company Phil Militello

**Answered By:** Adamson Associates, Inc. George Metzger

**Co-Author:**

**REQUEST:**

Contract Doc Ref: (ASI 128 dated 12/16/14)  
 Specification Section 09 66 23

Location: N/A

Closest Column Line Intersection: N/A

Add'l Doc Ref's: N/A

Specification Section 09 66 23 (1.7) E identifies "Manufacturer (Fabricator) Qualifications."

It is unclear who specifically is the "Manufacturer (Fabricator)."

Please confirm that "Manufacturer (Fabricator)" refers to the trade subcontractor installing the epoxy terrazzo flooring on-site.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Specification Section 09 66 23 (1.7) E describes the terrazzo Manufacturer (Fabricator) qualifications, while 09 66 23 (1.7) F describes the Installer's qualifications, the two entities may be one and the same provided they meet both qualification requirements.

**REQUEST:**

Contract Doc Ref: P1-2602,2502, A1-2902 (ASI 128)  
 Location: ZONE 1 , Grids 4 & D, Level: Roof Park Level  
 Closest Column Line Intersection: 4 & D, 4 & F  
 Add'l Doc Ref's: N/A

A1-2902 depicts two Roof Drains at Gridline 4/D & 4/F but these aren't shown on P1-2602, moreover P1-2502 doesn't depict any risers for the same. Please confirm these roof drains are required and, if so, provide updated drawings for the same.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**

Roof drains at gridlines 4/D and 4/F are not required and have been removed from drawing A1-2904. Drawing will be issues in a future ASI.

Add'l Doc Ref: Attached

See attached CD RFI 761 SK1 & SK2 for items 1 to 4:

- 1)The note states that 4 posts are required but only 2 posts are shown. Please clarify.
- 2)Confirm the dimension shown as 11'-11 should read 12'-3 1/4.
- 3) It is understood that the 4 beams indicated as +4 on plan are to be revised to EL. 86'-4 per E53 but it is not clear what is being requested for the HSS10x8x1/2 (Mark A13665). Please clarify.
- 4) Note 2 does not occur on E53. Please clarify what is being requested.

2) Dimension should read as 12'-3 1/4".

3) Maintain same datum 86'-4" for HSS 10X8X1/2.

4) Disregard Note 2.

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

There is a contradiction between the structural framing plan (S1-2303) and structural detail (6/S1-7660). The S1-7302 callout plan on the S1-2303 structural plan refers to 6/S1-7660 detail. The detail (6/S1-7660) shows that the steel beams are aligned with escalator pit walls (marked with green fill). The framing plan (S1-2303) shows the exact positions of the steel beams (marked with red dashed line).

If we follow the dimensions of beams on S1-2303 (2'-4" from D.8; 2'-4" from E.2; 1'-10 5/8" from E.6; 1'10 5/8" from D.4; 8" from the edge of the escalator pit), the steel beams will be in a different position than what is shown on detail (6/S1-7660). In this case the typical detail cannot be applied.

Please provide an updated sheet S1-2303 with the corrected detail callout.

**REQUEST:**  
 Contract Doc: A1-2203; A/A1-6013; A1-2223; 3/A1-9255; S1-2203  
 Location: Zone 1, Lower Concourse  
 Gridline: A-B /9-10.1  
 Add'l Doc Ref's: Virtual Building PH1-CR #141

**SUGGESTION:**

**ANSWER:**  **Accept Suggestion:**   
 For updated 3/A1-9255 and structural requirements for the ramp knee walls, refer to response to RFI T-2212.

NOTE: Due to a difference in calendar month between date answered and date received, there was a delay in posting this RFI.

Unresolved issue from Phase 1. See attached.

The ramp located at gridlines 9 to 10.1 and A to B are supported by a concrete wall (marked with yellow fill).

The A1-2203 plan do not define the type of the supporting wall. The A1-2223 plan shows a type 10 wall, the 3/A1-9255 detail shows a concrete wall, and the S1-2203 plan do not show any wall to the same place.

The A1-2223 (PER ASI 128) drawing shows the type 10 CMU wall but the 3/A1-9255 ( PER ASI 128) architectural

**From:** Webcor Construction LP                      Quang Le                      **To:** Turner Construction Company Phil Militello                      **Answered By:** Turner Construction Com; Phil Militello

**Co-Author:** Skanska USA Civil West California DisRyan Clayton

**REQUEST:**  
 Contract Doc Ref: 7/S1-5020  
 Location: Roof Level  
 Add'l Doc Ref's: SK1

1) 7/S1-5020 details metal deck attached to 12 gauge closure with puddle welds (arc spot welds). AWS D1.3 does not allow arc spot welding sheet to sheet (table 1.3). As an alternative please confirm a 3/8" x 1-1/2" arc seam weld is acceptable. Spacing requirements will remain at 12".

2) At a typical weld plate condition at high flutes as shown on SK1, please confirm it is acceptable to use #12- 14x1 HWH Tek 3 screws, spacing at 12" or a 3/8" x 1-1/2" arc seam weld. See attached SK1.

**SUGGESTION:**

**ANSWER:**                      **Accept Suggestion:**

1) Seam welds in lieu of puddle welds as proposed are acceptable.

2) Either of the two options: seams welds or self-drilling screws are acceptable.

Reason for RFI (TT): We agree with reason for request: Alternate Proposal. We categorize this RFI as Request for substitution

**Co-Author:** Shimmick Construction Company, Inc. Sylvia Hartanto

**REQUEST:**

Contract Doc Ref: N/A  
 Location: 3rd Lift Walls  
 Grid Line: N/A  
 Add'l Doc Ref's: Attached

Please reference attached 3rd lift foundation wall comprehensive drawings showing as-installed unistrut locations, RFI T-1549, submittal TG0600-926 and attached photo. Unistrut locations are dimensioned in red from one location to another, and dimensioned in green off of Grid lines. If any foundation wall is not shown in the following drawings, the unistrut has been installed per contract layout and RFI T- 1549 tolerances.

As installed the unistrut has four ( 4) conditions:

1. Unistrut has been installed not per contract O.C. layout, but no more than 10' spacing with RFI T- 1549 tolerances. Please confirm these locations/condition is acceptable.
2. Unistrut has been installed not per contract O.C. layout, but less than 10' spacing and RFI T-1549 tolerances. Please confirm these locations/condition is acceptable.
3. Unistrut has been installed not per contract O.C. layout, and more than 10' spacing with RFI T-1549 tolerances. Please reference marked up comprehensive drawings for these specific locations. Please confirm locations/condition is acceptable on an individual basis or SCCI proposes to install an additional piece of unistrut to ensure the O.C. spacing is no more than 10' with +/-6" tolerance provided in RFI T-1549. This additional unistrut install will be performed similar to the method prescribed in submittal TG0600-926.
4. Unistrut has been installed not per contract O.C. layout, and installed skewed. Please confirm it is acceptable to abandon this specific piece of unistrut and install two (2) replacment pieces on either side, which will ensure the O.C. spacing is no more than 10' with 6" tolerance provided in RFI T-1549. This additional unistrut install will be performed similar to the method prescribed in submittal TG0600-926.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

1. This condition is acceptable. Refer to confirmation on attached PDF-AAI response.
2. This condition is acceptable. Refer to confirmation on attached PDF-AAI response.
3. Refer to mark ups on attached PDF-AAI response. Note that the accepted tolerance is +/- 4" off the 10'-0" spacing as per response to RFI T-1549.
4. This condition is acceptable. Refer to mark ups on attached PDF-AAI response.

| Gridline: D-F/4-7   |   |   | Please refer to A1-2862 and A1-2863.  |                   |                   |                    |                          |
| Add'l Doc Ref's: Virtual Building CR #112   |   |   | This is the third time WOJV has asked for clarification on this issue related to actual vs. nominal dimensions of a CMU block wall. If WOJV still has a question on this issue please have Jeff Heath call George Metzger to discuss this further so the design team can understand your issue with an 8" block wall being 7 5/8" actual dimension. |                   |                   |                    |                          |
| See attached Virtual Building CR #112.  |   |   |   |                   |                   |                    |                          |
| There is a contradiction between the structural floor plan (S1-2351) and the architectural plans (A1-2862; A1-2963). The CMU walls are annotated with 12" wide on the architectural plans. The A1-2862 slab edge plan refers to the structural plans. The structural plan (S1-2351) shows 8" and 12" CMU walls in this area. The actual thickness of walls are 7 5/8" and 11 5/8" in the wall schedule (A-0022). Using actual wall thicknesses results in different dimensions on the architectural plan (A1-2963). |   |   |   |                   |                   |                    |                          |
| Issue with 12" concrete walls is solved, but S1-2351 (03/31/14, ISSUED FOR CONSTRUCTION) still includes noted 12" CMU walls. The 8" CMU still do not have dimension. ASI128 does not solve the issue.   |   |   |   |                   |                   |                    |                          |
| Please provide missing dimensions.  |   |   |   |                   |                   |                    |                          |

Henry Chiang  |  |                    | <b>Answered By:</b> Adamson Associates, Inc. George Metzger |  |                      |                    |                          |
| <b>REQUEST:</b><br>Contract Doc Ref: 03 20 02<br>Location: Pendulum Bearings<br>Grid Line: N/A<br>Add'l Doc Ref's: Attached<br><br>Please find attached Mageba's RFI and Technical Proposal.<br><br>1. In the attached technical proposal Mageba have considered the maximum load stated at static, even though the isolators can handle the load at maximum displacement. For dynamic displacement, Mageba have indicated the maximum load possible considering the need for re-centering capabilities of the devices. This consideration had been done due to the following reasons:<br><br>- The nominal friction coefficient of Robo Slide for these devices is approximately 4.0%. considering the loads indicated in the specification, in case of displacement, such loads multiplied by the friction coefficient would be too high., and the static re-centering will not be possible, especially due to the relatively small displacements.<br><br>- After reviewing the design of the pendulum isolators, we Mageba, found that the only way Mageba can ensure re-centering is by adjusting the displacement to 5.9 inches, where we would have re-centering with the proposed maximum loads under seismic conditions.<br><br>The maximum loads proposed for these isolators under seismic conditions and displacement of 5.9 are:<br>Type A: 1,708 Kips<br>Type B: 1,236 Kips<br><br>- Note that for horizontal loads, the proposed devices would actually reach the minimum displacement for 4" with the requested maximum horizontal force, which are:<br>Type A: 125 Kips<br>Type B: 90 Kips<br><br>However please note that due to the short displacement, high loads and friction coefficient, the static re-centering will not be fulfilled, only the dynamic re-centering would be ensured. |  | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br>1-) This question is very similar to those in RFI T-2219. Information on displacement demands, vertical load demands and re-centering were provided in response to RFI T-2219 along with contract specifications. The vertical loads under gravity loads and seismic loads are very similar (see response to RFI T-2219) hence only single set of vertical loads were including in the specifications. As indicated in RFI T-2219 bearings will be re-centered by the trainbox walls (designed to remain elastic) and a self-centering mechanism is not relevant. See structural sheet S1-3135 to how the bearings are located within the structure. This sheet shows Gridline 35 bearings, Gridline 34 bearings are located similarly. Maximum loads provided in this RFI (1708 kips for Type A and 1236 kips for Type B) are lower than those provided in the specifications and are not acceptable, that said the bearings will not experience more than 4" displacement. The vertical reactions provided in the specifications need to be satisfied at 4" displacement. Horizontal reactions provided in the specifications shall also be satisfied at 4" displacement.<br><br>2-) Isolator technical specifications shall be submitted to the design team as a submittal not as an RFI. The submittals shall include bearing properties and attachment information to the structure. As indicated in Specification 032002, section 1.4.9, calculations shall also be submitted to show that attachments develop the forces that can be developed in the bearing. |                      |                    |                          |

**REQUEST:**  
 Contract Doc: 1/A1-2951  
 Location: Zone 1, Roof Park Level  
 Gridline: D/1  
 Add'l Doc Ref's: Virtual Building CR #411

Please see attached Virtual Building CR #411.

There are contradicting dimensions for wall and landing on the enlarged floor plan (1/A1-2951). The landing and the wall is aligned on the floor plan, but the dimension values show different distances (2' - 4 1/2" and 2' - 5").

The landing were modeled following the dimension values on the enlarged floor plan, and the wall is aligned to the edge of the landing. The wall's distance from the grid D is 1' - 6 1/2".

Please provide corrected dimensions.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**   
 Wall and landing dimensions conflict for Stair 201 are clarified in the enclosed sketch SKA-4451.

NOTE: Due to a difference in calendar month between date answered and date received, there was a delay in posting this RFI.

| T-2323        | <p>System Sheet (Beale Street) (S1-6058; TG 08.1 Package). The W30x90 Steel Beam missed from the Gridline E.</p> <p>The beam was modeled per the S1-2307 framing plan. The S1-2307 and S1-6058 (ASI 128) still show the contradicting information about beams.</p> <p>Please provide updated sheet with beam information.</p> <p><b>TTC - Contradicting position and content of section</b></p> <p><b>From:</b> Webcor Construction LP      Stephanie Azzolino      <b>To:</b> Turner Construction Company Phil Militello</p> <p><b>Co-Author:</b> Webcor Construction LP      Jeff Heath</p> <p><b>REQUEST:</b></p> <p>Contract Doc: 1,5/S1-6100<br/>                     Location: Zone 3, Roof Park Level<br/>                     Gridline: F-H/21<br/>                     Add'l Doc Ref's: Virtual Building CR #644</p> <p>See attached Virtual Building CR #644.</p> <p>There are few contradicting gridline (marked yellow) on the overall section (5/S1-6100). The position of the section (5/S1-6100) is shown on Plan - Roof Park Cafe Steel Frame View (1/S1-6100), it is parallel with gridline F.6. It causes that the appearing gridline should be only the gridline 21 on the overall section instead of the gridlines G/F-F.7.</p> <p>The position of overall section is modeled according to the Roof Park Cafe Steel Frame View (1/S1-6100), the correct position of gridline 21 is marked with red on the screenshot. The S1-6100 (ASI 128) does not solve the issue.</p> <p>Please provide revised sheet S1-6100 with corrected position and section.</p> | Closed        | 02/25/2015          | 03/07/2015           | 03/08/2015   | Potentially        | <input type="checkbox"/> |

| Ref: P1-2202  |  |  | This condition has been resolved by rerouting the sanitary waste east of grid line 7, it has been relocated in the ground level ceiling in ASI 0130.                  |                      |                      |                    |                          |
| Location: Lower Concourse   |  |  | Also, a sketch submitted by DMI on March 20 showed a sanitary waste rerouting at grid lines 3/F which I reviewed and approved (DMI will follow with a conforming RFI) |                      |                      |                    |                          |
| Closest Column Line: 4-A  |  |  |   |                      |                      |                    |                          |
| Add'l Doc Ref's : N/A   |  |  |   |                      |                      |                    |                          |
| At column line 4-A on P1-2202, the invert elevation of 8" sanitary line from reference(0) is 10'-0 1/4" however the sleeve per the design documents is at 12'-6"(12'-7 1/4") difference(below invert) 2'-7". This elevation is driven from column line 7-D; Please advise |  |  |   |                      |                      |                    |                          |

**Co-Author:** Shimmick Construction Company, Inc. Henry Chiang

**REQUEST:**

Contract Doc Ref: N/A  
 Location: 4th Lift Foundation Wall  
 Grid Line: N/A  
 Add'l Doc Ref's: Attached

Please see attached photos and cut sheets regarding Foundation Wall 4th Lift Sleeve Supports.

The Foundation Wall 4th Lift stainless steel sleeves are currently supported by P4100 unistrut assemblies set on the top of wall. Shimmick is requesting approval to cast these supports into the 4th lift pour as opposed to removing the supports prior/during the pour. Leaving the supports in place will keep the sleeves more independent from the rebar in case adjustments are needed on the rebar cage.

Please confirm it is acceptable to cast the Foundation Wall 4th Lift Sleeve Supports into the foundation wall.

**SUGGESTION:**

**ANSWER:**

**Accept Suggestion:**

This is a means and methods of construction. The Design Team does not take exception to the proposed embedded Unistrut, as long as they conform with concrete cover requirements for reinforcement.

 Add'l Doc Ref's: N/A

See attached Dimensional report and numbered print.  
 Dimension #2 18.00" ±.0313 checks 17.936/17.97.  
 Please confirm attached dimensions are acceptable.

**SUGGESTION:**

Please provide disposition on out of tolerance conditions.

**ANSWER:**

**Accept Suggestion:**

Confirmed. GC to coordinate the impact of this dimensional deviation with other sub-contractors and any fit up or other issues that might arise due to this condition are addressed at no cost to the owner.  
 Reason for RFI (TT): None given. We categorize this RFI as substitution request.

## 30100 - Transbay Transit Center Project

| <u>Number</u> | <u>Subject</u> | <u>Status</u> | <u>Date Created</u> | <u>Date Required</u> | <u>Date Answered</u> | <u>Cost Impact</u> | <u>Proceed</u> |
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|
|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

Contract drawing S1-3203, Elevation A, shows starter bars for the East Ramp Wall developed with headed reinforcing into the Lower Concourse. At the south boundary column depicted in Detail 5/S 1-3204, #7 formsavers were installed in lieu of the required matching #10's.

Additionally, some of the required starter bars do not fall within the boundary column envelope. Please confirm that it will be acceptable to use a combination of existing #7 formsavers and drilled-and-bonded #7's to reestablish the starter bar layout. All four of the southernmost dowels are to be fully developed. Of these four, two will be developed into existing form saver sockets and the remaining two will be drilled and bonded to a 22" embedment. The remaining (4)

boundary column starter bars will be drilled and bonded to 7-7/8" embedment or developed into existing formsaver sockets (see attached sketch). The south face of boundary column will form the face of corridor as shown on Sheet No. CD-3a in the rebar shop drawings TG0600-374.1.

Additionally, there is conflict in the number of boundary reinforcing bars as shown on Detail 5/S1-3204 and Elevation A/S1-3203. Please confirm that only (8) bars are required and that the longitudinal tie in the center of the wall in Detail 5/S1-3204 is not required.

#### 2. North Pilaster:

Formsavers for the northern-most pilaster were installed in the Lower Concourse 4" to the south of where they needed to be. Please confirm it is acceptable to drill and epoxy #9 dowels at 10 1/8" embedment so the pilaster can be poured in the correct location (see attached sketch).

#### 3. 2nd Northern-most Pilaster:

Formsavers for the 2nd northern-most pilaster were not installed. In order to accommodate the horizontal bars for the East Ramp Wall, please confirm it is acceptable to drill and epoxy #9 dowels at 10 1/8" embedment in the configuration shown in the attached sketch.

#### 4. Formsavers Without Proper Clearance:

Per a walk with the SEOR, please confirm it is acceptable to abandon 9 select formsavers in the Lower Concourse out of the 160 vertical dowels in the East Ramp Wall due to clearance issues. Dowels will be installed at abandoned

**Answered By:** Potentially

**REQUEST:**      **SUGGESTION:**      **ANSWER:**      **Accept Suggestion:**

Contract Doc: 1/A1-9023  
 Location: Zone 4, Bus Deck Level  
 Gridline: D.4-E.6/31-32  
 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #236

See attached Virtual Building PH3(ASI)-CR #236.

There is an incorrect dimension. The dimension of the wall (marked with red) is not exact.

The wall has other references it will be followed.

Please provide the correct dimension.

**Answered By:** Adamson Associates, Inc. George Metzger

**REQUEST:**      **SUGGESTION:**      **ANSWER:**      **Accept Suggestion:**

Contract Doc: A1-2896  
 Location: Zone 4, Bus Deck Level  
 Gridline: D.4-E.2/27.1-28  
 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #237

See attached Virtual Building PH3(ASI)-CR #237.

There are missing dimensions of the concrete curb (marked with red) on the slab edge plan (A1-2896).

The distance is scaled from the plan. The end of curbs were modeled 6'-1" from gridline 27.1.

Please provide the missing dimensions.

Please refer to attached sketch SKA-4514 for clarification.

| <b>REQUEST:</b><br>Contract Doc Ref: S1-7137, S1-7138<br>Location: All Elevators<br>Add'l Doc Ref's: CD RFI 791 SK1, CD RFI 790 SK4<br><br>See attached CD RFI 791 SK1:<br>All elevator posts currently shown on the structural drawings span unsupported from floor to floor except as shown on S1-7137 & S1-7138 @ PE502/503 (referenced in CD RFI 790 SK4). Please confirm that this remains the intent or supply revised structural drawings or details if this is to be revised. |   | <b>SUGGESTION:</b> |   | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/><br><br>This RFI is not clearly presented and could lead to misunderstandings. Cover page includes a single question, however there are two separate questions in other pages. It is unclear whether some of this is internal within the contractor and their subs or whether they are directed to the design team. The Design Team's response assumes the red comments are from Otis and Blue ones are from the contractor, and that the contractor is seeking answers to both questions in the RFI.<br><br>1) It is not clear if the spacing mentioned in the Otis comment is the spacing understood by the contractor. Otis seem to be referring to plan spacing of the supports (elevator posts) and contractor seem to be referring to spacing of horizontal bracing of elevator supports between different floors. Contractor may want to clarify this further. We can confirm that the design intent only, as it is put forth in the construction documents, which is, posts typically go unsupported from floor to floor, unless otherwise noted in the contract drawings.<br><br>Given this status, the Design Team is unable to confirm, nor verify this information without a complete shop drawing submittal process.<br><br>2) Elevator support framing as put forth in the construction documents is based on the on the design criteria provided by Division 14. If Otis requests any changes to the elevator support framing indicated in the construction documents (for example, reduce number of posts), it is required that they submit calculations to show that design criteria (e.g., deflection requirements) can still be met with those modifications. |                      |                    |                          |

 RFI Response P1-0686

Per RFI Response P1-0686, "Reference to the preparation of the concrete slab and installation of the terrazzo crack suppression system shall be deleted from section 09 66 23."

Specification Section 09 66 23 Epoxy Terrazzo Flooring has not been updated to delete references to the preparation of the concrete slab and installation of the terrazzo crack suppression system.

Please provide a revised Specification Section 09 66 23 that reflects RFI Response P1-0686.

 Sheet A1-6006  
 Detail A/A1-7307  
 Detail A/A1-7805  
 Details 1, 4, & 6/A1-7836

Location: N/A

Closest Column Line Intersection: N/A

Add'l Doc Ref's:  
 RFI RESPONSE T-2109

Sheet A1-6006 illustrates a beam supporting the escalator at GL 28/Second Level and calls out Detail A/A1-7307 and Detail A/A1-7805.

1. Detail A/A1-7307 references Detail 6/A1-7836. Detail 6/A1-7836 shows the beam fireproofed with SFRM and enclosed in a rated wall enclosure.
2. Detail A/A1-7805, references Detail 4/A1-7836. Detail 4/A1-7836 shows the beam fireproofed with IFRM and enclosed in a rated wall enclosure. Furthermore, Detail 4/A1-7836 references Detail 1/A1-7836. Detail 1/A1-7836 shows the rated wall enclosure beginning 1'-5" off of the center line of GL E.

By these details, beam A2987 (as referenced in RFI T-2109) would be approximately half SFRM and half IFRM.

**SUGGESTION:**

**ANSWER:** **Accept Suggestion:**   
 Confirmed. Beam A2987 is to receive IFRM-1 as stated in RFI Response T-2109. Detail 6/A1-7836 is clarified in attached sketch SKA-4504.

| <b>REQUEST:</b><br>Contract Doc Ref: ASI 128/ Drawings: TE1-4602 - 4607; SE1-2602 & 2607; Specification: 12 93 10; 26 50 02; 26 50 01<br>Details Drawings: L1-9632-9634; Detail 4, SE1-4001<br>Location: Zone 02 - 07, Park Level<br>Column Line: Park Perimeter<br><br>Park Pathway Lighting is shown to be an E-2 Fixture that require a number of questions to be answered; |                                | <b>SUGGESTION:</b>                                    |                     | <b>ANSWER:</b> <b>Accept Suggestion:</b> <input type="checkbox"/>  |                      |                    |                          |
| 1. Per Spec Section 12 93 10 2.2.B the Beacon is Amber. Typically, Beacons are Blue. Please confirm Amber as the required color.   |                                |   |                     | 1. Confirmed   |                      |                    |                          |
| 2. Is it acceptable for the beacon to be an LED light?   |                                |   |                     | 2. Yes   |                      |                    |                          |
| 3. What is the intent of how the beacon lights are to operate? Panic Switch? Blue Phone?   |                                |   |                     | 3. Roof beacons are part of the mass notification system. The beacons will sequence same as the roof level fire alarm strobe notification devices, with input from the fire alarm system through the MNA connection/interface.   |                      |                    |                          |
| 4. Is the operating device of the beacon also to connect to video surveillance system? If not provide operational sequence from initiation to intended results.  |                                |   |                     | 4. No. The Park Level Beacons are not connected to video surveillance system. In terms of sequence of operation, the Park Level Beacons are to be arranged to operate automatically upon receipt of a fire alarm signal at the TTC fire detection and alarm system to coincide with the emergency evacuation plan/emergency voice communication system sequence of operation during a fire emergency. In addition, the Park Level Beacons would also be arranged to automatically activate in response to various non-fire event scenarios as prescribed by the TTC Concept of Operations and Emergency Operations Plan. In addition, capability to manually activate the Park Level Beacons by designated TTC management staff or security staff is to be provided to allow for manual override/control of the Park Level Beacon system. The Park Level Beacons are only to be used for Park Level Occupant Notification to alert hearing impaired individuals of an emergency event and that upon alerting individuals, further response/actions via message board display, signage and/or TTC security staff assistance would further direct individuals as to whether to evacuate the Park Level, relocate to another portion of the Park Level or to take other action as prescribed by the Emergency Operations Plan. The Concept of Operations and Emergency Operations Plan are to be developed by the TJPA and its security director and are not yet finalized. |                      |                    |                          |
| 5. E2 is specified as Fluorescent but the Cut Sheet indicates Metal Halide. Please confirm lamping requirements and would it be acceptable to use LED fixtures in lieu of either Fluorescent or Metal Halide?  |                                |   |                     | 5.   |                      |                    |                          |
| 6. Is there a specific design for the acrylic light housing? (Frosted, Prismatic, Fresnel, etc).   |                                |   |                     | a. Per Specification Section 26 50 02-2 dated 17 December 2013, lamping for E2 to be (2) 32-watt T8 fluorescent (3100 lumens, 42000 hrs rated life, 3000K, 85 CRI) (Osram Sylvania FO32/830/XPS/ECO). Per  |                      |                    |                          |
| 7. Please confirm there are no speaker on the plain poles, only on the component poles.  |                                |   |                     |  |                      |                    |                          |
| 8. Please confirm there are no cameras on the plain plains, only the component poles? Also confirm one or two cameras.   |                                |   |                     |  |                      |                    |                          |
| 9. Per Specification 26 50 02 - 3 a custom color is required for E2 pylon housing. Please provide finish   |                                |   |                     |  |                      |                    |                          |

|---------------|----------------|---------------|---------------------|----------------------|----------------------|--------------------|----------------|

this specification, fixtures are to be modified as specified. Lamps to be located on removable gear tray, mounted vertically, as specified in Section 26 50 02-2.

b. Standard LED MTR Column does not produce comparable lumen output to the specified fluorescent fixture. If the Contractor wishes to submit LED in lieu of specified lamps, Contractor shall provide complete shop drawings for proposed LED version, working samples and complete photometric calculation verifying that the LED design meets or exceeds performance of current specification.

6. Refer to Specification Section 26 50 02-2 dated 17 December 2013, for information regarding injection-molded acrylic multi-prisms reflector. Provide satine acrylic cylinders to be located between lamps and MTR rings to diffuse lamp image.

7. Speakers are required in designated pylons (SG) refer to TE1-26xx series drawings.

8. a. Please have Fisk clarify ¿ plain plains¿ ¿ request unclear

b. Refer to SE1-26xx series for camera locations and quantities

9. Refer to Section 09 97 13 part 3.6-C for Pylon finished

**Co-Author:** Webcor Construction LP      Jeff Heath

**REQUEST:**  
 Contract Doc: 3 & 4/4A1-7845  
 Location: Zone 4, Bus Deck Level  
 Gridline: D-F.7/29-31.7  
 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #276

See attached Virtual Building PH3(ASI)-CR #276.

There is a contradiction between type of wall on the sheet 4/A1-7845 and 3/A1-7845. The sheet shows a wall type with type 10 (marked with green) but the other plan shows this wall as type 51.

The wall will be modeled as type 51.

Please confirm.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**   
 Confirmed. The correct wall type is 51.

**Co-Author:** Webcor Construction LP      Jeff Heath

**REQUEST:**  
 Contract Doc: 1/A1-7837; B/A1-7239; 4/A1-7204  
 Location: Zone 4, Bus Deck Level  
 Gridline: D-F/32-32.4  
 Add'l Doc Ref's: Virtual Building PH3(ASI)-CR #277

See attached Virtual Building PH3(ASI)-CR #277.

The sheet 4/A1-7204 and B/A1-7239 show the wall type 11 (marked with yellow) but the detail 1/A1-7837 shows type 1 for the same wall.

The wall will be modeled with type 11.

Please confirm.

**SUGGESTION:**

**ANSWER:**      **Accept Suggestion:**   
 Confirmed. The wall type is 11.
